Use the **rmdeptgroup** command to delete a specific department and its members. If you use the **rmdeptgroup** command without the -rmchildren parameter, the department is deleted, and the members are moved up a level in the hierarchy.
- [**rmexport**](#)
Use the **rmexport** command to remove an export.
- [**rmfs**](#)
Use the **rmfs** command to remove a file system from an active management node. You must have Administrator authority to use this command.
- [**rmfset**](#)
Use the **rmfset** command to remove a fileset from a file system. You must have Administrator authority to use this command.
- [**rmsrg**](#)
Use the **rmsrg** command to delete the specified Storage Resource Group. The group types (Storage Resource Groups, Reporting Groups and Application Groups) that have child groups are not deleted. A warning message is issued and indicates that the group type being deleted contains child groups and the child groups must be deleted before the parent group can be deleted.
- [**rmza**](#)
Use the **rmza** command to remove a zone alias or aliases from a zone. You must have Administrator authority to use this command.

- [rmzaptops](#)
Use the **rmzaptops** command to remove a port or ports from a zone alias. You must have Administrator authority to use this command.
- [rmzone](#)
Use the **rmzone** command to delete a zone or remove a zone from a zone set. If you remove or delete the last zone in a zone set, the zone set is also deleted. This command must be run as a transaction. You must have Administrator authority to use this command.
- [rmzoneports](#)
Use the **rmzoneports** command to remove switch ports from a zone. This command must be run as a transaction. You must have Administrator authority to use this command.
- [rmzs](#)
Use the **rmzs** command to delete a zone set. This command must be run as a transaction. You must have Administrator authority to use this command.
- [rollback](#)
Use the **rollback** command to erase any commands that were issued since you started the transaction. You must have Administrator authority to use this command.
- [runoptschedule](#)
Use the **runoptschedule** command to run a schedule that analyzes storage tiering.
- [setarray](#)
Use the **setarray** command to set the type of back-end storage system, type of Redundant Array of Independent Disks (RAID), type of disk, and number of disks for an array.
- [setbackenddisktype](#)
Use the **setbackenddisktype** command to set or update the type of back-end disk.
- [setbackendraidthe](#)
Use the **setbackendraidthe** command to set the types of back-end RAID arrays for managed disk groups.
- [setbackendtype](#)
Use the **setbackendtype** command to set or update the type of back-end storage system.
- [setdscfg](#)
Use the **setdscfg** command to set the value of a property in the property file for the Device server. You must have Administrator authority to use this command.
- [setquota](#)
Use the **setquota** command to set the amount of disk space and number of inodes that are assigned on a file system for a specified user name, group, or fileset.
- [showoptresults](#)
Use the **showoptresults** command to show the recommendations for optimizing the placement of volumes.
- [start](#)
Use the **start** command to start a transaction. You must have Administrator authority to use this command.
- [unassignvol](#)
Use the **unassignvol** command to remove the host ports from the assignment list for a volume. You must have Administrator authority to use this command.
- [unlinkset](#)
Use the **unlinkset** command to unlink a fileset. You must have Administrator authority to use this command.
- [unmountfs](#)
Use the **unmountfs** command to unmount a file system.
- [updatesrg](#)
Use the **updatesrg** command to update the attributes of the specified Storage Resource Group with a new name, description, or user-defined properties.

Related information

- [Parameter aliases](#)
- [Command aliases](#)

actzs

Use the **actzs** command to activate changes to the zone set in the fabric. This command must be run within a transaction. You must have Administrator authority to use this command.

Syntax

```

▶▶ tpc tool — actzs — -user user_name -pwd password -url url — -fabric — WWN —
                                     -help — ? — -silent —▶
▶ — zone_set —▶▶

```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
 - pwd password
Specifies the password for the IBM Spectrum Control user ID.
 - url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
 - fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
 - help | -h | -?
Lists help information for the command.
 - silent
Suppresses all output for the command. If you omit this parameter, output is included.
- zone_set

The `zone_set` variable is the name of the zone_set.

Example: Activating changes to the zone set

The following commands activate the PARIS zone set:

```
tpctool> -user me -pwd mypass -url myhost:myport
tpctool> start -fabric 100000051E34F6A8
tpctool> actzs -fabric 100000051E34F6A8 PARIS
tpctool> commit -fabric 100000051E34F6A8
```

addza

Use the **addza** command to add a zone alias to a zone. You must have Administrator authority to use this command.

Syntax

```
► tpctool — addza — -user user_name -pwd password -url url — -fabric WWN — -help — ? — -silent — -zone →
► zone — alias ◀
```

Parameters and arguments

`-user user_name`
Specifies an IBM Spectrum Control user ID.

`-pwd password`
Specifies the password for the IBM Spectrum Control user ID.

`-url url`
Specifies the Device server. The format of the URL is `system:port_number`, where `system` represents either the host name or IP address, and `port_number` represents the IBM Spectrum Control Device server port.

`-fabric WWN`
Specifies the fabric. The `WWN` variable is the worldwide name (WWN).

`-help | -h | -?`
Lists help information for the command.

`-silent`
Suppresses all output for the command. If you omit this parameter, output is included.

`-zone zone`
Specifies the name of the zone where you want to add a zone alias.

`alias`
Specifies the name of the zone alias to be added to the zone.

Example: Adding a zone alias

The following commands add the PARIS zone alias to the EUROPE zone:

```
tpctool -user me -pwd mypass -url myhost:myport
tpctool> start -fabric 100000051E34F6A8
tpctool> addza -fabric 100000051E34F6A8 -zone EUROPE PARIS
tpctool> commit -fabric 100000051E34F6A8
```

addzaptops

Use the **addzaptops** command to add ports to a zone alias. You must have Administrator authority to use this command.

Syntax

```
► tpctool — addzaptops — -user user_name -pwd password -url url — -fabric WWN — -help — ? — -silent — -za — zone_alias — port ◀
```

Parameters and arguments

`-user user_name`
Specifies an IBM Spectrum Control user ID.

`-pwd password`
Specifies the password for the IBM Spectrum Control user ID.

`-url url`
Specifies the Device server. The format of the URL is `system:port_number`, where `system` represents either the host name or IP address, and `port_number` represents the IBM Spectrum Control Device server port.

-fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | -h | -?
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

-za *zone_alias*
Specifies the name of the zone alias where the port is to be added.

port
Specifies the name of the port to be added to the zone alias.

Example: Adding a port to a zone alias

The following commands add a port to the PARIS zone alias:

```
tpctool -user me -pwd mypass -url myhost:myport
tpctool> start -fabric 100000051E34F6A8
tpctool> addzports -fabric 100000051E34F6A8 -za PARIS 210000E08B0B4C2G
tpctool> commit -fabric 100000051E34F6A8
```

addzone

Use the **addzone** command to add a zone to a zone set. This command must be run as a transaction. For more information, see the **start** command. You must have Administrator authority to use this command.

Syntax

```
tpctool — addzone — -user user_name -pwd password -url url — -fabric — WWN — -help — ? — -silent — -zs — zone_set — zone —
```

Parameters and arguments

-user *user_name*
Specifies an IBM Spectrum Control user ID.

-pwd *password*
Specifies the password for the IBM Spectrum Control user ID.

-url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | -h | -?
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

-zs *zone_set*
Specifies the zone set. The *zone_set* variable is the name of the zone set.

zone
Specifies the zone.

Example: Add a zone to a zone set

The following commands add the WINDOWSNT zone to the PARIS zone set.

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> addzone -fabric 100000051E34F6A8 -zs PARIS WINDOWSNT
tpctool> commit -fabric 100000051E34F6A8
```

Related reference

- [start](#)

addzoneports

Use the **addzoneports** command to add switch ports to a zone. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- zone zone
Specifies the zone. The *zone* variable is the name of the zone.
- help | -h | -?
Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- ports | -
Specifies the switch ports. The *ports* variable is a list of worldwide port names (WWPNs). If you specify a single dash (-), the WWPNs are read from standard input.

Example: Adding a switch port to a zone set

The following commands add several switch ports to the WINDOWSNT zone. The list of WWPNs is read from standard input.

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> addzoneports -fabric 100000051E34F6A8 -zone WINDOWSNT -
tpctool> commit -fabric 100000051E34F6A8
```

assignvol

Use the **assignvol** command to assign host ports to volumes. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev subsystem
Specifies the globally unique identifier (GUID) of a storage subsystem such as that obtained by running the **lsdev -subsys** command.
- hp host_port
Specifies the host ports. The *host_port* variable is a comma-separated list of worldwide port numbers (WWPNs), such as the port numbers obtained by running the **lsport** command.
- hn host_name
Specifies the names of the host systems for the ports. The *host_name* variable is a comma-separated list of host system names. There must be one name for each port in the list of host ports.
- ht host_type
Specifies the type of host system on which the Fibre Channel port is located. The *host_type* variable is a comma-separated list of host system types, such as the types obtained by running the **lshtype** command.
- lun LUN_ID
Specifies the logical unit number (LUN ID) that the hosts map to the volumes. The *LUN_ID* variable is a comma-separated list of LUN IDs. There must be one LUN ID for each volume in the argument list.
- sp subsystem_port

- Specifies the worldwide port numbers (WWPNs) that the hosts use to access the volume. The *subsystem_port* variable is a comma-separated list of WWPNs, such as that obtained by running the **lsdevp** command. If you omit this parameter, the default ports are used.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- volume id | -
Specifies the volumes. The *volume_ID* variable is a comma-separated list of volume IDs, such as that obtained by running the **lsvol** command. If a single dash (-) is issued, the volume IDs are read from standard input.

Example: Assign a host port to a volume

The following command assigns a host port to a volume:

```
tpctool assignvol -user me -pwd mypass -url myhost:myport -dev 2105.22232+0
-hp 5005076300C79470 -lun a3
```

autosetarray

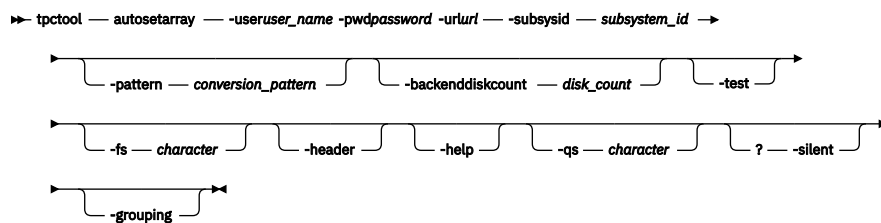

Use the **autosetarray** command to extract and save information about storage pools.

You can save information about a storage pool such as the type of back-end storage system, type of RAID, and type of disk. To do this action, use a default pattern or create a pattern that matches the names of pools in a subsystem. If the match is successful, the information about the pool is extracted and saved. This command is available for the following storage systems.

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

You must have Administrator authority to use this command.

Syntax

Storage pool names and pattern matching

The names of storage pools must contain the following information:

- A character that represents a valid type of back-end storage system
- A number or character that represents a valid type of back-end RAID
- A series of characters that represent a valid type of back-end disk

Tip: To obtain a list of valid types of back-end storage system, types of disk, and types of RAID, run the following commands: **lsbackendtypes**, **lsbackenddisktypes**, and **lsbackendraitypes**. If the types of back-end storage system, types of disk, and types of RAID that are used in the pool names are not listed, you can add them to the list. See the descriptions of the following commands: **setbackentype**, **setbackenddisktype**, and **setbackendraitype**.

The default pattern is structured as shown in the following table.

Position in pattern	Pattern
1	B
2	x
3	x
4	x

Position in pattern	Pattern
5	x
6	x
7	x
8	D
9	R
10	D
11	D
12	x*

You can use the default pattern or create patterns to match the names of pools in a storage subsystem. A list of the characters that are used to create patterns is provided in the following table.

Character	Represents
B	The character that is used to represent the type of back-end storage system. The matching character must meet the following criteria. <ul style="list-style-type: none"> • Must be in the position that is specified by the pattern • Must be of the same length • Must be a valid type of storage system In the default pattern, one character is used to represent the type of back-end storage system.
x	The character that is used to represent insignificant characters. In the default pattern, the second, third, fourth, fifth, sixth, and seventh characters in a matching pool name are ignored.
D	The characters that are used to represent the type of back-end disk. Matching characters must meet the following criteria. <ul style="list-style-type: none"> • Must be in the position that is specified by the pattern • Must be of the same length • Must be a valid type of disk In the default pattern, three characters are used to represent the type of back-end disk.
R	The number or character that is used to represent the type of back-end RAID such as 1, or x. The matching character must meet the following criteria. <ul style="list-style-type: none"> • Must be in the position that is specified by the pattern • Must be of the same length • Must be a valid type of RAID In the default pattern, one character is used to represent the type of back-end RAID.
x*	The character followed by an asterisk that is used to represent zero or any number of insignificant characters that occur at the end of a pool name. In the default pattern, the 12th character and all subsequent characters in a matching pool name are ignored.
C	The characters that are used to represent the number of disks. In the default pattern, the number of disks is not specified. To specify the number of disks, use the -backenddiskcount parameter. The default value is 1. You can create a custom pattern to extract the number-of-disks value from the name of the MDisk group. Matching characters must meet the following criteria. <ul style="list-style-type: none"> • Must be in the position that is specified by the pattern • Must use numeric values such as 0 - 9 • Must be of the same length <ul style="list-style-type: none"> ◦ C represents 0 - 9 ◦ CC represents 00 - 99

Sample: Using the default pattern

You issue the **autosetarray** command and the default pattern is used to extract information about the CFG1xGGA1071 storage pool. In the table, each character in the default pattern is matched against the corresponding character in the pool name.

Default pattern	Pool name	Description
B	C	The type of back-end storage system
x	F	The character is ignored
x	G	The character is ignored
x	1	The character is ignored
x	x	The character is ignored
x	G	The character is ignored
x	G	The character is ignored
D	A	The first character of three characters that is used to represent the type of back-end disk
R	1	The type of back-end RAID
D	0	The second character of three characters that is used to represent the type of back-end disk
D	7	The third character of three characters that is used to represent the type of back-end disk
x*	1	This character and all subsequent characters are ignored

The information about the pool is extracted and saved.

Information	Extracted values	Description
Type of back-end storage system	C	EMC Clariion
Type of back-end disk	A07	SATA - 7,500 rpm
Type of back-end RAID	1	RAID 1
Number of disks	1	1

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- subsysid subsystem_id
Specifies the ID or the globally unique identifier of the storage subsystem.
- pattern conversion_pattern
Specifies the pattern that is used to extract information from pool names. If you do not specify a pattern, the default pattern is used.
- backendsdiskcount disk_count
Specifies the number of disks. If you use the default pattern or create a pattern that does not extract the number of disks from pool names, you can enter the number of disks. The default number of disks is 1.
- test
Verifies the pattern that is used with a specified storage subsystem. The information is extracted and displayed, but it is not saved.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Using patterns to extract and save information about pools

The following command extracts information about pools in the specified storage subsystem that match the default pattern. If a pool name does not match the pattern, an information message is displayed.

```
tpctool> autosetarray -subsysid 00000200A0C0005C+0
```

The following information messages and output are displayed:

```
[AAJ002013E] The pool name mdiskgroup0 is too short to be matched
against the pattern BxxxxxxDRDDx*.
[AAJ002013E] The pool name Cognos is too short to be matched
against the pattern BxxxxxxDRDDx*.
[AAJ002013E] The pool name mdiskgrp1 is too short to be matched
against the pattern BxxxxxxDRDDx*.
[AAJ002013E] The pool name mdiskgrp2 is too short to be matched
against the pattern BxxxxxxDRDDx*.
```

Name of Array	Back-end Type	Back-end RAID Type	Back-end Disk Type
mdiskgroup0	-	-	-
Cognos	-	-	-
mdiskgrp1	-	-	-
mdiskgrp2	-	-	-
Cpool3GA60713	C	6	A07
Cpool2GA607	C	6	A07
Dpool1GA607F	D	6	A07

Back-end	Disk Count	Status
-	No Match	
-	No Match	
-	No Match	
-	No Match	
1	Successful	
1	Successful	
1	Successful

- [lsbackendraitypes](#)

catdscfg

Use the **catdscfg** command to list the contents of the property files for the Device server and to check the status of the Device server. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is `system:port_number`, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing the contents of the property file

The following command lists the contents of the property file:

```
tpctool> catdscfg -url localhost:9550 -user ***** -pwd *****
```

The following output is returned:

Property	Context	Value
AgentManager.Registration	AM	YES
Fabric.Manager.Password	AM	*****
Fabric.Manager.Username	AM	manager
Registration.Server.Host	AM	tivoli12
Registration.Server.Port	AM	9511
Registration.Server.PW	AM	*****
TPCData.Password	AM	*****
TPCData.UserName	AM	manager
default.authorization.enabled	CIM	true
default.credential	CIM	default
default.principal	CIM	default
FabricCIMTransactionTimeout	CIM	600
FabricCIMZoneDBChecksumUsage	CIM	true
FabricCIMZSetActivationRetryInterval	CIM	20000
FabricCIMZSetActivationRetryMaxCount	CIM	9

Note: This is a partial sample of the actual output.

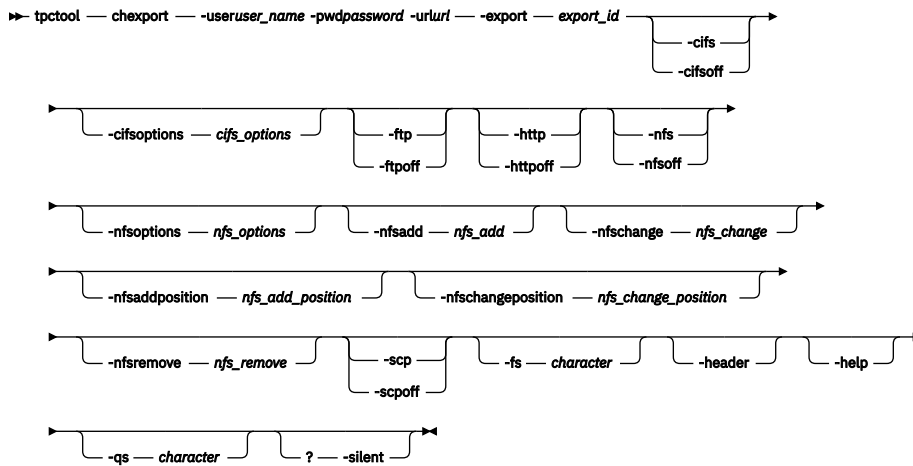

chexport

Use the **chexport** command to change the protocol configuration for an export.

An *export* is a shared disk space that is accessible through the protocols that you specify when you run the **mkexport** command. You can create exports and enable them for HTTP, FTP, Secure Copy Protocol (SCP), Network File System (NFS), and Common Internet File System (CIFS) protocols. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- export export_id
Specifies the name of the export. This name is the export key that is listed in the ID column of the **lsexport** command output.
- active | -inactive
Marks the export as temporarily active or inactive. You can access the data only in an active export.
- cifs | -cifsoff
Adds or removes the CIFS protocol for the export.
- cifsoptions cifs_options
Defines the CIFS protocol options for the export. If the *cifsoptions* value contains spaces, the entire option must be enclosed in matching single quotation marks and the quotation marks must be preceded by an escape character.
- ftp | -ftppoff
Adds or removes FTP for the export.
- http | -httppoff
Adds or removes HTTP for the export.
- nfs | -nfsoff
Adds or removes the NFS protocol for the export.
- nfsoptions nfs_options
Defines the NFS clients and their options for the export.
- nfsadd nfs_add
Adds the NFS clients and their options to the export.
- nfschange nfs_change
Modifies the NFS clients and their options for the export.
- nfsaddposition nfs_add_position
Specifies the position of a new NFS entry that was specified by the *nfsadd* parameter.
- nfschangeposition nfs_change_position
Specifies the position of a modified NFS entry that was specified by the *nfschange* parameter.
- nfsremove nfs_remove
Removes one or more NFS clients from the export.
- scp | -scppoff
Adds or removes SCP for the export.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Changing the FTP and HTTP options for an export

The following command adds FTP and removes HTTP from the export.

```

tptool> chexport
-export cindyexport+storage1.storage.tucson.ibm.com+storage1.storage.tucson.
ibm.com+0 -user admin -pwd password -url localhost:9550 -ftp -httppoff

```

The following output is returned:

```
ExportId
=====
cindyexport+storage1.storage.tucson.ibm.com+storage1.storage.tucson.ibm.
com+0

Status
=====
SUCCESS
```

Example: Defining the CIFS options for an export

The following command defines the CIFS protocol options for the export.

```
chexport -export eexp10+kq98n5d.ibm+00000200A22045DC+0 -cifs
-cifsoptions "browseable=no,\"comment=comment for eexp10\",leases=no,
sharemodes=no,syncio=yes,hideunreadable=yes,cifsac1=no,oplocks=no,
locking=no,\"read only\",synconclose=no,\"access control=Everyone:ALLOWED:FULL;
Administrator:ALLOWED:FULL\"-user db2admin -pwd g0vmware -url localhost:9550
```

The following output is returned:

```
ExportId                      Status
=====
eexp10+kq98n5d.ibm+00000200A22045DC+0 SUCCESS
```

Example: Changing the NFS options for an export

The following command adds, modifies, and removes NFS entries for the export.

```
tpctool> unlinkfset -fileset eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0
-user admin -pwd password -url localhost:9550
```

The following output is returned:

```
ExportId
=====
eexp600+kq98n5d.ibm+00000200A22045DC+0

Status
=====
SUCCESS
```

Example: Changing the NFS options and their positions for an export

The following command adds and modifies NFS entries and their positions for the export.

```
tpctool> chexport -export eexp700+kq98n5d.ibm+00000200A22045DC+0
-nfsadd "host4(ro)" -nfsaddposition host2 -nfschange "host2(ro)"
-nfschange position 3 -active -user db2admin -pwd g0vmware
-url localhost:9550
```

The following output is returned:

```
ExportId
=====
eexp700+kq98n5d.ibm+00000200A22045DC+0

Status
=====
SUCCESS
```

chfs

Use the **chfs** command to change the properties of a file system, and to add or remove disks to or from a file system.

If you use this command to both add and remove disks, disks are added first and then disks are removed. Other settings are applied after disks are added or removed. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id
Specifies the ID of file system to be changed.
- adddisks disk_name
Specifies the disks to add to the file system. The *disk_name* variable contains a comma-separated list of disk names.
Tip: You can verify the availability of a disk by running the **lsnsd** command.
- pool pool_name
Adds to the file system a set of free disks that have the file system pool name that is set as a storage pool. On IBM® Storwize® V7000 Unified, all disks in the file system pool must be tagged for this file system to be used.
Tip: You can list all of the disks in a storage pool by running the **lsnsd** command.
- createdisks size | mdisk_grp | N=num_disks | pool=pool_name | usage_type=usage_type
Creates disks implicitly, and then adds them to the file system. This option is applicable only for Storwize V7000 Unified.
 - size
Specifies the size of the new disks. Size is specified as an integer with capacity up to a petabyte without a space between the size and the unit; for example 17G. Disk sizes must be specified either without suffix (byte) or with K (kilobyte), M (megabyte), G (gigabyte), T (terabyte), or P (petabyte). Values less than 512 MB are not supported. This parameter is mandatory.
 - mdisk_grp
Specifies the storage system managed disk (MDisk) group in which the underlying NAS volumes are created. This parameter is mandatory.
Tip: You can see a list of available MDisk groups by using the **svcinfo lsmdiskgrp** command.
 - num_disks
Specifies the number of storage system NAS volumes that is created in each MDisk group. This parameter is optional. The default number of disks is 1.
 - pool
Specifies a pool for the disks. This parameter is optional. The default value is system.
 - usage_type
Specifies the usage type for the disks. This parameter is optional. Specify one of the valid usage types.
 - dataAndMetadata
 - dataOnly
 - metadataOnly

The default usage type is dataAndMetadata. The only valid usage type for a non-system pool is dataOnly.
- noverify
Specifies that disks must not be verified as belonging to an existing file system. If this option is used, either the -adddisks parameter or the -pool parameter must also be specified.
- numInodes max_num_inodes[:num_inodes_preallocate]
Specifies the maximum number of files for this file system. The *num_inodes_preallocate* variable specifies the number of inodes that the system immediately preallocates. You can specify values in thousands (k) or in millions (M). To specify values of 100 million for the *max_num_inodes* variable and 1 million for the *num_inodes_preallocate* variable, enter **-numInodes 100M:1M**.
- removedisks disk_name
Specifies the disks to remove from the file system. On IBM Storwize V7000 Unified, this option completely removes the specified disks and the data on them by deleting the volumes on the storage system.
Tip: You can verify the availability of a disk by running the **lsnsd** command.

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Change a file system

The following command changes a file system by removing a disk.

```
tpctool> chfs -filesystem eefs+kq458mv.ibm+00000200A2A0153C+0
-user admin -pwd password -url localhost:9550 -removedisks IFS1319490696615
```

The following output is returned:

FilesystemId	Status
eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

chfset

Use the **chfset** command to change the attributes of a fileset.

You can change the name of, or comment that is associated with, an existing file set. You can also change the maximum number of inodes and the number of inodes to allocate for an independent fileset. You must have Administrator authority to use this command.

Syntax

```
tpctool — chfset — -user user_name -pwd password -url url — -filesystem file_set_id — -name name —
- comment comment — -numInodes max_num_inodes[:num_inodes_preallocate] —
- fs character — -header — -help — -qs character — ? — -silent
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_set_id
Specifies the IBM Spectrum® Control key of the fileset to be changed. The fileset key is listed in the ID column of the **lsfset** command output.
- name name
Specifies the new name for this fileset.
- comment comment
Specifies a new comment that displays in the output of the **lsfset** command. The length of this comment can be a maximum of 255 characters. You must enclose comments in double quotation marks.
- numInodes max_num_inodes[:num_inodes_preallocate]
Specifies the maximum number of files for this fileset. The *num_inodes_preallocate* variable specifies the number of inodes that the system immediately preallocates. You can specify values in thousands (k) or in millions (M). To specify values of 100 million for the *max_num_inodes* variable and one million for the *num_inodes_preallocate* variable, enter *-numInodes 100M:1M*. GPFS defines a minimum number of inodes, which might be greater than the maximum specified. The default values for the fileset are one million (1M) for the *max_num_inodes* variable and 50,000 (50 K) for the *num_inodes_preallocate* variable.
- fs character

- Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Changing the attributes of a fileset

The following command changes the name of a fileset.

```
tpctool> chfset -fileset eefset+eefs+kq458mv.ibm+00000200A2A0153C+0
-name eefset01 -user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesetId	Status
eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

chkquota

Use the **chkquota** command to check quota limits for users, user groups, and filesets on a file system and to write the information to the GPFS database.

Because quota information in the database is not updated in real time, you must run the **chkquota** command before the **lsquota** command. This sequence refreshes the quota information in the GPFS database. You must have Administrator authority to use this command.

By specifying a file system, you can use the **chkquota** command to check the quotas for users, user groups, and filesets. This process can be lengthy because these devices can have large numbers of files. When the command completes, the collected data is updated in the GPFS database and is then available to the **lsquota** command for retrieval. The **chkquota** command output displays a completion status of success or error. It does not display the quota information. The **lsquota** displays the data that is collected by the **chkquota** command.

Syntax

```
tpctool — chkquota — -user user_name -pwd password -url url — -filesystem file_system_id →
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id
Specifies the ID for the file system that is associated with the quota. You can use the **lsfs** command to return information, including the IDs, for all file systems that are discovered. The ID is listed in the ID column of the **lsfs** command output.

Example: Check a quota for a file system

The following command checks the status of a quota for a file system:

```
tpctool> chkquota -filesystem gpfs1+kq98n5d.ibm+00000200A16045DC+0
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
gpfs1+kq98n5d.ibm+00000200A16045DC+0	SUCCESS

chwcache

Use the **chwcache** command to modify the attributes of a cache fileset on a wide area network (WAN) cluster.

Data on a home system is cached to this fileset. Use the **lswcache** command to view the attributes of the cache fileset. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- cache cache_id
Specifies the ID of the cache fileset to be changed.
You can use the **lswcache** command to retrieve the cache fileset ID.
- name name
Specifies the new name for the cache fileset.
- cachemode read-only | local-updates | single-writer
Specifies the operating mode for the cache system. The default mode is *read-only*.
- comment comment
Specifies a comment for the cache.
- fileopenrefreshinterval interval
The maximum interval, in seconds, between when a file is opened on the cache system and when it was last validated with the home system. The default value is 30.
- filelookuprefreshinterval interval
The maximum interval, in seconds, between when a file is accessed on the cache system and when it was last validated with the home system. The default value is 30.
- directoryopenrefreshinterval interval
The maximum interval, in seconds, between when a directory is opened on the cache system and when it was last validated with the home system. The default value is 60.
- directorylookuprefreshinterval interval
The maximum interval, in seconds, between when a directory is accessed on the cache system and when it was last validated with the home system. The default value is 60.
- remotepath remote_path

Alternatively, you can specify the path of the cache source, and the IP address is determined automatically. For example, `-remotepath /ibm/gpfs0/wcacheSource`.

-expirationtimeout timeout

-homeip home_ip

Restriction: You cannot use FQDNs.

Specifies the hard limit or maximum of disk space usage by the fileset created for the WAN cache. The default value is 0, which implies there is no limit.

Specifies the soft limit or minimum of disk space usage by the fileset created for the WAN cache. The default value is 0, which implies there is no limit.

The time interval, in seconds, between a write operation on the cache filesset and the corresponding update on the home filesset. The default value is 15.

Defines the inode limits for the fileset created for the WAN cache. The *max_num_inodes* variable specifies the maximum number of inodes that can be allocated to the fileset. The *num_inodes_preallocate* variable specifies the number of inodes that the system immediately preallocates. You can specify values in thousands (K) or in millions (M). To specify values of 100 million for the *max_num_inodes* variable and 1 million for the *num_inodes_preallocate* variable, enter `-numInodes 100M:1M`. If not provided the default values are 100K:100K.

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

Lists help information for the command.

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

Suppresses all output for the command. If you omit this parameter, output is included.

The following command changes the attributes of a cache fileset.

The following output is returned:

CacheId	Status
ctest+ee+storage1.storage.tucson.ibm.com+127.0.0.1+0	SUCCESS

Use the **chwcachesource** command to change the properties of a home system on a fileset. The home system is the source of the data in a wide area network (WAN) cache configuration. You can use WAN caching to distribute data transparently among data centers and multiple remote locations without disruption to applications. You must have Administrator authority to use this command. You can modify the properties of the home system by adding or removing cache systems. You can also update the public keys on all the cache systems for the specified home system.

```
➤ tpctool — chwcachesource — -useruser_name -pwdpassword -urlurl — -cachesource — cache_source_id ➔
```

┌───────────┴───────────┐ ┌───────────┴───────────┐ ┌───────────┴───────────┐

```
      -addclient — client_definition      -removeclient — client_cluster_id      -updatekeys
```

┌───────────┴───────────┐ ┌───────────┴───────────┐ ┌───────────┴───────────┐

```
      -fs — character      -header      -help      -as — character      ? — -silent
```

-user user_name	Specifies an IBM Spectrum Control user ID.
-pwd password	Specifies the password for the IBM Spectrum Control user ID.
-url url	Specifies the Device server. The format of the URL is <i>system:port_number</i> , where <i>system</i> represents either the host name or IP address, and <i>port_number</i> represents the IBM Spectrum Control Device server port.
-cachesource cache_source_id	

- Specifies the ID of the home system that is created by the **mkwccachesource** command. Use the **lswccachesource** command to retrieve the cache source ID.
- addclient *client_definition*
Adds a cache system to the existing list of clients for a specified home system. The *client_definition* variable contains a comma-separated list of the IP address and access mode of the management nodes for the cache systems. Access mode can be either ro (read-only) or rw (read/write). Only one of the cache clients can have read/write permission at any time. You must enclose this parameter in single quotation marks.
Restriction: You cannot add a cache client with read/write access if there is an export with read/write access for the same path. For example, an export is enabled on protocol types like NFS, CIFS, or FTP.
- removeclient *client_cluster_id*
Removes a cache system from the existing list of clients for a specified home system. The *client_cluster_id* variable is the cluster ID of the cache system. Use the **lswccachesource** command with the **-l** option to find the cluster ID of a specified cache system.
Restriction: You cannot remove the last cache system for a specified cache home system.
- updatekeys
Updates the public keys of all the cache systems for the specified home systems.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Adding a cache system to a home system that is enabled for WAN caching

The following command adds a cache system to a home system on the home cluster.

```
tpctool> chwccachesource -cachesource eesrc10+storage1.storage.tucson.
ibm.com+127.0.0.1+0 -addclient '127.0.0.2(ro)'
```

The following output is returned:

CachesourceId	Status
===== eesrc10+storage1.storage.tucson.ibm.com+127.0.0.1+0	SUCCESS

Example: Removing a cache system from a home system that is enabled for WAN caching

The following command removes a cache system from a home system on the home cluster.

```
tpctool> chwccachesource -cachesource eesrc10+storage1.storage.tucson.
ibm.com+127.0.0.1+0 -removeclient 792217928950257960
```

The following output is returned:

CachesourceId	Status
===== eesrc10+storage1.storage.tucson.ibm.com+127.0.0.1+0	SUCCESS

ckzone

Use the **ckzone** command to verify that a fabric contains a zone.

Syntax

```
➔ tpctool — ckzone — -user user_name -pwd password -url url — -fabric WWN — zone —>
                                     -help ? -silent
```

Parameters and arguments

- user *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd *password*
Specifies the password for the IBM Spectrum Control user ID.
- url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help | -h | -?

- Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- zone
Specifies the zone.

Example: Verifying that a fabric contains a zone

The following command checks whether the fabric contains the *SUNSOLARIS* zone.

```
tpctool> ckzone -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 SUNSOLARIS
```

If the fabric contains the zone, the following text is returned:

```
Zone SUNSOLARIS found in fabric 100000051E34F6A8
```

ckzs

Use the **ckzs** command to verify that a fabric contains a zone set.

Syntax

```
tpctool — ckzs — -user user_name -pwd password -url url — -fabric — WWN — zone_set
```

-help ? — -silent

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help | -h | -?
Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- zone_set
Specifies the zone set. The *zone_set* variable is the name of the zone set.

Example: Verifying that a fabric contains a zone set

The following command determines whether the fabric contains the *PARIS* zone set.

```
tpctool> ckzs -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8 PARIS
```

If the fabric contains the zone set, the following text is returned:

```
Zoneset PARIS found in fabric 100000051E34F6A8
```

commit

Use the **commit** command to commit a transaction. When you commit a transaction, all the commands issued after you started the transaction are enacted. You must have Administrator authority to use this command.

Syntax

```
tpctool — commit — -user user_name -pwd password -url url — -fabric — WWN —
```

-help

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric WWN

Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | -h | -?

Lists help information for the command.

Example: Committing a transaction

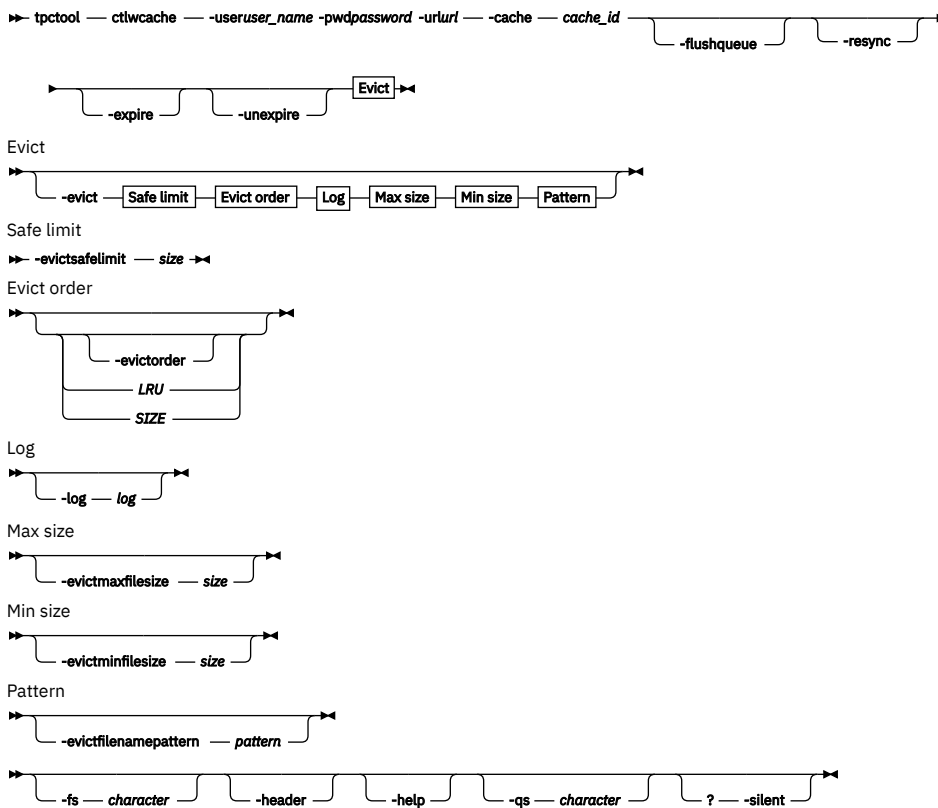

The following command commits a transaction. The user has previously specified connection options, started a transaction, and issued a fabric-control command:

```
tpctool> commit -fabric 100000051E34F6A8
```

ctlwcache

Use the **ctlwcache** command to run maintenance operations on a cache fileset on a wide area network (WAN) cluster. Data on a source cluster is cached to this fileset. You can resynchronize cache data to the source fileset, flush the cache to the source fileset, remove cached data, and expire or unexpire the data in a fileset. Use the **lswcache** command to view the attributes of the cache fileset. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-cache cache_id

Specifies the ID of the cache fileset to be changed. You can use the **lswcache** command to retrieve the cache fileset ID.

-name name

Specifies the new name for the cache fileset.

-flushqueue

Flushes the queue at the cache gateway node to the source file set. The command completes when the queue is empty.

-resync

Synchronizes the cache source and the contents of the cache file set. Various events can cause inconsistencies between the source and cache versions of data. Use this parameter to ensure that the source version is consistent with the cache version.

Restriction: You can use this option only when the cache state is active.

- expire
Marks all the cache fileset contents as expired.
You must ensure that the `expirationtimeout` setting for the cache fileset is enabled. To view the `expirationtimeout` value, use the **lswcache** command with the `-v` parameter. You can change the `expirationtimeout` value by using the **chwcach** command.
- unexpire
Removes the expired status from all of the cache fileset contents that are marked as expired.
You must ensure that the `expirationtimeout` setting for the cache fileset is enabled. To view the `expirationtimeout` value, use the **lswcache** command with the `-v` parameter. You can also change the `expirationtimeout` value by using the **chwcach** command.
- evict
Removes cache data if the soft limit is set for the disk usage by the fileset. You can remove cache data either when the cache file set is created by using the **mkwcache** command, or later by using the **setquota** command. You can use the **lsquota** command to view quota values. If you specify the `-evict` parameter, you must specify the `-evictsafelimit` parameter.
- evictsafelimit size
Specifies the safe limit for eviction. This safe limit overrides the soft limit value during the manual eviction operation. You must specify a value that is less than the value for the soft limit. Specify the size as an integer either without suffix (byte) or with `K` (kilobyte), `M` (megabyte), `G` (gigabyte), `T` (terabyte), or `P` (petabyte). These suffixes are not case-sensitive.
- evictorder LRU | SIZE
Evicts the contents of a specified cache fileset based on the order of the queue. Specify `LRU` to evict least recently used files first. Specify `SIZE` to evict larger-sized files first.
- log log
Specifies the location of the eviction log file. The log file location must be within an active export. By default, the logged information is appended to the system event log, `mmfs.log`.
- evictmaxfilesize size
Specifies the maximum file size for eviction. Specify the size as an integer (byte) or with the suffix `K` (kilobyte), `M` (megabyte), `G` (gigabyte), `T` (terabyte), or `P` (petabyte). These suffixes are not case-sensitive.
- evictminfilesize size
Specifies the minimum file size for eviction. Specify the size as an integer (byte) or with the suffix `K` (kilobyte), `M` (megabyte), `G` (gigabyte), `T` (terabyte), or `P` (petabyte). These suffixes are not case-sensitive.
- evictfilenamepattern pattern
Specifies the file name pattern for eviction. You can use the percent sign (%) as the wildcard character.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Synchronizing a cache source and the contents of the cache fileset

The following command synchronizes a cache source and the contents of the cache fileset.

```
tpctool> ctlwcache -cache cache3+ad+storage3.storage.tucson.
ibm.com+127.0.0.1+0 -resync
```

The following output is returned:

CacheId	Status
cache3+ad+storage3.storage.tucson.ibm.com+127.0.0.1+0	SUCCESS

Example: Removing a cache fileset

The following command removes the contents of a specified cache fileset based on size order, by using an eviction safe limit of 10,000 bytes.

```
tpctool> ctlwcache -cache cache3+ad+storage3.storage.tucson.
ibm.com+127.0.0.1+0 -evict -evictsafelimit 10000 -evictorder SIZE
```

The following output is returned:

CacheId	Status
cache3+ad+storage3.storage.tucson.ibm.com+127.0.0.1+0	SUCCESS

- [setquota](#)

deactzs

Use the **deactzs** command to deactivate the active zone set. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

➤ **tpctool** — **deactzs** — **-user***user_name* **-pwd***password* **-url***url* — **-fabric** — *WWN* — **-help** — **? — -silent** ➤

Parameters and arguments

- user** *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd** *password*
Specifies the password for the IBM Spectrum Control user ID.
- url** *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric** *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help** | **-h** | **-?**
Lists help information for the command.
- silent**
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Deactivating the active zone set

The following commands deactivate the active zone set:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> deactzs -fabric 100000051E34F6A8
tpctool> commit -fabric 100000051E34F6A8
```

encrypt

Use the **encrypt** command to generate an encrypted password for use in the configuration file. This command takes text from standard input and generates 7-bit ASCII-equivalent characters (uencode).

Syntax

➤ **tpctool** — **encrypt** — *password* ➤

- password*
Specifies the password to be encrypted.

Example: Encrypting a password

The following command encrypts the specified password:

```
tpctool encrypt myverylongpassword
```

getdscfg

Use the **getdscfg** command to list the current value of a property from the property file for the Device server. You must have Administrator authority to use this command.

Syntax

➤ **tpctool** — **getdscfg** — **-user***user_name* **-pwd***password* **-url***url* — **-property** — *property_key* — **-context** — *context* — **-fs** — *character* — **-header** — **-help** — **-qs** — *character* — **? — -silent** ➤

- user** *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd** *password*

- url url
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- property property_key
Specifies the property key. The *property_key* variable is the property key.
- context context
Specifies a classification or category for a configuration property. The *context* variable is the context properties. For example, The following parameter applies to the IBM Spectrum® Control Device server only.
-context DeviceServer
- The following parameter applies to the IBM Spectrum Control performance manager only.
-context PerformanceManager
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing a property value

The following command lists the value of the SnmpRetryCount property:

```
tpctool> getdscfg -url localhost:9550 -user ***** -pwd ***** -property
SnmpRetryCount -context DeviceServer
```

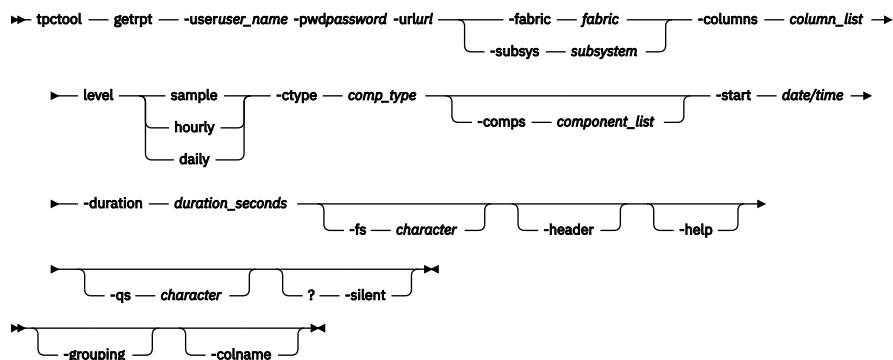

The following output is returned:

Property	Context	Value
SnmpRetryCount	DeviceServer	3

getrpt

Use the **getrpt** command to list a performance report for a specified storage subsystem.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric fabric
Specifies the name of a switch, such as one that is returned by the **lsdev** command.
- subsys subsystem
Specifies the name of a storage subsystem, such as one that is returned by **lsdev**. The name of the storage subsystem is the globally unique identifier (GUID) of that storage subsystem.

- columns *column_list*
Specifies what columns displays in the report. The columns are obtained from the **lscounters** and **lsmetrics** commands.
- level *sample | hourly | daily*
Specifies the level for which the performance metrics that are summarized. You can specify a sample summary, an hourly summary, or a daily summary.
- ctype *comp_type*
Specifies that the output includes only components of the specified type. For more information about the *comp_type* variable, see the **lstype** command.
- comps *component_list*
Specifies the component list. The *component_list* variable specifies the components, such as one that is returned by **lscomp**.
- start *date/time*
Specifies the date and time to start the sampling period. The date and time are formatted as:

yyyy.MM dd:HH:mm:ss

All time zones are relative to the Device server. For more information, see the **lstime** command.
- duration *duration_seconds*
Specifies the duration of the sampling period, in seconds. The *duration_seconds* variable is an integer.
- fs *character*
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs *character*
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.
- colname
Displays the name of the counter or metric in the column header. By default, an integer that indicates the column or metric type is displayed in the column header.

Example: Listing performance metrics

The following command lists a report of performance metrics:

```
tpctool> getrpt -user me -pwd mypass -url myhost:myport
-fabric 100005668 -subsys 2105.22232+0 -level daily
```

Note: If you have multiple volumes in your subsystems, use the -fs *character* option with a comma as a field separator.

```
tpctool> getrpt -subsys 2107.1302541+0 -columns 1,2,4,5,10,11,13,14,22,23,28,29,31,
32,33,34,35,36,37,38,39,40,41,42,43,44,45,46,47,48,49,50,51,52,53,54,55,56,57,58,5,
9,828,829,830,831,832,833,801,802,803,804,805,806,807,808,809,810,811,812,813,814,
815,816,817,818,819,820,821,822,823 -ctype vol -level sample -start 2007.06.27:19:
01:40 -duration 3600 -fs
```

linkset

Use the **linkset** command to create a junction to connect a name in a directory of a parent file set to the root directory of a child fileset. You must have Administrator authority to use this command.

As a prerequisite, the file system must be mounted and the junction path must be under the mount point of the file system. A dependent file set that is contained within an owner fileset can be linked only inside its owner path or in a directory tree of the owner path. A fileset without an owner can be linked anywhere in the file system.

Although a junction is displayed as a directory, you cannot issue directory commands to remove a junction. Use the **unlinkset** command instead.

Syntax

```
➔ tpctool — linkset — -user user_name -pwd password -url url — -help — -fileset — file_set_id — -path — path —
-headers — ? — -silent — -qs — character — -fs — character —
```

Parameters and arguments

- user *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd *password*
Specifies the password for the IBM Spectrum Control user ID.
- url *url*

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-help | -h | -?

Lists help information for the command.

-fileset file_set_id

Specifies the IBM Spectrum® Control key of the fileset to be linked. The fileset key is listed in the ID column of the **lsfset** command output.

-path path

Specifies the name of the junction. The name must not refer to an existing file system object.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

Example: Linking a fileset

The following command links the fileset that is named **eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0** to the path **/ibm/eefs/eefsetdir01**.

```
tpctool> linkset -fileset eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0  
-path /ibm/eefs/eefsetdir01 -user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesetId	Status
eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

lsappgroup

Use the **lsappgroup** command to display a list of applications that are known to IBM Spectrum Control.

Syntax

```
tpctool — lsappgroup — -user user_name -pwd password -url url  
                                -fs character -header -help  
-qs character -? -silent -l
```

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

-l

Specifies the long version of the information:

- Name
Specifies the name that identifies the application.
- ID
The unique ID of the application. For example, **/Application/5044** where 5044 is the database ID of the application.
- Parent(s)
Specifies the direct parent of the application. For example, **Db2**.
- Type
Specifies the type of application.
- Subtype
Specifies another qualifier for the type of application. For example, if **HRApplication** is a type of application then **Project** might be a subtype.
- Status
Specifies the health of the application. For example, **NORMAL**, **WARNING** or **ERROR**.
- Description
Specifies the description of the application.
- User-defined property 1, 2, 3
A user-defined property (UDP1,2,3) that can contain anything of significance to the administrator.
- Path(s)
Specifies the hierarchy path of the application from the top level on down. For example, **/Lab/Testlab**.

Example: Displaying a list of applications

The following command generates a list of applications that are known to IBM Spectrum Control:

```
tpctool>lsappgroup
```

The following output is returned:

Name	ID	Parents	Type
Appgroup1	/Application/5035		HRApplication
Appgroup2	/Application/5041		Medical
Db2appgroup	/Application/5044	Db2	
Accounting	/Application/5046		Finance
Testlab	/Application/5052	"Lab, Test"	TestLab

The following command generates a list of applications that are known to IBM Spectrum Control, and the long version of the information:

```
tpctool>lsappgroup -l
```

The following output is returned:

Name	ID	Parents	Type	Subtype	Status	Description
UDP1	UDP2	UDP3	Paths			
Appgroup1	/Application/5035		HRApplication	Project	ERROR	"Description 1"
Appgroup2	/Application/5041		Medical	Program	ERROR	"Description 2"
Db2appgroup	/Application/5044	Db2	IT	Project	ERROR	"Description 3"
Accounting	/Application/5046		Finance	Program	NORMAL	"Description 4"
Testlab	/Application/5052	"Lab, Test"	TestLab	-	ERROR	-
UDP1	UDP2	UDP3	Paths			
-	-	-	/Appgroup1			
attrib1	-	-	/Appgroup2			
attrib1-	-	-	/Db2/Db2appgroup			
-	-	-	/Accounting			
-	-	-	"/Lab/Testlab, /Test/Testlab"

- [lsappgroupmembers](#)

lsappgroupmembers

Use the **lsappgroupmembers** command to list members of a specified application.

Syntax

```
tpctool -- lsappgroupmembers -- -user user_name -pwd password -url url
                                     -fs character -header
                                     -id ApplicationGroupID
                                     -help -qs character ? -silent -l
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- id ApplicationGroupID
The unique ID of the application. For example, `/Application/5044` where **5044** is the database ID of the application. The output includes the following information:
 - Member Key
 - Member Name
 - Member Type
- l
Specifies that the long version of the information is listed. The following information is included:
 - UDP1
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character can contain any alphanumeric character, and must be fewer than 255 characters in length.
 - UDP2
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character can contain any alphanumeric character, and must be fewer than 255 characters in length.
 - UDP3
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character can contain any alphanumeric character, and must be fewer than 255 characters in length.

Example: Displaying a list of the members for an application

The following command generates a list of the members for a specified application:

```
tpctool> lsappgroupmembers -id /Application/5044 -l
```

The following output is returned.

Member Key	Member Name	Member Type
george_ifs_share2+kq98n5d.ibm+00021	george_ifs_share2	Export
omni+Atlas.storage.abc.ibm.com	omni	Virtual Machine
XIV_1+Atlas.storage.abc.ibm.com	XIV_1	Data Store
root+SMAC+kq99n5d.ibm+00000200A3C044DC+0	root	Fileset

UDP1	UDP2	UDP3
ABCLab	-	-
ABCLab	-	-
-	-	-
-	-	-

Isarray

Use the **lsarray** command to display information about arrays and back-end storage systems. For SAN Volume Controller, XIV® systems, and Dell EMC VMAX and VNX storage systems, the command displays information about block pools. You use the **setarray** command or **autosetarray** command to provide information about back-end storage systems. You can also enter information about back-end storage systems on the Pool Properties page in the IBM Spectrum Control GUI.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev system
Specifies the globally unique identifier (GUID) of the storage system. You can use the **lsdev** command to return information, including the GUID, for all storage systems that are discovered by IBM Spectrum Control.
- l
Specifies that the detailed version of information about arrays is provided. If you issue the **lsarray** command and do not specify the -l parameter, only the array ID is displayed.

Column label	Details
Array	The ID of the array.
Label	The name of the storage pool (managed disk group).
Total Size (GB)	The total amount of storage space.
Free Size (GB)	The total amount of available storage space.
Status	The operational status of the storage pool that hosts the array.
Types of Disk	The types of disk that host the arrays. <ul style="list-style-type: none"> • <code>Solid State</code> for solid-state disks • <code>Non-Solid State</code> for hard disks • <code>Mixed</code> for solid-state disks and hard disks
Encrypted	Shows whether arrays are hosted on encrypted disks.
Read I/O Capability	Shows the read I/O capability in seconds of storage arrays. The calculation of read I/O capability is based on the following characteristics. <ul style="list-style-type: none"> • The type of storage system • The type of RAID • The type of disk • The number of disks
Back-end Type	The type of back-end storage system that manages disk group storage.
Back-end RAID Type	The type of Redundant Array of Independent Disk (RAID) that the back-end storage system uses.
Back-end Disk Type	The type of disk that the back-end storage system uses.
Back-end Disk Count	The total number of disks.

Tip: To find out how to set values for back-end storage subsystems, see the description of the **setarray** command.

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Listing array information

The following command lists IDs for the arrays on the specified system:

```
tpctool> lsarray -user me -pwd mypass -url myhost:9550 -dev 2107.75DG000+0
```

The following output is returned:

```
Array
=====
IBMTSDS: IBM.2107-75DG000-P17+2107.75DG000+0
IBMTSDS: IBM.2107-75DG000-P16+2107.75DG000+0
IBMTSDS: IBM.2107-75DG000-P15+2107.75DG000+0
IBMTSDS: IBM.2107-75DG000-P14+2107.75DG000+0
IBMTSDS: IBM.2107-75DG000-P1+2107.75DG000+0
IBMTSDS: IBM.2107-75DG000-P0+2107.75DG000+0
```

Example: Listing detailed information about an array

The following command provides detailed information about the array on the specified system:

```
tpctool> lsarray -dev 0000020064405BA0+0 -l
```

The following output is returned:

```
Array                               Label      Total Size (GB) Free Size (GB)
=====
0000020064405BA0:0+0000020064405BA0+0 mdisk_grp  407.38      310.25

Status  Types of Disk  Encrypted Read I/O Capability Back-end Type
=====
NORMAL  Non-Solid State  No      0      D

Back-end RAID Type Back-end Disk Type Back-end Disk Count
=====
5                  F10                  160
```

lsbackenddisktypes

Use the **lsbackenddisktypes** command to list the types of back-end disks and their average input/output.

This command is available for the following storage systems:

- Storwize® V7000
- SAN Volume Controller

Syntax

```
tpctool — lsbackenddisktypes — -user user_name -pwd password -url url
                                     -fs character -header
                                     -help -qs character ? -silent -grouping
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Listing back-end disk types

The following command lists the types of back-end disks:

```
tpctool> lsbackenddisktypes
```

If the command is successful, a list of the types of back-end disks is displayed.

```
Back-end Disk Type  Description                               IOPS
=====
A07                  "Sata - 7 500 rpm"                        40
F10                  "Fiber - 10 000 rpm"                      120
F15                  "Fiber - 15 000 rpm"                      150
DEFAULT              "DEFAULT TYPE FOR UNCONFIGURED DEVICES"  0
```

When you issue the **lsbackenddisktypes** command, the following information is displayed.

Backend Disk Type
The type of back-end disk. For example: A07

Description

A description of the type of back-end disk. For example: "Sata - 7500 rpm"

IOPS

Input/Output (I/O) per second. The average number of input/output operations per second for the disk.

Tip: Use the **setbackenddisktype** command to set or update the type of a back-end disk.

lsbackendraidtypes

Use the **lsbackendraidtypes** command to list the types of back-end RAID arrays that are available for managed disk groups.

This command is available for the following storage systems:

- Storwize® V7000
- SAN Volume Controller

Syntax

```
tpctool lsbackendraidtypes -user user_name -pwd password -url url -fs character -header -help -qs character -silent -grouping
```

Parameters and arguments

- user** user_name
Specifies an IBM Spectrum Control user ID.
- pwd** password
Specifies the password for the IBM Spectrum Control user ID.
- url** url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs** character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header**
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help** | **-h** | **-?**
Lists help information for the command.
- qs** character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent**
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping**
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Listing back-end RAID types

The following command lists the available types of back-end RAID types.

```
tpctool> lsbackendraidtypes
```

If the command is successful, a list of the available types of back-end RAID types is displayed.

```
Back-end RAID Type Weighted IO
=====
X                  1
6                  6
5                  4
1                  2
DEFAULT           1
```

When you issue the **lsbackendraidtypes** command, the following information is displayed.

Backend RAID Type

The type of back-end RAID array. Possible values are DEFAULT, 1, 5, 6, X, or an array type that is set with the **setbackendraidtype** command.

Weighted IO

The weighted input/output of the RAID type.

Tip: Use the **setbackendraidtype** command to set or update the type of a back-end RAID array.

lsbackendtypes

Use the **lsbackendtypes** command to list the types of back-end storage systems.

More information, such as the name, description, and cache hit ratio of the back-end type of the storage system is also provided. This command is available for the following storage systems:

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Displaying a list of types of back-end storage systems

The following command provides a list of the types of back-end storage systems:

```
tpctool> lsbackendtypes
```

A list of the types of back-end storage subsystem is displayed.

Back-end Type	Name	Cache Hit Ratio
Fake	F800	100
X	XIV	70
D	DS8000	50
S	"EMC Symmetrix"	50
C	"EMC Clariion"	50
DEFAULT	DEFAULT	0

```
Description
=====
"Theoretical All Cache subsystem"
"IBM XIV"
"DS8K Disk Controller"
"DMX BE Cache Hit Ratio"
"CX BE Cache Hit Ratio"
"DEFAULT TYPE FOR UNCONFIGURED DEVICES"
```

When you issue the **lsbackendtypes** command, the following information is displayed:

- Back-end Type
The type of back-end storage system such as *D*
- Name
The name that is associated with the type of back-end storage system. For example, the name *DS8000* is associated with type *D*
- Cache Hit Ratio
The estimated cache hit ratio for read operations
- Description
A description of the type of back-end storage system

Tip: Use the **setbackendtype** command to set or update the type of back-end storage system.

Iscluster

Use the **lscluster** command to list all clusters or specified clusters that are on a Storwize® V7000 Unified storage system.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev dev_id | -cluster cluster_id...
Specifies that information is displayed for all clusters that are on a storage system. This parameter requires the globally unique identifier (GUID) of the storage system. You can use the **lsdev** command to return information, including the GUID, for all storage systems that were discovered.
The -cluster parameter specifies that information is displayed only for specific clusters. You can enter one or multiple cluster IDs. Use a comma to separate multiple IDs.
- l
Specifies that the following information is listed.

ID
An ID for the cluster that is composed of the cluster name, storage system name, and storage system format.
Cluster
The name of the cluster.
Cluster ID
The cluster ID as defined by the Storwize V7000 Unified file module.
Type
One or more of the following types: interface, management, or storage.

If you omit this parameter, only the ID is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing all clusters that are on a storage system

The following command generates a list of all clusters that are on a Storwize V7000 Unified storage system.

```
tpctool> lscluster -dev 00000200A0E0005C+0 -l
```

The following output is returned:

ID	Cluster
storage2.storage.tucson.ibm.com+00000200A0E0005C+0	storage2.storage.tucson.ibm.com

Cluster ID	Type
12402779238946656959	interface,storage

lscomp

Use the **lscomp** command to list the components for which performance data is collected.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- subsys subsystem
Specifies the storage subsystem. The subsystem variable is the GUID of the storage subsystem. You can use the **lsdev** command to return information, including the GUID, for all storage subsystems that are discovered by IBM Spectrum® Control.
- ctype comp_type
Specifies that the output is to include only components of the specified type. For more information about the *comp_type* variable, see the **lstype** command.
- level sample | hourly | daily
Specifies the level for which the performance counters are to be summarized. You can specify a sample summary, an hourly summary, or a daily summary.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing performance counters

The following command generates a list of performance counters for volumes on the specified storage subsystem:

```
tpctool> lscounters -user me -pwd mypass -url myhost:myport
-subsys 2105.22232+0 -ctype vol -level sample
```

The following output is returned.

Counter	Value
Read I/O Count (normal)	1
Read I/O Count (sequential)	2
Write I/O Count (normal)	4
Write I/O Count (sequential)	5
Read Cache Hit Count (normal)	10
Read Cache Hit Count (sequential)	11
Write Cache Hit Count (normal)	13
Write Cache Hit Count (sequential)	14
Read Data Count	22
Write Data Count	23
Read Service Periods	28
Write Service Periods	29
Disk to Cache Transfers (normal)	31
Disk to Cache Transfers (sequential)	32
Cache to Disk Transfers	33
NVS Allocation Count	34
DFW I/O Count (normal)	35
DFW I/O Count (sequential)	36
NVS Delayed I/O Count	37
Cache Delayed I/O Count	38
Record-Mode-Read I/O Count	39
Record-Mode-Read Cache Hit Count	40
Quick Write Promote Count	41

- [lstype](#)

Syntax

If the `-l` parameter is not issued, only the **Name**, **ID**, **Parents** and **Type** columns are returned.

Example: Displaying a list of departments

The following output is returned:

Name	ID	Parents	Type
Sales	/Department/5035	-	-
Accounting	/Department/5041	Finance	-
Tax	/Department/5044	Accounting,Sales	-
HR_WorldWide	/Department/5045	-	HR
HR_US	/Department/6245	HR_WorldWide	HR
HR Asia	/Department/6246	HR_WorldWide	HR

The following command generates a list of departments that are known to IBM Spectrum Control, and the long version of the information:

```
tpctool>lsdeptgroup -l
```

The following output is returned:

Name	ID	Parent(s)	Type	Subtype	Status
Sales	/Department/5035	-	-	Project	ERROR

Accounting	/Department/5041	-	Finance	Project	ERROR
Tax	/Department/5044	Accounting, Sales	-	Project	ERROR
HR_US	/Department/6245	HR_WorldWide	HR	Program	NORMAL
HR_Asia	/Department/6246	HR_WorldWide	HR	Program	Normal

Description	UDP1	UDP2	UDP3	PATHS
"Description 1"	-	-	-	/Department/5035
"Description 2"	-	-	-	-
"Description 3"	-	-	-	-
"Description 4"	-	-	-	-
"Description 5"	-	-	-	/Department/6246

- [lsdeptgroupmembers](#)

lsdeptgroupmembers

Use the **lsdeptgroupmembers** command to list members of a specified department.

Syntax

```
tpctool — lsdeptgroupmembers — -user user_name -pwd password -url url
                                     -fs character -header
                                     -help -qs character ? -silent -id DepartmentGroupName -l
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- id DepartmentGroupName
The unique name of the department. In addition to the **Member ID** column, the output includes the following information:
 - Member Name
The name of the department or departments that are associated with the -memberid parameter of the department.
 - Member Type
The type of department or application.
- l
Specifies that the long version of the information is listed. Besides the **Member ID**, **Member Name** and **Member Type** columns, the following information is included:
 - UDP1, UDP2, UDP3
The user-defined property (UDP) contains anything of significance to the administrator. This alphanumeric character can be a maximum of 255 characters in length.

Example: Displaying a list of the members for a department

The following command generates a list of the members of a specified department:

```
tpctool> lsdeptgroupmembers -id/Department/5041
```

The following output is returned.

Member ID	Member Name	Member Type
/Department/5044	Tax	Department
/Application/6050	NetSuite	Application

Example: Displaying a long list of the members for a department

The following command generates a long list of the members of a specified department:

```
tpctool> lsdeptgroupmembers -id/Department/5041 -l
```

The following output is returned.

Member ID	Member Name	Member Type	UDP1	UDP2	UDP3
/Department/5044	Tax	Department	-	-	-
/Application/6050	NetSuite	Application	-	-	-

Isdev

Use the **lsdev** command to list information about storage systems, fabrics, and switches. This information includes the globally unique identifier (GUID) or worldwide name (WWN) for the fabric, the user-defined name, the resource type, the status, and the time that the status was updated.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- perf
Specifies that resources for which performance data is collected will be listed. You must have the applicable authority to view the resources.
- level sample | hourly | daily
Specifies the level for which the information is summarized. You can specify a sample summary, an hourly summary, or a daily summary.
- fabric
Specifies that only fabrics are listed. You must have Administrator authority to use this option.
- sysys
Specifies that only storage systems are listed.
- l
Specifies that the long version of the information is listed. The following information is given.
 - GUID or WWN
 - User-defined name
 - Resource type
 - Status
 - Time that the status was updatedIf you omit this parameter, only the GUID or WWN is listed.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Command Aliases

You can run the following **lsdev** command aliases that are predefined by IBM®.

```
lsfabric
lsdev -fabric
lsperf
lsdev -perf
lssubsys
lsdev -subsys
```

Example: Listing all resources

The following command lists the GUIDs for all storage systems in the IBM Spectrum Control environment:

```
tpctool> lsdev -user me -pwd mypass -url myhost:myport -subsys
```

The following output is returned:

```
GUID
=====
9.47.97.159:0000020065400048+0
9.47.97.161:0000020060C0002A+0
1750.13AAW2A+0
1750.13AB1WA+0
2107.1302541+0
2107.1301901+0
2105.22232+0
2105.20870+0
```

Example: Listing the long version of information

The following command lists the long version of information for fabrics.

```
tpctool> lsdev -user me -pwd mypass -url myhost:myport -fabric -l
```

The following output is returned:

GUID	Name	Type	Status	Timestamp
100000051E34F6A8	100000051E34F6A8	-	UNKNOWN	2004.12.31:00:00:00
10000060695130FD	1000006069514262	-	UNKNOWN	2004.12.31:00:00:00
1000006069514262	10000060695130FD	-	UNKNOWN	2004.12.31:00:00:00

lsdevp

Use the **lsdevp** command to list worldwide port names (WWPNs) for a subsystem.

Syntax

```
tpctool lsdevp -user user_name -pwd password -url url -dev subsystem [-l] [-fs character]
[-header] [-help] [-qs character] [-?] [-silent]
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev subsystem
Specifies the globally unique identifier (GUID) of the storage subsystem. You can use the **lsdev** command to return information, including the GUID, for all storage subsystems that are discovered by IBM Spectrum Control.
- l
Specifies that the long version of the information is to be listed.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing worldwide port names

The following command lists the WWPNS for the specified subsystem:

```
tpctool> lsdevp -user me -pwd mypass -url myhost:myport -dev 2105.22232+0
```

The following output is returned:

```
WWPN
=====
5005076300C79470
5005076300D09470
5005076300CB9470
5005076300CC9470
5005076300C29470
5005076300CF9470
5005076300C89470
5005076300C39470
```

lsdisk

Use the **lsdisk** command to list all the physical disks on a specified storage subsystem.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- subsys subsystem
Specifies the GUID of the storage subsystem. You can use the **lsdev** command to return information, including the GUID, for all storage subsystems that are discovered.
- l
Specifies that long version of the information is listed. The following information is included.
 - Key
 - Label
 - Vendor
 - Model
 - Serial Number
 - Capacity
 - Speed
 - Encrypted
 - Solid State
- If this parameter is not issued, only the host name is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Displaying a list of physical disks on a storage subsystem

The following command generates a list of physical disks on a specified storage subsystem:

```
lsdisk -subsys 2107-1300361+0 -l
```

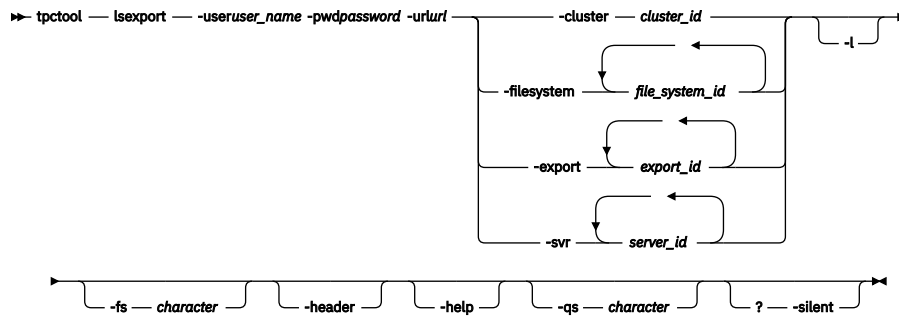

The following output is returned:

Key	Label			Vendor	Model
=====					
8000350BFC0D00D+IBM.2107-1300361	U2107.D01.Q000004-P1-D14			Seagate	S0AE146
Serial Number	Capacity	Speed	Encrypted	Solid State	
=====					
8000350BFC0D00D	146.0	-	No	No	

lsexport

Use the **lsexport** command to list all exports or specified exports that are associated with a cluster that is on a Storwize® V7000 Unified storage system. You can also list exports by file system, Netapp, or server that is managed by a Storage Resource Agent (SRA).

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- cluster cluster_id | -filesystem file_system_id... | -export export_id... | -svr svr_id...
The -cluster parameter specifies that information is displayed for all exports that are associated with a cluster. You can use the **lscluster** command to return information, including the cluster IDs, for all clusters that were discovered.
The -filesystem parameter specifies that information is displayed only for exports that are associated with specific file systems. You can enter one or multiple file system IDs. Use a comma to separate multiple IDs. You can use the **lsfs** command to return information, including the file system IDs, for all file systems that were discovered.
The -export parameter specifies that information is displayed only for specific exports. You can enter one or multiple export IDs. Use a comma to separate multiple IDs.
The -svr parameter specifies that information is displayed for all exports that are associated with a specific server. You can use the **lssvr** command to return information, including the server IDs, for all servers that were discovered.
- l
Specifies that the following information is listed.

ID
An ID for the export. For a file, the ID is composed of the export name, cluster name, storage system name, and storage system format. For a server, it is composed of the export name and server name.

Export
The name of the export.

Path
The path on the computer where the export is located.

Protocol
The protocol for the export can be one of following values: HTTP, FTP, SCP, CIFS, or NFS.

Active
Indicates whether the export is active or inactive in the cluster. The value can be true or false. If an export is inactive, it is included in the list of exports, but the data that is associated with the export cannot be accessed.

Options
The configuration options that were set for the export. This column contains information only if the protocol is CIFS or NFS.

If you omit this parameter, only the ID is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: List all nodes that are on a cluster

The following command generates a list of all exports that are on a Storwize V7000 Unified cluster.

```
tpctool> lsexport -cluster storage2.storage.tucson.ibm.com+00000200A0E0005C+0 -l
```

The following output is returned:

ID	Export
RandomExport1+storage2.storage.tucson.ibm.com+00000200A0E0005C+0	RandomExport1
RandomExport1+storage2.storage.tucson.ibm.com+00000200A0E0005C+0	RandomExport1

lsextent

Use the **lsextent** command to display a list of all the storage extents on a specified storage system. An example of a storage extent is a managed disk on a SAN Volume Controller. For Dell EMC VMAX storage systems, the command displays the Disk Group.

Syntax

```
tpctool — lsextent — -user user_name -pwd password -url url — -sys sys — subsystem
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- sys subsystem
Specifies the GUID of the storage system. You can use the **lsdev** command to return information, including the GUID, for all storage systems that are discovered.
- l
Specifies that long version of the information is listed. The following information is included.
 - Key
 - Label
 - Total Capacity
 - Free Space
 - Virtual
- If this parameter is not issued, only the host name is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Displaying a list of storage extents on a storage system

The following command generates a list of storage extents on a specified storage system:

```
tpctool> lsextent -subsys 2107-1300361+0 -l
```

The following output is returned:

Key	Label	Total Capacity
IBM.2107-1300361-R8+2107-1300361+0	IBM.2107-1300361-R8	581.0
IBM.2107-1300361-R7+2107-1300361+0	IBM.2107-1300361-R7	1688.0
IBM.2107-1300361-R6+2107-1300361+0	IBM.2107-1300361-R6	519.0

Free Space Virtual
0.0 No
0.0 No
0.0 No

lsfcpath

Use the **lsfcpath** command to list the paths for data transmission between a system with a fibre-channel host bus adapter (HBA) and a storage subsystem.

Syntax

```
tpctool lsfcpath -user user_name -pwd password -url url -svr server -dev GUID -fs character -header -help -qs character ? -silent
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- svr server
Specifies a system with a fibre-channel HBA. The *server* variable is the host name of the system.
- dev GUID
Specifies the storage subsystem. The *GUID* variable is the globally unique identifier (GUID).
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing data paths

The following command lists the paths on which data can be transmitted between MARKETING and the storage subsystem 2105.20870+0:

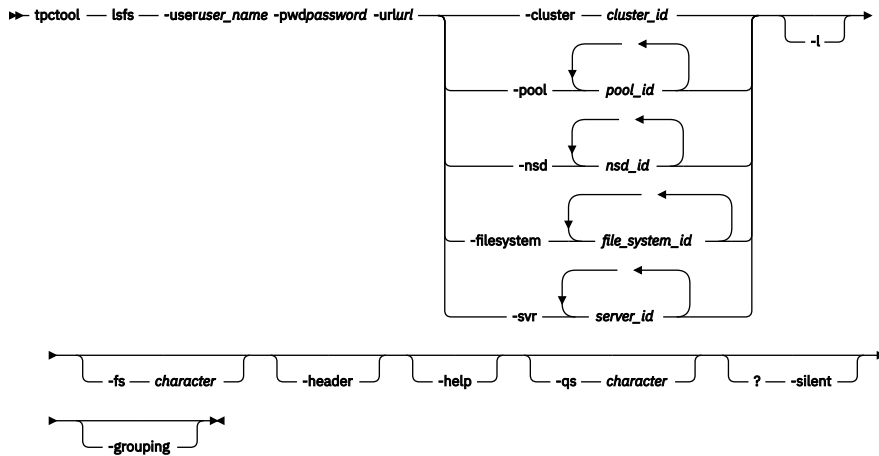

```
tpctool> lsfcpath -user me -pwd mypass -url myhost:myport -svr MARKETING -dev 2105.20870+0
```

The following output is returned:

ServerPort	SubsystemPort
210000E08B1Co9E	710000E08W1Co8F

lsfs

Use the **lsfs** command to list all file systems or specified file systems that are associated with a cluster on a Storwize® V7000 Unified or IBM Spectrum Scale storage system. You can also list file systems by pool or Network Shared Disk (NSD).

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- cluster cluster_id | -pool pool_id... | -nsd nsd_id... | -filesystem file_system_id... | -svr server_id...
The -cluster parameter specifies that information is displayed for all file systems that are on a cluster. You can use the **lscluster** command to return information, including the cluster IDs, for all clusters that were discovered.
The -pool parameter specifies that information is displayed only for file systems that are associated with specific pools. You can enter one or multiple pool IDs. Use a comma to separate multiple IDs. You can use the **lspool** command to return information, including the pool IDs, for all pools that were discovered.
The -nsd parameter specifies that information is displayed only for file systems that are associated with specific NSDs. You can enter one or multiple NSD IDs. Use a comma to separate multiple IDs. You can use the **lsnsd** command to return information, including the NSD IDs, for all NSDs that were discovered.
The -filesystem parameter specifies that information is displayed only for specific file systems. You can enter one or multiple file system IDs. Use a comma to separate multiple IDs.
The -svr parameter specifies that information is displayed for all file systems that are associated with a specific server. You can use the **lssvr** command to return information, including the server IDs, for all servers that were discovered.
- l
Specifies that the following information is listed.
 - ID
fqz0_r_cli_lsfs
fqz0_r_cli_lsfs
An ID for the file system that is composed of the file system name, cluster name, storage system name, and storage system format.
 - File System
The name of the file system.
 - Mount Point
The name or mount point (UNIX/Linux®) of the file system (for example, c:\, d:\, /opt, or /export/home).
 - Cluster/Server
The name of the cluster or server that is associated with the file system.
 - Capacity (GB)
The capacity of the file system.
 - Used Space (GB)
The amount of used storage space in the file system.
 - Available Space (GB)
The amount of unused storage space in the file system.
 - Maximum File Count
The total number of files in a file system. This value does not include files on file systems that were not scanned.
 - Used I-Nodes
The number of used inodes in the file system.
 - Free I-Nodes
The number of unused inodes in the file system. If you omit this parameter, only the ID is returned.
 - UDP1
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.
 - UDP2
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.
 - UDP3
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English, the value 12000 displays as 12,000. The grouping character is determined by the system locale.

Example: List all file systems that are on a cluster

The following command generates a list of all file systems that are on a Storwize V7000 Unified cluster.

```
tpctool> lsfs -cluster storage2.storage.abc.ibm.com+00000200A0E0005C+0 -l
```

The following output is returned:

ID	File System
gpfs0+storage2.storage.abc.ibm.com+00000200A0E0005C+0	gpfs0
testadd+storage2.storage.abc.ibm.com+00000200A0E0005C+0	testadd

lsfs

Use the **lsfs** command to list all filesets or specified filesets that are associated with a file system on a Storwize® V7000 Unified or IBM Spectrum Scale storage system.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id | -fileset file_set_id...
Specifies that information is displayed for all filesets that are on a file system.
The -filesystem parameter requires the ID for the file system. You can use the **lsfs** command to view information, including the file system IDs, for all file systems that were discovered.

The -fileset parameter specifies that information is displayed only for specific filesets. You can enter one or multiple fileset IDs. Use a comma to separate multiple IDs.

-l

Specifies that information is listed. The following information is included:

ID

An ID for the fileset that is composed of the fileset name, file system name, cluster name, storage system name, and storage system format.

Fileset

The name of the fileset.

Path

The path for the fileset. The path is displayed only if linked is displayed in the Status column.

Status

The status of the fileset can be one of the following values: linked or unlinked.

Used Space (GB)

The amount of space that is used by the fileset.

Used I-Nodes

The number of used inodes in the fileset.

Type

The type of the fileset, such as cache source or cache. No value in this column indicates that the fileset is not enabled for caching.

If you omit this parameter, only the ID is returned.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-grouping

Enables the grouping of numeric values. For example, in English, the value 12000 is displayed as 12,000. The grouping character is determined by the system locale.

Example: List all filesets that are on a specified file system

The following command generates a list of all filesets that are on a file system:

```
tpctool> lsfset -filesystem  
gpfs0+storage3.storage.tucson.ibm.com+127.0.0.1+0  
-l
```

The following output is returned:

ID

Ishtype

Use the **Ishtype** command to list host types. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev subsystem
Specifies the globally unique identifier (GUID) of the storage subsystem. You can use the **lsdev** command to obtain information, including the GUID, for all storage subsystems that are discovered.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing host types

The following command lists the host types that are associated with the specified subsystem.

```
tpctool> lshtype -user me -pwd mypass -url myhost:myport -dev 2105.22232+0
```

The following output is returned.

```

Isoptschedules

Use the **isoptschedules** command to show a list of the schedules that you created to analyze storage tiering.

In the GUI, you can analyze storage tiering. On the Optimization Analysis page, you can create schedules that are based on the criteria that you created when you analyzed tiering.

When you issue the **isoptschedules** command, the following information is shown:

Schedule ID

Specifies the ID of the schedule.

Schedule Name

Specifies the name of the schedule.

Most Recent Job ID

Specifies the current or most recent job ID.

Syntax

Parameters and arguments

-l

Specifies that the following additional information is listed.

Most Recent Start Time

The last time that the schedule was run.

Next Start Time

The next time that the schedule is run.

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

Example: Showing a list of the analyze tiering schedules

Issue the following command to show a list of the schedules that were created to analyze tiering:

```
tpctool> isoptschedules -l
```

The following output is returned:

Schedule ID	Schedule Name	Most Recent Job ID
1244	opt1357942625952	10002
459011	op61354	8038

Most Recent Start Time	Next Start Time
2013.01.11:15:11:05	2013.02.11:17:00:30
2013.01.12:07:33:12	NA

Ismetrics

Use the **lsmetrics** command to list available performance metrics. You must have Fabric operator or Disk operator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- subsys subsystem
Specifies the storage subsystem. The subsystem variable is the GUID of the storage subsystem. You can use the **lsdev** command to return information, including the GUID, for all storage subsystems that are discovered by IBM Spectrum® Control.
- ctype comp_type
Specifies that the output includes only components of the specified type. For more information about the *comp_type* variable, see the **lstype** command.
- level sample | hourly | daily
Specifies the level for which the performance metrics be summarized. You can specify a sample summary, an hourly summary, or a daily summary.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing performance metrics

The following command generates a list of performance metrics for switch ports on the specified fabric:

```
tptool lsmetrics -user me -pwd mypass -url myhost:myport  
-fabric 100000051E34F6A8 -ctype switch_port -level sample
```

The following output is returned:

Metric	Value
Port Send Packet Rate	855
Port Receive Packet Rate	856
Total Port Packet Rate	857
Port Send Data Rate	858
Port Receive Data Rate	859
Total Port Data Rate	860
Port Peak Send Data Rate	861
Port Peak Receive Data Rate	862
Port Send Packet Size	869
Port Receive Packet Size	870
Overall Port Packet Size	871
Error Frame Rate	872
Dumped Frame Rate	873
Link Failure Rate	874

- [lstype](#)

Isnode

Use the **Isnode** command to list all nodes or specified nodes that are associated with a cluster that is on a Storwize® V7000 Unified storage system.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- cluster cluster_id | -node node_id...
Specifies that information is displayed for all nodes that are on a cluster.
For the -cluster parameter, specify the ID for the cluster. You can use the **lscluster** command to view information, including the cluster IDs, for all clusters that were discovered.
The -node parameter specifies that information is displayed only for specific nodes. You can enter one or multiple node IDs. Use a comma to separate multiple IDs.
- l
Specifies that the following information is listed.

ID
An ID for the node that is composed of the node name, cluster name, storage system name, and storage system format.

Node
The name of the node.

Description
The description of the node.

IP Address
The IP address for the node.

Role
One or more of the following roles: interface, management, or storage.

Cache Gateway Node
Specifies **Yes** or **No** to indicate whether an interface node is enabled to function as a caching gateway node that exchanges data with other systems.

Status
One of the following values: **NORMAL**, **CRITICAL**, or **WARNING**.

If you omit this parameter, only the ID is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing all nodes that are on a cluster

The following command generates a list of all nodes that are on a cluster.

```
tpctool> lsnode -cluster storage3.storage.tucson.ibm.com+127.0.0.1+0 -l
```

The following output is returned:

lsnsd

Use the **lsnsd** command to list all Network Shared Disks (NSDs) or specified NSDs that are on a Storwize® V7000 Unified storage system. You can also list NSDs by file system, pool, or both.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev dev_id | -pool pool_id... | -filesystem file_system_id... | -nsd nsd_id...
The -dev parameter specifies that information is displayed for all NSDs that are associated with a storage system. This parameter requires the globally unique identifier (GUID) of the storage system. You can use the **lsdev** command to return information, including the GUID, for all storage systems that were discovered.
The -pool parameter specifies that information is displayed only for NSDs that are associated with specific pools. You can enter one or multiple pool IDs. Use a comma to separate multiple IDs. You can use the **lspool** command to return information, including the pool IDs, for all pools that were discovered.
The -filesystem parameter specifies that information is displayed only for NSDs that are associated with specific file systems. You can enter one or multiple file system IDs. Use a comma to separate multiple IDs. You can use the **lsfs** command to return information, including the file system IDs, for all file systems that were discovered.
The -nsd parameter specifies that information is displayed only for specific NSDs. You can enter one or multiple NSD IDs. Use a comma to separate multiple IDs.
- l
Specifies that the following information is listed.
 - ID
The ID for the NSD that is composed of the NSD name, storage system name, and storage system format.
 - NSD
NSD: The name of the NSD.
 - Cluster ID
The ID for the cluster that is associated with the NSD as defined by the Storwize V7000 Unified file module.
 - Failover Group
The failure group that the NSD belongs to.
 - Type
One or more of the following types: dataAndMetadata, dataOnly, metadataOnly.
 - Pool
The pool that the NSD is associated with.
 - Status
One of the following values: NORMAL, CRITICAL, WARNING, or UNREACHABLE.
 - Disk Space (GB)
The total disk space for the NSD.
 - Available Space (GB)
The amount of unused disk space for the NSD.

File System

The file system that the NSD is associated with.

If you omit this parameter, only the ID is returned.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-grouping

Enables the grouping of numeric values. For example, in English, the value 12000 displays as 12,000. The grouping character is determined by the system locale.

Example: List all NSDs that are on a storage system

The following command generates a list of all NSDs that are on a Storwize V7000 Unified storage system.

```
tpctool> lsnsd -dev 00000200A0E0005C+0 -1
```

The following output is returned:

lspool

Use the **lspool** command to list all file system pools that are on a specified Storwize® V7000 Unified storage system. You can also list the pools by file system.

Syntax

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-dev dev_id | -filesystem file_system_id... | -pool pool_id...

The `-dev` parameter specifies that information is displayed for all pools that are associated with a storage system. This parameter requires the globally unique identifier (GUID) of the storage system. You can use the `lsdev` command to return information, including the GUID, for all storage systems that were discovered. The `-filesystem` parameter specifies that information is displayed only for pools that are associated with specific file systems. You can enter one or multiple file system IDs. Use a comma to separate multiple IDs. You can use the `lsfs` command to return information, including the file system IDs, for all file systems that were discovered. The `-pool` parameter specifies that information is displayed only for specific pools. You can enter one or multiple pool IDs. Use a comma to separate multiple IDs.

- l
Specifies that the following information is listed.
 - ID
An ID for the pool that is composed of the pool name, storage system name, and storage system format.
 - Pool
The name of the pool.
 - Capacity (GB)
The capacity of the pool.
 - Available Space (GB)
The amount of unused space that is in the pool.
- If you omit this parameter, only the ID is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English, the value 12000 displays as 12,000. The grouping character is determined by the system locale.

Example: List all file system pools that are on a storage system

The following command generates a list of all file system pools that are on a Storwize V7000 Unified storage system.

```
tpctool> lspool -dev 00000200A0E0005C+0 -l
```

The following output is returned:

ID	Pool	Capacity (GB)	Available Space (GB)
system+00000200A0E0005C+0	system	21400	20109.43

lsport

Use the `lsport` command to list the ports that are on a Fibre Channel host bus adapter (HBA).

Syntax

```
tpctool lsport -user user_name -pwd password -url url -svr server [-l] [-fs character]
[-header] [-help] [-qs character] [-?] [-silent]
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is `system:port_number`, where `system` represents either the host name or IP address, and `port_number` represents the IBM Spectrum Control Device server port.
- svr server
Specifies a system with a fibre-channel HBA. The `server` variable is the host name of the system.
- l
Specifies that the long version of the information is listed.
 - Worldwide port name (WWPN)
 - Name
 - Status
- If you omit this parameter, only the WWPN is returned.
- fs character

- Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
 - Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
 - Lists help information for the command.
- qs character
 - Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
 - Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing port information

The following command lists the long version of information about the ports that are associated with the Fibre Channel HBA.

```
tpctool> lsport -user me -pwd mypass -url myhost:myport -svr <server> -l
```

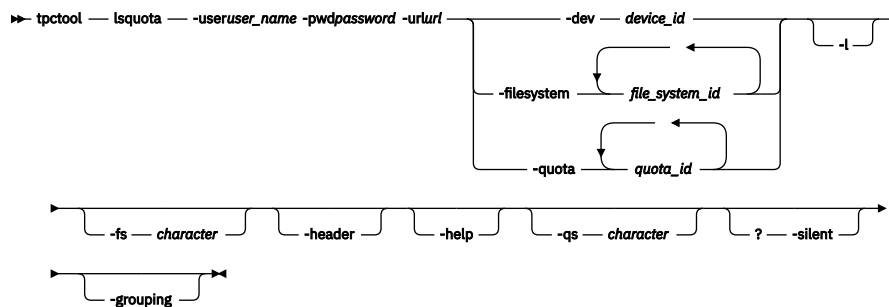

The following output is returned:

WWPN	Name	Status
210000E08B1Co9E	Marketing	Active

lsquota

Use the **lsquota** command to list all quotas or specified quotas that are on a Storwize® V7000 Unified storage system. You can also list quotas by file system.

Syntax

Parameters and arguments

- user user_name
 - Specifies an IBM Spectrum Control user ID.
 - pwd password
 - Specifies the password for the IBM Spectrum Control user ID.
 - url url
 - Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
 - dev dev_id | -filesystem file_system_id... | -quota quota_id...
 - The -dev parameter specifies that information is displayed for all quotas that are associated with a storage system. This parameter requires the globally unique identifier (GUID) of the storage system. You can use the **lsdev** command to return information, including the GUID, for all storage systems that were discovered.
 - The -filesystem parameter specifies that information is displayed only for quotas that are associated with specific file systems. You can enter one or multiple file system IDs. Use a comma to separate multiple IDs. You can use the **lsfs** command to return information, including the file system IDs, for all file systems that were discovered.
 - The -quota parameter specifies that information is displayed only for specific quotas. You can enter one or multiple quota IDs. Use a comma to separate multiple IDs.
 - l
 - Specifies that the following information is listed.
- | | |
|-----------------|---|
| ID | The identifier for the quota. |
| Name | The name of the user, group, or fileset that the quota is associated with. |
| File System | The file system that the quota is associated with. |
| Type | The type of quota can be one of the following values: user, file set, or group. |
| SL Usage (GB) | The soft limit for storage space usage. |
| HL Usage (GB) | The hard limit for storage space usage. |
| Used Space (GB) | |

- The amount of used storage space.
 - SL I-Nodes
 - The soft limit for inode usage.
 - HL I-Nodes
 - The hard limit for inode usage.
 - Used I-Nodes
 - The number of used inodes.
 - Gracetime Usage (sec.)
 - The time frame in which storage space usage must be brought below the quota.
 - Gracetime I-Nodes (sec.)
 - The time frame in which inode usage must be brought below the quota.
 - In Doubt (KB)
 - The amount of data for which the quota was not updated.
- If you omit this parameter, only the ID is returned.
- fs character
 - Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
 - header
 - Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
 - help | -h | -?
 - Lists help information for the command.
 - qs character
 - Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
 - silent
 - Suppresses all output for the command. If you omit this parameter, output is included.
 - grouping
 - Enables the grouping of numeric values. For example, in English, the value 12000 displays as 12,000. The grouping character is determined by the system locale.

Example: Displaying a list of all quotas that are on a storage system.

The following command generates a list of all quotas on a Storwize V7000 Unified storage system:

```
tpctool> lsquota -dev 00000200A0E0005C+0 -l
```

The following output is returned:

ID	Name						
4572_U_10000000+00000200A0E0005C+0	10000000						
4572_F_Adrian+00000200A0E0005C+0	Adrian

0	0	0

lssrg

Use the **lssrg** command to display a list of storage resource groups that are known to IBM Spectrum Control.

Syntax

```
tpctool — lssrg — -user user_name -pwd password -url url
                                     -fs character -header -help
                                     -qs character ? -silent -l
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
 - pwd password
Specifies the password for the IBM Spectrum Control user ID.
 - url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
 - fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
 - header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
 - help | -h | -?
Lists help information for the command.
 - qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
 - silent
Suppresses all output for the command. If you omit this parameter, output is included.
 - l
Specifies that the long version of the information is listed, which includes the following information:
 - Description
 - User Defined Property 1
 - User Defined Property 2
 - User Defined Property 3
- If this parameter is not issued, only the group name is returned.

Example: Displaying a list of storage resource groups

The following command generates a list of storage resource groups that are known to IBM Spectrum Control.

```
tpctool>lssrg -l
```

The following output is returned:

Name	Description	UDP1	UDP2	UDP3
=====				
administrator.my-example-srg				

lssrgmembers

Use the **lssrgmembers** command to list members of a specified storage resource group.

Syntax

```
tpctool -- lssrgmembers -- -user user_name -pwd password -url url  
                                     -fs character -header  
-help -qs character ? -silent -name SRGName
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- name SRGName
The unique name of a storage resource group. The output includes the following information.

- Member Key
- Member Type

Example: Displaying a list of the members of a storage resource group

The following command generates a list of the members of a specified storage resource group.

```
tpctool> lssrgmembers -name administrator.my-example-srg
```

The following output is returned.

Member Key	Member Type
1000080088E32D2D	Switch
100000051E0405C5	Switch
2107-1300361+0	Subsystem

lssvr

Use the **lssvr** command to list all systems that are discovered by Fabric Manager. You must have Fabric Administrator authority to use this command.

Syntax

```
tpctool -- lssvr -- -user user_name -pwd password -url url [-l] [-help] [-fs character]
[-qs character] [-? -silent] [-header]
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- l
Specifies that the long version of the information is listed. The following information is included:
 - Host name
 - Operating system
 - IP address
 - Status
 - UDP1, which can contain any alphanumeric character, and must be fewer than 255 characters in length.
 - UDP2, which can contain any alphanumeric character, and must be fewer than 255 characters in length.
 - UDP3, which can contain any alphanumeric character, and must be fewer than 255 characters in length.
 - Key - a combination of the GUID, the host name, and the IP address

If this parameter is not issued, only the host name is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing long version of the information for all systems discovered by Fabric Manager

The following commands list the long version of the information for all systems that are discovered by Fabric Manager.

```
tpctool
tpctool> lssvr -l
```

The following output is returned:

Name	OS	IP	Status
Marketing	Windows	9.32.245.164	NORMAL

Key
bfcf0e0192a111dc9ac60011258d9a29+tb142-wi+9.47.97.149+++

UDP1	UDP2	UDP3
WindowsSRA	ABCLab	Bld80

lssvrdisk

Use the **lssvrdisk** command to list all of the physical disks that are known to a specified server.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- srv server_name
Specifies the key of a server that has a IBM Spectrum® Control agent that is deployed to it. Use the **lssvr -l** command to retrieve a list of servers and the associated keys.
- l
Specifies that long version of the information is listed. The following information is included.
 - Key - a combination of the GUID, the host name, and the IP address
 - Driver
 - Vendor
 - Model
 - Serial Number
 - Capacity
 - Path

If this parameter is not issued, only the host name is returned.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing long information for all physical disks known to a specified server

The following commands list long information for all physical disks that are known to a specified server.

```

tpctool
tpctool> lssvrdisk -srv bfcf0e0192a111dc9ac60011258d9a29+tb142-wi.beaverton.
ibm.com+9.47.97.149+++ -l

```

The following output is returned:

Key	Driver	Vendor	Model
3HX30J0X000075154506	Adaptec AIC-7902B - Ultra320 SCSI	IBM-ESXS	ST336753LC FN

Serial Number	Capacity	Path
3HX30J0X000075154506	36401479680	Disk 0

lsswitch

Use the **lsswitch** command to display a list of all switches in a specified fabric.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- fabric fabric
Specifies the WWN of the fabric that is associated with the switches. Use the **lsdev -l** command to see a list of available fabrics.
- l
Specifies that the long version of the information is listed. The following information is included.

- WWN
- Label
- Type
- Vendor
- Model
- Status

If this parameter is not issued, only the host name is returned.

Example: Listing long information for all switches on a specified fabric

The following command lists long information for all switches in the specified fabric:

```

tpctool
tpctool> lsswitch -fabric 10000800880476F0 -l

```

The following output is returned:

WWN	Label	Type	Vendor	Model	Status
100000051E34AEE1	tb500_sw	Physical	Unknown	26.2	UNREACHABLE

lstime

Use the **lstime** command to list the time ranges for which performance data is available.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url

- Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
 - subsys subsystem
Specifies the storage subsystem. The *subsystem* variable is the GUID of the storage subsystem. You can use the **lsdev** command to return information, including the GUID, for all storage subsystems that are discovered by IBM Spectrum® Control.
 - level sample | hourly | daily
Specifies the level for which the time ranges for performance data that is available is to be summarized. You can specify a sample summary, an hourly summary, or a daily summary.
 - ctype comp_type
Specifies that the output include only components of the specified type. For more information about the *comp_type* variable, see the **lstype** command.
 - comps component_list
Specifies the component list. The *component_list* variable specifies the components, such as those that are returned by **lscomp**.
 - fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
 - header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
 - help | -h | -?
Lists help information for the command.
 - qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
 - silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Displaying a list of time ranges

The following command generates a list of time ranges for performance data.

```
tpctool> lstime -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 -ctype switch_port -level sample
```

Related reference

- [lstype](#)

lstype

Use the **lstype** command to list the components that are recognized by IBM Spectrum® Control. No authorization is required to run this command.

Syntax

Parameters and arguments

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing all component types

The following command lists the component types that are recognized by IBM Spectrum Control:

```
tpctool> lstype
```

The following output is returned:

Name	Type
all	-1
unknown	0
subsystem	1

```

subsys_port 2
controller 3
stor_pool 4
svc_iogrp 5
ds_rio 6
svc_mdgrp 7
da 8
ds_rank 9
array 10
svc_mdisk 11
vol 12
switch 13
switch_port 14

```

lsvm

Use the **lsvm** command to list all virtual machines that are known to IBM Spectrum® Control. You can also list only the virtual machines that were discovered through hypervisors.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- hypervisor hypervisor_id
Specifies that information is displayed for all virtual machines that were discovered through a specific hypervisor.
- l
Specifies that the following information is listed.
 - VM ID
A unique ID for the virtual machine.
 - VM Name
The name of the virtual machine if discovered through a hypervisor. For all other virtual machines, the name is the URL of the host server.
 - Hypervisor Name
The name of the hypervisor for virtual machines that were discovered through a hypervisor. For all other virtual machines, this field is non-applicable.
 - IP Address
The IP address of the server that is associated with the virtual machine.
 - OS Type
The operating system type of the server that is associated with the virtual machine.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: List all virtual machines on a hypervisor

The following command generates a list of all virtual machines for a particular hypervisor.

```
tpctool> lsvm -l
```

The following output is returned:

```

ID Name Hypervisor Name OS Type Host Name IP Address
=====
sor1+sour.storage.abc.ib.com sor1 sour.storage.abc.ib.com "Microsoft Windows Server 2016 or later (64-Bit)"
sor1.storage.abc.ib.com 192.168.111.21
sor2+sour.storage.abc.ib.com sor2 sour.storage.abc.ib.com "Red Hat Enterprise Linux 7 (64-Bit)"
sor2.storage.abc.ib.com 192.168.111.22

```

lsvm disk

Use the **lsvm disk** command to list all the VMWare virtual machine disks that are known to the given virtual machine or hypervisor.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- svr servername
Specifies a server key that represents either a virtual machine or hypervisor. Server keys can be obtained by using the **lssvr -l** command.
- l
Specifies that the long version of the information is listed. If this parameter is not issued, only the host name is returned.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

lsvol

Use the **lsvol** command to list all volumes on a system, list a specific volume or volumes, or list volumes on a specific array.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- dev GUID
Specifies the storage subsystem. The *GUID* variable is the globally unique identifier (GUID).
- array array
Specifies the array. The *array* variable is the array ID. You can use the **lsarray** command to return information, including array IDs, about the arrays on a specific storage subsystem.
- l
Specifies that long information is listed. In addition to the volume ID, the volume size and FlashCopy® relationship information are listed. Also includes the user defined properties: UDP1, UDP2 and UDP3.
The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- volume id | -
Specifies the volumes. The *volume_ID* variable is a comma-separated list of volume IDs, such as that obtained by running the **lsvol** command. If a single dash (-) is issued, the volume IDs are read from standard input.

Example: Listing the volumes on a subsystem

The following command lists all volumes on a specified subsystem. The **-dev** parameter specifies your system. More information for the volumes can be displayed as specified with the **-l** parameter.

```
tpctool> lsvol -user me -pwd mypass -url myhost:9550 -dev 2107.75DG000+0 -l
```

The following output is returned:

ID	Label	Size	Format
IBM. 2107-75DG000-111e+1+2107.75DG000+0	Sample_Vol_111E (ID:111e)	100	FB
IBM. 2107-75DG000-111d+1+2107.75DG000+0	Sample_Vol_111D (ID:111d)	100	FB
IBM. 2107-75DG000-111c+1+2107.75DG000+0	Sample_Vol_111C (ID:111c)	100	FB
FlashCopy	RealUsed	Encrypted	
UNAVAILABLE	100	No	
UNAVAILABLE	100	No	
UNAVAILABLE	100	No	
UDP1	UDP2	UDP3	
Sample	HostA	-	
Sample	HostA	-	
Sample	HostA	-	

FlashCopy

Indicates if the volume is in a FlashCopy relationship and whether it is a FlashCopy source or target. Volumes that are not in a FlashCopy relationship are displayed with a blank value. If information about the copy relationship of a volume is not available, UNAVAILABLE is displayed.

Note:

- This value is available for volumes of the following systems only: IBM® System Storage® DS8000® and IBM SAN Volume Controller.

Real Used

Indicates the amount of space, in gigabytes, that a volume uses. IBM Spectrum® Control allocates the entire space for standard-provisioned volumes when they are created. For thin-provisioned volumes, it does not. This column displays the space that is being used.

Note:

- If a system is new and there is no data in the volumes, the value is zero. For example, the Size field might show 16 GB but the Real Used is 0.
- For non-thin provisioned volumes, the Real Used value always matches the Size value.
- Thin provisioned volumes always have an asterisk before their name (Label).
- Thin provisioned volumes of other storage systems are not supported by IBM Spectrum Control. The Real Used value is displayed as N/A.

Encrypted

Indicates if the volumes are on encrypted disks (Yes or No).

UDP1

The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.

UDP2

The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.

UDP3

The user-defined property (UDP) contains anything of significance to the group administrator. This alphanumeric character string must contain fewer than 255 characters in length.

lsvolgroup

Use the **lsvolgroup** command to display a list of volume groups that are known to IBM Spectrum Control.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- svr server_id
(optional) The -svr parameter specifies that information is displayed for all volume groups that are associated with a specific server. You can use the **lssvr** command to return information, including the server IDs, for all servers that were discovered.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- l
Specifies that the long version of the information is listed, which includes the following information:
 - ID
 - Name
 - Server Name
 - Capacity (GB)
 - Used Capacity (GB)
 - Free Space (GB)

If this parameter is not issued, only the ID is returned.

Example: Displaying a list of volume groups

The following command generates a list of volume groups that are known to IBM Spectrum Control.

```
tpctool>lsvolgroup -svr c8bf94c4e7df11e1861cd2308c029302+hops3.storage.abc.ibm.com
+9.11.92.102+++ -l
```

The following output is returned:

ID	Name	Server Name	Capacity (GB)
Used Capacity (GB)	Free Space (GB)		
rootvg+hops3.storage.abc.ibm.com	rootvg	hops3.storage.abc.ibm.com	68.25
68.00	0.25		

lszone

Use the **lszone** command to list the zones in a zone set.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url

- Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
 - Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- active
 - Specifies that only the active zones are listed. If this option is not issued, all zones are listed.
- fs character
 - Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
 - Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
 - Lists help information for the command.
- qs character
 - Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
 - Suppresses all output for the command. If you omit this parameter, output is included.
- zone_set
 - Specifies the zone set. The *zone_set* variable is the name of the zone set.

Example: Listing all zones

The following command lists the names of all zones in the PARIS zone set:

```
tpctool> lszone -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 PARIS
```

The following output is returned:

```
Name
=====
WINDOWSNT
SUNSOLARIS
TEST
...
```

Example: Listing only the active zones

The following command lists the active zones:

```
tpctool> lszone -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 -active PARIS
```

The following output is returned:

```
Name
=====
SUNSOLARIS
```

lszs

Use the **lszs** command to list information about zone sets. This information includes the zone set name and status.

Syntax

Parameters and arguments

- user user_name
 - Specifies an IBM Spectrum Control user ID.
- pwd password
 - Specifies the password for the IBM Spectrum Control user ID.
- url url
 - Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
 - Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- active
 - Specifies that only information about the active zone set is listed. If you omit this option, information about all zone sets is listed.
- l
 - Specifies that the long version of the information is listed:
 - Name

- Status: active or inactive

If you omit this option, only the name of the zone is listed.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Listing the long version of information for all zone sets

The following command lists the long version of information for all zone sets:

```
tpctool> lszs -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 -l
```

The following output is returned:

Name	Status
PARIS	ACTIVE
LONDON	INACTIVE

Example: Listing the active zone set

The following command lists the name of the active zone set:

```
tpctool> lszs -user me -pwd mypass -url myhost:myport
-fabric 100000051E34F6A8 -active
```

The following output is returned:

```
Name
=====
PARIS
```

mkappgroup

Use the **mkappgroup** command to create an application with a specific name, type, description, and user-defined properties. You must have Administrator authority to use this command.

Syntax

```
tpctool — mkappgroup — -user user_name -pwd password -url url — -name ApplicationGroupName →
      -description ApplicationDescription — -type type of application defined by the user →
      -subtype UserDefinedSubtype — -udp1 UDP1 — -udp2 UDP2 — -udp3 UDP3 →
```

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-name ApplicationGroupName

A unique name not already in use, fewer than 60 characters long. It cannot contain any of the following characters:

```
\ / : * ? " < > | .
```

-description ApplicationGroupDescription

(optional) The description can contain any alphanumeric characters, and must be fewer than 255 characters long.

-type The type of application defined by the user

(optional) The type determines the type of application that is created. For example, a type might be Payroll, Finance, Project, General, or a similar type. This parameter can contain any alphanumeric character, and must be fewer than 128 characters in length.

-subtype UserDefinedSubtype

(optional) The subtype specifies another qualifier for the type. For example, if the -type is Db2® Group, the -subtype might be Logs, Tablespace, or another subtype that is related to Db2 Group. This parameter can contain any alphanumeric character, and must be fewer than 128 characters in length.

- udp1 UDP1
(optional) A user-defined property (UDP) that can contain anything of significance to the application administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters in length.
- udp2 UDP2
(optional) A user-defined property that can contain anything of significance to the application administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters in length.
- udp3 UDP3
(optional) A user-defined property that can contain anything of significance to the application administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters in length.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Creating an ID, type and subtype for an application

The following command creates an application Accounting with a type of Finance and a subtype of Payroll:

```
tpctool> mkappgroup -name Accounting -type Finance -subtype Payroll
```

The following output is returned:

Name	ID	Status
Accounting	/Application/7506214	SUCCESS

Related reference

- modifyappgroup

mkdeptgroup

Use the **mkdeptgroup** command to create a department with a specific name, description, type, subtype, and user-defined properties. You must have Administrator authority to use this command.

Syntax

```
➤ tpcroot mkdeptgroup -useruser_name -pwdpassword -urlurl -name DepartmentGroupName ->
└─ -description DepartmentDescription -type The type of department defined by the user
└─ -subtype UserDefinedSubtype -udp1 UDP1 -udp2 UDP2 -udp3 UDP3
```

Parameters and arguments

- user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- name DepartmentGroupName
A unique name not already in use, with a maximum of 60 characters in length. It cannot contain any of the following characters:
`\ / : * ? " < > | .`
- description DepartmentGroupDescription
(optional) The description can contain any alphanumeric characters, with a maximum of 255 characters in length.
- type
(optional) The type of department that is created. This parameter can contain any alphanumeric character, with a maximum of 60 characters in length. For example, if a department is named, Accounting, then the type might be Finance.
- subtype UserDefinedSubtype
(optional) The subtype specifies another qualifier for the type. For example, if the -type is Finance, the -subtype parameter might be Payroll. This parameter can contain any alphanumeric character, with a maximum of 60 characters in length.
- udp1 UDP1

(optional) A user-defined property (UDP) that can contain anything of significance to the department administrator. The UDP can contain any alphanumeric character, with a maximum of 255 characters in length.

-udp2 UDP2

(optional) A user-defined property that can contain anything of significance to the department administrator. The UDP can contain any alphanumeric character, with a maximum of 255 characters in length.

-udp3 UDP3

(optional) A user-defined property that can contain anything of significance to the department administrator. The UDP can contain any alphanumeric character, with a maximum of 255 characters in length.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Creating an ID, type and subtype for a department

The following command creates the ID of /Department/5041, a type of Finance, with a subtype of Payroll for a department:

```
tpctool> mkdeptgroup -name Accounting -type Finance -subtype Payroll
```

The following output is returned:

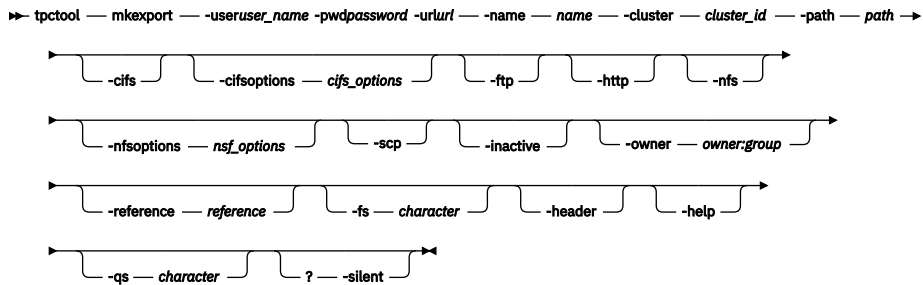

Name	ID	Status	Type	Subtype
Accounting	/Department/5041	Success	Finance	Payroll

mkexport

Use the **mkexport** command to create an export to access data through a data transfer protocol.

An *export* is a shared disk space that is accessible through the protocols that you specify when you run the **mkexport** command. You can create exports and enable them for HTTP, FTP, Secure Copy Protocol (SCP), Network File System (NFS), and Common Internet File System (CIFS) protocols. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-name name

Specifies the name of the export.

-cluster cluster_id

Specifies the name of the IBM Spectrum® Control cluster key. The cluster key is listed in the ID column of the **lscluster** command output. This value is different from the Cluster ID output from the **lscluster** command.

-path path

Specifies the path for the export.

-cifs

Configures the CIFS protocol for the export.

-cifs options cifs_options

Defines the CIFS protocol options for the export. If the `cifsoptions` name or value contains spaces, the entire option must be enclosed in matching single quotation marks. The quotation marks must be preceded by an escape character.

- ftp
Configures FTP for the export.
- http
Configures HTTP for the export.
- nfs
Configures the NFS protocol for the export.
- nfsoptions `nfs_options`
Defines the NFS clients and their options for the export.
- scp
Configures SCP for the export.
- inactive
Marks the export as inactive. An inactive export is added to the list of exports, however you cannot access the data. You can use this parameter to modify the access control lists (ACLs) before you later activate the export with the **chexport** -active command.
- owner | -reference
Where owner `owner:group` sets the owner or owner group for the directory or reference `reference` sets the directory owner to the owner of the reference file. The reference file name must be an existing file or directory.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Creating an export that is enabled for HTTP, SCP, and NFS protocols

The following command creates an export to access data through HTTP, SCP, and the NFS protocol:

```
tpctool> mkexport -name cindyexport  
-cluster storage1.storage.tucson.ibm.com+storage1.storage.tucson.ibm.com+0  
-path /ibm/gpfs0/cindy -user admin -pwd password -url localhost:9550  
-http -scp -nfs
```

The following output is returned:

```
ExportId  
=====  
cindyexport+storage1.storage.tucson.ibm.com+storage1.storage.tucson.ibm.com+0  
  
Status  
=====  
SUCCESS
```

You are not required to enter credentials if you have already run the **tpctool** command with credentials.

Example: Creating an export that is enabled for CIFS protocol

The following command creates an export to access data through the CIFS protocol:

```
tpctool mkexport -name eexp10 -path /ibm/gpfs0/eexp10  
-cluster kq98n5d.ibm+00000200A22045DC+0 -cifs  
-cifsoptions "browseable=no,\"comment=comment for eexp10\",leases=no,  
sharemodes=no,syncio=yes,hideunreadable=yes,cifsacl=no,oplocks=no,  
locking=no,\"read only\",syncclose=no,\"access control=Everyone:ALLOWED:FULL;  
Administrator:ALLOWED:FULL\" -user db2admin -pwd g0vmw are -url localhost:9550
```

The following output is returned:

```
ExportId  
=====  
eexp10+kq98n5d.ibm+00000200A22045DC+0  
  
Status  
=====  
SUCCESS
```

mkfs

Use the **mkfs** command to create a GPFS file system to manage files on a storage device.

You can access the file system content by using file services like Common Internet File System (CIFS) or Network File System (NFS). You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- name name
Specifies the name of the file system. The name must be unique and can be a maximum of 256 characters.
- cluster cluster_id
Specifies the name of the IBM Spectrum® Control cluster key. The cluster key is listed in the ID column of the **lscluster** command output.
Tip: This value is different from the `Cluster ID` output from the **lscluster** command.
- mountpoint mount_point
Specifies the mount point directory of the GPFS file system.
- noverify
Specifies that the disk descriptor is not verified so that disks that contain an old descriptor can be reused. Specify the `-noverify` parameter only when you want to reuse disks that are no longer needed for an existing file system. If the command is interrupted for any reason, you must use the `-noverify` parameter when you run the command again.
- numInodes max_num_inodes[:num_inodes_preallocate]
Specifies the maximum number of files for this file system. The *num_inodes_preallocate* variable specifies the number of inodes that the system immediately preallocates. You can specify values in thousands (k) or in millions (M). To specify values of 100 million for the *max_num_inodes* variable and 1million for the *num_inodes_preallocate* variable, enter `-numInodes 100M:1M`.
- numNodes num_nodes
Specifies the estimated number of nodes that is mounted with the file system.
- disks disk_name
Specifies the disks to create the file system on. The *disk_name* variable contains a comma-separated list of disk names.
Tip: You can verify the availability of a disk by running the **lsnsd** command.
- pool pool_name
Specifies the file system pool to create the file system on.
Tip: You can list all the disks in a pool by running the **lsnsd** command.
- discoverdisks
Specifies that IBM Spectrum Control detects and uses free GPFS Network Shared Disks (NSDs) automatically, which are tagged for a specified file system but not yet included. This option is applicable only for Storwize® V7000 Unified.
Tip: You can verify the availability of a disk by running the **lsnsd** command.
- createdisks size | mdisk_grp1 | mdisk_grp2 | N=num_disks
Creates disks implicitly, before the file system is created, and then adds them to the file system. This option is applicable only for Storwize V7000 Unified.
 - size
Specifies the size of the new disks. Size is specified as an integer with capacity up to petabyte without a space between the size and the unit; for example 17G. Disk sizes must be specified either without suffix (byte) or with K (kilobyte), M (megabyte), G (gigabyte), T (terabyte), or P (petabyte). Values less than 512 MB are not supported. This parameter is mandatory.
 - mdisk_grp1
Specifies the storage system managed disk (MDisk) group in which the underlying NAS volumes are created. This parameter is mandatory.

- Tip: You can see a list of available MDisk groups by using the **svcinfo lsmdiskgrp** command.
- mdisk_grp2**
Specifies the second storage system MDisk group in which the underlying NAS volumes are created. This parameter is optional.
- Tip: You can see a list of available MDisk groups by using the **svcinfo lsmdiskgrp** command.
- num_disks**
Specifies the number of storage system NAS volumes that is created in each MDisk group. This parameter is optional. The default number of disks is 3.
- fs character**
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header**
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?**
Lists help information for the command.
- qs character**
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent**
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Create a file system by using the createdisks parameter

The following command first creates one disk of 20 GB and then creates a file system.

```
tpctool> mkfs -name eefs05 -cluster kq98n5d.ibm+00000200A20045DC+0
-createdisks 20G,0,N=1 -user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
eefs05+kq98n5d.ibm+00000200A20045DC+0	SUCCESS

Example: Create a file system by using the pool parameter

The following command creates a file system on a specified pool.

```
tpctool> mkfs -name eefs06 -cluster kq98n5d.ibm+00000200A20045DC+0
-pool slpool -user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
eefs06+kq98n5d.ibm+00000200A20045DC+0	SUCCESS

Example: Create a file system by using the discoverdisks parameter

The following command discovers all the disks that are tagged to the **eefs07** file system, creates the **eefs07** file system, and finally adds the disks to it.

```
tpctool> mkfs -name eefs07 -cluster kq98n5d.ibm+00000200A20045DC+0
-discoverdisks -user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
eefs07+kq98n5d.ibm+00000200A20045DC+0	SUCCESS

Example: Create a file system by using the disks parameter

The following command creates a file system on the specified disks.

```
tpctool> mkfs -name eefs01 -cluster storage3.storage.tucson.ibm.com+9.11.92.174+0
-disks array0_sas_60001ff078c3a0789ff0001,array1_sas_60001ff078c3a0689fe0000
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
eefs01+storage3.storage.tucson.ibm.com+9.11.92.174+0	SUCCESS

mkfset

Use the **mkfset** command to create a fileset that is associated with a file system on a Storwize® V7000 File Module storage system. With filesets, you can use functions such as snapshots or quotas within a file system. You must have Administrator authority to use this command.

The new fileset is empty except for a root directory, and is not shown in the directory name space until you run the **linkfset** command. When you create a fileset, you can establish policies and quotas on the fileset before you link the fileset to the name space. You can create a maximum of 10,000 filesets for each file system.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- name name
Specifies the name of the fileset.
- filesystem file_system_id
Specifies the IBM Spectrum® Control file system key. The file system key is listed in the ID column of the **lsfs** command output.
- owner owner_file_set_name
Specifies the name of the independent fileset where the new file set is allocated. This parameter is mutually exclusive with the -independent parameter. Both filesets must belong to the same file system.
- independent
Specifies whether you want to create an independent fileset with its own allocated inodes. Otherwise, the fileset is created as a dependent fileset, and is allocated on the file system or in an independent fileset. This parameter is mutually exclusive with the -owner parameter.
- comment comment
Specifies a comment that displays in the output of the **lsfset** command. The length of this comment can be a maximum of 255 characters. You must enclose comments in double quotation marks.
- numInodes max_num_inodes[:num_inodes_preallocate]
Specifies the maximum number of files for a new, independent file set. This parameter can be used only with the -independent parameter. The *num_inodes_preallocate* variable specifies the number of inodes that the system immediately preallocates. You can specify values in thousands (k) or in millions (M). To specify values of 100 million for the *max_num_inodes* variable and 1million for the *num_inodes_preallocate* variable, enter `-numInodes 100M:1M`. GPFS defines a minimum number of inodes, which might be greater than the maximum specified. The default values for the fileset are 1million (1 M) for the *max_num_inodes* variable and 50,000 (50 K) for the *num_inodes_preallocate* variable.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Create a file system

The following command creates a fileset on a specified file system.

```
tpctool> mkfset -name eefset
-filesystem eefs+kq458mv.ibm+00000200A2A0153C+0
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesetId	Status
eefset+eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

mksrg

Use the **mksrg** command to create a storage resource group with a specific name, type, description, and user-defined properties. You must have Administrator authority to use this command.

Syntax

```
tpctool mksrg -user user_name -pwd password -url url -name SRGname -description SRGDescription
           -udp1 SRGUDP1 -udp2 SRGUDP2 -udp3 SRGUDP3 -fs character -header
           -help -qs character ? -silent
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- name SRGname
A unique name not already in use, fewer than 60 characters long. It cannot contain any of the following characters:
`\ / : * ? " < > | .`
The user name of the user who is creating the storage resource group is added to the beginning of the storage resource group name, followed by the name that is specified in the *name* variable.
- description SRGDescription
(optional) The description can contain any alphanumeric characters, and must be fewer than 255 characters long.
- udp1 SRGUDP1
(optional) A user-defined property that can contain anything of significance to the storage resource group administrator. The user-defined property (UDP) can contain any alphanumeric character, and must be fewer than 255 characters long.
- udp2 SRGUDP2
(optional) A user-defined property that can contain anything of significance to the storage resource group administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters long.
- udp3 SRGUDP3
(optional) A user-defined property that can contain anything of significance to the storage resource group administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters long.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Creating a storage resource group

The following command creates a storage resource group with the specified attributes:

```
tpctool> mksrg -name testsrg -description Test-SRG-Description
-udp1 myudp1 -udp2 myudp2 -udp3 myudp3
```

The following output is returned:

Name	Status
Administrator.testsrc	SUCCESS

mkzone

Use the **mkzone** command to create a zone. This command must be run within a transaction. You must have Administrator authority to use this command.

Important:

- An *orphan zone* is one that does not belong to a zone set. If the zone that you are creating is an orphan zone and the switch and data source that you are using support orphan zones, use only the **mkzone** command to create the zone. However, if the switch and data source that you are using do not support orphan zones, you must use the **addzone** command within the same transaction to add the zone to a zone set. Specify the **addzone** command AFTER you create the zone by using the **mkzone** command. For details about adding a zone to a zone set, see the **addzone** command.
- To activate your changes to a zone set, use the **actzs** command. For details, see the **actzs** command.

Syntax

➔ **tpctool** — **mkzone** — **-user** *user_name* **-pwd** *password* **-url** *url* — **-fabric** *WWN* — **-zone** *zone* — **-help**

└─ ? — **-silent** ─┐
└─ *ports* ─┐

Parameters and arguments

- user** *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd** *password*
Specifies the password for the IBM Spectrum Control user ID.
- url** *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric** *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- zone** *zone*
Specifies the zone. The *zone* variable is the name of the zone.
- help** | **-h** | **-?**
Lists help information for the command.
- silent**
Suppresses all output for the command. If you omit this parameter, output is included.
- ports** | **-**
Specifies the switch ports. The *ports* variable is a list of worldwide port names (WWPNs). If you specify a single dash (-), the WWPNs are read from standard input.

Example: Creating a zone

In the following example, assume that the switch that you are using does not support orphan zones. To create the SUNSOLARIS zone, add the zone to a zone set, and activate the zone set. Specify all zoning changes within one transaction, from start to commit, and then activate the zone set by using the **actzs** command. The list of WWPNs is read from standard input.

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> mkzone -fabric 100000051E34F6A8 -zone SUNSOLARIS -
tpctool> addzone -fabric 100000051E34F6A8 -zs PARIS SUNSOLARIS
tpctool> commit -fabric 100000051E34F6A8
tpctool> actzs -fabric 100000051E34F6A8 PARIS
```

Related reference

- [addzone](#)
- [actzs](#)

mkzs

Use the **mkzs** command to create a zone set. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

```

▶ tpctool — mkzs — -user user_name -pwd password -url url — -fabric WWN —
└─ -help ─┘ └─ ? — -silent ─┘

└─ zone_set ─▶

```

Parameters and arguments

-user user_name
Specifies an IBM Spectrum Control user ID.

-pwd password
Specifies the password for the IBM Spectrum Control user ID.

-url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | -h | -?
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

zone_set
Specifies the zone set. The *zone_set* variable is the name of the zone set.

Tip: To create a zone set, you must include at least one zone.

Example: Creating a zone set

The following commands create the PARIS zone set, which includes the SUNSOLARIS zone:

```

tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> mkzone -fabric 100000051E34F6A8 -zone SUNSOLARIS -
tpctool> mkzs -fabric 100000051E34F6A8 PARIS
tpctool> addzone -fabric 100000051E34F6A8 -zs PARIS SUNSOLARIS
tpctool> commit -fabric 100000051E34F6A8

```

modifyappgroup

Use the **modifyappgroup** command to modify an existing application. You can add and remove members of the application by specifying the member type and the key for the individual member. You can also use a -tagkey and -tagvalue member pair.

Syntax

```

▶ tpctool — modifyappgroup — -user user_name -pwd password -url url — -add — -remove — -id ApplicationGroupID —
└─ -type ─┘ └─ -key memberKey OR -tagkey ─┘ └─ -tagvalue tagvalue ─▶
├─ appgroup ─┘
├─ datastore ─┘
├─ export ─┘
├─ filesystem ─┘
├─ filesset ─┘
├─ server ─┘
├─ vm ─┘
├─ volume ─┘
└─ volumegroup ─┘
└─ udp1 ─┘
└─ udp2 ─┘
└─ udp3 ─┘

└─ -help ─┘ └─ -fs character ─┘ └─ -qs character ─┘ └─ ? — -silent ─┘ └─ -header ─▶

```

Parameters and arguments

-user user_name
Specifies an IBM Spectrum Control user ID.

-pwd password
Specifies the password for the IBM Spectrum Control user ID.

-url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-add
Adds a member to the specified application, which is designated by the specified member type and key or the -tagkey,-tagvalue parameter pair. Restriction: Vaults can only be added with the IBM Spectrum® Control GUI.

-remove
Removes a member from the specified application, which is designated by the member type and key that you specify or the -tagkey,-tagvalue parameter pair. Use the **lsappgroupmembers -id ApplicationGroupID** command to view a list of members and member keys for a specified application.

-id ApplicationGroupID

The identifier of the application that is being modified. Use the **lsappgroup** command, to view a list of the applications that are known to IBM Spectrum Control.

-type

appgroup | datastore | export | filesystem | fileset | server | vm |
volume | volumegroup

Denotes the type of element that needs to be added to or removed from the application.

-key memberKey

The unique key that corresponds to the member and member type that is specified by the **-type** parameter.
You can specify one of the following key types for this parameter:

appgroup

The identifier of the application to be added or removed.

datastore

The ID of the data store, which is composed of the data store name and the hypervisor host name.

To find the hypervisor server key for the data store, use the **lssvr** command, and the **lsfs** command, with the **-svr hypervisor_server_key** option, to obtain the ID of the data store. For example, C:\TPC_install_directory\cli>tpctool lssvr -l and C:\installation_dir\cli>tpctool lsfs -svr key_from_the_first output.

The following example shows how to add a data store to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id  
ApplicationGroupID -type datastore -key ID_from_lsfs_output
```

export

The ID of the export, which is composed of the export name, cluster name, storage system name, and storage system format for IBM® Storwize® V7000 Unified and IBM Spectrum Scale. For servers and NetApp file servers, this parameter is composed of the export name and host name of the servers and NetApp file servers.

To find the ID for the export, use the **lssvr** command to locate the server key for servers and NetApp file servers, or use the **lsdev** command to get a share and the subsystem ID.

For example: C:\installation_dir\cli>tpctool lssvr -l and C:\installation_dir\cli>tpctool lsdev -subsys -l.

To find the cluster, run the following command:

```
C:\installation_dir\cli>tpctool lscluster -dev  
GUID_of_the_subsystem -l
```

The following example shows how to find the exports:

```
C:\installation_dir\cli>tpctool lsexport -svr  
server_key or C:\installation_dir\cli>tpctool  
lsexport -cluster ID_of_the_cluster
```

The following example shows how to add an export to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id  
ApplicationGroupID -type export -key id_from_lsexport_output
```

Note: AIX® and Linux® exports are only available if the user of the computer explicitly exports the directories.

filesystem

The ID of the file system, which is composed of the file system name and host name of the server.

The ID of the file system is listed in the ID column of the **lsfs** command output.

To find the server key for the file system, use the **lssvr** command, and the **lsfs** command, with the **-svr server_key** option.

For example:

```
C:\installation_dir\cli>tpctool lssvr -l and C:\installation_dir\cli>tpctool lsfs -svr  
key_from_the_first_output
```

The following example shows how to add a file system to an application :

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id  
ApplicationGroupID -type filesystem -key id_from_lsfs_command_output
```

fileset

The unique ID of the fileset, which is composed of the file system name, cluster name, storage system name, and storage system format for IBM Storwize V7000 Unified and IBM Spectrum Scale.

The unique ID of the fileset is listed in the File Set column of the **lsfset** command output.

The following example shows how to add a fileset to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id  
ApplicationGroupID -type fileset -key id_from_lsfset_command_output
```

The following example shows how to remove a fileset from an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -remove -id  
ApplicationGroupID -type fileset -key id_from_lsfset_command_output
```

server

The combination of the GUID, the host name, and the IP address. The unique key for the server is listed in the Key column of the **lssvr -l** command output.

The following example shows how to retrieve the ID for the server:

```
C:\installation_dir\cli>tpctool lssvr -l
```

The following example shows how to add a server to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id
ApplicationGroupID -type server -key id_from_lssvr_output
```

vm

The ID of the virtual machine, which is composed of the virtual machine and the host name of the hypervisor. The ID of the virtual machine is listed in the Key column of the **lsvm** command output.

The following example shows how to obtain the ID for the virtual machine:

```
C:\installation_dir\cli>tpctool lsvm
```

The following example shows how to add a virtual machine to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id
ApplicationGroupID -type vm -key id_from_lsvm_output
```

volume

The ID of the storage volume, which is composed of the storage volume name, storage system name, and storage system format. The ID of the storage volume is listed in the ID column of the **lsvol** command output.

The following example shows how to find the ID of the volume:

```
C:\installation_dir\cli>tpctool lsvol -dev
GUID_of_the_subsystem -l
```

The following example shows how to obtain the key for the subsystem of the volume:

```
C:\installation_dir\cli>tpctool lsdev -subsys -l
```

The following example shows how to add the ID of the volume to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id
ApplicationGroupID -type volume -key volume_id
```

volumegroup

The ID of the volume group, which is composed of the volume group name and the host name. The ID of the volume group is listed in the Key column of the **lsvolgroup** command output.

The following example shows how to obtain the ID for the server:

```
C:\installation_dir\cli>tpctool lssvr -l
```

The following example shows how to find the ID of the volume group:

```
C:\installation_dir\cli>tpctool lsvolgroup -svr
server_ID_from_lssvr_output -l
```

The following example shows how to add the ID of the volume group to an application:

```
C:\installation_dir\cli>tpctool modifyappgroup -add -id
ApplicationGroupID -type volumegroup -key volumegroup_id
```

-tagkey udp1 or udp2 or udp3

Specifies the -tagkey parameter that is used to create application members.

Only the following -type parameters can be defined with tags:

- server
- filesystem
- appgroup

-tagvalue tagvalue

Specifies the -tagvalue parameter that is used to create application members.

Note: You can only specify one -tagkey and-tagvalue parameter member pair at a time.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Adding members to an application

The following example adds the application member that is specified by the **-type** and **-key** parameters, to /Application/5055.

You can add members to a specified application, with the following command:

```
tpctool
tpctool> modifyappgroup -add -id /Application/5044 -type appgroup
-key /Application/5055
```

The following output is returned:

Group Name	Member Key	Member Type	Status
DB2appgroup	/Application/5055	Application Group	SUCCESS

Example: Removing members of an application

The following example removes the application member that is specified by the **-type** and **-key** parameters, from application -id /Application/5055 .

You can remove members of a specified application with the following command:

```
tpctool
tpctool> modifyappgroup -remove -id /Application/5044 -type appgroup
-key /Application/5055
```

The following output is returned:

Group Name	Member Key	Member Type	Status
DB2appgroup	/Application/5055	Application Group	SUCCESS

Example: Adding application members with tags

The following example adds servers that are specified by the **-tagkey** and **-tagvalue** parameters to the application with -id /Application/5044.

You can add members to a specified application with tags using the following command:

```
tpctool
tpctool> modifyappgroup -id /Application/5044 -add -type server -tagkey
udp1 -tagvalue "dbservers"
```

The following output is returned:

Group Name	Member Key	Member Type	Status
DB2appgroup	bea358-ui.storage.abc.ibm.com+192.0.2.51+++	Server	SUCCESS
DB2appgroup	228e76-ui.storage.abc.ibm.com+192.0.2.76+++	Server	SUCCESS

Related reference

- [modifyappgroupviafile](#)

modifyappgroupviafile

Use the **modifyappgroupviafile** command to modify an existing application by using an input file. You can add and remove members by specifying the member type and identifiers or by using a member type with a -tagkey and -tagvalue pair.

You can specify -tagkey and -tagvalue pairs, for a given resource type, in the following ways:

- To select resources that match all of the specified tags, the -tagkey and -tagvalue parameters must be specified in this format:

```
-tagkey udp1 udp2 -tagvalue value1 value2
```

For example, to select the resources that have **udp1** set to **US** and **udp2** set to **West** specify:

```
-tagkey udp1 udp2 -tagvalue US West
```

- To select resources that match at least one of the specified tags, the -tagkey and -tagvalue parameters must be specified in this format:

```
-tagkey udp1 -tagvalue value1 -tagkey udp2 -tagvalue value2
```

For example, to select resources that have **udp1** set to **US** or **udp2** set to **West** specify:

```
-tagkey udp1 -tagvalue US -tagkey udp2 -tagvalue West
```

Syntax

```
➤ tpctool — modifyappgroupviafile — -user user_name -pwd password -url url — -inputfile — inputfilename ➤
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- inputfile inputfilename
Indicates the name of the input file, which contains information about the members that need to be added to or removed from applications.

All the other parameters are specified directly in the input file. The input file specifies the application where the members are added or removed by using the -add or -remove parameters:

```
-id <ApplicationGroupID> -add
-id <ApplicationGroupID> -remove
```

Then, the input file specifies the type and identifiers of the members for the application.
The -memberid parameter can be separated by spaces or commas. For example:

```
-memberid /Application/5044 /Application/5045  
-memberid /Application/5044,/Application/5045
```

If a -name parameter contains spaces or commas, it must be marked in quotations by using the double quotation character. For example:

```
-name "datastore1 (5) "
```

-id ApplicationGroupID

Indicates the unique ID of the application where the member is added or removed. Use the **lsappgroup** command, to view a list of the applications.

-type appgroup

Specifies that the entities are applications. The -memberid parameter specifies the unique IDs of the applications to be added or removed from the application, which is specified by the -id parameter. For example:

```
-type appgroup -memberid <appgroupname1>, <appgroupname2>, <appgroupname3>...
```

When you are using the -tagkey and -tagvalue member pair:

```
-type appgroup -tagkey <tag_key> -tagvalue <tag_value>
```

-type server

Specifies that the entities are servers or hypervisors. The -name parameter specifies the host names of the servers or hypervisors. For example:

```
-type server -name <hostname1>, <hostname2> ...
```

-type datastore

Specifies that the entities are data stores. The -servername parameter specifies the name of the hypervisor the data store belongs to and the -name parameter specifies the names of the data stores. For example:

```
-type datastore -servername <hostname> -name <datastore1> <datastore2> ...
```

-type export

Specifies that the entities are exports. The identifiers of the entities have different formats, which depend on whether the export members belong to servers or to IBM® Storwize® V7000 Unified cluster or IBM Spectrum Scale cluster. For example:

```
-type export -servername <hostname> -name <export1>, <export2> ..  
-type export -devicename <displaynameofdevice> -clustername <hostnameofcluster>  
-name <export1>, <export2>
```

-type filesystem

Specifies that the entities are file systems. The -servername parameter specifies the name of the server that the file system belongs to and the -name parameter specifies the names of the file system. For example:

```
-type filesystem -servername <hostname> -name <filesystem1>, <filesystem2> ..
```

When you are using the -tagkey and -tagvalue member pair:

```
-type filesystem -tagkey <tag_key> -tagvalue <tag_value>
```

-type fileset

Specifies that the entities are filesets of the file systems. The -devicename parameter specifies the IBM Storwize V7000 Unified or IBM Spectrum Scale storage system that the fileset belongs to. The -clustername parameter specifies the IBM Storwize V7000 Unified or IBM Spectrum Scale cluster the fileset belongs to. The -filesystemname parameter specifies the IBM Storwize V7000 Unified or IBM Spectrum Scale file system the fileset belongs to. For example:

```
-type fileset -devicename <displaynameofdevice>  
-clustername <hostnameofcluster> -filesystemname <filesystem1>  
-name <fileset1>, <fileset2>
```

-type vm

Specifies that the entities are virtual machines that were discovered by the hypervisor probe. The -servername parameter specifies the host name of the hypervisor that the virtual machine belongs to and the -name parameter specifies the names of the virtual machine. For example:

```
-type vm -servername <hostname> -name <vm1>, <vm2>, ..
```

-type volume

Specifies that the entities are storage volumes. The entities identifiers specify the display name of the storage system by using the -devicename parameter, and the display names of the storage volumes by using the -name parameter. For example:

```
-type volume -devicename <displaynameofdevice> -name <vol1>, <vol2>, ..
```

-type volumegroup

Specifies that the entities are the volume groups of the server. The entities identifiers specify the host name of the server and the names of the volume groups. For example:

```
-type volumegroup -servername <hostname> -name <vg1>, <vg2>, ...
```

-tagkey udp1 or udp2 or udp3

Specifies the tagkey that is used to create application members with an input file.
Only the following -type parameters can be defined with tags:

- server
- filesystem
- appgroup

-tagvalue tagvalue

Specifies the tagvalue that is used to create application members with an input file.

Example: Modifying members by using an input file

You can modify the members according to the contents of the input file with the following command:

```
tpctool
tpctool> modifyappgroupviafile -inputfile testModifyAppGroup04.txt
tpctool>
```

If the command successfully completes, no message is displayed.

If some members are not found in the IBM Spectrum® Control database, a warning message is displayed:

```
tpctool> modifyappgroupviafile -inputfile testModifyAppGroup05.txt
HWNDA0048W The following entities were not found: System1.storage.abc.ibm.com:
vm01,vm02,..
tpctool>
```

In this example, the `vm01` and `vm02` virtual machines of the `System1.storage.abc.ibm.com` hypervisor were not found in IBM Spectrum Control database.

Example: Adding and removing members from an application by using an input file

If you want to add and remove members from the application, `/Application/7599105`, specify two `-id` stanzas, one with the `-add` parameter and the other with the `-remove` parameter, followed by any other parameters. For example:

```
-id /Application/7599105 -add
    -type appgroup -memberid /Application/7605938
    -type export -servername server1 -name export1, export2, export3
    -type export -servername server2 -name export1, export2, export3
    -type export -servername server3 -name export1, export2, export3
    -type volume -servername server2 -name vg1, vg2
-id /Application/7599105 -remove
    -type appgroup -memberid /Application/7605939
    -type export -servername server1 -name export4, export5, export6
    -type volume -servername server2 -name vg3
```

Example: Adding and removing members from multiple applications by using an input file

To include more than one application, use multiple `-id` stanzas followed by other parameters. The same parameter can be used again for each `-id` stanza. For example:

```
-id /Application/7599105 -add
    -type appgroup -memberid /Application/7605938
    -type export -servername server1 -name export1, export2, export3
    -type volume -servername server2 -name vg1, vg2
-id /Application/7599105 -remove
    -type export -servername server1 -name export4, export5, export6
    -type volume -servername server2 -name vg3
-id /Application/7599106 -add
    -type vm -servername server1 -name vm1, vm2, vm3
    -type server -name server1, server2, server3
```

Example: Adding and removing members from an application by using an input file with tags

The following example adds application members that are specified by the `-tagkey` and `-tagvalue` parameter pairs. For example:

```
-id /Application/7599105 -add
    -type appgroup -tagkey udp1 -tagvalue TPCAppGroup
    -type server -tagkey udp1 -tagvalue Department1Servers
    -type filesystem -tagkey udp1 -tagvalue JFS
```

modifydeptgroup

Use the **modifydeptgroup** command to modify an existing department. You can add and remove members of a department by specifying the member type. For example, a deptgroup type for a department or an appgroup type for an application and the `-memberid` parameter for the individual member. You can also use a `-tagkey` and `-tagvalue` member pair.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
 - pwd password
Specifies the password for the IBM Spectrum Control user ID.
 - url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
 - add
Adds a member to the specified department, which is designated by the specified member -type and -memberid or the -tagkey, -tagvalue parameter pair.
 - remove
Removes a member from the specified department, which is designated by the specified member -type and -memberid parameters or the -tagkey, -tagvalue parameter pair. Use the **lsdeptgroupmembers -id id of the department** command to view a list of members and member IDs for a specified department.
 - id DepartmentGroupID
Indicates the unique ID of the department where the member is added or removed. Use the **lsdeptgroup** command, to view a list of the departments that are known to IBM Spectrum Control.
 - type deptgroup|appgroup
Denotes the department or application type that needs to be added or removed. This parameter can contain any alphanumeric character, with a maximum of 60 characters in length.
 - memberid MemberID of the type
The unique ID of the member being added or removed. Use the **lsdeptgroup** command, to view a list of the departments that are known to IBM Spectrum Control. You can specify one of the following key types for this parameter:
 - deptgroup
The unique name of the department to be added or removed that is specified by the **-memberid** parameter.
 - appgroup
The unique name of the application to be added or removed that is specified by the **-memberid** parameter.
 - tagkey udp1 or udp2 or udp3
Specifies the -tagkey parameter that is used to add or remove department members.
 - tagvalue tagvalue
Specifies the -tagvalue parameter that is used to add or remove department members.
- Note: You can only specify one -tagkey and -tagvalue parameter member pair at a time.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
 - header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
 - help | -h | -?
Lists help information for the command.
 - qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
 - silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Adding members to a department

The following example adds the department member that is specified by the **-type** and **-memberid** parameters, with /Department/5044 -type deptgroup.

You can add members of a specified department, with the following command:

```

tpctool
tpctool> modifydeptgroup -id /Department/5041 -add -type deptgroup
-memberid /Department/5044

```

The following output is returned:

Group Name	Member ID	MemberType	Status
Accounting	/Department/5044	Department	SUCCESS

You can add an appgroup type to a specified department, with the following command:

```

tpctool
tpctool> modifydeptgroup -id /Department/5035 -add -type appgroup
-memberid /Application/7024

```

The following output is returned:

Group Name	Member ID	Member Type	Status
Sales	/Application/7024	Application	SUCCESS

Example: Removing members of a department

The following example removes the department member that is specified by the **-type** and **-memberid** parameters.

You can remove members of a specified department with the following command:

```
tpctool
tpctool> modifydeptgroup -id /Department/5041 -remove -type deptgroup
-memberid /Department/5044
```

The following output is returned:

Group Name	Member ID	MemberType	Status
Accounting	/Department/5044	Department	SUCCESS

You can remove the appgroup type for a specified department, with the following command:

```
tpctool
tpctool> modifydeptgroup -id /Department/5035 -remove -type appgroup
-memberid /Application/7024
```

The following output is returned:

Group Name	Member ID	Member Type	Status
Sales	/Application/5044	Application	SUCCESS

Example: Adding department members with tags

The following example adds department members that are specified by the **-tagkey** and **-tagvalue** parameters.

You can add members of a specified department with tags using the following command:

```
tpctool
tpctool> modifydeptgroup -add -id /Department/5041 -type deptgroup -tagkey udp1
-tagvalue value1
```

The following output is returned:

Group Name	Member ID	Member Type	Status
Accounting	/Department/5044	Department Group	SUCCESS
Accounting	/Department/5035	Department Group	SUCCESS
Accounting	/Department/6044	Department Group	SUCCESS
Accounting	/Department/6035	Department Group	SUCCESS

Example: Removing department members with tags

The following example removes department members that are specified by the **-tagkey** and **-tagvalue** parameters.

You can remove members of a specified department with tags using the following command:

```
tpctool
tpctool> modifydeptgroup -remove -id /Department/5041 -type deptgroup -tagkey udp1
-tagvalue value1
```

The following output is returned:

Group Name	Member ID	Member Type	Status
Accounting	/Department/5044	Department Group	SUCCESS
Accounting	/Department/5035	Department Group	SUCCESS
Accounting	/Department/6044	Department Group	SUCCESS
Accounting	/Department/6035	Department Group	SUCCESS

Related reference

- [modifydeptgroupviafile](#)

modifydeptgroupviafile

Use the **modifydeptgroupviafile** command to modify an existing department by using an input file. You can add and remove members by specifying the member type (deptgroup, appgroup) and identifiers or by using a member type with a **-tagkey** and **-tagvalue** pair.

You can specify **-tagkey** and **-tagvalue** pairs, for a given resource type, in the following ways:

- To select resources that match all of the specified tags, the **-tagkey** and **-tagvalue** parameters must be specified in this format:

```
-tagkey udp1 udp2 -tagvalue value1 value2
```

For example, to select the resources that have `udp1` set to `US` and `udp2` set to `West` specify:

```
-tagkey udp1 udp2 -tagvalue US West
```

- To select resources that match at least one of the specified tags, the `-tagkey` and `-tagvalue` parameters must be specified in this format:

```
-tagkey udp1 -tagvalue value1 -tagkey udp2 -tagvalue value2
```

For example, to select resources that have `udp1` set to `US` or `udp2` set to `West` specify:

```
-tagkey udp1 -tagvalue US -tagkey udp2 -tagvalue West
```

Syntax

```
➔ tpctool — modifydeptgroupviafile — -user user_name -pwd password -url url — -inputfile — inputfilename ➔
```

Parameters and arguments

`-user user_name`

Specifies an IBM Spectrum Control user ID.

`-pwd password`

Specifies the password for the IBM Spectrum Control user ID.

`-url url`

Specifies the Device server. The format of the URL is `system:port_number`, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

`-inputfile inputfilename`

Indicates the name of the input file that is used to parse the input file from the CLI program.

All the other parameters are specified directly in the input file. The input file specifies the department where the members are added or removed by using the `-add` or `-remove` parameters:

```
-id <deptgroupname> -add
```

```
-id <deptgroupname> -remove
```

Then, the input file specifies the type and identifiers of the members for the department.

The `-memberid` parameter can be separated by spaces or commas. For example:

```
-memberid /Department/5044 /Department/5045
```

```
-memberid /Department/5044,/Department/5045
```

`-id DepartmentGroupID`

Indicates the unique ID of the department where the member is added or removed. Use the `lsdeptgroup` command, to view a list of the departments that are known to IBM Spectrum Control.

`-type deptgroup|appgroup`

Specifies that the entities are a department or application. The `-memberid` parameter specifies the unique names of the departments or applications to be added or removed from the department, which is specified by the `-id` parameter. For example:

```
-type deptgroup -memberid /Department/5045, /Department/5046,  
/Department/5047....
```

```
-type appgroup -memberid /Application/5050, /Application/5051,  
/Application/5052....
```

When you are using the `-tagkey` and `-tagvalue` member pair:

```
-type deptgroup -tagkey <tag_key> -tagvalue <tag_value>
```

`-memberid MemberID of the type`

The unique ID of the member being added or removed. Use the `lsdeptgroup` command, to view a list of the departments that are known to IBM Spectrum Control. Use the `lsappgroup` command to view the list of applications.

You can specify one of the following types of ids for this parameter:

- Department -memberid, for example, `/Department/12345`.
- Application -memberid, for example, `/Application/56789`.

`-tagkey udp1 or udp2 or udp3`

Specifies the `-tagkey` parameter that is used to add or remove department members, with an input file.

`-tagvalue tagvalue`

Specifies the `-tagvalue` parameter that is used to add or remove department members, with an input file.

When you are using the `-tagkey` and `-tagvalue` member pair:

```
-type deptgroup -tagkey <tag_key> -tagvalue <tag_value>
```

Example: Modifying department members by using an input file

You can modify the department members according to the contents of the input file with the following command:

```
tpctool  
tpctool> modifydeptgroupviafile -inputfile testModifyDeptGroup04.txt  
tpctool>
```

If the command successfully completes, no message is displayed.

If some members are not found in the IBM Spectrum Control database, a warning message is displayed:

```
tpctool> modifydeptgroupviafile -inputfile testModifyDeptGroup04.txt
HWNDA0048W The following entities were not found: /Department/5041,
/Department/5044, /Department/7044,..
tpctool>
```

Example: Adding and removing members from a department by using an input file

If you want to add and remove members from the deptgroup1 department, specify two `-deptgroupname` stanzas, one with the `-add` parameter and the other with the `-remove` parameter, followed by any other parameters. For example:

```
-id /Department/5041 -add
-type deptgroup -memberid /Department/6000, /Department/6001, /Department/6002
-type appgroup -memberid /Application/7000, /Application/7001, /Application/7002
-remove
-type deptgroup -memberid /Department/6000, /Department/6001, /Department/6002
```

Example: Adding and removing members from multiple departments by using an input file

To include more than one department, use multiple `-id` stanzas followed by other parameters. The same parameter can be used again for each `-id` stanza. For example:

```
-id /Department/5041 -add
-type appgroup -memberid /Application/7004, /Application/7005, /Application/7006,
/Application/7007, /Application/7008, /Application/7009

-id /Department/5044 -remove
-type appgroup -memberid /Application/7004, /Application/7005, /Application/7006,
/Application/7007, /Application/7008, /Application/7009

-id /Department/7044 -add
-type deptgroup -memberid /Department/6000, /Department/6001, /Department/6002,
/Department/6003, /Department/6004, /Department/6005
```

Example: Adding and removing members from an department by using an input file with tags

The following example adds department members that are specified by the `-tagkey` and `-tagvalue` parameter pairs. For example:

```
-id /Department/9003 -add
-type deptgroup -tagkey udp1 -tagvalue TPCDeptGroup
-type appgroup -tagkey udp1 -tagvalue TPCAppGroup
```

- [modifydeptgroup](#)

modifysrg

Use the **modifysrg** command to modify an existing storage resource group. You can add and remove members by specifying the member type, such as switch or volume, and the key for the member you want to add or remove.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- add
Adds a member to the specified storage resource group, which is designated by the specified member type and key.
- remove
Removes an existing member from the specified storage resource group, which is designated by the specified member type and key. Use the **lssrgmembers -name SRGName** to see a list of members and member keys for a specified storage resource group.
- name SRGName
Indicates the unique storage resource group where the member is added or removed. To view a list of the storage resource groups that are known to IBM Spectrum Control, see the output of the **lssrg**.
- type
srg | fabric | switch | server | subsystem | pool |
volume | hostdisk | vm disk | mdisk | disk | filesystem | export | vm | volume group | datastore
Denotes the type of element that corresponds to the unique key in the **key** parameter of this function.
- key memberKey
Specifies the unique key that corresponds to the member and member type that is specified in the **type** parameter.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Adding or removing members of a storage resource group

You can add or remove members of a specified storage resource group with the following command:

```
tpctool
tpctool> modifysg -remove -name test.srg -type srg
-key Administrator.my-new-example-srg
```

The following output is returned:

SRG Name	Member Key	Member Type	Status
test.srg	Administrator.my-new-example-srg	Storage Resource Group	SUCCESS

mountfs

Use the **mountfs** command to mount a file system on all interface and management nodes or a specified subset. You must have Data Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id
Specifies the ID of file system to be mounted.
- nodes nodes

Lists the nodes to mount the file system on in a comma-separated list. Specify only the interface node, management node, or both. If you omit this parameter, the file system is mounted on all interface and management nodes.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Mount a file system

The following command mounts a file system on a management node.

```
tpctool> mountfs -filesystem eefs+kq458mv.ibm+00000200A2A0153C+0  
-user admin -pwd password -url localhost:9550 -nodes mgmt001st001
```

The following output is returned:

FilesystemId	Status
eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

Related information

rmappgroup

Use the **rmappgroup** command to delete a specific application and its members. If you use the **rmappgroup** command without the **-rmchildren** parameter, the application is deleted, and the members are moved up a level in the hierarchy.

Syntax

```
➦ tpctool — rmappgroup — -user user_name -pwd password -url url — -id ApplicationGroupID — -rmchildren —  
-fs character -header -help -qs character ? -silent
```

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-id ApplicationGroupID

Specifies the unique ID of the application to be deleted. For example, **/Application/5044** where **5044** is the database ID of the application.

-rmchildren

(Optional) Specifies that any members of the application can be deleted. When you use this parameter, any subcomponent that belongs only to the application is removed. If the subcomponent belongs to more than one application, it is removed from the application and not deleted.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Deleting an application and the subcomponents

The following command deletes a specified application and the subcomponents:

```
tpctool
tpctool> rmappgroup -id /Application/5044 -rmchildren
```

The following output is returned:

Name	Status
Db2appgroup	SUCCESS

Example: Deleting an application and moving the subcomponent up a level

The following command deletes a specified application and moves the subcomponent up a level in the hierarchy:

```
tpctool
tpctool> rmappgroup -id /Application/5044
```

The following output is returned:

Name	Status
Db2appgroup	SUCCESS

If there are no top level applications in the hierarchy, the subcomponents become the top level application.

rmbackenddisktype

Use the **rmbackenddisktype** command to remove a back-end type of disk.

This command is available for the following storage systems:

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

You must have Administrator authority to use this command.

The following actions occur when you issue the **rmbackenddisktype** command to remove a back-end type of disk.

- The type is removed from the set of back-end types of disk.
- The type is reset to *DEFAULT* in back-end storage subsystems that are set to the type of disk that is removed.

Tip: You can use the following commands to set the back-end type of disk:

- **setarray**
- **setbackenddisktype**

You can also set the back-end type of disk for storage systems on the MDisk Group Details page in the IBM Spectrum® Control graphical user interface.

Syntax

```
tpctool rmbackenddisktype -type disk_type -user user_name -pwd password -url url -fs character -header -help -qs character ? -silent -grouping
```

Parameters and arguments

-type disk_type

Specifies the back-end type of disk. Specify a back-end type of disk or enter one of the following values.

Value	Description
A07	Sata - 7,500 rpm
F10	Fiber - 10,000 rpm
F15	Fiber - 15,000 rpm
DEFAULT	Default value

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Removing a back-end type of disk

```
tpctool> rmbackenddisktype -type A07
```

```
Back-end Disk Type Status
=====
A07                      Succeeded
```

rmbackendraidtype

- Storwize® V7000
- SAN Volume Controller

Syntax

Parameters and arguments

Value	Description
DEFAULT	The default RAID type.
1	RAID 1
5	RAID 5
6	RAID 6
X	The RAID type that is used by IBM® XIV® Storage System.

Example: Removing a type of back-end RAID array

The following command removes a type of back-end RAID array:

```
tpctool> rmbackendraidtype -type testing
```

If the command is successful, a list of the types of back-end RAID types that are removed is displayed:

```
Back-end Type Status
=====
testing          Succeeded
```

rmbackendtype

Use the **rmbackendtype** command to remove a type of back-end storage system.

This command is available for the following storage systems:

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

You must have Administrator authority to use this command.

When you issue the **rmbackendtype** command to remove a type of back-end storage system, the following actions occur:

- The type is removed from the set of back-end types.
- The type is reset to *DEFAULT* in back-end storage systems that are set to the back-end type that is removed.

Tip: You can use the following commands to set the type of back-end storage system:

- **setarray**
- **setbackendtype**

You can also set the type of back-end storage system on the MDisk Group Details page in the IBM Spectrum® Control graphical user interface.

Syntax

```
➤ tpctool — rmbackendtype — -type — storage_system_type — -user user_name -pwd password -url url — -fs — character —
-headers — -help — -qs — character — ? — -silent — -grouping —
```

Parameters and arguments

-type storage_system_type

Specifies the type of back-end storage system that manages most of the storage pool resources. Specify a type of back-end storage system or enter one of the following values.

Value	Name
C	EMC Clariion
D	IBM® System Storage® DS8000®
S	EMC Symmetrix
X	IBM XIV® Storage System
DEFAULT	Default value

Tip: Use the **lsbackendtypes** command to show a list of back-end storage systems.

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-grouping

Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Removing a type of back-end storage system

The following command removes the specified type of back-end storage system:

```
tpctool> rmbackendtype -type L
```

The type of back-end storage system that is removed is displayed:

```
Back-end Type Status
=====
L              Succeeded
```

rmdeptgroup

Use the **rmdeptgroup** command to delete a specific department and its members. If you use the **rmdeptgroup** command without the **-rmchildren** parameter, the department is deleted, and the members are moved up a level in the hierarchy.

Syntax

➔ **tpctool** — **rmdeptgroup** — **-user** *user_name* **-pwd** *password* **-url** *url* — **-id** *DepartmentGroupID* — **-rmchildren**

└─ **-fs** *character* ─┘ └─ **-header** ─┘ └─ **-help** ─┘ └─ **-qs** *character* ─┘ └─ **?** **-silent** ─┘

Parameters and arguments

- user** *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd** *password*
Specifies the password for the IBM Spectrum Control user ID.
- url** *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- id** *DepartmentGroupID*
Specifies the ID of the department to be deleted.
- rmchildren**
(Optional) Specifies that any members of the department are be deleted. When you use this parameter, any member that belongs only to the department is removed. If the members belong to more than one department, they are removed from the department and not deleted.
- fs** *character*
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header**
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help** | **-h** | **-?**
Lists help information for the command.
- qs** *character*
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent**
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Deleting a department and the subdepartments

The following command deletes a specified department and the subdepartments:

```
tpctool
tpctool> rmdeptgroup -id /Department/5041 -rmchildren
```

The following output is returned:

```
Name              Status
=====
Accounting        SUCCESS
```

Example: Deleting a department and moving the subdepartment up a level

The following command deletes a specified department and moves any subdepartments up one level in the hierarchy:

```
tpctool
tpctool> rmdeptgroup -id /Department/5041
```

The following output is returned:

```
Name              Status
=====
Accounting        SUCCESS
```

If there are no top level departments in the hierarchy, the subdepartment or subdepartments become the top level department.

- [mkdeptgroup](#)

rmexport

Use the **rmexport** command to remove an export.

Removing an export does not remove the data or folder from the file system. You must have Administrator authority to use this command.

When you remove an export, the system behaves differently according to the export protocols. When an NFS export is removed, all connections to that shared space are immediately closed. When a CIFS export is removed, any user who is connected to the shared space can continue to write to that space. However, if the user disconnects, reconnects, and then attempts to write to the space again, the write operation fails.

Syntax

```
tpctool --rmexport --user user_name -pwd password -url url --export export_id -fs character
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- export export_id
Specifies the name of the export. This is the export key that is listed in the ID column of the **lsexport** command output.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Removing an export

The following command deletes the specified export:

```
tpctool> rmexport -export cindyexport+storage1.storage.tucson.ibm.com+storage1.storage.tucson.ibm.com+0 -user admin -pwd password -url localhost:9550
```

The following output is returned:

```
ExportId
=====
cindyexport+storage1.storage.tucson.ibm.com+storage1.storage.tucson.ibm.com+0

Status
=====
SUCCESS
```

rmfs

Use the **rmfs** command to remove a file system from an active management node. You must have Administrator authority to use this command.

Attention: When you remove a file system, all the data on that file system is deleted.

You must unmount a file system on all nodes before you can delete it. Use the **unmountfs** command to unmount a file system.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id
Specifies the ID of the file system to be removed.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Remove a file system

The following command removes a file system.

```
tpctool> rmfs -filesystem eefs+kq458mv.ibm+00000200A2A0153C+0  
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesystemId	Status
eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

rmfset

Use the **rmfset** command to remove a fileset from a file system. You must have Administrator authority to use this command.

Important: You must use the **unlinkfset** command to unlink a fileset from a file system before you can remove it.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password

- Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- help | -h | -?
Lists help information for the command.
- fileset file_set_id
Specifies the IBM Spectrum® Control key of the fileset to be removed. The fileset key is listed in the **ID** column of the **lsfset** command output.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

Example: Removing a fileset

The following command removes the fileset named **eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0**.

```
tpctool> rmfset -fileset eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesetId	Status
eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

rmsrg

Use the **rmsrg** command to delete the specified Storage Resource Group. The group types (Storage Resource Groups, Reporting Groups and Application Groups) that have child groups are not deleted. A warning message is issued and indicates that the group type being deleted contains child groups and the child groups must be deleted before the parent group can be deleted.

Syntax

```
tpctool — rmsrg — -user user_name -pwd password -url url — -name SRGname — -fs character —
-headers — -help — -qs character — ? — -silent
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- name SRGname
Specifies the name of the Storage Resource Group to be deleted.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Deleting a Storage Resource Group

The following command deletes a specified Storage Resource Group:

```
tpctool
tpctool> rmsrg -name Administrator.testsg
```

The following output is returned:

Name	Status
=====	
Administrator.testsg	SUCCESS

rmza

Use the **rmza** command to remove a zone alias or aliases from a zone. You must have Administrator authority to use this command.

Syntax

```
tpctool — rmza — -user user_name -pwd password -url url — -fabric WWN — -zone zone —
                                     -help — ? — -silent —
zone — zone_alias —
```

Parameters and arguments

-user user_name
Specifies an IBM Spectrum Control user ID.

-pwd password
Specifies the password for the IBM Spectrum Control user ID.

-url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | -h | -?
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

-zone zone
Specifies the zone. The *zone* variable is the name of the zone.

zone_alias
Specifies the name or names of the zone aliases to be removed from the zone.

Example: Removing zone aliases from a zone

The following commands remove the PARIS zone alias from the EUROPE zone:

```
tpctool -user me -pwd mypass -url myhost:myport
tpctool> start -fabric 100000051E34F6A8
tpctool> rmza -fabric 100000051E34F6A8 -zone EUROPE PARIS
tpctool> commit -fabric 100000051E34F6A8
```

rmzaports

Use the **rmzaports** command to remove a port or ports from a zone alias. You must have Administrator authority to use this command.

Syntax

```
tpctool — rmzaports — -user user_name -pwd password -url url — -fabric WWN —
                                     -help — ? — -silent —
-za — zone_alias — port —
```

Parameters and arguments

-user user_name

- id *id*
Specifies an IBM Spectrum Control user ID.
- pwd *password*
Specifies the password for the IBM Spectrum Control user ID.
- url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help | -h | -?
Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- za *zone_alias*
Specifies the name of the zone alias from which the ports to be removed.
- port*
Specifies the name or names of the ports to be removed from the zone alias.

Example: Removing a port from a zone alias

The following commands remove a port from the PARIS zone alias:

```
tpctool> -user me -pwd mypass -url myhost:myport
tpctool> start -fabric 100000051E34F6A8
tpctool> rmzapsorts -fabric 100000051E34F6A8 -za PARIS 210000E08B0B4C2G
tpctool> commit -fabric 100000051E34F6A8
```

rmzone

Use the **rmzone** command to delete a zone or remove a zone from a zone set. If you remove or delete the last zone in a zone set, the zone set is also deleted. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- zone zone
Specifies the zone. The *zone* variable is the name of the zone. If the last zone in the zone set is removed or deleted, the zone set also is deleted.
- zs zone_set
Specifies that zone is removed from the zone set. The *zone_set* variable is the name of the zone set. If this option is not issued, the zone is deleted.
- help | -h | -?
Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Tip: To delete a zone from a zone set, the zone must be included in another zone set.

Example: Deleting a zone

The following commands delete the `WINDOWSNT` zone:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> rmzone -fabric 100000051E34F6A8 -zone WINDOWSNT
tpctool> commit -fabric 100000051E34F6A8
```

Example: Removing a zone from a zone set

The following commands remove the `WINDOWSNT` zone from the `PARIS` zone set:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> rmzone -fabric 100000051E34F6A8 -zone WINDOWSNT -zs PARIS
tpctool> commit -fabric 100000051E34F6A8
```

rmzoneports

Use the **rmzoneports** command to remove switch ports from a zone. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

► **tpctool** — **rmzoneports** — **-user***user_name* **-pwd***password* **-url***url* — **-fabric** — *WWN* — **-zone** — *zone* — **-help** —

— **?** — **-silent** — **ports** — ►

Parameters and arguments

-user *user_name*
Specifies an IBM Spectrum Control user ID.

-pwd *password*
Specifies the password for the IBM Spectrum Control user ID.

-url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-zone *zone*
Specifies the zone. The *zone* variable is the name of the zone.

-help | **-h** | **-?**
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

ports | **-**
Specifies the switch ports. The *ports* variable is a list of worldwide port names (WWPNs). If you specify a single dash (-), the WWPNs are read from standard input.

Example: Removing switch ports from a zone set

The following commands remove several switch ports from the SUNSOLARIS zone. The list of WWPNs is read from standard input:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> rmzoneports -fabric 100000051E34F6A8 -zone SUNSOLARIS -
tpctool> commit -fabric 100000051E34F6A8
```

rmzs

Use the **rmzs** command to delete a zone set. This command must be run as a transaction. You must have Administrator authority to use this command.

Syntax

► **tpctool** — **rmzs** — **-user***user_name* **-pwd***password* **-url***url* — **-fabric** — *WWN* — **-help** — **?** — **-silent** — *zone_set* — ►

Parameters and arguments

-user *user_name*
Specifies an IBM Spectrum Control user ID.

-pwd *password*
Specifies the password for the IBM Spectrum Control user ID.

-url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fabric *WWN*
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).

-help | **-h** | **-?**
Lists help information for the command.

-silent
Suppresses all output for the command. If you omit this parameter, output is included.

zone_set
Specifies the zone set. The *zone_set* variable is the name of the zone set.

Tip: To delete a zone set, it must be inactive. If you attempt to delete a zone set that is empty, the zone set is not deleted and no error message is given.

Example: Deleting a zone set

The following commands delete the PARIS zone set:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
tpctool> rmzs -fabric 100000051E34F6A8 PARIS
tpctool> commit -fabric 100000051E34F6A8
```

rollback

Use the **rollback** command to erase any commands that were issued since you started the transaction. You must have Administrator authority to use this command.

Syntax

```
➤ tpctool — rollback — -user user_name -pwd password -url url — -fabric — WWN — -help —
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN
Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help | -h | -?
Lists help information for the command.

Example: Rolling back a transaction

The following command rolls back a transaction. The user has previously issued connection options, started a transaction, and issued a fabric-control command:

```
tpctool> rollback -fabric 100000051E34F6A8
```

runoptschedule

Use the **runoptschedule** command to run a schedule that analyzes storage tiering.

In the GUI, you can create schedules that are based on the criteria that you entered for tiering analysis. Each time that the schedule is run, a job with a unique ID is created.

When you issue the **runoptschedule** command, the job ID for the schedule is shown.

Tip: Issue the **lsopschedules** command to show a list of schedules and schedule IDs. After you issue the **runoptschedule** command, you can issue the **showoptresults** command to show the results of the analysis.

Syntax

```
➤ runoptschedule — -schedule_id schedule_id — -user user_name -pwd password -url url — -fs — character —  
-header -help -qs — character
```

Parameters and arguments

- schedule_id schedule_id
Specifies the ID of the schedule.
- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

Example: Running a schedule

Issue the following command to run the schedule:

```
tpctool> runoptschedule -schedule_id 811002
```

The following output is returned:

```
Job ID
=====
18006
```

setarray

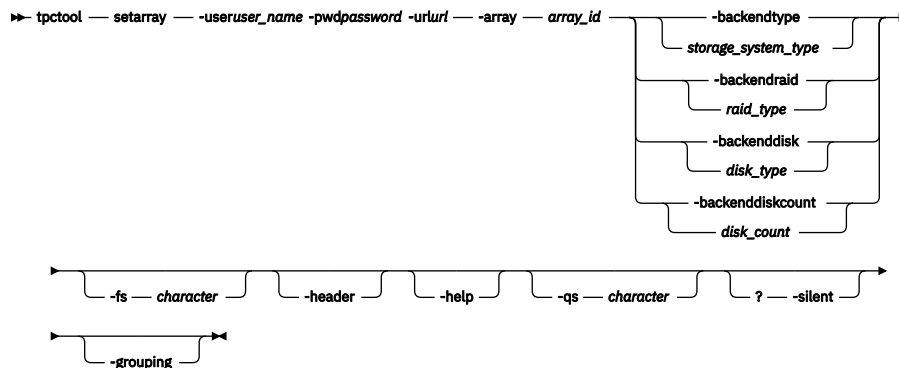

Use the **setarray** command to set the type of back-end storage system, type of Redundant Array of Independent Disks (RAID), type of disk, and number of disks for an array.

This command is available for the following storage systems:

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

You must have Administrator authority to use this command.

Syntax

Parameters and arguments

When you issue the **setarray** command, you must enter a value for the array parameter and at least one of the following parameters:

- -backendtype
- -backendraid
- -backenddisk
- -backenddiskcount

The default value is used for the parameters that you do not set.

Tip: You can set the values for back-end storage systems on the MDisk Group Details page in the IBM Spectrum® Control graphical user interface.

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- array array_id
Specifies the ID of the array.
- backendtype storage_system_type
Specifies the type of back-end storage system that manages most of the subsystem pool resources. You can enter a type that you added or use one of the following values.

Value	Name
C	EMC Clariion
D	DS8000®

Value	Name
S	EMC Symmetrix
X	XIV®
DEFAULT	Default value

Tip: Use the **lsbackendtypes** command to provide a list of existing back-end types of storage systems and use the **setbackendtype** command to add new back-end types of storage systems.

-backendraid raid_type

Specifies the type of RAID that is associated with the back-end storage system. You can enter a type that you added or use one of the following values.

Value	Description
1	RAID 1
5	RAID 5
6	RAID 6
X	RAID X
DEFAULT	Default value

Tip: Use the **lsbackendraidtypes** command to provide a list of existing back-end types of RAID and use the **setbackendraidtype** command to add new back-end types of RAID.

-backenddisk disk_type

Specifies the type of disk. You can enter a type that you added or use one of the following values.

Value	Description
A07	Sata - 7,500 rpm
F10	Fiber - 10,000 rpm
F15	Fiber - 15,000 rpm
DEFAULT	Default value

Tip: Use the **lsbackenddisktypes** command to provide a list of existing back-end types of disk and use the **setbackenddisktype** command to add new back-end types of disk.

-backenddiskcount disk_count

Specifies the number of disks.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-grouping

Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Setting back-end storage subsystem values

The following command sets the back-end storage system, type of RAID, type of disk, and the number of disks for the specified array:

```
tpctool> setarray -array 0000020064405BA0:0+0000020064405BA0+0 -backendtype D
-backendraidtype 5 -backenddisktype F10 -backenddiskcount 160
```

The array ID and the status of the message is displayed.

```
Array List                               Status
=====
0000020064405BA0:0+0000020064405BA0+0 Succeeded.
```

setbackenddisktype

Use the **setbackenddisktype** command to set or update the type of back-end disk.

This command is available for the following storage systems:

- Storwize® V7000
- SAN Volume Controller

You must have Administrator authority to use this command.

Syntax for setting and updating back-end disk types

Use this syntax to set a new type of back-end disk:

Use this syntax to update the type of a back-end disk:

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- type disk_type
Specifies the type of the back-end disk that manages most of the back-end pool resources. The maximum number of characters that you can enter is 10. You can specify a back-end disk type or use one of the following values:

Value	Description
A07	Sata - 7,500 rpm
F10	Fiber - 10,000 rpm
F15	Fiber - 15,000 rpm
DEFAULT	Default type for unconfigured devices

- iops disk_iops
The average number of input/output operations per second for the disk. You can specify a value or use one of the following values.

IOPS Value	Back-end Disk Type
40	A07
120	F10
150	F15
0	Default value for unconfigured devices

- description description
Provides more information about the type of back-end disk. The maximum number of characters that you can enter is 256.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Setting a back-end disk type

The following command sets the type of back-end disk for a back-end disk pool:

```
tpctool> setbackenddisktype -type testing -description testing -iops 99
```

If the command is successful, the following message is displayed:

```
Back-end Disk Type Status
=====
testing                Succeeded.
```

setbackendraidtype

Use the **setbackendraidtype** command to set the types of back-end RAID arrays for managed disk groups.

This command is available for the following storage systems:

- Storwize® V7000
- SAN Volume Controller

You must have Administrator authority to use this command.

Syntax

Parameters and arguments

-type *raid_type*

Specifies the type of the back-end RAID array. You can specify a back-end RAID type or use one of the following values:

Value	Description
DEFAULT	The default RAID type.
1	RAID 1
5	RAID 5
6	RAID 6
X	The RAID type that is used by IBM® XIV® Storage System.

Tip: Use the **lsbackendraidtypes** command to list the available types of back-end RAID types.

-weightedio *weighted_io*

Specifies the weighted input/output of the RAID type.

-user *user_name*

Specifies an IBM Spectrum Control user ID.

-pwd *password*

Specifies the password for the IBM Spectrum Control user ID.

-url *url*

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs *character*

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

-help | -h | -?

Lists help information for the command.

-qs *character*

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

-grouping

Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Setting back-end RAID types

The following command sets a type of back-end RAID:

```
tptool> setbackendraidtype -type testing -weightedio 15
```

If the command is successful, the following message displays:

```
Back-end RAID Type Weighted IO
=====
testing              Succeeded.
```

setbackendtype

Use the **setbackendtype** command to set or update the type of back-end storage system.

This command is available for the following storage systems:

- Storwize® V7000
- Storwize V7000 Unified
- SAN Volume Controller

You must have Administrator authority to use this command.

Syntax for setting and updating back-end types of storage systems

Use this syntax to set a new type of back-end storage system:

```
tpctool --setbackendtype --user user_name --pwd password --url url --type storage_system_type --name storage_system_name --cachehit cache_hit_ratio --description description --fs character --header --help --qs character ? --silent --grouping
```

Use this syntax to update a type of back-end storage system:

```
tpctool --setbackendtype --user user_name --pwd password --url url --type storage_system_type --name storage_system_name --cachehit cache_hit_ratio --description description --fs character --header --help --qs character ? --silent --grouping
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- type storage_system_type
Specifies the type of back-end storage system that manages most of the subsystem pool resources. The maximum number of characters that you can enter is 10. You can enter a type or use one of the following values:

Value	Name
C	EMC Clariion
D	DS8000®
S	EMC Symmetrix
X	XIV®
DEFAULT	Default value

- name storage_system_name
Specifies the name of the back-end type of storage system. The maximum number of characters that you can enter is 256. The name of the type of storage system is displayed on the MDisk Group Details page in the IBM Spectrum® Control graphical user interface. You can enter a name or use one of the following values.

Description value	Associated type value
"EMC Clariion"	C
DS8000	D
"EMC Symmetrix"	S
XIV	X
DEFAULT	DEFAULT

Tip: If you enter a value for the -name or -description parameter that contains spaces, you must enclose the value in double quotation marks such as "My Description".

- cachehit cache_hit_ratio
Specifies the ratio of cache hits for read operations. The maximum number of characters that you can enter is 4. You can specify a value or use one of the following values:

Value	Back-end storage system
50	EMC Clariion
50	DS8000
70	EMC Symmetrix
50	XIV
0	Default value

- description description
Provides more information about the type of back-end storage system. The maximum number of characters that you can enter is 256. You can enter a description or use one of the following values:

Value	Description
"CX BE Cache Hit Ratio"	EMC Clariion
"DS8K Disk Controller"	DS8000
"DMX BE Cache Hit Ratio"	EMC Symmetrix
"IBM XIV"	XIV
"DEFAULT TYPE FOR UNCONFIGURED DEVICES"	0 (default value)

- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.

- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- grouping
Enables the grouping of numeric values. For example, in English the value 12000 would display as 12,000. The grouping character is determined by the system locale.

Example: Setting a new type of back-end storage system

The following command sets a new type of back-end storage system:

```
setbackendtype -type L -name test3 -cachehit 90 -description test_3
```

The following message is displayed:

```
Back-end Type Status
=====
L           Succeeded.
```

setdscfg

Use the **setdscfg** command to set the value of a property in the property file for the Device server. You must have Administrator authority to use this command.

Syntax

```
➤ tpctool — setdscfg — -user user_name -pwd password -url url — -property — property_key —>
                                     -help
? — ? — ? — ? — value — ? — ? — -silent —>
      -context context
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- help | -h | -?
Lists help information for the command.
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- property property_key value
Specifies the value to set for the indicated property key. The *property_key* variable is the property key and the *value* variable is the value.
- context context
Specifies a classification or category for a configuration property. The *context* variable is the context properties. For example, `-context DeviceServer` applies to the IBM Spectrum® Control Device server only. The parameter, `-context PerformanceManager`, applies to the IBM Spectrum Control performance manager only.

Example: Setting a property value

The following command sets the value of the **SnmpRetryCount** property to 3:

```
tpctool setdscfg -url localhost:9550 -user ***** -pwd ***** -property
SnmpRetryCount -context DeviceServer 3
```

setquota

Use the **setquota** command to set the amount of disk space and number of inodes that are assigned on a file system for a specified user name, group, or fileset.

A file system consists of attributes that include user names, groups, and filesets. You can set the amount of disk space and the number of inodes that are assigned for each attribute. This action limits the attributes from using more than the maximum amount of space or inodes that it was assigned. You must have Administrator authority to use this command.

Syntax

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- usr | -group | -fileset
Specifies the type of quota.
- filesystem file_system_id
Specifies the ID for the file system that is associated with the quota. You can use the **lsfs** command to view information, including the IDs, for all file systems that are discovered. The ID is listed in the ID column of the **lsfs** command output.
- sspace s_space
Specifies the usage soft limit or level of disk space at a level less than that which the user, group, or fileset can safely operate. If you enter a size without a suffix, then the unit of measurement is byte. Otherwise, enter the suffix k (kilobyte), m (megabyte), g (gigabyte), t (terabyte), or p (petabyte).
- hspace h_space
Specifies the usage hard limit or maximum disk space which the user, group, or fileset can accumulate. If you enter a size without a suffix, then the unit of measurement is byte. Otherwise, enter the suffix k (kilobyte), m (megabyte), g (gigabyte), t (terabyte), or p (petabyte).
- sinode s_inode
Specifies the soft limit or the number of inodes space at a level less than that which the user, group, or fileset can safely operate. You can enter inode limits with only k (kilobyte), or m (megabyte) suffixes. The maximal value that you can specify is 2 GB.
- hinode h_inode
Specifies the hard limit or maximum number of inodes which the user, group, or fileset can accumulate. You can enter inode limits with only k (kilobyte), or m (megabyte) suffixes. The maximal value that you can specify is 2 GB.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.

Example: Set a quota for a user (-usr)

The following command sets the amount of disk space and number of inodes that are assigned on a file system for the user `tpcuser`:

```
tpctool> setquota -filesystem ee_fs03+kq98n5d.ibm+00000200A20045DC+0
-usr tpcuser -sspace 70M -hspace 100M -user admin -pwd password
-url localhost:9550
```

The following output is returned:

```
QuotaId          Status
=====
4971_U tpcuser+00000200A20045DC+0 SUCCESS
tpctool>
```

Example: Set a quota for a group

The following command sets the amount of disk space and number of inodes that are assigned on a file system for the group `users`:

```
tpctool> setquota -filesystem ee_fs03+kq98n5d.ibm+00000200A20045DC+0
-group users -sspace 50M -hspace 100M -user admin -pwd password
-url localhost:9550
```

The following output is returned:

```
QuotaId          Status
=====
4971_G_users+00000200A20045DC+0 SUCCESS
```

Example: Set a quota for a fileset

The following command sets the amount of disk space and number of inodes that are assigned on a file system for the fileset `testfset`:

```
tpctool> setquota -filesystem ee_fs03+kq98n5d.ibm+00000200A20045DC+0
-fileset testfs -sspace 50M -hspace 100M -user admin -pwd password
-url localhost:9550
```

The following output is returned:

QuotaId	Status
=====	=====
4971_F_testfs+00000200A20045DC+0	SUCCESS

showoptresults

Use the **showoptresults** command to show the recommendations for optimizing the placement of volumes.

In the web GUI, you use the Analyze Tiering wizard to specify criteria for analyzing the tiering of volumes. For example, you specify the following criteria:

- The storage pools that contain the volumes that you want to analyze
- The target storage pools for placing volumes that are underutilized and overutilized.
- The storage tiering policy to place volumes in the storage tier that best meets the performance requirements of the volumes

If the workload activity requirements of the analyzed volumes are not met, recommendations for optimizing the placement of the volumes are provided. In the web GUI, you can create schedules that are based on the criteria that you entered in the Analyze Tiering wizard. Each time the schedule is run, a job with a unique job ID is created.

Tip: To issue the **showoptresults** command, you must enter the job ID that is associated with the schedule. Issue the **lsoptschedules** command to show a list of the schedule IDs and their associated job IDs.

When you issue the **showoptresults** command, the following information is displayed for each volume.

Recommendation ID

Specifies the unique ID for the recommendations.

Volume

Specifies the name of the volume that is selected. For volumes in mirrored volume relationships, it specifies the name of the primary volume.

Source Pool

Specifies the current location of the volume.

Destination Pool

Specifies the storage pool that best meets the workload requirements of the volume.

Source Tier

Specifies the tier level of the source storage pool.

Destination Tier

Specifies the tier level of the destination storage pool.

Volume Copy Pool

Specifies the original location of the secondary volume of a volume in a mirrored volume relationship.

Server

Specifies the name of the server that the volume is assigned to.

Syntax

```
➔ showoptresults -job_id job_id -user user_name -pwd password -url url
                                     -fs character -header
                                     -help -qs character
```

Parameters and arguments

-job_id job_id

Specifies the ID of the job.

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-fs character

Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

-header

Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

- help | -h | -? Lists help information for the command.
- qs character Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").

Example: Show the analysis results for a job

Issue the following command to show the analysis results for a job:

```
tpctool> showoptresults -job_id 11002
```

The following output is returned:

Recommendation ID	Volume	Source Pool
68066	volume_1	pool_a
68067	volume_2	pool_c

Destination Pool	Source Tier	Destination Tier
pool_b	2	1
pool_f	1	3

Volume Copy Pool	Server
-	-
-	-

start

Use the **start** command to start a transaction. You must have Administrator authority to use this command.

Syntax

```
tpctool — start — -useruser_name -pwdpassword -urlurl — -fabric — WWN — -help
```

Parameters and arguments

- user user_name Specifies an IBM Spectrum Control user ID.
- pwd password Specifies the password for the IBM Spectrum Control user ID.
- url url Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- fabric WWN Specifies the fabric. The *WWN* variable is the worldwide name (WWN).
- help | -h | -? Lists help information for the command.

Example: Starting a transaction

The following command starts a transaction:

```
tpctool> start -user me -pwd mypass -url myhost:myport -fabric 100000051E34F6A8
```

unassignvol

Use the **unassignvol** command to remove the host ports from the assignment list for a volume. You must have Administrator authority to use this command.

Syntax

```
tpctool — unassignvol — -useruser_name -pwdpassword -urlurl — -hp — host_port — -f — -fs — character — -dev — GUID — -header — -help — -qs — character — ? — -silent — volume_id
```

Parameters and arguments

- user *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd *password*
Specifies the password for the IBM Spectrum Control user ID.
- url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- hp *host_port*
Specifies the host ports. The *host_port* variable is a comma-separated list of worldwide port numbers (WWPNs).
- f
Turns off the confirmation message that is displayed before the ports are removed from the assignment list.
- fs *character*
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- dev *GUID*
Specifies the storage subsystem. The *GUID* variable is the globally unique identifier (GUID) of the storage subsystem as returned by the **lsdev -sys** command.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs *character*
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- volume_id | -
Specifies the volumes. The *volume_ID* variable is a comma-separated list of volume IDs, such as that obtained by running the **lsvol** command. If a single dash (-) is issued, the volume IDs are read from standard input.

Example: Removing host ports

The following command removes three host ports from the assignment list for the specified volume:

```
tpctool> unassignvol -user me -pwd mypass -url myhost:myport  
-hp 5005076300C79470,5005076300D09470,5005076300CB9470 2105.22232
```

The following output is returned:

Volume ID	PoolID	Status
2105.22232	P0	SUCCESS
2105.22232	P1	SUCCESS
2105.22232	P2	SUCCESS

unlinkfset

Use the **unlinkfset** command to unlink a fileset. You must have Administrator authority to use this command.

Unlinking a fileset makes all the files in the fileset inaccessible for as long as the fileset remains unlinked. The files are not deleted; they are only inaccessible.

Syntax

```
tpctool — unlinkfset — -user user_name -pwd password -url url — -fileset file_set_id — -f —  
-help —  
-header — ? — -silent — -qs — character — -fs — character
```

Parameters and arguments

- user *user_name*
Specifies an IBM Spectrum Control user ID.
- pwd *password*
Specifies the password for the IBM Spectrum Control user ID.
- url *url*
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- help | -h | -?
Lists help information for the command.
- fileset *file_set_id*
Specifies the IBM Spectrum® Control key of the fileset to be unlinked. The fileset key is listed in the **ID** column of the **lsfset** command output.
- f
Forces the files to be unlinked. If you use this option, the command forcibly closes any open files, causing the **ESTALE** error the next time the file is used.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.

- silent
Suppresses all output for the command. If you omit this parameter, output is included.
- qs character
Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks (").
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.

Example: Unlinking a fileset

The following command unlinks the fileset named `eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0`.

```
tpctool> unlinkfset -fileset eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0
-user admin -pwd password -url localhost:9550
```

The following output is returned:

FilesetId	Status
eefset01+eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

unmountfs

Use the **unmountfs** command to unmount a file system.

The **unmountfs** command unmounts a file system on all interface nodes, management nodes, or a specified subset. You must have Administrator authority to use this command.

Attention: Exports of the file system can block the unmount process. The active exports of the file system must be inactive before the unmount process is done.

Syntax

```
tpctool — unmountfs — -user user_name -pwd password -url url — -filesystem file_system_id — -nodes nodes —
- wait — -fs character — -header — -help — -qs character —
? — -silent —
```

Parameters and arguments

- user user_name
Specifies an IBM Spectrum Control user ID.
- pwd password
Specifies the password for the IBM Spectrum Control user ID.
- url url
Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.
- filesystem file_system_id
Specifies the ID of file system to be unmounted.
- nodes nodes
Lists the nodes to unmount the file system on, in a comma-separated list. Specify only the interface node, management node, or both. If you omit this parameter, the file system is unmounted on all nodes.
- wait
Indicates that the system waits until the file system is unmounted on all the nodes. An error occurs after the system waits 3 minutes.
- fs character
Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
Lists help information for the command.
- qs character

Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").

-silent

Suppresses all output for the command. If you omit this parameter, output is included.

Example: Unmount a file system

The following command unmounts a file system on a management node.

```
tpctool> unmountfs -filesystem eefs+kq458mv.ibm+00000200A2A0153C+0  
-user admin -pwd password -url localhost:9550 -nodes mgmt001st001
```

The following output is returned:

FilesystemId	Status
=====	
eefs+kq458mv.ibm+00000200A2A0153C+0	SUCCESS

updatesrg

Use the **updatesrg** command to update the attributes of the specified Storage Resource Group with a new name, description, or user-defined properties.

Syntax

```
tpctool — updatesrg — -user user_name -pwd password -url url — -currentname currentSRGName — -newname →  
→ newSRGName — -newdescription newdescription — -newudp1 user-defined-property1 — -newudp2 →  
→ user-defined-property2 — -newudp3 user-defined-property3 — -fs character — -header →  
→ -help — -qs character — ? — -silent →
```

Parameters and arguments

-user user_name

Specifies an IBM Spectrum Control user ID.

-pwd password

Specifies the password for the IBM Spectrum Control user ID.

-url url

Specifies the Device server. The format of the URL is *system:port_number*, where *system* represents either the host name or IP address, and *port_number* represents the IBM Spectrum Control Device server port.

-currentname currentSRGName

Specifies a unique name already in use, fewer than 60 characters long. It cannot contain any of the following characters:

`\ / : * ? " < > | .`

The name of the user who creates the Storage Resource Group forms the beginning of the name. Use the **lssrg -l** command to display a list of Storage Resource Groups.

-newname newSRGName

Specifies a unique name not already in use, fewer than 60 characters long. It cannot contain any of the following characters:

`\ / : * ? " < > | .`

The name of the user that creates the Storage Resource Group is added to the beginning of the Storage Resource Group name, followed by the name that is specified in the **newSRGName** variable.

-newdescription newdescription

Specifies a description that can contain any alphanumeric characters, and must be fewer than 255 characters long.

-newudp1 user-defined-property1

(optional) Specifies a user-defined property that might contain anything of significance to the Storage Resource Group administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters long.

-newudp2 user-defined-property2

(optional) Specifies a user-defined property that might contain anything of significance to the Storage Resource Group administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters long.

-newudp3 user-defined-property3

(optional) Specifies a user-defined property that might contain anything of significance to the Storage Resource Group administrator. The UDP can contain any alphanumeric character, and must be fewer than 255 characters long.

-fs character

- Specifies the 7-bit character that separates the information in the output. If you omit this parameter, the information is separated by blank spaces.
- header
 - Suppresses the column headings in the output. If you omit this parameter, the column headings are included.
- help | -h | -?
 - Lists help information for the command.
- qs character
 - Specifies the 7-bit character that surrounds character strings and date stamps in the output. If you omit this parameter, character strings and date stamps are enclosed by double quotation marks ("").
- silent
 - Suppresses all output for the command. If you omit this parameter, output is included.

Example: Updating the attributes of a Storage Resource Group

The following command updates a Storage Resource Group with the specified attributes:

```
tpctool
tpctool> updatesrg -currentname currentSRGName -newname newSRGName
-newdescription newdescription -newudp1 user-defined-property1
-newudp2 user-defined-property2 -newudp3 user-defined-property3
```

The following output is returned:

Name	Status
Administrator.my-new-example-srg	SUCCESS

Command aliases

This topic discusses command aliasing.

With aliasing, you define a name for the alias followed by a value that is the name of a command and any options associated with command. The aliased command string is replaced by the defined value and the entire line is reparsed. Passwords used in aliased commands must first be encrypted using the **encrypt** command.

Aliased commands are saved in the command configuration file. The default configuration file is c:\program files\ibm\tpc\cli\libs\tpccli.conf.

For example, to shorten a frequently used command, you can define the following alias:

```
tpctool>lsperf = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url 9.44.33.126:8990 -fabric -perf
```

After the alias is defined, you can run the **lsperf** command to run the aliased **lsdev** command previously displayed.

You can provide a short form command targeting different device servers, as follows:

```
tpctool>lsperfd1 = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostOne:9161 -perf

tpctool>lsperfd2 = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostTwo:9161 -perf
```

You can specify additional options and arguments for an aliased command:

```
tpctool>lsperfd2 -fabric -ctype port
```

The command is expanded as follows:

```
tpctool>lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostTwo:9161 -perf -fabric -ctype port
```

You can also nest aliases:

```
tpctool>lsperf = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostTwo:9161 -perf -fabric

tpctool>lsperfd1 = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostOne:9161

tpctool>lsperfd2 = lsdev -user dsadmin -pwd 1ac75d82784ce0a327d45289604ae7b227
-url hostTwo:9161
```

To unset an alias, type the name of the command alias followed by the '=' sign:

```
lsperf =
```

Parameter aliases

This topic lists common parameters and their aliases.

The following list shows parameters and their corresponding aliases.

- pwd
 - Password. The password is automatically encrypted using the same encryption algorithm as the **password** command before being stored in the config file. In conjunction with the interactive mode, this enables secure password encryption (plain text passwords will not appear in a command line).

-url
URL
-fs
Field-separator
-silent
Suppress-output
-header
Show-header
-l
Long
-dev
subsystem
-fabric
Fabric
-svr
Server

agent.sh command

The **agent.sh** command lets you start, stop, and restart the Storage Resource agent. You can also display the status and version of the Storage Resource agent.

Note:

- You must have root authority to run this command.
- For Windows, the status, stop, and start functions are handled through the Windows Services panel.

➔ **agent.sh** — status — start — stop — restart — version — versionall ➔

Parameters:

status
Displays the current status of the Storage Resource agent. The status is returned is running or not running.

start
Starts the Storage Resource agent.

stop
Stops the Storage Resource agent.

restart
Stop and then start the Storage Resource agent.

version
Displays the current version of the Storage Resource agent.

versionall
Displays the version of the Storage Resource agent and its related components.

dataCollector command

The dataCollector command is used to start and stop the data collector service.

About this task

The asset, capacity, and performance metadata for the storage systems in your data centers is collected by the data collector, analyzed, and then shown on the IBM Spectrum® Control GUI. The data collector service is part of the Device server. When you stop and start the Device server, the data collector stops and starts automatically.

Note:

Important: Do not use the dataCollector command unless you are directed by IBM® Support.

On Windows operating systems, you must have Administrator rights to stop or start the data collector service. On AIX® or Linux® operating systems, you must have root privileges to stop or start the data collector service.

Procedure

1. Log on to the server where the IBM Spectrum Control servers are installed.
2. Open a command window or shell script and go to the data collector directory.
The data collector service is installed in the *installation_dir/datacollector* directory.
3. Choose one of the following options to stop or start the data collector service:
 - a. On a Windows operating system, click the Start menu, enter `services.msc` and press Enter.
 - b. Select IBM Spectrum Control data collector and then stop or start it.

Or

 - a. Run the **dataCollector.bat** script with the stop or start parameter.

Or

 - a. On an AIX or Linux operating system, run the **dataCollector.sh** script with the stop or start parameter.

Configuration files

Use the parameters in IBM Spectrum® Control configuration files to help resolve problems.

The parameters in the configuration files are case-sensitive.

The default *installation_dir* for IBM Spectrum Control installations is as follows:

Windows operating systems:

c:\Program Files\IBM\TPC

Linux® or AIX® operating systems:

/opt/IBM/TPC

The default file locations for the configuration files for IBM Spectrum Control are as follows:

IBM Spectrum Control:

Windows operating systems:

installation_dir\config

Linux or AIX operating systems:

installation_dir/config

Data server:

Windows operating systems:

installation_dir\data\config

Linux or AIX operating systems:

installation_dir/data/config

Device server:

Windows operating systems:

installation_dir\device\conf

Linux or AIX operating systems:

installation_dir/device/conf

Storage Resource agent:

Windows operating systems:

installation_dir\agent\config\agent.config

Linux or AIX operating systems: operating systems:

installation_dir/agent/config/agent.config

Restriction: On Windows installations, if you installed IBM Spectrum Control by using a domain user account, you must disable User Account Control to edit the configuration files.

- [server.config file](#)

The following information lists the parameters that are set in the server.config file. These parameters include controller, logging, repository, and service.

- [scheduler.config file](#)

The following information lists the parameters that are set in the scheduler.config file. These parameters include concurrency parameters and jobs parameters.

- [TPCD.config file](#)

The list of parameters that are set in the TPCD.config file include server parameters and GUI parameters.

- [Specifying the tablespace size for IBM Spectrum Control](#)

This section provides information on the size of the tablespace to specify when you install IBM Spectrum Control

- [agent.config file](#)

The agent.config file contains configuration parameters for the Storage Resource agent. These parameters are set when the Storage Resource agent is installed. The parameters can also be changed manually by editing the file.

server.config file

The following information lists the parameters that are set in the server.config file. These parameters include controller, logging, repository, and service.

Controller parameters

name

The Data Manager server name is the name of the host computer.

port

The port on which the server listens for requests. The default is 9549.

maxConnections

The maximum number of concurrent sockets that the server opens. The default is 500.

routerThreads

The number of threads that redirect incoming requests to the appropriate service provider. The default is 1.

serviceThreads

The number of threads to allocate for the internal service provider of the server. The default is 2.

agentErrorLimit

The number of consecutive attempts to reach an agent before the agent is displayed as DOWN. The default is 3. When an agent is in this state, no attempts to connect are made until either the agent contacts the server or the agent status is manually changed to UP.

adminGroup

The name of the group a user must be a member of to perform administrative functions from the GUI, the default is **adm**.

commEncrypted

The switch that secures communication between the Server or Agent and the Server/GUI by encrypting the DataStream.

- **0** = Off. Do not encrypt the DataStream.
- **1** = On. Encrypt the DataStream.

FileSystemScan NFSTimeout

Determines the numbers of seconds that a Storage Resource agent waits for a status system call on a Network File System (NFS) before it times out.

hostAlias

This parameter is displayed if the HOST_ALIAS is not specific and represents the name of the server. The value for this parameter is used when multiple computers have the same name or the name cannot be determined.

Logging parameters

logsKept

The number of server logs to keep. The default is 5.

messagesPerLog

The maximum number of messages in a log. When this number is reached the log is closed and a new log is created. The default is 100,000.

Repository parameters

driver

The name of the JDBC driver to use, normally:

- Db2®: **COM.ibm.db2.jdbc.app.DB2Driver**

url

The URL used to connect to the database, normally:

- Db2: **jdbc:db2:database_name**

user

The user name that IBM Spectrum® Control uses to connect to the repository.

connectionPool

The number of database connections in a pool of reusable open connections. The default is 10.

Service parameters

name

Repeating section that indicates the service providers that are required to start.
The REQUIRED parameters are as follows:

- **TStorm.server.svp.GuiSvp**
- **TStorm.server.svp.AgentSvp**
- **scheduler.Scheduler**

scheduler.config file

The following information lists the parameters that are set in the scheduler.config file. These parameters include concurrency parameters and jobs parameters.

Concurrency parameters

maxSubmitThreads

The maximum number of threads to create that handle the submission of jobs. The default is 3.

maxCompleteThreads

The maximum number of threads to create to handle job completions. Initially creates a pool of half the number of threads specified that can grow to the maximum.
The default is 3.

Jobs parameters

minutesAdvanced

The number of minutes in advance of scheduled time to begin the scheduling process. The default is 1. Use this option to allow for the processor time that is involved in scheduling a job so that the job starts close to the scheduled time.

delayLimitMinutes

Number of minutes after scheduled start time that the Scheduler continues to attempt to start a job for a selected resource, so that resource state is not in a down state or, connection status is not in a failed state. The default is 120.

Location of the scheduler.config file

The scheduler.config file is in the following directories:

Windows operating systems:
installation_dir\data\config

Linux® or AIX® operating systems:
installation_dir\data/config

TPCD.config file

The list of parameters that are set in the TPCD.config file include server parameters and GUI parameters.

The following list describes the server parameters:

threadPoolSize

Number of initial threads to create for handling requests. The default is 3.

abbreviatedProbe

Only SCSI commands are sent to disk drives for inquiry and disk capacity information. The default is 1.

maxThreads

Set the maximum number of threads for handling requests. The default is 8.

pingReceiveTimeout

Number of seconds to wait before it indicates that a ping failed. The default is 10.

skipAutoFS

Set to 1 if you want to skip the **automount** process during discovery on the Oracle Solaris Storage Resource agent. By default, discovery always processes **automount** on all Oracle Solaris Storage Resource agents managed by the Data server.

saveNonRoot

Set to 1 if you want to monitor non root exports. The default is 0.

If you do not set this parameter, the export paths that are not at the root of the file system are discarded. If the NAS server has only non root exports accessible to the agent, it will not be added. Restart the Data server for this setting to take effect.

batchPartitionWaitRetryCount

Specify the number of times that the Storage Resource agent tries to get a report partition before the Storage Resource agent fails with an error.

Large batch reports are generated in partitions. The partitions are placed on the IBM Spectrum® Control server, and the Storage Resource agent gets them from the server when the batch report is created.

The following list describes the GUI parameters:

threadPoolSize

Number of initial threads to create for handling user interface requests. The default is 3.

maxThreads

Set the maximum number of threads for handling user interface requests. The default is 10.

reportRowLimit

Maximum number of rows that are sent at a time to the user interface. If this number is exceeded, a More button is displayed over the table, along with a warning message. The default is 5000.

keepCachedReport

Number of minutes to retain incomplete reports in the tmp directory for the server. The default is 120.

Specifying the tablespace size for IBM Spectrum Control

This section provides information on the size of the tablespace to specify when you install IBM Spectrum® Control

About this task

When you install IBM Spectrum Control, you can specify the tablespace size of the repository database or accept the default values. The space needed for the IBM Spectrum Control database schema varies significantly with storage network configuration, data collection, data retention period, and other factors.

The following table provides space estimates for a storage configuration containing 5000 volumes with some general assumptions.

Table 1. Tablespace allocation for the IBM Spectrum Control database schema

Tablespace	Description of tablespace usage	Recommended size for a 5000 volume configuration	Assumptions
KEY	This tablespace is used for configuration data which is constantly used. For example, the key entity and relationships data (T_RES_STORAGE_SUBSYSTEM, T_RES_STORAGE_VOLUME, and the normalization tables, and so forth)	500 MB	

Tablespace	Description of tablespace usage	Recommended size for a 5000 volume configuration	Assumptions
NORMAL	This tablespace is used for snapshots and miscellaneous data	500 MB	A table that uses significant space is T_RES_STORAGE_VOLUME_SNAPSHOT. This table uses about 2500 bytes for each record. The number of snapshots depends on the data collection activities.
BIG	This tablespace is used for performance statistics	2 to 3 GB or 400* MB per day of performance data	The data collected for performance data for storage volumes can use a significant amount of space (about 200 bytes for each record). For 5000 volumes, if performance data is collected every 5 minutes, the data for one day would be 300 MB. If the data is kept for 7 days, the data collected would take about 2 to 3 GBs. If the data is kept longer, the storage must be scaled up accordingly.
TEMP	This tablespace is used for temporary data for query processing and other temporary tables	1GB	

agent.config file

The agent.config file contains configuration parameters for the Storage Resource agent. These parameters are set when the Storage Resource agent is installed. The parameters can also be changed manually by editing the file.

The following list contains the parameters for the agent.config file.

Servename

Fully qualified host name of the system on which the Data server is installed.

Portnumber

Port on which the Data server listens for communications from the Storage Resource agent. By default, the port is set to 9549.

IPAddress

IP address of the server on which the Data server is installed.

Log files

When you have a problem, you can check several product log files.

- [Default locations of log files](#)

Check the log files to view detailed information about IBM Spectrum Control processing and to troubleshoot problems.

Default locations of log files

Check the log files to view detailed information about IBM Spectrum® Control processing and to troubleshoot problems.

The following list shows the default log file locations for IBM Spectrum Control and other components.

Device server

The IBM® WebSphere® Liberty Profile log files for the Device server are in the following directories:

Windows operating systems.

`installation_dir\wlp\usr\servers\deviceServer\logs`

Linux® or AIX® operating systems.

`installation_dir/wlp/usr/servers/deviceServer/logs`

The operational log files for the Device server are in the following directories:

Windows operating systems.

`installation_dir\device\log`

Linux or AIX operating systems.

`installation_dir/device/log`

The log files for the data collector are in the following directories:

Windows operating systems.

`installation_dir\datacollector\log`

Linux or AIX operating systems.

`installation_dir/datacollector/log`

Alert server:

The IBM WebSphere Liberty Profile log files for the Alert server are in the following directories:

Windows operating systems.

`installation_dir\wlp\usr\servers>alertServer\logs`

For example, C:\Program Files\IBM\TPC\wlp\usr\servers>alertServer\logs

Linux or AIX operating systems.

`installation_dir/wlp/usr/servers/alertServer/logs`

The operational log files for the Alert server are in the following directories:

Windows operating systems.

installation_dir\alert\log

For example, C:\Program Files\IBM\TPC>alert\log

Linux or AIX operating systems.

installation_dir/alert/log

Data server

Windows operating systems.

installation_dir\data\log

Linux or AIX operating systems.

installation_dir/data/log

Export server

Windows operating systems.

installation_dir\export\logs

Linux or AIX operating systems.

installation_dir/export/logs

Web server log files

Windows operating systems.

installation_dir\wlp\usr\servers\webServer\logs

Linux or AIX operating systems.

installation_dir/wlp/usr/servers/webServer/logs

IBM Spectrum Control GUI

Windows operating systems.

installation_dir\web\log

Linux or AIX operating systems.

installation_dir/web/log

Storage Resource agents

installation_dir/agent/log/name_of_server_SRA_communicates_with

Tips:

- For Windows operating systems, the default *installation_dir* is C:\Program Files\IBM\TPC.
- For Linux or AIX operating systems, the default *installation_dir* is /opt/IBM/TPC.

Script parameters

Script parameters provide specific information on the alert that triggered the script to be run.

The parameters that are passed to a script depend on the type of alert that was triggered. The following table describes all the script parameters:

Script Parameter	Description
amount	Threshold exceeded amount.
archive-file-count	The number of log files in the archived log directory.
archive-log-directory	Name of the archive log directory that triggered the archive log directory Instance alert.
available-extents	The number of extents still available to the segment for growth. This value equals the maximum extents available to the object minus the extents that are currently allocated to the segment.
available-space	Available pool space after a change
blade	Name of a blade.
chained-row-count	The number of chained rows in a table that triggered the Chained Row table alert.
computer	Computer name where the triggering condition occurred.
consecutive-failures	Number of consecutive failed attempts to ping the computer.
controller	Name of a back-end controller.
cluster-name	The name of an HACMP or MSCS cluster.
creator.name	Creator of the ping, probe, or scan schedule. Name of the schedule.
current-grown-defects	Current® number of grown defects on the disk.
current-node-name	When an HACMP or MSCS cluster resource group moves, this parameter identifies the cluster node that now hosts the cluster resource group.
current-RAM MB	Current value of the RAM in megabytes.
current-VM MB	Current value of the sum of the RAM and the swap space in megabytes.
database	The name of the database where the triggering condition occurred.
database-tablespace	The name of the database or table space where the triggering condition occurred.
device-name	Name of a device.
disk-array	Name/alias of a disk array.
dump-date	The date when the last memory dump was performed.
endpoint	Name of an endpoint device.
extent-count	The number of extents that are allocated to a segment, or the number of free extents in the table space (depends on Alert type).
failed-jobs	Number of failed jobs in the run. (Each job runs on a different computer).
file-of-violating-files	Temporary file that contains a list of files that violate the constraint. The files are listed as one file per line.

Script Parameter	Description
file-of-violating-owners	Temporary file that contains a list of owners who owns the violating files.
free-inodes	Maximum number of files available to be created on this file system.
free space size-designator	Total amount of free space, in KB, MB, or GB.
from-entity-type	Type of new fabric connection from an entity.
HBA-driver	HBA driver
HBA-firmware	HBA firmware
io-group	Name of the I/O group.
largest-extent-size size-designator	Total amount of the largest free extent in the table space, which is measured in KB, MB, or GB.
manufacturer/serial-number	Manufacturer of the disk. Serial number of the disk.
mdisk	Name of an MDisk.
mdisk-group	Name of an MDisk group.
mount-point	Path to the file system.
new-capacity	New capacity of a storage subsystem, volume, or pool.
new-version	New version of the HBA driver, firmware, or a subsystem.
node	Name of a node.
old-capacity	Previous capacity of a storage subsystem, volume, or pool.
old-grown-defects	Previous number of grown defects on the disk.
old-node-name	When an HACMP or MSCS cluster resource group moves, this parameter identifies the cluster node that previously hosted the cluster resource group.
old-RAM MB	Previous value of the RAM in megabytes.
old-version	Previous version of the HBA driver, firmware, or a subsystem.
old VM MB	Previous value of the sum of the RAM and the swap space in megabytes.
path	Path to the directory.
percent-of-capacity %	Percentage of capacity of the file system, database, or table space.
percent-of-table-size	The percentage of space that is allocated to a segment that is empty and unused (the percentage of space over the "high-water mark"). Available on the Empty Used Segment Space table alert.
percent-of-total-rows %	The percentage of table rows that are chained.
pool	Name of a storage pool.
port	Name of a port.
rdbms-instance-name	Oracle SID, SQL Server name, Sybase Server name, UDB Instance name
rdbms-type	Oracle, SQL Server, or Sybase
run-number	Number of the run.
segment	The name of the table segment that triggers the alert.
segment-type	<p>The type of segment that triggers the alert. The following list includes the possible types of segments.</p> <ul style="list-style-type: none"> • TABLE • TABLE PARTITION • TABLE SUBPARTITION • NESTED TABLE • CLUSTER • INDEX • INDEX PARTITION • INDEX SUBPARTITION • LOBINDEX • LOBSEGMENT • LOB PARTITION • LOB SUBPARTITION
storage-volume	Name of a storage volume
subsystem	Name of a storage subsystem
switch	Name of a switch
table	The name of the table that triggered the alert condition.
table space	The name of the table space that triggered the alert condition.
threshold	Value that you set for the triggering condition. If the value unit was specified as a %, then a % follows this value.
threshold thr-designator	Value of the triggering condition, in KB, MB, or GB, or % (value units).
to-entity-type	Type of new fabric connection to an entity.
total-jobs	Total number of jobs in a run.
total-file-size size designator	Total amount of storage that is consumed by the archive log directory, which is measured in KB, MB, or GB.
usage size-designator	Value of used disk space, in KB, MB, or GB.
violating-file-count	Number of files that met the conditions that are defined in the constraint.
virtual-server-name	The name of an HACMP or MSCS cluster resource group.
zone	Name of a zone.
zoneset	Name of a zone set.
zone-alias	Name of a zone alias
zone-member	Name of a zone member

Opening IBM Spectrum® Control GUIs and CLIs

To manage and monitor storage resources, open IBM Spectrum Control GUIs and CLIs.

About this task

You can open the following GUIs and CLIs:

- [Opening IBM Spectrum Control GUI](#)
- [Opening Db2 Command Window](#)
- [Opening IBM Data Studio Administration client on Windows operating systems](#)
- [Opening IBM Tivoli Monitoring Services](#)

Opening IBM Spectrum Control GUI

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. On the Start page, right-click, and then click the All apps taskbar button.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start, > All Programs.

2. Click IBM Spectrum Control > IBM Spectrum Control.

Opening Db2® Command Window

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. On the Start page, right-click, and then click the All apps taskbar button.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start, > All Programs.

2. Click IBM DB2 > Command Line Tools > Command Window.

Opening IBM® Data Studio Administration client on Windows operating systems

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. On the Start page, right-click, and then click the All apps taskbar button.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start, > All Programs.

2. Click IBM Data Studio > Data Studio Administration Client.

Opening IBM Tivoli® Monitoring Services

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. On the Start page, right-click, and then click the All apps taskbar button.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start > All Programs.

2. Click IBM Tivoli Monitoring > IBM Tivoli Monitoring Services.

Accessing administration tools

To manage and maintain IBM Spectrum Control, access the Windows system administration tools.

About this task

To complete tasks in IBM Spectrum Control, you must open the following administration and maintenance facilities:

Frequently Asked Questions

View answers to common questions about IBM Spectrum® Control.

How do you know if your storage system is supported by IBM Spectrum Control and which SMI-S agents are supported?

To confirm whether your storage system is supported and which SMI-S agent is supported for that system, review the supported products list for the current release of IBM Spectrum Control at [IBM Spectrum Control interoperability matrix for storage systems](#).

You encounter errors while collecting performance data on SAN Volume Controller. You fail to associate SAN Volume Controller performance data from non-configuration node with SAN Volume Controller performance data from configuration node. You encounter incomplete SAN Volume Controller performance data sample.

This issue is caused by a configuration issue with SAN Volume Controller (time zone). Reset the time zone on SAN Volume Controller by logging into the SAN Volume Controller through putty. Run this command first:

```
svctask settimezone -timezone 509
```

This forces the cluster into the Universal time zone. To get the time zone you want the cluster to be in, run this command:

```
svctask settimezone -timezone
```

Protocols and standards

This section provides an overview of the protocols and standards that are used within IBM Spectrum® Control.

- **[Web Based Enterprise Management](#)**
Web Based Enterprise Management (WBEM) is an initiative of the Distributed Management Task Force (DMTF) with the objective to enable the management of complex IT environments. It defines a set of management and internet standard technologies in order to unify the management of complex IT environments.
- **[Storage Management Initiative Specification](#)**
The Storage Networking Industry Association (SNIA) defines a standard that is used within IBM Spectrum Control to create and develop a universal open interface for managing storage devices including storage networks.
- **[Service Location Protocol](#)**
The Service Location Protocol (SLP) is an Internet Engineering Task Force (IETF) standard. SLP provides a scalable framework for the discovery and selection of network services.
- **[Simple Network Management Protocol](#)**
The Simple Network Management Protocol (SNMP) is an Internet Engineering Task Force (IETF) protocol for monitoring and managing systems and devices in a network. Functions supported by the SNMP protocol are the request and retrieval of data, the setting or writing of data, and traps that signal the occurrence of events.
- **[Fibre Channel Methodologies of Interconnects](#)**
IBM Spectrum Control supports the ANSI T11 Fibre Channel FC-MI (Fibre Channel Methodologies of Interconnects) for the automated discovery of FC SAN assets and topology.

Web Based Enterprise Management

Web Based Enterprise Management (WBEM) is an initiative of the Distributed Management Task Force (DMTF) with the objective to enable the management of complex IT environments. It defines a set of management and internet standard technologies in order to unify the management of complex IT environments.

The WBEM initiative is composed of three main conceptual elements:

Common Interface Model (CIM)

CIM is a formal object-oriented modeling language that is used to describe the management aspects of systems.

xmlCIM

This is the grammar to describe CIM declarations and messages used by the CIM protocol.

Hypertext Transfer Protocol (HTTP)

HTTP is used as a way to enable communication between a management application and a device that both use CIM.

The WBEM architecture defines the following elements:

CIM Client

The CIM Client is a management application like IBM Spectrum® Control that uses CIM to manage devices. A CIM Client can reside anywhere in the network, because it uses HTTP to talk to CIM Object Managers and Agents.

CIM Managed Object

A Managed Object is a hardware or software component that can be managed by a management application by using CIM.

CIM Agent

A CIM Object Manager that includes the provider service for a limited set of resources. An agent may be embedded or hosted and can be an aggregator for multiple devices.

CIM Provider

A CIM Provider is the element that translates CIM calls to the device-specific commands. A provider is always closely linked to a CIM.

CIM Object Manager (CIMOM)

The central component of the CIM Server responsible for the communication between the CIM server components.

CIM Server

A server that receives and processes CIM Operation Message Requests and issues CIM Operation Message Responses.

Storage Management Initiative Specification

The Storage Networking Industry Association (SNIA) defines a standard that is used within IBM Spectrum® Control to create and develop a universal open interface for managing storage devices including storage networks.

For information about SMI-S, see <http://www.snia.org>.

SNIA has fully adopted and enhanced the Common Information Model (CIM) standard for storage management in its Storage Management Initiative - Specification (SMI-S). SMI-S was launched to create and develop a universal open interface for managing storage devices including storage networks. SMI-S provides:

- A comprehensive specification for the management of heterogeneous storage and storage area networks (SANs).
- The information available to a WBEM client from an SMI-S compliant CIM server (provider).
- Profiles organized by:
 - Storage
 - Fabric
 - Host
 - Common profiles and subprofiles
- An object-oriented CIM and XML-based interface for managing SAN devices, services, and fabrics.
- An initial discovery, which is SLP based.

The idea behind SMI-S is to standardize the management interfaces so that management applications can utilize these and provide cross-device management. This means that a newly introduced device can be immediately managed as it will conform to the standards.

The models and protocols in the SMI-S implementation are platform-independent, enabling application development for any platform, and enabling them to run on different platforms. The SNIA will also provide interoperability tests which will help vendors test their applications and devices if they conform to the standard.

Service Location Protocol

The Service Location Protocol (SLP) is an Internet Engineering Task Force (IETF) standard. SLP provides a scalable framework for the discovery and selection of network services.

The Internet Engineering Task Force (IETF) is a large open international community of network designers, operators, vendors, and researchers that are concerned with the evolution of the Internet architecture and the smooth operation of the Internet. The IETF includes formal standards for SNMP and MIBs. For more information about IETF, see <http://www.ietf.org>.

SLP enables the discovery and selection of generic services, which can range in function from hardware services such as those for printers or fax machines, to software services such as those for file servers, email servers, web servers, databases, or any other possible services that are accessible through an IP network.

Traditionally, to use a particular service, a user, or client application provided the host name or network IP address for the service. With SLP, however, it is not necessary for the user or client application to know individual host names or IP addresses. Instead, the user or client application can search the network for the required service type and an optional set of qualifying attributes.

For example, a user can search for all available printers that support Adobe PostScript. Based on the service type such as printers and the attributes such as PostScript, SLP searches the user's network for matching services, and returns the discovered list to the user.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) is an Internet Engineering Task Force (IETF) protocol for monitoring and managing systems and devices in a network. Functions supported by the SNMP protocol are the request and retrieval of data, the setting or writing of data, and traps that signal the occurrence of events.

SNMP is a protocol that enables a management application to query information from a managed device. The managed device has software running that sends and receives the SNMP information. This software module is usually called the SNMP agent.

An SNMP management application can read information from an SNMP agent in order to monitor the device that the SNMP agent is running on. Therefore, the device needs to be polled on an interval bases. The SNMP manager can also change the configuration of a device, by setting certain values to corresponding variables. A device can also be set up to send a notification to the SNMP manager (this is called a trap) to asynchronously inform this SNMP manager of a status change.

Depending on the existing environment and organization it is very likely that your environment already has an SNMP management application in place. IBM Spectrum® Control can be set up to send traps.

SNMP uses a hierarchical structured Management Information Base (MIB) to define the meaning and the type of a particular value. A MIB defines managed objects that describe the behavior of the SNMP entity, which can be anything from an IP router to a storage subsystem. The information is organized in a tree structure.

For users planning to make use of the IBM Spectrum Control SNMP trap alert notification capabilities, an SNMP MIB is included in the server installation.

The MIB is provided for use by your SNMP management console software. Most SNMP management products provide a program called a MIB compiler that can be used to import MIBs. This will allow you to view IBM Spectrum Control generated SNMP traps from within your management console software. Refer to your management console software documentation for instructions on how to compile or import a third party MIB.

For a Cisco switch to successfully receive and respond to queries from IBM Spectrum Control, the following basic requirements must be met:

- IBM Spectrum Control can use SNMPv3 (preferred) or SNMPv1 to probe switches and fabrics. The SNMPv3 protocol is preferred because it provides better security, but switches that use the SNMPv1 protocol are also supported. Some switches are configured to use SNMPv3 by default.
- The Fibre Alliance FC Management MIB (FA MIB) and Fibre Channel Fabric Element MIB (FE MIB) must be enabled on the switch.
- When you use the SNMPv1 protocol, the community string that is configured in IBM Spectrum Control must match one of the community strings that are configured on the switch with read access. Additionally, Cisco switches must have a community string match for write access. The default community strings in IBM Spectrum Control are "public" for read access and "private" for write access. Other community strings can be defined on the switches, but are not used. Community strings are not relevant when you use the SNMPv3 protocol.
- SNMP access control lists must include the IBM Spectrum Control system. These access control lists are defined and configured on the switches. Some lists automatically include all hosts, while others exclude all by default.
- The Fibre Channel (FC) or Fibre Channel over Ethernet (FCoE) protocols must be enabled on the switch. Some switches, such as the Cisco Nexus 5000 series, require you to enable these protocols. Otherwise, IBM Spectrum Control does not recognize the switch when you try to add it using the Add Switches and Fabrics for Monitoring dialog. For instructions on how to configure Cisco switches for FCoE enablement, go to the Cisco product website at <http://www.cisco.com> and click Support.

IBM Spectrum Control uses port 162 to listen for SNMP traps. This is the default port. For switches, you must configure the switch to send SNMP traps to the Device server IP address. If you need to change the default port number, use the **setdscfg** command. The attribute to set is **SNMPTrapPort**.

System administrators must set up their SNMP trap ringer with the provided MIB files in order to receive SNMP traps from IBM Spectrum Control. These files are located in the following directories on the product installation DVD:

For the Data server:

`data\snmp\tivoliSRM.mib`

For the Device server :

`device\snmp\fabric.mib`

Fibre Channel Methodologies of Interconnects

IBM Spectrum® Control supports the ANSI T11 Fibre Channel FC-MI (Fibre Channel Methodologies of Interconnects) for the automated discovery of FC SAN assets and topology.

ANSI T11 Fibre Channel FC-MI includes the following for the automated discovery of FC SAN assets and topology:

- Hosts (HBAs)
- FC interconnects
- FC storage devices

The T11 FC-MI also includes the following:

- FC-GS-3/4 (discovery, zoning, and so forth)
- RNID (advanced device recognition)
- Platform registration (device recognition and launch)
- Common HBA API (fabric and storage views)
- Name server (connectivity)
- Management server (SAN connectivity and topology)
- RSCN (advanced event detection)
- SCSI queries (storage views, volume information, and so forth)
- SNMP Fabric Element (FE) MIB
- SNMP FC Management MIB (discovery, performance statistics, and so forth)
- SNMP alerts

IBM Spectrum Control technical community

Connect, learn, and share with storage professionals: product support technical experts who provide their perspectives and expertise.

Access the IBM Spectrum® Control technical community at <https://www.ibm.com/developerworks/servicemanagement/>.

Use IBM Spectrum Control technical community in the following ways:

- Become involved with transparent development, an ongoing, open engagement between other users and developers of IBM® products.
- Connect one-on-one with the experts to collaborate and network about IBM and the Storage Management community.
- Read blogs to benefit from the expertise and experience of others.
- Use forums to collaborate with the broader user community.

Accessibility features for IBM Spectrum Control

Accessibility features help users who have a disability, such as restricted mobility or limited vision, to use information technology products successfully.

Accessibility features

The following list includes the major accessibility features in IBM Spectrum® Control:

- Keyboard-only operation in the GUI.
- The IBM® Documentation that includes the following accessibility features:
 - The IBM Documentation is provided in XHTML 1.0 format, which is viewable in most web browsers. With XHTML, you can view documentation according to the display preferences that are set in your browser. XHTML supports screen readers and other assistive technologies.
 - All documentation for IBM Spectrum Control is available in Adobe Portable Document Format (PDF) by using the Adobe Acrobat Reader. To access PDFs, go to [Printable documentation](#).
 - All images in the IBM Documentation are provided with alternative text, so that visually impaired users can understand the contents of the images.
- Interfaces that are commonly used by screen readers.

The setting for the automatic-refresh button in the screen reader is toggled to the ON position by default. If you want the screen reader to read the previous text, complete the following steps:

1. Navigate to the Accessibility Settings Navigation region by using the arrow keys. The region is located after the IBM Spectrum Control application title.
2. Click Enter to toggle the automatic-refresh button to the OFF position. (An alert sounds to make you aware that the turn-off automatic-refresh toggle button was pressed.)
3. To move backward to the previously read text so that the screen reader can read it again, use the arrow keys. You can move backwards and forwards through the page.
4. When you are ready to move on, click Enter to toggle the automatic-refresh button to the ON position and to refresh the page. (An alert sounds to make you aware that the turn-on, automatic-refresh toggle button was pressed.)

Tip: Alternatively, let the toggle setting persist, and refresh as needed by pressing the F5 key.

Keyboard navigation

Most of the features of the IBM Spectrum Control GUI are accessible by using the keyboard. For those features that are not accessible, equivalent function is available by using the command-line interface (CLI), except as noted in the product release notes.

You can use keys or key combinations to perform operations and initiate many menu actions that can also be done through mouse actions. The following sections describe the keys or key combinations for different parts of the GUI:

For navigating in the GUI and the context-sensitive help system:

- To navigate to the next link, button, or topic within a panel, press Tab.
- To move to the previous link, button, or topic within a panel, press Shift+Tab.
- To select an object, when the object is in focus, press Enter.

For actions menus:

- To navigate to the grid header, press Tab.
- To reach the drop-down field, press the Left Arrow or Right Arrow key.
- To open the drop-down menu, press Enter.
- To select the menu items, press the Up Arrow or Down Arrow key.
- To start the action, press Enter.

For filters:

To specify a filter option and text:

1. Press Tab to navigate to the magnifying glass icon.
2. Press the Up Arrow or Down Arrow key to navigate the filtering list.
3. Press Enter to select a filtering option.
4. When a filtering option is selected, the cursor moves to the filter text box. Type the filter text and press Enter. To reset a filter, press Enter.

For text fields:

- To navigate to text fields, press Tab.
- To navigate to the fields that are available for editing, press Tab.
- To navigate to the next field or to the Submit button, press Tab.

For tables or lists:

- To navigate between column headers, focus on a column header and use the Left Arrow and Right Arrow keys to move to other column headers.
- To navigate between data cells, focus on a data cell and use the Left, Right, Up, Down, Pageup, and Pagedown Arrow keys.
- To sort a column, focus on a column header and press Enter. The focus remains on the column header after the sort occurs.
- To change the size of a column, focus on the column header, hold Shift+Control, and press the Left or Right Arrow keys.
- To follow a link in a data cell, focus on a data cell and press Shift+F9.
- To open a menu for a table row, focus on the row and press Shift+F10.
- To select consecutive rows, select the first row and hold Shift, press the Up or Down Arrow keys to go to the last row in the range, and press the Space bar to add the new rows to the selection.
- To select non-consecutive rows, select a row and hold Control, press the Up or Down Arrow keys, and press the Space bar to add the new row to the selection.

Restriction: For Chinese languages, the keyboard combination Control+Space bar is not enabled for selecting multiple rows at the same time.

Keyboard navigation with Firefox for Mac users: If you're using Firefox on a Mac with IBM Spectrum Control and want to use keyboard navigation, complete the following steps:

1. In Firefox, go to Preferences, > Advanced, > General and clear the check mark for Always use the cursor keys to navigate within pages. This step enables the use of Tab key to navigate between GUI elements.
2. In the URL address bar of Firefox, type about:config and press Enter.
Tip: If a warning prompt is displayed, click the button to accept the risk of changing browser settings. Existing settings won't be changed; instead, you'll be adding a preference setting for accessibility.
3. To add an accessibility preference for tab focus, right-click on the configuration page and select New, > Integer.
4. In the New integer value window, type accessibility.tabfocus and click OK.
5. Type 7 to set the integer value and click OK.
6. Open your Mac's System Preferences app, go to Keyboard, > Shortcuts, and select All Controls.

IBM and accessibility

For more information about IBM's commitment to accessibility, see the IBM Human Ability and Accessibility Center website at <http://www.ibm.com/able>.

Troubleshooting and problem determination

When a problem occurs with IBM Spectrum® Control, you want to find a solution quickly. You can resolve a problem by using two approaches: troubleshooting and problem determination.

Troubleshooting

In many cases, you can resolve problems without contacting the IBM® Support Center. When you encounter a problem with IBM Spectrum Control, you can search the troubleshooting section of the Knowledge documentation for a solution. Troubleshooting information explains the cause of a problem at a high level and describes the actions that you can take to resolve the problem.

Problem determination

If you cannot resolve a problem by using the troubleshooting information that is provided in the IBM Spectrum Control Knowledge documentation, contact the IBM Support Center so that the cause of your problem can be determined. To learn how to gather information for the IBM Support Center, use the problem determination section of the Knowledge documentation.

- [Troubleshooting in IBM Spectrum Control](#)
You can use this information to resolve issues or problems with IBM Spectrum Control.
- [Getting support](#)
For help with resolving issues with IBM Spectrum Control, you can contact IBM Support or use IBM self-help resources.

Troubleshooting in IBM Spectrum Control

You can use this information to resolve issues or problems with IBM Spectrum® Control.

- [Introduction to troubleshooting](#)
The troubleshooting information explains the cause of a problem at a high level and describe actions that you can take to resolve the problem.
- [Resolving problems](#)
If you experience an error with IBM Spectrum Control, you can use problem determination to determine why an error occurred, and explain how to resolve the problem.

Introduction to troubleshooting

The troubleshooting information explains the cause of a problem at a high level and describe actions that you can take to resolve the problem.

- [GUI troubleshooting](#)

GUI troubleshooting

Troubleshoot and resolve problems in the IBM Spectrum® Control GUI.

- [Renewing security certificates](#)
You can renew the IBM Spectrum Control server certificates that are expiring or have expired.
- [Displaying performance metadata](#)
Occasionally, you might find that performance metadata cannot be displayed in IBM Spectrum Control. This issue might occur when metadata is not available for the selected time range or device, or when the cache, cookies, and history in your web browser need to be cleared to refresh the GUI with the latest metadata.
- [Troubleshooting FTP transfers](#)
When you attempt to send files to IBM® by using FTP, such as a log package from the System Management page or a compressed file from the service tool, the upload cannot be completed. This problem might occur because of network or firewall restrictions.
- [The status of jobs is not updated after the Device server is stopped](#)
The statuses of data collection jobs in the IBM Spectrum Control GUI are not updated after the Device server is stopped.
- [Changing the session timeout value for the web-based GUI](#)
A session of the web-based GUI times out and returns to the login page.
- [Error message: This web browser is not supported](#)
This message is displayed on the login page in Internet Explorer 8.
- [The GUI installation program displays the incorrect title on AIX 7.x with the UTF-8 locale](#)
This problem is cosmetic only and does not impact the installation of IBM Spectrum Control on the AIX® 7.x operating system when you use UTF-8 locales.
- [Error message: Out of memory at line: 14](#)
If you use Internet Explorer, the details page of the GUI might become unresponsive after the page is open for an hour or more.
- [Interface icons are not displayed in the correct positions](#)
The icons on the dashboard, resource lists, and details pages in the GUI are not displayed in the correct positions and do not respond to mouse or keyboard actions.
- [The status of a virtual machine is not consistent](#)
The status of a monitored virtual machine might be different depending on the page in the GUI where it is being viewed.
- [Information exported to a CSV file is incorrectly formatted by spreadsheet program](#)
Information that is displayed in the web-based GUI can be exported to a comma-separated values (CSV) file. When you are viewing a CSV file in a spreadsheet program, some information might not match what is displayed in the web-based GUI.

Renewing security certificates

You can renew the IBM Spectrum® Control server certificates that are expiring or have expired.

Before you begin

Note: This procedure assumes that you install IBM Spectrum Control on a Windows operating system by using the default installation paths and ports.
Make a backup copy of the following files:

- `installation_dir\wlp\usr\servers\deviceServer\resources\security\key.p12`
- `installation_dir\wlp\usr\servers>alertServer\resources\security\key.p12`
- `installation_dir\wlp\usr\servers\deviceServer\server.xml`
- `installation_dir\wlp\usr\servers>alertServer\server.xml`
- `installation_dir\wlp\usr\servers\webServer\resources\security\key.p12`
- `installation_dir\wlp\usr\servers\webServer\server.xml`

About this task

When secure socket layer (SSL) certificates expire or are close to expiring, you need to renew them. If you continue to receive error messages about the web server certificate expiration, use this more advanced method.

Procedure

1. Stop the IBM Spectrum Control servers and services.
2. Delete the following files: `installation_dir\wlp\usr\servers\deviceServer\resources\security\key.p12`; `installation_dir\wlp\usr\servers>alertServer\resources\security\key.p12`; `installation_dir\wlp\usr\servers\webServer\resources\security\key.p12`.
3. Open a command window and run the following commands:

- a. `cd installation_dir\wlp\bin`
- b. `securityUtility.bat createSSLCertificate --server=deviceServer --password=default --validity=825`
- c. `securityUtility.bat createSSLCertificate --server=alertServer --password=default --validity=825`
- d. `securityUtility.bat createSSLCertificate --server=webServer --password=default --validity=825`

For each of the preceding commands, you see output similar to the following example:

```
Creating keystore
C:\Program Files\IBM\TPC\wlp\usr\servers\deviceServer\
resources\security\key.p12

Created SSL certificate for server deviceServer

Add the following lines to the server.xml to enable SSL:
<featureManager> <feature>ssl-1.0</feature>
</featureManager>
<keyStore
id="_home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_troubleshooting_fqz0_t_tbs_renewing_security_cert
ificates_defaultKeyStore" password="{xor}Ozo5PiozKw=" />
```

Note: Do not add the example lines to the server.xml files. Those lines are already included in the server.xml files.

- e. `cd installation_dir\jre\bin`
 - f. `ikeycmd -cert -delete -db installation_dir\wlp\usr\servers\deviceServer\resources\security\key.p12 -pw default -type pkcs12 -label default`
 - g. `ikeycmd -cert -create -db installation_dir\wlp\usr\servers\deviceServer\resources\security\key.p12 -pw default -label default -size 2048 -sig_alg SHA256_WITH_RSA -expire 825 -dn "CN=<machine_FQDN>, OU=deviceServer, O=ibm, C=us" -san_dnsname <machine_FQDN> -eku serverAuth`
 - h. `ikeycmd -cert -delete -db installation_dir\wlp\usr\servers>alertServer\resources\security\key.p12 -pw default -type pkcs12 -label default`
 - i. `ikeycmd -cert -create -db installation_dir\wlp\usr\servers>alertServer\resources\security\key.p12 -pw default -label default -size 2048 -sig_alg SHA256_WITH_RSA -expire 825 -dn "CN=<machine_FQDN>, OU=alertServer, O=ibm, C=us" -san_dnsname <machine_FQDN> -eku serverAuth`
 - j. `ikeycmd -cert -delete -db installation_dir\wlp\usr\servers\webServer\resources\security\key.p12 -pw default -type pkcs12 -label default`
 - k. `ikeycmd -cert -create -db installation_dir\wlp\usr\servers\webServer\resources\security\key.p12 -pw default -label default -size 2048 -sig_alg SHA256_WITH_RSA -expire 825 -dn "CN=<machine_FQDN>, OU=webServer, O=ibm, C=us" -san_dnsname <machine_FQDN> -eku serverAuth`
- Where `<machine_FQDN>` is the fully qualified domain name of the machine where you installed the IBM Spectrum Control servers. For example, `myserver.mycompany.com`
4. If you renewed the Device server certificate, complete steps 4, 5, and 6 in *Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server*.
 5. Start the IBM Spectrum Control servers and services.
 6. Start the IBM Spectrum Control GUI and click Home, > System Management.
 7. Verify that the servers and services are running properly.

Results

The certificate is renewed.

What to do next

Verify the IBM Spectrum Control web server certificate renewal. To verify that the certificate is renewed, open the IBM Spectrum Control GUI. If the new certificate was successfully applied, no web browser certificate or security warnings are displayed. To view the web server certificate, complete the following steps. These steps might be different depending on your browser version.

Mozilla Firefox:

1. Right-click a GUI page and select View Page Info.
2. On the Page information page, click Security, > View Certificate.

Internet Explorer:

1. Right-click a GUI page and select Properties.
2. On the Properties page, click Certificates.

Related tasks

- [Stopping the IBM Spectrum Control servers by using the GUI](#)
- [Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server with a self-signed certificate OR an external certificate](#)

Displaying performance metadata

Occasionally, you might find that performance metadata cannot be displayed in IBM Spectrum® Control. This issue might occur when metadata is not available for the selected time range or device, or when the cache, cookies, and history in your web browser need to be cleared to refresh the GUI with the latest metadata.

About this task

If performance metadata cannot be displayed in IBM Spectrum Control, you can try clearing the cache, cookies, and history in your web browser to refresh the GUI with the latest metadata.

Procedure

1. Clear your web browser's cache, cookies, and history using the following steps:

In Mozilla Firefox:	In Google Chrome:
a. Click Tools > Options and select Privacy & Security. b. Under Cookies and Site Data, click Clear Data. c. Under History, click Clear History.	a. Click Settings and select Privacy and security. b. Click Clear browsing data, accept the default choices, and click Clear data.

2. After the cache, cookies, and history is cleared, click the browser refresh button to update the product GUI.

For more detailed and up-to-date instructions about how to clear the cache, cookies, and history in different types and versions of web browsers, refer to the documentation for those browsers.

Troubleshooting FTP transfers

When you attempt to send files to IBM® by using FTP, such as a log package from the System Management page or a compressed file from the service tool, the upload cannot be completed. This problem might occur because of network or firewall restrictions.

About this task

When IBM Spectrum® Control uploads a log package to IBM Software Support, it is sent to the Enhanced Customer Data Repository (ECuRep) by using standard FTP protocol. The upload is secure and the data is encrypted with AES-128 key for each file part and RSA-2048 key for the key exchange. The name of the FTP server that receives the upload is ftp.ecurep.ibm.com.

If IBM Spectrum Control cannot connect to the FTP server because of firewall restrictions in your organization, you must open the necessary ports for FTP transfers from the IBM Spectrum Control server. Because standard, unencrypted FTP in passive mode is used for uploads (encryption is done at the data level, not the connection level), the firewall must be configured to allow passive FTP connections to ftp.ecurep.ibm.com. Contact your network administrator for assistance.

For older firewalls, open port 21 (the default FTP) and ports 65024 - 65535 (for passive FTP). For more information, see http://www.ibm.com/de/support/ecurep/send_ftp.html.

If your organization uses a proxy server for FTP, complete the following steps to troubleshoot uploads from IBM Spectrum Control:

Procedure

1. Use a text editor to create a file that is named ibmsdduu.config.
2. In ibmsdduu.config, specify the proxy configuration to use.
 - a. To determine the specific information that must be included in ibmsdduu.config for your FTP proxy, review the following instructions:

SOCKS Server and HTTP Proxy Support

```
-socks4 enable SOCKS 4 support
-socks5 enable SOCKS 5 support
-http_proxy enable support for http proxy tunneling

-socks4 -sock5 and -http_proxy are exclusive, the last switch in
```

command line is used

-proxyhost=<host> define the address of the proxy or SOCKS server

-proxyport=<port> define the port of the proxy.
default: 1080 for SOCKS4 and SOCKS5
8080 for http_proxy

-proxyuser=<userid> define the userid for the proxy or SOCKS server

-proxypw=<password> define the password for the proxy or SOCKS server

proxy userid and proxy password are optional

FTP Proxies

ftp proxy support is enabled with a separate command line option.
This enables the combination of SOCKS server and a ftp proxy if necessary.

-ftp_proxytype=<type> enables ftp proxy support and define the type of
the proxy. <type> is an integer, see
ftp proxy types below
Default: 0 - no proxy

-ftp_proxyuser userid for the ftp proxy

-ftp_proxypw password for the ftp proxy

-ftp_proxyhost hostname or ip address of the ftp proxy

-ftp_proxyport port number of the ftp proxy
Default: 21

FTP Proxy Types

There are several ftp proxy types known. Each type is using a different
login procedure and needs different commands to connect to the target
ftp server.

In the list of supported ftp proxy types <server>,<user>,<password>
are referring to the target ftp server, <p_user> and <p_passwd> to the
ftp proxy account.

-ftp_proxytype=0
no ftp proxy is used (this is the default)

-ftp_proxytype=1
connect; USER <p_user>; PASS <p_passwd>;
SITE <server>; USER <user>; PASS <passwd>

-ftp_proxytype=2
connect; SITE <server>; USER <user>; PASS <passwd>

-ftp_proxytype=3
connect; USER <p_user>; PASS <p_passwd>;
OPEN <server>; USER <user>; PASS <passwd>

-ftp_proxytype=4
connect; OPEN <server>; USER <user>; PASS <passwd>

-ftp_proxytype=5
connect; USER <user>@<server>; PASS <passwd>

-ftp_proxytype=6
connect; USER <p_user>@<server>; PASS <p_passwd>;
USER <user>; PASS <passwd>

-ftp_proxytype=7
connect; USER <user>@<server> <p_user>;PASS <p_passwd>;
ACCT <passwd>

-ftp_proxytype=8
connect; USER <user>@<server> <p_user>;PASS <passwd>;
ACCT <p_passwd>

-ftp_proxytype=9
connect; USER <user>@<p_user>@<server>;PASS <passwd>;
ACCT <p_passwd>

-ftp_proxytype=10
connect; USER <user>@<p_user>@<server>;PASS <p_passwd>;
ACCT <passwd>

-ftp_proxytype=11
connect; USER <p_user>; PASS <p_passwd>;
USER <user>@<server>; PASS <passwd>

-ftp_proxytype=12 (CheckPoint Firewall 1)
connect; USER <user>@<p_user>@<server>
PASS <passwd>@<p_passwd>

- b. Based on the type of FTP proxy server that you use, copy and paste the appropriate section from step 2a into ibmsdduu.config.
- c. For the section that you pasted into ibmsdduu.config, provide information such as host name, port, user ID, and password, as needed.

For example:

```
-ftp_proxytype=1
-ftp_proxyuser=my_user_id
-ftp_proxypw=my_password
-ftp_proxyhost=ftp_proxy.my_company.com
-ftp_proxyport=21
```

Where:

- **my_user_id** and **my_password** represent the authentication credentials for connecting to the FTP proxy server.
- **ftp_proxy.my_company.com** represents the DNS name of the FTP proxy server.

3. Save the file to *installation_dir/services*, where *installation_dir* represents the directory where IBM Spectrum Control is installed.

The default installation directory is as follows:

- Windows: C:\Program Files\IBM\TPC
- Linux® / AIX®: /opt/IBM/TPC

4. Try to upload the log package or compressed file again.

What to do next

If you still cannot automatically upload a log package in the IBM Spectrum Control GUI, you can try uploading it manually. For information about how upload files to ECuRep manually, see the following topics:

- [FTP Transfer](#)
- [Upload through browser](#)

Log packages are stored on the IBM Spectrum Control server at the following location: *installation_dir/wlp/usr/servers/webServer/apps/WebServer.ear/TPC-GUI.war/serviceLog*

The status of jobs is not updated after the Device server is stopped

The statuses of data collection jobs in the IBM Spectrum® Control GUI are not updated after the Device server is stopped.

Problem

If the Device server is stopped while data collection jobs are running, the jobs are also stopped. However, even though the jobs are no longer collecting data, their statuses are still displayed as "running" in the GUI.

Action

To display the correct status of the jobs in the GUI, restart the Device server. For information about how to start the Device server, see [Starting the IBM Spectrum Control servers by using scripts](#).

Changing the session timeout value for the web-based GUI

A session of the web-based GUI times out and returns to the logon page.

Problem

The Lightweight Third Party Authentication (LTPA) token timeout value that is set in the IBM® WebSphere® Application Server Liberty ltpa.xml file determines when you are automatically logged out of the GUI. The default timeout value is 120 minutes.

Action

To change the timeout value for the LTPA token, complete the following steps:

1. Log on to the IBM Spectrum® Control server with administrative privileges.
2. Open a command prompt and go to *installation_dir/wlp/usr/servers/webServer* directory.
3. Edit the ltpa.xml file and change the value of the *expiration* attribute from 120 to the desired value.
4. Save and exit the ltpa.xml file.

Error message: This web browser is not supported

This message is displayed on the logon page in Internet Explorer 8.

Problem

You cannot log on because Internet Explorer 8 is not supported with this version of the product.

Action

To ensure that you can log on to IBM Spectrum® Control, upgrade to Internet Explorer 9 or later. For a list of web browsers that you can use with IBM Spectrum Control, see [IBM Spectrum Control interoperability matrix](#). In the Agents, Servers and Browser column, click the version of IBM Spectrum Control that is installed on your system. On the next page, click Web Browsers to find the web browsers that you can use.

The GUI installation program displays the incorrect title on AIX 7.x with the UTF-8 locale

This problem is cosmetic only and does not impact the installation of IBM Spectrum® Control on the AIX® 7.x operating system when you use UTF-8 locales.

Problem

The IBM Spectrum Control installation program displays the incorrect title on the AIX 7.x operating system when you use a UTF-8 locale identifier.

Action

For UTF-8 locales, if you installed IBM Spectrum Control on an AIX 7.x operating system and set your locale identifier to a UTF-8 locale (for example, fr_FR.UTF-8), the window title in the installation program is incorrect. The incorrect title is displayed as "sun-awt-X11-XFramePeer".

For non-UTF-8 locales, if you installed IBM Spectrum Control on an AIX 7.x operating system and set your locale identifier to a non-UTF-8 locale (for example, FR_FR), the window title in the installation program is correct. The correct title is displayed as "IBM Spectrum Control".

Error message: Out of memory at line: 14

If you use Internet Explorer, the details page of the GUI might become unresponsive after the page is open for an hour or more.

Problem

When you use Internet Explorer, if the details page of the GUI is open for long periods, the following message is displayed:

Out of memory at line: 14

Environment

This problem occurs on Windows operating systems when you use Internet Explorer.

Resolving the problem

Use Mozilla Firefox 3.6 or later to view the GUI. Alternatively, increase the memory of the system that is running Internet Explorer, or restart Internet Explorer and log on to the GUI again.

Related reference

- [Web browser support](#)

Interface icons are not displayed in the correct positions

The icons on the dashboard, resource lists, and details pages in the GUI are not displayed in the correct positions and do not respond to mouse or keyboard actions.

Problem

The GUI does not display correctly in Internet Explorer 9 when Compatibility View is turned on. When Compatibility View is on, the pages in the GUI are displayed as if you were using an earlier version of Internet Explorer.

Action

To ensure that the GUI is displayed correctly in Internet Explorer 9, complete the following steps:

1. In Internet Explorer 9, go to Tools > Compatibility View Settings.
2. In the section Websites you've added to Compatibility View, ensure that the website address for the GUI is not included.
3. Clear the following check boxes:
 - Include updated website lists from Microsoft
 - Display intranet sites in Compatibility View
 - Display all websites in Compatibility View
4. Click Close to apply the changes to the web browser.
5. Refresh the current page to apply the changes to the GUI.

The status of a virtual machine is not consistent

The status of a monitored virtual machine might be different depending on the page in the GUI where it is being viewed.

Problem

For example, if a virtual machine that is managed by a hypervisor is down or unreachable, the following statuses might be displayed:

- On the details page for a hypervisor, the status of the virtual machine might be Normal.
- On the details page for a server, the status of the virtual machine might be Unreachable.

This situation occurs because different probes are collecting data about the status of a virtual machine:

- Probes of the managing hypervisor collect information about the status of the virtual machine configuration.
- Probes of the virtual machine collect information about the virtual computer that is hosted by the virtual machine.

Action

Based on the status that you want to view, go to the corresponding location in the GUI:

- For the status of the virtual machine configuration, go to the details page for a hypervisor.
- For the status of the virtual computer that is hosted by the virtual machine, go to the details page for a server.

Information exported to a CSV file is incorrectly formatted by spreadsheet program

Information that is displayed in the web-based GUI can be exported to a comma-separated values (CSV) file. When you are viewing a CSV file in a spreadsheet program, some information might not match what is displayed in the web-based GUI.

Problem

A CSV file is a plain-text file. No type information is provided for the values in the CSV file, but a spreadsheet program, such as Lotus® Symphony® or Microsoft Excel, can determine a type based on the value itself. If a value contains only numeric characters, a spreadsheet program might determine that it is a numeric value. It might also format the value in a particular style, such as in decimal format or scientific notation. Sometimes, this automatic reformatting of values results in values that are incorrectly displayed. For example, a worldwide port name (WWPN) should be treated as a text even if it contains only numeric characters. If a spreadsheet program converts the WWPN to a new format, it no longer reflects that actual name.

Action

If values in the CSV file do not match the values that are displayed when the file is opened in a spreadsheet program, consult the documentation for the spreadsheet program you are using. When you open a CSV file in spreadsheet program, you can typically override the automatic formatting behavior and specify how values are imported. To verify that the values in the CSV file match the values that are shown in the spreadsheet program, you can open the CSV file in a text editor.

General troubleshooting

Use this section to troubleshoot and resolve problems with the IBM Spectrum® Control GUI.

- [Alerts aren't being generated](#)
Alerts aren't being generated because the Alert server stopped responding.
- [Performance information is not displayed for a resource](#)
Performance information is not displayed for a resource in performance views and charts.

If needed, you can disable cipher block chaining (CBC) ciphers in IBM Spectrum Control in response to the Lucky 13 vulnerability.

Alerts aren't being generated

Alerts aren't being generated because the Alert server stopped responding.

Problem

In some cases, the Alert server might be locked into a processing loop and stop responding when it processes performance alerts that include suppression settings. During this time, no alerts are generated or notifications sent for any alert definitions.

Action

To avoid this issue, complete the following steps:

1. In a text editor, open `installation_dir/bin/etc/Datastore.properties`.
2. Change `san.logger.trace.level=DEBUG_MAX` to `san.logger.trace.level=DEBUG_MIN`.
3. To apply the change, complete the following steps to restart the Alert server:
 - a. In the GUI, go to Home > System Management.
 - b. Click Component Servers in the Components section.
 - c. Click Stop Server next to the Alert server.
 - d. Click Start Server next to the Alert server.

Performance information is not displayed for a resource

Performance information is not displayed for a resource in performance views and charts.

Problem

For some resources and metrics, performance information is not displayed during a specific time range and resolution (granularity).

Action

If performance data is not being displayed for a resource and metric, one of the following situations might have occurred:

- A performance monitor was never defined for the resource. You must run a performance monitor to collect and view performance data. To schedule a performance monitor, go to the resource list page, right-click a resource, and select **Data Collection** > **Schedule**.
- A performance monitor was defined for the resource, but is not running. Accordingly, depending on when the most recent performance monitor completed, try adjusting the time range and data resolution on the performance view. You might need to change the data resolution to hourly or daily. Alternatively, start the performance monitor so that it can collect new data. To start a performance monitor, go to the resource list page, right-click a resource, and select **Data Collection** > **Start Performance Monitor**.
- A performance monitor was defined and is running, but cannot collect any data. Check the values of **Status** and **Latest Error** (message) for the performance monitor on the **Home** > **Performance Monitors** page. To resolve some common problems, try the following actions:
 - Verify that the local area network is available and a firewall is not preventing network access to the resource and product services.
 - Verify that the resource you want to monitor is up and available.
 - If an SMI-S provider (CIM agent) is being used to communicate with the resource, ensure that the provider can be accessed, and is up and available.
- None of the selected metrics is available. The metrics that are available for a resource are determined by a number of factors, such as the type of resource, release version of a resource, and level of SMI-S provider (if used). Select different metrics to view performance data.
- An internal component of Spectrum Control is not available or is down. To investigate the issue, try the following actions:
 - Check the status of the product servers and database repository on the **Home** > **System Management** page. In **Component Servers**, ensure that the servers are up and running. In **Database**, ensure that the database repository is up and running.
 - Check the log files that were generated for the internal components. [Location of log files](#).
- For FlashSystem 900, SNMP is not enabled on the storage system. IBM Spectrum® Control communicates with the SNMP agent on port 161 (UDP) to collect performance data.
To enable the SNMP agent, open the management GUI of a storage system, go to **Settings** > **Notifications** > **SNMP**, click **Agent**, and enter a community name.

The Data server is shut down automatically

If IBM Spectrum® Control cannot reach the database repository after 30 minutes, the Data server is shut down automatically.

Problem

You cannot complete actions in the IBM Spectrum Control GUI. This problem might occur when the Data server is down. The following message might be displayed:

BPCUI0209E A database operation cannot be completed.

Action

Verify that the local area network is available. Ensure that the IBM Spectrum Control database is up and running. Ensure that the Data server is up and running. Try the action again. For information about how to start DB2®, see [Manually starting Db2 on Windows](#). For information about how to start the Data server, see [Starting the IBM Spectrum Control servers by using scripts](#).

Fabric probe of DCFM CIM/OMs returns Java "Out of Memory" errors

During a fabric probe of a DCFM CIM/OM, if Java™ "Out of Memory" errors are returned, use the following steps to increase the server memory allocation for the DCFM CIM/OM.

Action

1. Open the DCFM management application. **Server** > **Options** > **Software Configuration** > **Memory Allocation**
2. Increase the server memory allocation to 1024.
3. Restart the DCFM services using the Server Management Console.
4. Run the fabric probe again.

Cluster resource group alerts are not triggered

This problem can occur on systems running PowerHA® SystemMirror® for AIX® or Microsoft Cluster Server (MSCS).

Problem

A computer alert is defined that uses one of the following triggering conditions:

- Cluster Resource Group Added
- Cluster Resource Group Removed
- Cluster Resource Group Moved

The event occurs, but no alert is triggered.

Action

The IBM Spectrum® Control agent checks to find out whether it is running in a IBM® PowerHA SystemMirror for AIX or MSCS cluster at the following times:

- When the agent is started
- When a probe is run

If the PowerHA SystemMirror for AIX or MSCS service is started after the agent, the agent is not aware of the cluster. Any cluster resource group alerts that you might have defined cannot be triggered.

To solve this problem, run a probe on one of the cluster nodes.

Slow performance when moving data from the database repository

Repocopy and other DB2® movement utilities might perform slowly or be in a wait state when moving data from the IBM Spectrum® Control database repository.

Problem

The IBM Spectrum Control user interface, repocopy tool, or DB2 data movement utilities might be in a wait state or perform poorly when you attempt to move data from the database repository while running discovery, probe, scan, and performance monitor jobs at the same time.

Action

Use the repocopy tool or DB2 data movement utilities to migrate data in the database repository during times when discovery, probe, scan, and performance monitoring jobs are not running or are scheduled to run.

Error message when running repocopy on server that uses remote database

This error occurs when you run **repocopy** on a server machine that uses a remote database.

Problem

You see these error messages when you run **repocopy** on a server machine that uses a remote database:

```
This application has failed to start because DB2APP.dll was not found.  
Re-installing the application may fix this problem.
```

```
Import/Export: Can't find library TSRMinsudb (TSRMinsudb.dll)  
in <library_path> or java.library.path  
<library_path>  
<java_library_path>
```

Action

Click **OK** to both messages.

The Data Server service fails with a logon failure when restarted

This error occurs when using Window's Active Directory domain policy.

Problem

When you restart the machine, the TSRMsrv1 user ID is no longer in the administrator's group and cannot log in to the machine. If there is a domain policy established that defined which users would be in the "Administrators" group, local users are automatically removed from the "Administrators" group when the system is restarted if the user ID is not one of the named accounts.

Action

Make sure that the user ID is one of the named accounts in the domain policy.

Specifying a LUN ID for the assignvol command

This error occurs when specifying a LUN ID for the **assignvol** command.

Problem

When specifying a LUN ID for the **assignvol** command, the LUN ID value will not be taken into consideration for the DS8000® storage devices. The reason for this is because the CIMOM does not offer support for client selectable LUN IDs.

Action

Understand the problem as described here.

Cannot monitor an EMC CIMOM on a Solaris server

This condition occurs when you try to monitor a Pegasus-based CIMOM like the EMC CIMOM.

Problem

When trying to log into a Pegasus-based CIMOM like the EMC CIMOM on a Solaris server, a login error is returned. If you are unable to log in, this could be a result of having the operating system language locale improperly set or not set at all. Check to see that the operating system language locale is properly set.

Action

An example of a properly set language locale for a Solaris server is found in the `/etc/default/init` file. This file contains the following lines which are dependant on the geographical location.

```
TZ=US/Arizona
CMASK=022
LC_COLLATE=en_US.ISO8859-1
LC_CTYPE=en_US.ISO8859-1
LC_MESSAGES=C
LC_MONETARY=en_US.ISO8859-1
LC_NUMERIC=en_US.ISO8859-1
LC_TIME=en_US.ISO8859-1
```

Incorrect entries are LC lines with incorrect locale entries or the LC language locale lines are missing.

SQLCODE-440 displayed if install IBM Spectrum Control on system with bad system clock

This error occurs when you install IBM Spectrum® Control on a system with a clock that is set for a future time and not the current time.

Problem

You receive this DB2® error message when you try to open the topology view for the fabric:

```
com.ibm.db2.jcc.c.SqlException: DB2 SQL error: SQLCODE: -440,
SQLSTATE: 42884, SQLERRMC: RTRIM;FUNCTION
```

Action

Correct the system clock and restart the IBM Spectrum Control services.

CIM agent runs slowly

This error occurs for the CIM agent.

Problem

The CIM agent runs slowly.

Action

Try stopping and restarting the IBM Spectrum® Control services. If this does not help, increase the value of `com.ibm.tpc.perf.ConteConnectTimeOut` in the following file:

```
installation_dir\device\conf\pm.conf
```

Assigned LUN is not recognized by the host

A LUN assigned to a host using IBM Spectrum® Control is not recognized by the host, and IBM Spectrum Control does not report the error.

Problem

This problem can occur if the host connection for the selected host was incorrectly configured on the storage subsystem, and the host is unable to log in to the storage subsystem. Some examples of configuration settings that, if incorrectly configured, can cause this problem are the storage subsystem I/O port configuration (FICON®/FcSf) or the OS selection.

Action

Remove all LUNs from the storage subsystem for the selected host and delete the host connection. Recreate the host connection with the correct configuration settings, and once again assign the LUNs to the host.

On AIX systems, numbers in the Storage Resource agent registry are printed as formatted numbers

On AIX® systems, numbers in the Storage Resource agent or configuration file are printed as formatted numbers.

Problem

Numbers are printed in formatted format in the following Storage Resource agent registry or configuration files:

```
/etc/Tivoli/TSRM/registryNA
<SRA_install_directory>/agent/config/Agent.config
```

For example, instead of 9510, the number appears as 9,510. This is a known in AIX libraries. This problem occurs with a earlier level C++ library (a level earlier than 7.0.0.5) on the system.

Action

Update your C++ libraries. To check your library version, run the following command:

```
lsldpp -L | grep -i xlc
```

An example of the output is shown:

xlc.aix50.rte	7.0.0.3	C	F	C Set ++ Runtime for AIX 5.0
xlc.cpp	6.0.0.0	C	F	C for AIX Preprocessor
xlc.msg.en_US.cpp	6.0.0.0	C	F	C for AIX Preprocessor
xlc.msg.en_US.rte	7.0.0.0	C	F	C Set ++ Runtime
xlc.rte	7.0.0.1	C	F	C Set ++ Runtime

To upgrade your libraries, follow these steps:

1. Get the library updates. Go to <http://www-933.ibm.com/support/fixcentral/>.
2. Select the following:

Product Group	Rational
Product	XL C++ Runtime
Installed Version	8.0.0.0
Platform	AIX

3. Click **Continue**, then click **Continue** again.
4. Download the updates.

Fabric probe job failed

The fabric probe job failed.

Problem

A fabric probe job failed. Here is an example of the error messages you see in the fabric probe log:

```
3/13/09 12:53:32 PM BTADS0029I Scanner AttributePEOnly data from agent
x.xx.xxx.xxx:9510 has not changed since last scan.
3/13/09 12:53:33 PM BTADS0033E Error invoking AttributePEOnly on host
x.xx.xxx.xxx:9510 .
3/13/09 12:53:33 PM java.lang.reflect.UndeclaredThrowableException
at $Proxy16.invoke(Unknown Source)
at com.ibm.tpc.discovery.tsanm.InbandScanner.process(InbandScanner.java:136)
at com.ibm.tpc.infrastructure.threads.TPCThread.run(TPCThread.java:257)
Caused by: java.net.ConnectException: Connection refused: connect
at java.net.PlainSocketImpl.socketConnect(Native Method)
...
3/13/09 12:53:46 PM BTADS0033E Error invoking Topology on host
x.xx.xxx.xxx:9510 .
3/13/09 12:53:46 PM java.lang.reflect.UndeclaredThrowableException
at $Proxy16.invoke(Unknown Source)
at com.ibm.tpc.discovery.tsanm.InbandScanner.process(InbandScanner.java:136)
at com.ibm.tpc.infrastructure.threads.TPCThread.run(TPCThread.java:257)
```

```
Caused by: java.net.SocketException: Operation timed out: connect:could be
    due to invalid address
    at java.net.PlainSocketImpl.socketConnect(Native Method)
```

Action

Check the IP address in the /etc/hosts file on the agent system. If the IP address has changed, enter the correct IP address and restart the agent on the system.

Error Messages: Get SQLCODE: -964, SQLSTATE: 57011, Unexpected error occurred while performing [a function]

You might receive these error messages when performing tasks within IBM Spectrum® Control.

Problem

When performing tasks within IBM Spectrum Control that require accessing and storing data in the database repository, you might receive error messages similar to the following:

```
[message #]: Unexpected error occurred while performing the following [functions]
```

where [message

#] represents the number of the error message and [functions] represents a task that you were performing.

You might also see the following error message in the database installation log:

```
Instruction SQL : insert into t_stat_file_temp
SQLSTATE: 57011, Vendor error code: -964
DB2 SQL error: SQLCODE: -964, SQLSTATE: 57011,
SQLERRMC: null
```

These error messages are a result of running out of space in the transaction log. The transaction log configuration is set as:

```
db2 update db cfg for $DBNAME using logprimary 8
db2 update db cfg for $DBNAME using logsecond 16
```

Each transaction log file is 10 MB (logFileSize=2500 pages of 4 KB each). Eight (8) primary log files are allocated all the time; secondary log files are allocated as needed, and deleted when not needed, to the maximum of 16.

Action

Increase the transaction log files. See the DB2® documentation for information about increasing the transaction log files.

Data server crashes on AIX

This error occurs when you are running the Data server on AIX®.

Problem

The Data server crashes on AIX with the following messages in the system error logs:

```
ERROR LOGGING BUFFER OVERFLOW caused by
EXCESSIVE LOGGING BY SOFTWARE PROGRAM.
```

Action

Increase the paging space on the server.

No performance data is retrieved

This error occurs when you try to get performance data.

Problem

You are not successful in getting performance data.

Action

For a successful performance data collection to occur, the device must have been discovered and probed successfully.

Performance monitoring job fails immediately after it starts

This error occurs when you run a performance monitoring job and it fails immediately after it starts.

Problem

The performance monitoring job fails immediately after it starts.

Action

This problem usually occurs when there is a network connectivity problem with the CIM agent.

Error message "performance data files could not be correlated"

This error occurs when you uninstall the agent using the IBM Spectrum® Control uninstallation program.

Problem

You get this error message for the SAN Volume Controller subsystem during performance data collection.

Action

For SAN Volume Controller subsystems, this error message can occur during performance data collection. This is usually a problem with mismatching timestamps for the I/O statistics dump files on the SAN Volume Controller itself. This problem can be resolved by setting the time zone properly on the cluster.

Performance correlation step takes a long time

This error occurs when a performance correlation step is done.

Problem

The performance correlation step takes a long time.

Action

The performance correlation step can take a long time to complete if there are a lot of volumes. This causes a delay in collecting the first performance sample. To work around this problem, place the CIM agent and IBM Spectrum® Control servers on faster machines. You can also use multiple CIM agents to monitor a set of storage subsystems.

Cannot define a performance monitor for a switch

This error occurs when trying to define a performance monitor for a switch.

Problem

You cannot define a performance monitor for a switch.

Action

If you cannot define a performance monitor for a switch because it does not appear in the list of switches that can be monitored, do the following:

- Check to see that the SMI-S version supported by the switch vendor is 1.1 or higher.
- Check to see if the CIM agent supports the switch sub-profile.
- Check to see if the CIM agent discovery completed successfully.
- Check to see if a fabric probe was run on the fabric that contains the switch after the CIM agent discovery completed successfully for that switch. Then verify that this fabric probe also completed successfully.

File system storing database tables runs out of space

This problem occurs on systems running AIX® 5.x.

Problem

The file system storing the database table spaces runs out of space. This is shown by the following kinds of errors as seen in the DB2® log called `db2diag.log`:

```
2005-11-06-12.59.10.815891-420 E36562387C690      LEVEL: Error
PID       : 176316          TID    : 1          PROC  : db2pclnr 0
INSTANCE: db2inst1        NODE   : 000
FUNCTION: DB2 UDB, buffer pool services, sqlbClnrAsyncWriteCompletion,
probe:0
MESSAGE : ADM6017E The table space "TPCTBSPTMP" (ID "5") is full.
          Detected on
          container "/home/db2inst1/db2inst1/TPCDB/TPC/TPCTBSPTMP"
          (ID "0").
          The underlying file system is full or the maximum allowed
          space usage
          for the file system has been reached. It is also possible
          that there
          are user limits in place with respect to maximum file size
          and these limits have been reached.
```

This problem is seen on AIX 5.x with JFS file system. Large files need to be enabled on the file system because the table space files can get quite large. Enable large files on JFS or JFS2.

Action

During installation of AIX 5.1 or later, ensure that JFS or JFS2 with large file system support is installed. Follow the AIX documentation for this purpose as well as to back up and restore data between file systems. It is recommended to ensure that the file system size (especially for `/home`) is not too small (for example, not less than 4 GB). Back up your existing data before you recreate your file system. For information about file systems, see: http://www-01.ibm.com/support/knowledgecenter/ssw_aix_53/com.ibm.aix.baseadm/doc/baseadmndita/fs_types.htm.

Alternatively, you can set the `DIAGPATH` and `SPM_LOG_PATH` variables to point to an external, fast disk drive.

Error message: There is a problem with this website's security certificate

You receive this error message on Internet Explorer when you launch the DS8000® Element Manager.

Problem

You cannot launch the DS8000 Element Manager.

Action

To resolve this issue, follow these steps:

1. Launch the DS8000 Element Manager in a Web browser.
2. You see this error message:

There is a problem with this website's security certificate.

3. Click the link labeled **Continue to this website (not recommended)**.
Note: In the Internet Explorer taskbar, you see a red box labeled **Certificate Error**. Click the **Certificate Error** box.
4. Click **View certificates** in the dialog window. You see a **Certificate** dialog window.
5. Click **Install Certificate** button.
6. Click **Next**.
7. Select **Place all certificates in the following store** radio button.
8. Click **Browse**. You see the **Select Certificate Store** dialog window.
9. Select the **Show physical stores** check box.
10. Expand the **Trusted Root Certification Authorities** navigation tree entry.
11. Select the **Local Computer** subtree entry.
12. Click **OK**.
13. Click **Next**.
14. Click **Finish**.
15. Click **OK** on the message box **The import was successful**.
16. Click **OK** to close the **Certificate** window.
17. Close the Web browser.
18. Launch the DS8000 Element Manager.

Cannot discover fabric on Red Hat Linux using Emulex HBA

A fabric probe operation performed on Red Hat® Linux® using a Storage Resource agent cannot find the Emulex HBA.

Problem

When you installed the Emulex driver, the installation might not have installed the 32-bit DFC libraries because of missing prerequisites. The following messages appear during the Emulex driver installation:

```
Installing DFC libraries via RPM ...
Unable to install 32-bit development kit library due to missing
32-bit shared object library: libnl.so
If 32-bit development kit desired, please install RPM package:
libnl-1.0-0.10.pre5.4.i386 (or equivalent) that includes 32-bit libnl.so.
```

Action

Verify that the DFC 32-bit library, `/usr/lib/libdfc.so`, is on the system. If the library is missing, install the missing prerequisite package shown during the Emulex driver installation, and rerun the Emulex driver installation.

Cannot get version of Storage Resource agent on SUSE Linux

You cannot get the version of the Storage Resource agent on SUSE Linux®.

Problem

You try to run the following command to get the version of the Storage Resource agent on SUSE Linux:

```
./agent.sh version
```

This command does not get the version of the Storage Resource agent.

Action

To get the version of the Storage Resource agent, run the following command:

```
./agent.sh versionall
```

Cannot log on to two instances of IBM Spectrum Control by using the same browser

You cannot log on to two instances of IBM Spectrum® Control by using the same browser.

Problem

When you try to log on to more than one instance of IBM Spectrum Control by adding a tab or opening a new window in a browser, you are logged out of the first instance. This situation occurs because the Lightweight Third-Party Authentication (LTPA) cookie that is set by the first server (`TPC_server1`) is being overwritten by the LTPA cookie that is set by the second server (`TPC_server2`).

Action

To avoid this issue, take one of the following actions:

- Use different web browsers to log on to the different servers. For example, you can log on to one instance on Internet Explorer and the second instance by using Mozilla Firefox.
- If you are using single sign-on, make sure the Jazz® for Service Management servers are configured with the same LDAP information. By configuring the second authentication service to use the same LTPA keys as the first server, the LTPA cookies do not overwrite each other.
- If you are not using single sign-on, configure the LTPA cookies on each server to use the fully qualified host name of the server instead of only the parent domain name. Complete the following steps for each server to configure the domain name:

1. Log on to the IBM Spectrum Control server with administrative privileges.
2. Open a command prompt and go to `installation_dir/wlp/usr/servers/webServer` directory.
3. Edit the `server.xml` file and change this line:

```
<webAppSecurity ssoUseDomainFromURL="true" />
```

to:

```
<webAppSecurity ssoDomainNames="<fully qualified host name of
IBM Spectrum Control server>" />
```

4. Save and exit the `server.xml` file.

Because the servers are now identified by their fully qualified host names, an LTPA cookie that is set by one server does not overwrite an LTPA cookie that is set by the other server.

Warning in Probe Log for Storage Resource agents on AIX (STA0115W)

If certain services, such as `mountd` daemon, are not running on the AIX® Storage Resource agents, warning entries are displayed in the Probe log for Storage Resource agents deployed on AIX.

About this task

To review the Storage Resource agent Probe log for warnings and fix the underlying issue, complete the following steps:

Procedure

1. Run the **'rpcinfo -p localhost'** command to ensure that the **portmapper**, **status**, **nlocmgr**, **nfs**, and **mountd** programs are registered with the portmapper. The **'rpcinfo -p localhost'** command output shows that the **portmapper**, **status**, **nlocmgr**, **nfs**, and **mountd** programs are registered with the portmapper and up and running.
2. If you do not see the programs, start them.
For example, to start **mountd** on the AIX operating system, run the following command:

```
'startsrc -s mountd'
```

3. Run the **'rpcinfo -p localhost'** command again to verify that the required daemons are running.

Example

Here is an example of a message that appears in the log:

```
Apr 4, 12 1:44:11.000 AM EST AGT0446I Fabric discovery found switch fabric
Apr 4, 12 1:44:12.000 AM EST STA0115W Cannot connect to mountd to list exports:
RPC: 1832-019 Program not registered
Apr 4, 12 1:44:12.000 AM EST STA0110I Probe completed with warnings
```

A generic Storage Resource agent probe error might be a registration problem / GUID mismatch

A generic Storage Resource agent (SRA) probe error might occur when sending data to the server.

Problem

A generic Storage Resource agent (SRA) probe error might occur when sending data to the server, with the following in the SRA probe log:

```
STA0109I Probe completed successfully
STA0249I Sending results to server
AGT0306E Failed to send Probe complete status to server, for Agent in /opt/IBM/TPC
STA0251E Results not saved
```

Action

To check if this problem is caused by a registration problem or GUID mismatch, review the Data Server logs (TPC\data\log\TPCD_0000xx.log file) for the following:

```
SRV0040E: No agent is registered under machine identifier
XX.XX.X.XX (GUID: XXXxxXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX)

GEN0100E: Error processing request from host
<XX.XX.X.XX >, for service <Scheduler>, request(3, 1)
```

To resolve this issue manually register the SRA again so the GUID matches. Register the SRA by running the following command on the SRA host:

```
<SRA_install_location>/agent/bin/Agent -notify register -serverName <server_name>
```

Following IBM Spectrum Control server upgrade, the Storage Resource agents (SRA) might lack the Upgrade action

Immediately following an upgrade of the IBM Spectrum® Control server, the SRAs will have the Agent State of *Upgrade needed*, but might not have the option to start the SRA upgrade.

Problem

An Agent State of *Upgrade needed* occurs following an upgrade of the IBM Spectrum Control server, but there is no option available in IBM Spectrum Control to start the SRA upgrade.

Action

When a probe is run on the SRA, the option to upgrade will be available. Simply wait for the scheduled probes to occur, or to speed up the process, manually start probes of the SRAs, and then upgrade each to the current version.

How to fix IBM Storwize V7000 Unified authentication errors

If the IP address for IBM® Storwize® V7000 Unified is not configured correctly on SAN Volume Controller, you get an authentication error when you add the storage system in IBM Spectrum® Control.

Problem

You can add IBM Storwize V7000 Unified on a SAN Volume Controller to IBM Spectrum Control as either a file storage system, or block storage system, or both. However, if you add a block storage system IP address for a file storage system, or vice versa, an authentication error occurs.

Action

To solve the issue, complete these steps:

1. Get the IP address of IBM Storwize V7000 Unified storage system from the Storwize V7000 Unified Management GUI.
2. Get the IP address for the Storwize V7000 Unified storage system registered on SAN Volume Controller by using the following command on a command line of SAN Volume Controller. **svcinfo lscluster -devicename**
3. Update the IP address on SAN Volume Controller with the IP address from step 1 by using the following command: **chsystemip -clusterip <IP address>**
4. Retry the connection on IBM Spectrum Control.

Slow performance on VMware virtual machines due to shared VMDK

The VMware virtual machine where you run IBM Spectrum® Control exhibits slow performance.

Problem

The VMware virtual machine where you run IBM Spectrum Control is using a shared VMDK (Virtual Machine Disk) with other virtual machines. When you use a shared VMDK, it reduces the total number of disk IOPS (Input/Output Operations Per Second) available for each virtual machine; this causes poor performance and high disk latency on the virtual machine where you run IBM Spectrum Control.

Action

Use a dedicated VMDK for the VMware virtual machine where you run IBM Spectrum Control. Reconfigure the other virtual machines to *not* use the same VMDK as your IBM Spectrum Control virtual machine.

For more information, see <https://kb.vmware.com/s/article/1031773>.

How to disable cipher block chaining (CBC) ciphers in IBM Spectrum Control in response to the Lucky 13 vulnerability.

If needed, you can disable cipher block chaining (CBC) ciphers in IBM Spectrum® Control in response to the Lucky 13 vulnerability.

Problem

IBM Spectrum Control contains all of the necessary patches to properly address the Lucky 13 vulnerability (<https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-0169>). However, you might also want to disable CBC ciphers in IBM Spectrum Control in response to the Lucky 13 vulnerability.

Important: After you disable the CBC ciphers, IBM Spectrum Control does not manage IBM® DS8000® storage systems unless they are updated to a firmware level that provides GCM cipher support. For more information, contact IBM DS8000 storage system support.

Action

To disable CBC ciphers in IBM Spectrum Control, complete these steps:

1. Stop all IBM Spectrum Control servers.
2. Open the `installation_dir/jre/lib/security/java.security` file.
3. To disable CBC ciphers in IBM Spectrum Control, insert `AES_128_CBC, AES_256_CBC` to the `jdk.tls.disabledAlgorithms` line.

BEFORE

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, EC keySize < 224, TLSv1, TLSv1.1, anon, NULL
```

AFTER

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, EC keySize < 224, TLSv1, TLSv1.1, AES_128_CBC, AES_256_CBC, anon, NULL
```

4. Restart the IBM Spectrum Control servers.

You receive this error message when Db2 stops running.
- [Error message: The statement is too long or too complex \(SQL0101N\)](#)
This error occurs when there is not enough storage available in the database heap to process a statement.
- [Db2 expired license error](#)
IBM Spectrum Control installation and operation requires that Db2 is running. After the Db2 trial license period expires, Db2 does not start without a valid license.
- [Context root not found on IBM Spectrum Control 5.3.5 or later on Red Hat Enterprise Linux 7](#)
On the Red Hat Enterprise Linux 7 operating system, the Db2 and IBM Spectrum Control web server are configured to start at the same time upon start up.

Db2 crashes on RHEL 7.2

IBM® Db2® servers might crash when the RemoveIPC option for Red Hat® Enterprise Linux® 7.2 is set to yes.

Problem

The logind.conf file for RHEL contains the option **RemoveIPC**. That option controls whether System V and POSIX IPC objects that belong to the user are removed when the user logs out. For RHEL 7.2, **RemoveIPC** is set to yes by default, which can cause the Db2 database to crash every time a database administrative task cron session finishes.

When Db2 crashes, you might see the following message in the db2diag.log file:

```
MESSAGE: Unexpected OS error. This most likely means that resources have been  
torn down from underneath the prefetcher. Terminating the prefetcher  
to prevent infinite looping.
```

Action

To resolve this problem, complete the following steps:

1. On the computer where RHEL 7.2 and Db2 is installed, open /etc/systemd/logind.conf in a text editor.
2. Set **RemoveIPC** to **no**.
3. Save the file.

You might need to restart RHEL 7.2 for the change to take effect.

For more information about this problem, see [Applications using IPC \(semaphores, shared memory, message queues\) have problems after update to RHEL 7.2.](#)

Db2 log messages ADM5530W can be ignored

ADM5530W messages in the Db2® Event Log and db2diag.log indicate that the materialized query table (MQT) is using the 'NOT LOGGED INITIALLY' option to improve database performance and create fewer transaction log entries. These messages do not require any user action and can be ignored.

To prevent these messages from appearing in the Event Log and db2diag.log, set the Db2 [`notifylevel`] and [`diaglevel`] parameters to 2.

Related information

- 🔗 [notifylevel - Notify level configuration parameter](#)
- 🔗 [diaglevel - Diagnostic error capture level configuration parameter](#)

Db2 log files fill the C drive on the Windows DB2® system

On Db2® servers that run for extended periods of time, the Db2 logs can grow large enough to fill the C: drive if the default Db2 log location is used.

Problem

When installing Db2 on a Microsoft Windows system, the default location of the DB2DIAG and SPMLOG log files is the C: drive. After running IBM Spectrum® Control for an extended period of time, the Db2 logs can fill up the C: drive, making it difficult to install other applications on that system. This can also prevent other applications from writing to the C: drive.

Action

Use the information provided in the following links to manage your Db2 logs:

- Control the size of the Db2 diagnostic log using the **diagsize** database configuration parameter: [diagsize - Rotating diagnostic and administration notification logs configuration parameter](#).
- Archive the Db2 diagnostic logs using the **archive** database configuration parameter: [db2diag - db2diag logs analysis tool command](#).

Cannot read Korean language logs from GUI

This problem occurs in Korean language environments.

Problem

You will not be able to view the log files from the IBM Spectrum® Control GUI because of a Db2® JDBC driver problem.

Action

You will have to read the files using another text viewer like **Notepad**.

Installation fails with "No valid local database found" error

During the IBM Spectrum® Control installation, an error occurs stating that no valid databases were found.

Action

This problem can occur if the db2profile is not sourced correctly, or if Db2® has not installed successfully. To resolve this issue, perform the following steps:

1. If the installation is on a UNIX server, be sure to source the db2profile. For example, for an instance of **db2inst1**, source the db2profile by entering the following: `. /home/db2inst1/sqllib/db2profile`. Note the space between the `.` and `/home`.
2. Verify the Db2 installation. See [Verifying that Db2 is installed correctly](#) for information about how to verify a Db2 installation.

Error message: GUI0023M

This error occurs when performing a system reboot.

Problem

After a reboot of the system, you receive the following error message:

```
GUI0023M Unable to connect to server after reboot.
```

If abnormal behaviors are observed which might be related to or impact Db2®, be sure to stop your Db2 instance properly before you perform a system reboot. If you do not stop Db2 properly, Db2 might take a long time to start. This will also cause IBM Spectrum® Control to not start.

Action

The Db2 instance might not have stopped properly. Manually stop and restart Db2.

Error message: SRV0024E

This error occurs when Db2® is down or not running.

Problem

This might be a problem with Db2. The Db2 database can be down or Db2 is not running. Check to see if Db2 is running. You will see this message:

```
PM SRV0024E The requested service provider has been shutdown.
```

Action

If Db2 is not running, start Db2 and then stop and restart the Device server and Data server.

Error message: SRV0044E

This error occurs when the password for the Db2® user ID account for which IBM Spectrum® Control is installed under is changed.

Problem

The GUI will not start and an error occurs in the log:

```
PM SRV0044E: Unable to connect to repository database. Please ensure that the repository database is up and running. Connection authorization failure occurred. Reason: password invalid.
```

Action

To change the Db2 user ID password, follow these steps:

1. From a command prompt, change to the directory where the file **repository.config** resides in the IBM Spectrum Control installation path. For example on Windows:

```
<installation_dir>\data\config
```

2. Run the following command for the Data server:

```
java -classpath "<installation_dir>\data\server\lib\TSRMsrv.zip" com.tivoli.itsrm.repository.Transform -p <new_db2userid_password> repository.config
```

3. Make sure the Device server is running. Run the following commands for the Device server:

```
cd <installation_dir>\device\bin\<platform> setenv srmcp -u <user_ID> -p <password> ConfigService setPw <new_password>
```

Where **<new_password>** is the new password. This sets the Db2 user ID password (not the Db2 administrator password).

4. Stop and then restart IBM Spectrum Control - Data server from the Windows Services window.
5. Restart IBM® WebSphere® Application Server V6 - Device server from the Windows Services window.
6. Start the IBM Spectrum Control GUI.

Db2 instance crashes

This problem occurs when running an agent probe.

Problem

An agent probe causes the Db2® instance to crash. You also receive this message in the Db2 logs:

```
ADM0501C A stack overflow exception has occurred. The DB2 instance has terminated abnormally.
```

Action

To resolve this problem, increase the Db2 stack size. Go to the Db2 directory:

C:\Program Files\IBM\SQLLIB

Follow these steps:

1. Stop the Device server and Data server.
2. Stop the Db2 database.
3. Run the following command:

```
.\misc\db2hdr .\bin\db2syscs.exe /s: 512
```

4. Start the Db2 database.
5. Start the Device server and Data Server.

Db2 connection errors

These errors occur when rebooting remote Db2® servers.

Problem

Getting Db2 connection errors in IBM Spectrum® Control server log files

Action

This could be caused by the remote Db2 server being rebooted. If this is the case, restart the Data Server and Device server.

Error message: SQL0968C

This error occurs when the file system storing the database table runs out of space.

Problem

You see this error message from Db2®:

SQL0968C The file system is full.

This is the explanation from Db2:

One of the file systems containing the database is full. This file system may contain the database directory, the database log files, or a table space container.

The statement cannot be processed.

Action

Free system space by erasing unwanted files. Do not erase database files. If additional space is required, it may be necessary to drop tables and indexes identified as not required.

On UNIX-based systems, this disk full condition may be due to exceeding the maximum file size allowed for the current user ID. Use the **chuser** command to update the **fsize**. A reboot might be necessary.

This disk full condition may be caused when containers are of varying sizes. If there is sufficient space in the file system, drop the table space and recreate it with containers of equal size.

For AIX® systems, check to see if the AIX file size limit goes beyond 2 GB. Check the sizes of the files. As the root user, run this command:

```
lsfs -qa
```

If you see "bf: false", then you need to enable the large file option to allow files to go over 2 GB.

It is suggested that you monitor Db2's database performance. You can do this through DB2®'s Health Center. For more information about DB2's Health Center, see [Planning to monitor Db2](#) and [IBM® Db2 Version 11.5 Knowledge documentation](#). Click **Monitoring > Database systems > Monitoring database systems > Monitoring database health**.

Error message when installing Db2 on Windows

You get an error message when installing Db2® on a Windows system.

You can receive one of the following error messages:

An error occurred while updating the services file on the system for the service name 'db2c_DB2' with port '25000'.

No valid local database found on the system.

You receive this error message because Db2 failed to configure the port at installation time.

An error occurred while initializing the Profile Registry.

Error message: HWNOP0033 Database operation failed

You receive this error message after running several storage optimizer jobs.

Problem

You receive this error message after running several storage optimizer jobs:

```
HWNOP0013E Database operation failed com.ibm.db2.jcc.b.SqlException:  
DB2 SQL error: SQLCODE: -956, SQLSTATE: 57011, SQLERRMC: null
```

This message indicates that all available memory for the database has been used. There is not enough storage available in the database heap to process the statement.

Action

Increase the database heap size to allow a larger database heap. If the database heap size is set to AUTOMATIC, you need to increase either the DATABASE_MEMORY database configuration setting, or the INSTANCE_MEMORY database manager configuration setting.

When updating the configuration parameters, it is suggested to change them by 10% of the current size until the error condition is resolved.

Here is an example of how to change the database heap size to 2400:

```
db2 UPDATE DB CFG FOR TPCDB USING DBHEAP 2400  
(the IBM Spectrum  
Control database schema sets the  
database heap size to 1800)
```

Here is an example of how to change the database heap size when disconnected from the database:

```
db2 CONNECT RESET;  
db2 UPDATE DB CFG FOR TPCDB USING DBHEAP 2400;
```

If all associated configuration parameters are set to either AUTOMATIC or COMPUTED, and the memory demands of the instance exceed the amount of memory configured on the system, then possible solutions would be to reduce the database workload or adding additional memory to the system.

Error message: DB2® SQL error: SQLCODE: -964, SQLSTATE: 57011

You receive this SQL exception when you migrate IBM Spectrum® Control data.

Problem

When migrating IBM Spectrum Control data, you get this error message in the database installation log:

```
Instruction SQL : insert into t_stat_file_temp  
SQLSTATE: 57011, Vendor error code: -964  
DB2 SQL error: SQLCODE: -964, SQLSTATE: 57011,  
SQLERRMC: null
```

This message indicates that there is not enough storage available in the database heap to process the statement. This error message is a result of running out of space in the transaction log. The transaction log configuration is set as:

```
db2 update db cfg for $DBNAME using logprimary 8  
db2 update db cfg for $DBNAME using logsecond 100
```

Each transaction log file is 10 MB (logFileSize=2500 pages of 4 KB each). Eight primary log files are allocated all the time. Secondary log files are allocated as needed, and deleted when not needed, to the maximum of 100.

Action

Increase the transaction log files. See the Db2® documentation for information about increasing the transaction log files. Go to [IBM® Db2 Version 11.5 Knowledge documentation](#). Search for **logprimary** and **logsecond**.

Error message: DB2® SQL error: SQLCODE: -973,STATE:57011, SQLERRMC:PCKCACHESZ

You receive this error when opening a panel in the IBM Spectrum® Control user interface that requires information from the database repository. For example, when you generate a report or view a list of devices managed by CIMOMs.

Problem

When you open a panel that requires information from the database repository, you might receive the following error:

```
Server: server_name      Status: 0
SQLSTATE: 57011, Vendor error code: -973
DB2 SQL error: SQLCODE: -973, SQLSTATE: 57011,
SQLERRMC: PCKCACHESZ
```

This message indicates an error related to the PCKCACHESZ configuration setting in Db2®. This parameter is allocated out of the database shared memory, and is used for caching of sections for static and dynamic SQL and XQuery statements on a database.

Action

Increase the value for PCKCACHESZ until the error in the user interface is resolved. Initially, increase the value of PCKCACHESZ to 78525. If that does not resolve the error, increase the value in 10% increments until the error is resolved.

To increase the value for PCKCACHESZ, complete the following steps:

1. Check the current value for PCKCACHESZ by running the following commands at the Db2 prompt:

```
db2 connect to tpcdb
db2 get db cfg show detail | grep PCKCACHESZ
```

2. Increase PCKCACHESZ to 78525:

```
db2 update db cfg for TPCDB using PCKCACHESZ 78525
```

Note: If PCKCACHESZ is set to **AUTOMATIC**, all applications must disconnect from the Db2 in order for the change to take effect.

3. If increasing PCKCACHESZ to 78525 does not resolve the problem, increase the value by 10% increments until the error condition is resolved:

```
db2 update db cfg for TPCDB using PCKCACHESZ NEW_VALUE
```

where the initial **NEW_VALUE** is 10% greater than 78525.

Error message: DEBUG: Error 2836

After you install Db2®, you might see this error message in the Db2 installation log file.

Problem

The error message is:

```
DEBUG: Error 2836: The control image_noJava on the dialog SetupInitialization
can not take focus
Internal Error 2836. SetupInitialization, image_noJava
Action 14:29:48: SetupInitialization. Dialog created
Action ended 14:29:48: SetupInitialization. Return value 1.
```

Action

This is an informational message for the Windows installation program and will not cause problems.

Error message: SRV0046E, Db2 stops running

You receive this error message when Db2® stops running.

Problem

You receive this error message:

```
SRV0046E: Repository connection status check failed.
The database manager is not able to accept new requests, has terminated all
requests in progress, or has terminated this particular request due to
unexpected error conditions detected at the target system.
```

This issue can occur on IA32 32-bit platforms due to a timing problem.

Action

Restart Db2.

Error message: The statement is too long or too complex (SQL0101N)

This error occurs when there is not enough storage available in the database heap to process a statement.

Problem

When you add many columns to a custom report, the following error message might be displayed:

```
SQL0101N The statement is too long or too complex
```

This message indicates that all available memory for the database is used.

Action

Increase the database heap size to allow a larger database heap. For example, to change the IBM Spectrum® Control database heap size, use the **db2 UPDATE DB** command:

```
db2 UPDATE DB CFG FOR TPCDB USING STMHEAP 500000
```

Db2 expired license error

IBM Spectrum® Control installation and operation requires that Db2® is running. After the Db2 trial license period expires, Db2 does not start without a valid license.

Problem

You get an error when you attempt to install or operate IBM Spectrum Control because Db2 is not running. After the Db2 trial license period expires, Db2 requires a valid license in order to start.

Action

Retrieve the valid Db2 license that is supplied on the IBM Spectrum Control download site. Find the db2awse_o.lic file in the awse_o/db2/license/ directory and run the db2licm command to apply the new license. For example, from the command line in the license directory run the following command:

```
db2licm -a db2awse_o.lic
```

Related information

- 📄 [IBM Spectrum Control version downloads](#)

Context root not found on IBM Spectrum Control 5.3.5 or later on Red Hat Enterprise Linux 7

On the Red Hat® Enterprise Linux® 7 operating system, the Db2® and IBM Spectrum® Control web server are configured to start at the same time upon start up.

Problem

If Db2 takes significantly longer to start up than the IBM Spectrum Control web server, you see a Context Root Not Found page when trying to load the IBM Spectrum Control GUI.

Action

Restarting the web server after Db2 has fully started might resolve the issue until the next start up. If not, to fix the issue across start ups, complete the following steps:

1. Edit the /etc/systemd/system/webWLP.service directory by adding the lines in **bold**:

```
[Unit]
Description=IBM Spectrum Control Web Server
After=db2fmcd.service

[Service]
ExecStartPre=/usr/bin/sleep 45
ExecStart=/usr/bin/bash -c "/opt/IBM/TPC/wlp/bin/server start webServer --clean >
/opt/IBM/TPC/wlp/bin/../../web/log/startServer.log"
ExecStop=/usr/bin/bash -c "/opt/IBM/TPC/wlp/bin/server stop webServer >
/opt/IBM/TPC/wlp/bin/../../web/log/stopServer.log"
TimeoutStopSec=360
Type=forking
LimitNOFILE=4096
LimitNPROC=131072
LimitFSIZE=infinity
LimitCORE=infinity

[Install]
WantedBy=multi-user.target
```

2. Run the following command as root:

```
# systemctl daemon-reload
```

Ensure that you also implemented this fix for Db2 AutoStart on Red Hat Enterprise Linux 7. See [DB2® AutoStart is not supported on Red Hat Enterprise Linux version 7](#).

Installation, uninstallation, and upgrading

Use this section to troubleshoot and resolve problems with IBM Spectrum® Control installation, uninstallation, and upgrading.

- [BTACS0043E: Probe fails after upgrading IBM Spectrum Control](#)
After upgrading to IBM Spectrum Control 5.3.2 or later, you encounter a **BTACS0043E** error during a probe.

Creating a keystore for an IBM Spectrum Control server

You need this recovery procedure if you do not know the keystore password for the Alert server, Device server, or Web server during an upgrade of IBM Spectrum Control.

Problem

During an upgrade to IBM Spectrum Control 5.3.4 or later, the Alert server, Device server, and Web server keystores are converted from the JKS format to the PKCS12 format. If a particular server's keystore password is not the default value and you do not know the server's current keystore password, then the server's keystore conversion does not occur. You must create a new keystore for that IBM Spectrum Control server before you can proceed with your upgrade of IBM Spectrum Control.

Action

Note: The following procedure assumes that you are running IBM Spectrum Control on a Windows operating system.
To create a keystore, use the following steps:

1. Cancel the IBM Spectrum Control installation program.
2. Stop each IBM Spectrum Control server whose current keystore password you do not know.
3. Make a backup of the following files for each IBM Spectrum Control server whose current keystore password is unknown:
 - `installation_dir\wlp\usr\servers\server_name\resources\security\key.jks`
 - `installation_dir\wlp\usr\servers\server_name\server.xml`where `installation_dir` is the IBM Spectrum Control installation location and `server_name` is the name of the IBM Spectrum Control server. For example, `alertServer`, `deviceServer`, or `webServer`.
4. Delete the following file for each IBM Spectrum Control server whose current keystore password is unknown:

- `installation_dir\wlp\usr\servers\server_name\resources\security\key.jks`
where `installation_dir` is the IBM Spectrum Control installation location and `server_name` is the name of the IBM Spectrum Control server. For example, `alertServer`, `deviceServer`, or `webServer`.
- Open a command window and run the following commands:
 - `cd installation_dir\wlp\bin`
 - `securityUtility.bat createSSLCertificate --server=server_name --password=new_password --validity=825`
 - `securityUtility.bat encode`
When prompted, enter the `new_password` value that you set in Step 5b and make note of the resulting encoded value.

Where `installation_dir` is the IBM Spectrum Control installation location, `new_password` is the new keystore password that you are setting, and `server_name` is the name of the IBM Spectrum Control server. For example, `alertServer`, `deviceServer`, or `webServer`. It is recommended to use the value `default` for the new keystore password.
 - `cd installation_dir\jre\bin`
 - `ikeycmd -cert -delete -db installation_dir\wlp\usr\servers\server_name\resources\security\key.jks -pw new_password -label default`
 - `ikeycmd -cert -create -db installation_dir\wlp\usr\servers\server_name\resources\security\key.jks -pw new_password -label default -size 2048 -sig_alg SHA256_WITH_RSA -expire 825 -dn "CN=<machine_FQDN>, OU=server_name, O=ibm, C=us" -san_dnsname <machine_FQDN> -eku serverAuth`
Where `<machine_FQDN>` is the fully qualified domain name of the machine where you installed the IBM Spectrum Control servers. For example, `myserver.mycompany.com`
 - For each IBM Spectrum Control server whose current keystore password is unknown, edit the `installation_dir\wlp\usr\servers\server_name\server.xml` file, where `installation_dir` is the IBM Spectrum Control installation location and `server_name` is the name of the IBM Spectrum Control server. For example, `alertServer`, `deviceServer`, or `webServer`.
In the `server.xml` file, locate the line for the `keyStore` element (for example - `<keyStore id="home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_troubleshooting_ref_create_new_kstore_servers_defaultKeyStore" password="{xor}OTAwbmw9Pi0=" />`).
Replace the password value with the encoded `new_password` value that you generated in Step 5c. Ensure that the password value is enclosed in double quotation marks and contains the `{xor}` prefix (for example - `<keyStore id="home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_troubleshooting_ref_create_new_kstore_servers_defaultKeyStore" password="{xor}encodedNewPassword" />`).
 - If you upgrade from IBM Spectrum Control 5.3.0 or later and if you create a new keystore for the IBM Spectrum Control Device server, you must use the **keytool** command to update the IBM Spectrum Control data collector trusted certificates or else the data collector does not communicate properly with the IBM Spectrum Control Device server.
Use the following steps, if you **did** create a new keystore for the IBM Spectrum Control Device server.

If you do **not** need to use these steps, proceed to Step 8.
 - `cd installation_dir\jre\bin` where `installation_dir` is the IBM Spectrum Control installation location.
 - Enter the following command to export the SSL certificate from the IBM Spectrum Control new Device server keystore:

`keytool.exe -exportcert -alias default -keystore "installation_dir\wlp\usr\servers\deviceServer\resources\security\key.jks" -storepass new_device_server_keystore_password -file deviceServer.cert`

where `installation_dir` is the IBM Spectrum Control installation location, `new_device_server_keystore_password` is the `new_password` value that you set in Step 5b.
 - Enter the following command to delete the previous IBM Spectrum Control Device server SSL certificate from the IBM Spectrum Control data collector trusted certificates:

`keytool.exe -delete -alias deviceServer -keystore "installation_dir\jre\lib\security\cacerts" -storepass data_collector_keystore_password`

where `installation_dir` is the IBM Spectrum Control installation location and `data_collector_keystore_password` is the IBM Spectrum Control data collector keystore password. The default value for this password is `changeit`.
 - Enter the following command to add the SSL certificate from the IBM Spectrum Control new Device server keystore to the IBM Spectrum Control data collector trusted certificates:

`keytool.exe -importcert -noprompt -trustcacerts -alias deviceServer -file deviceServer.cert -keystore "installation_dir\jre\lib\security\cacerts" -storepass data_collector_keystore_password`

where `installation_dir` is the IBM Spectrum Control installation location and `data_collector_keystore_password` is the IBM Spectrum Control data collector keystore password. The default value for this password is `changeit`.
 - Start each IBM Spectrum Control server that you stopped in Step 2.
 - Start the IBM Spectrum Control installation program again and upgrade to the latest version of IBM Spectrum Control.

Important: If your current IBM Spectrum Control system uses LDAP authentication **with** secure communication between IBM Spectrum Control and the LDAP repository, and if you create a new keystore for the IBM Spectrum Control Web server by using this procedure, you lose the LDAP server's SSL certificate and LDAP authentication does not work. To resolve this situation after you upgrade IBM Spectrum Control to 5.3.4 or later, you must log in to the IBM Spectrum Control GUI with the `tpcFileRegistryUser` user ID and password and complete the *Changing from operating system to LDAP authentication* procedure to reconfigure LDAP authentication with a secure communication between IBM Spectrum Control and the LDAP repository.

If your current IBM Spectrum Control system uses LDAP authentication **without** secure communication between IBM Spectrum Control and the LDAP repository, and if you create a new keystore for the IBM Spectrum Control Web server by using this procedure, LDAP authentication will continue to work after you upgrade to IBM Spectrum Control 5.3.4 or later.

- [Changing from operating system to LDAP authentication](#)

Error message: INS3105E Failure to install remote agent

This error occurs when you are installing a remote agent on a UNIX or Linux® system. .

Problem

You get this error message:

```
PM INS3105E: Host <fully_qualified_hostname> is associated
with an invalid loopback IP 127.0.0.1
```

In the `/etc/hosts` file, the line for the specified IP address should be:

```
127.0.0.1    localhost.localdomain localhost
```

and **not**

```
127.0.0.1    <fully_qualified_hostname> <short_hostname>
localhost.localdomain localhost
```

You should have a separate entry for the regular IP address and hostname of the IBM Spectrum® Control server. For example:

```
9.47.98.63 <fully_qualified_hostname> <short_hostname>
```

Action

The DB2® instance might not have stopped properly. Manually stop and restart DB2.

Installing a remote agent fails

This error occurs when you install a remote agent and it fails.

Problem

You are getting a connection error to the remote computer when you try to install a remote agent.

Action

When you are installing a remote agent from a Windows computer, you must have the HOSTS file set properly on the Windows computer. For information about the HOSTS file, see [Changing the HOSTS file](#).

The Solaris HBA identifies a SCSI device instead of fibre channel LUNs

This problem occurs when the Oracle Solaris HBA identifies a SCSI device instead of fibre channel LUNs.

Problem

This problem may be a result of a configuration setup problem with the HBA.

Action

In Solaris, make sure that the `/etc/hba.conf` file points to the correct vendor HBA API library.

For example, if the QLOGIC HBA API library is set as follows in the `/etc/hba.conf` file:

```
ql2x00    libqlsdm.so
```

This is incorrect and should be changed to:

```
ql2x00    /usr/lib/libqlsdm.so
```

In windows, this library is identified using the registry value at:

```
HKEY_LOCAL_MACHINE/SOFTWARE/SNIA/HBA/<vendor_name>
```

For example, for QLogic you will have this value:

```
HKEY_LOCAL_MACHINE/SOFTWARE/SNIA/HBA/QL2X00
```

The property for the library is in the `LibraryFile` key.

For QLogic, a correct configuration has the **LibraryFile** key set as:

```
C:\Program Files\QLogic Corporation\SANsurfer\ql2xhai2.dll
```

Also, the RDAC controller does not have a common HBA API interface. Therefore, the WWN and fibre identification does not work at this time.

Installing IBM Spectrum Control on Windows with installation files on a Samba fileshare

UNIX and Linux® file systems use Samba software to mount file systems on Windows. UNIX and Linux mark hidden files with a leading dot '.' in the file or the folder name.

Problem

In the Samba default configuration, the files and folders with the leading dot get the Windows "hidden" files attribute to ensure consistent behavior.

Action

Change the Samba configuration setting to:

```
hide dot files = no
```

for the Samba share or as a general setting in the Samba configuration file **smb.conf**. The files and folders are no longer marked as hidden.

Note: If your network share is a Samba share on a Linux or AIX® machine, add the following line to the configuration file. This file is in directory /etc/samba/smb.conf.

```
<share_name_where_installation_dir_files_are_located>
.
.
.
#Set to show "dotted" files
hide dot files = no
```

The dots represent any current lines that might be in the share name section.

Restart your Samba service or reload the configuration file. See your operating system documentation for information about restarting the service.

IBM Spectrum Control agent installation fails when files are mapped to a drive in a Windows Terminal Services environment

The IBM Spectrum® Control agent installation fails when files are mapped to a drive in a Windows Terminal Services environment.

Problem

The IBM Spectrum Control agent installation fails when files are mapped to a drive in a Windows Terminal Services environment.

Action

There are two ways to correct this problem:

1. Map the installation source files through the UNC path (for example, \\<server_name>\<disk>) rather than using the drive letter (do not use **net use x:\\<server_name>\<disk>**).
2. Copy the installation files manually to the target host and run the installation program locally.

Db2 services do not start when you restart the system on a UNIX platform

The Db2® services do not start when you perform a system reboot on UNIX.

Problem

On UNIX operating systems, the instance is not enabled for autostart by default.

Action

On UNIX operating systems, to enable an instance to start automatically after each system restart, enter the following command:

```
db2iauto -on <instance_name>
```

where <instance_name> is the login name of the instance.

Cannot install the Storage Resource agent on AIX through RSH

You cannot install the Storage Resource agent on an AIX® system that has the Remote Shell (RSH), but does not have the Secure Shell (SSH).

Problem

The AIX agent system does not have SSH but does have RSH. You can connect with RSH from the server through a command line, but the Storage Resource agent deployment fails with the following message:

```
RSH: ... Could not establish a connection to the target machine using the
credentials supplied
```

Action

Check the `.rhosts` file on the AIX agent system to see if it allows the server and user to connect to AIX through RSH. The `$HOME/.rhosts` file defines which remote hosts (computers on a network) can invoke certain commands on the local host without supplying a password.

The format of the `$HOME/.rhosts` file is:

```
<host_name_field>    [<user_name_field>]
```

Ensure that you add the server and user name to this file and save the file. Deploy the Storage Resource agent again.

Storage Resource agent failed to install using install command

The Storage Resource agent failed to install when using the install command.

Problem

When you specify the install command for the Storage Resource agent, check to see if you specified an agent installation location that contains an ending slash (\). For example, `C:\agent1\`. This causes the installation to fail.

Action

Do not specify an ending slash when you specify the agent installation location. For example, specify `C:\agent1`.

Upgrading to IBM Spectrum Control 5.4.1 on RHEL 7 fails during upgrade of Storage Resource agent

Problem

The upgrade process fails for IBM Spectrum® Control 5.4.1 on RHEL 7 during an upgrade of the Storage Resource agent.

Action

If your upgrade to IBM Spectrum Control 5.4.1 on RHEL 7 fails during an upgrade of the Storage Resource agent, complete the following steps:

1. If you are performing a GUI mode upgrade, click OK in the failure dialog and then cancel out of your upgrade to IBM Spectrum Control 5.4.1.
2. Search the RHEL 7 process table for the term: Agent. Note, there might be one Agent process running from your IBM Spectrum Control installation location. For example - `/opt/IBM/TPC/agent/bin/Agent`. Perform a **kill -9** command on that Agent process.
3. Apply all available updates and patches to your RHEL 7 operating system.
4. Resume your upgrade to IBM Spectrum Control 5.4.1.

You cannot install IBM Spectrum Control on AIX and Linux systems

You cannot install IBM Spectrum® Control on AIX® and Linux® systems. You receive an error message that indicates that the DB2® user ID does not exist.

Problem

You receive this error message:

```
User ID db2inst1 does not exist on the system
```

You receive this error message even though the db2inst1 user ID exists and DB2 is working properly. The error occurs because the shadow util package is not installed and configured on the system.

A shadow password file is a system file in which encrypted user passwords are stored. Normally, user information for each user is stored in an encrypted format in `/etc/passwd`. However, for shadow passwords, the shadow password file is moved to a separate database for local files, usually in `/etc/shadow` on AIX and Linux

systems.
The shadow password file can only be read by the root user.

Action

Check to see that the shadow passwords are installed and configured on the system.

If the file `/etc/shadow` exists on the system, then the shadow passwords are already installed and configured.

If not, install and configure the shadow passwords. Install the shadow utils package from the operating system CD.

For example, on Linux follow these steps:

1. Install the shadow utils package, shadow-utils-<version_release_architecture>.rpm.
2. To configure the shadow passwords after you install the package, run the following commands:

```
/usr/sbin/pwconv  
/usr/sbin/grpconv
```

Note: The instructions and package name and version might differ between operating systems. Also, the instructions for how to configure the shadow passwords might differ. Check the operating system CD or your vendor for instructions on how to install and configure the shadow passwords.

After reboot of the system, IBM Spectrum Control cannot communicate with Db2

After a reboot of the system on Windows, Db2® starts up but IBM Spectrum® Control cannot communicate with Db2.

Problem

To determine if this problem exists, open a command prompt window and run the command **netstat -na**. Port 25000 is not listed anywhere as a result of this command.

Action

If port 25000 is displayed, follow these steps to enable the Db2 service port for remote connections:

1. Open the Windows service file:

```
C:\WINDOWS\system32\drivers\etc\services
```

2. Search for the following line:

```
db2c_DB2 25000/tcp
```

Note the port number (the port number is probably 25000).

3. Open a Db2 command prompt window by running **db2cmd**. Run the following commands:

```
db2 update dbm cfg using SVCENAME db2c_DB2  
db2set  
db2stop  
db2start
```

Note:

- When you run the **db2set** command, an example of the output is:

```
DB2COMM=tcPIP
```

- If `db2c_DB2` is not the service name of the Db2 instance name on the system, use the name listed in the service file.
- If on a subsequent reboot of the system, this problem occurs again, then Db2 is not storing this information in the configuration file. Try running these commands:

```
db2 update dbm cfg using SVCENAME db2c_DB2 deferred  
(This forces DB2 to update the configuration file.)  
db2set  
db2stop  
(If DB2 displays an error message saying that the database manager was  
not stopped because the databases are still active, use the command  
db2stop force.)  
db2start
```

When you run the **db2set** command, an example of the output is:

```
DB2COMM=tcPIP
```

- Determine if the problem is fixed by running **netstat -na**.
- Verify that port 25000 is listed. For example, your output looks like this:

```
TCP 0.0.0.0:25000 0.0.0.0:0 LISTENING
```

As long as that port is active, Db2 can connect to IBM Spectrum Control.

Cannot deploy Storage Resource agent because of a timeout, get error message NAD0006E

You are trying to deploy a Storage Resource agent on a system and get this error message.

Problem

When you deploy a Storage Resource agent on a system, you see this error message in the log file:

```
NAD0006E Exception thrown for method updateNAOsInfo:
java.net.ConnectException: CTGRI0081E RXA internal
command run on xxxx.xxxx.xxxx.xxxx could not be completed
during the specified timeout interval.
```

You cannot deploy the Storage Resource agent.

Action

Use the tpctool command line interface to increase the default_timeout value for the Storage Resource agent.

1. Use the getdscfg command to see the current values for the Storage Resource agent:

```
tpctool> getdscfg -context SRA
```

The following output is returned:

Property	Context	Value
default_timeout	SRA	120000
long_timeout	SRA	300000
nfs_timeout	SRA	10000

2. Use the setdscfg command to change the default_timeout value:

```
tpctool> setdscfg -context SRA -property default_timeout 150000
```

3. Use the getdscfg command again to verify the new value for the default_timeout property:

```
tpctool> getdscfg -context SRA
```

The following output is returned:

Property	Context	Value
default_timeout	SRA	150000
long_timeout	SRA	300000
nfs_timeout	SRA	10000

Storage Resource agent information is inconsistent after stop and restart on Windows

On Windows, after you stop the Storage Resource agent, reboot the system, and restart the agent, the information displayed for the agent is not consistent.

Problem

For example, the IP address and agent name are not the same before and after you stop and start the Storage Resource agent.

Action

If the IBM Spectrum® Control server and Storage Resource agent (or Fabric agent) are installed on the same Windows system that is also the Primary Domain Controller and has Microsoft Failover Cluster node, then the hosts file must be changed.

You must enter the correct IP address, fully qualified domain name, and host name in the hosts file before installing IBM Spectrum Control. The hosts file is found in this directory:

```
C:\Windows\system32\drivers\etc\hosts
```

Enter a line in the hosts file, for example:

```
98.256.43.23 xyz.company.com xyz
```

If the IP address, fully qualified domain name, and host name are not added to the hosts file, then the preferred private IP address (169.x.y.z) for the Microsoft Failover Cluster Virtual Adapter is incorrectly returned as the IP address for the Data server and Storage Resource agent.

Cannot deploy Storage Resource agent after changing SSL certificates

You cannot deploy the Storage Resource agent after changing the SSL certificates.

Problem

When generating custom SSL certificates, the certificates have a start date, end date, and time when they are valid. These dates and times are related to the system where these custom certificates were generated (which is usually the server system). When installing a Storage Resource agent on a remote system, you must check the date and

time on the Storage Resource agent system. If the server and agent systems are in the same time zone, they must have the same date and time. Otherwise, the time zone difference should be set.
For example, if the server system is 8:00 PM, the agent system should also be 8:00 PM. If the agent system is set at a different time (for example, 6:00 PM) at the time the SSL custom certificates are generated on the server system with a time of 8:00 PM, the deployment of the Storage Resource agent will fail.

Action

Set the time zones on the agent system to match the server time.

Message in Device server log states that port 162 is in use

IBM Spectrum® Control uses the default port 162 to listen for SNMP traps. If another process is listening on port 162, you get an error message in the Device server log that port 162 is in use by another process.

Problem

You see this message in the Device server message log if another process is listening on port 162. IBM Spectrum Control uses the default port 162 to listen for SNMP traps. The Windows SNMP Trap service also uses port 162 to listen for SNMP traps.

Action

If the Windows SNMP Trap service is running, you can stop the service or change the IBM Spectrum Control default port. To change the default port number for IBM Spectrum Control, use the **tpctool** command line interface (CLI).

To set the port number for the Device server, complete the following steps:

1. Run the **getdsCfg** command to determine the current value of the port. From the command prompt, enter the following command:

```
tpctool getdsCfg -user username -pwd password -url host:port
-property SnmpTrapPort
```

Where:

- *user* is a IBM Spectrum Control user ID.
- *password* is the password for the IBM Spectrum Control user ID.
- *host* is the host name or IP address and *port* is a valid port number for the HTTP service of the Device server.

2. Run the **setdsCfg** command to change the port. Run the following command:

```
tpctool setdsCfg -user username -pwd password -url host:port
-property SnmpTrapPort -context user port_value
```

Where:

- *user* is a IBM Spectrum Control user ID.
- *password* is the password for the IBM Spectrum Control user ID.
- *host* is the host name or IP address and *port* is a valid port number for the HTTP service of the Device server.
- *port_value* is the port that you specify for IBM Spectrum Control to listen for SMNP traps.

Note: **-context user** must be entered exactly as shown in the preceding example.

3. Run the **getdsCfg** command again to verify the change to the port number.

For more information about **tpctool**, see [tpctool command](#). You can also view help from the command line by entering the command with the **-help** option.

Unable to log on to the GUI when the user name is defined in both the local OS repository and the Windows domain repository

You are unable to log on to the IBM Spectrum® Control GUI with a user name such as "Administrator".

Problem

You are unable to log on to the IBM Spectrum Control GUI with a user name such as "Administrator" when the user name is defined in both the local operating system repository and the Windows domain repository.

Cause

This problem occurs because a user name can have some IBM Spectrum Control roles mapped to local operating system groups and other roles to Windows domain groups.

Environment

This problem occurs on Windows operating systems.

Resolving the problem

If a user name, such as "Administrator", is defined in both the local operating system repository and the Windows domain repository, you must use a fully qualified name that contains either a domain name prefix or a machine prefix to log on to the IBM Spectrum Control GUI, for example, *domain_name*\Administrator or *machine_name*\Administrator.

Related tasks

- [Authorizing users](#)

BPCIN0057E and BPCIN0072E error messages: Installation on Linux operating system cannot proceed because of issues with DB2 db2inst1 user

In rare occurrences, the IBM Spectrum® Control installation program cannot validate the DB2® db2inst1 user during preinstallation on Linux® operating systems.

Problem

In this situation, the following messages are generated during a preinstallation check and are displayed at the beginning of the installation process:

BPCIN0057E The user name db2inst1 is not in an operating system group that has DB2 SYSADM authority.

BPCIN0072E The validation for user name db2inst1 has failed. Check to see if this user name exists or if DB2 is running.

Action

Determine whether the DB2 db2inst1 user has SYSADM authority and whether DB2 is running.

If the db2inst1 user does not have SYSADM authority or DB2 is not running, correct the problem and then continue the installation.

If the user has the correct authority and DB2 is running, cancel the installation and start the installation program again.

Java virtual machine error during uninstall of IBM Spectrum Control

You receive a Java™ virtual machine error message when you cancel an upgrade of IBM Spectrum® Control and you try to uninstall the new version of IBM Spectrum Control.

Problem

You upgrade IBM Spectrum Control to a new version. However, IBM Spectrum Control does not start after the upgrade. You attempt to uninstall the upgrade and you get a No Java virtual machine could be found error.

Solution

The Java virtual machine directory was renamed during the upgrade from `USER_INSTALL_DIR/jre` to `USER_INSTALL_DIR/jre.bck`. Rename it back to `USER_INSTALL_DIR/jre`.

CAM-CRP-1613: Regenerating cryptographic keys in Cognos Analytics 11

You encounter a **CAM-CRP-1613** error in the Check password for JVM truststore step when you save a configuration in the IBM® Cognos® Configuration tool. You must regenerate the cryptographic keys in Cognos Analytics 11.

Problem

When you complete the upgrade of your Cognos Analytics 11 environment, you save the configuration. You might encounter a failure in the Check password for JVM truststore step in the IBM Cognos Configuration tool. The following error is displayed in the Details area in IBM Cognos Configuration:

CAM-CRP-1613 Not able to retrieve configured password

Action

You must regenerate cryptographic keys in Cognos Analytics 11. For more information about how to regenerate cryptographic keys, see [How to regenerate cryptographic keys in Cognos Analytics 11](#).

BTACS0043E: Probe fails after upgrading IBM Spectrum Control

After upgrading to IBM Spectrum® Control 5.3.2 or later, you encounter a **BTACS0043E** error during a probe.

Problem

After you complete the upgrade of IBM Spectrum Control to 5.3.2 or later, and a probe attempts to collect metadata from a device, authentication to the IBM Spectrum Control server fails.

Error **BTACS0043E** is shown in the following log files:

Data collection log

```
STS0306I: Job queued for processing. Waiting for idle thread.  
GEN0404I: Probe started.  
SAA0022I: Storage Subsystem XYZ (0) will be probed.  
SRV0451E: Error calling device server probeAll service.  
BTACS0043E Failed to authenticate with host my.spectrum.control.server.ibm.com:9550.  
Invalid host authentication password.  
GEN0400E: Probe completed with errors.
```

Server log

```
GEN0042E: Error reading log-file installation_dir/device/log\SVC-2145-0123456789-IBM.340\msg.33  
520527.1.0000020012345678.log  
BTACS0043E Failed to authenticate with host my.spectrum.control.server.ibm.com:9550.  
Invalid host authentication password.  
java.lang.RuntimeException: BTACS0043E Failed to authenticate with host my.spectrum.control.server.ibm.com:9550:. Invalid host  
authentication password.
```

Action

Contact IBM® Software Support for assistance. For more information about this issue, see <https://www.ibm.com/support/pages/apar/IT31727>.

SAN Volume Controller troubleshooting

Use this section to troubleshoot and resolve SAN Volume Controller problems.

- [All ports of a host lose access to the volume](#)
This problem occurs with SAN Volume Controller.
- [Error message: performance data files could not be correlated](#)
This error occurs with the SAN Volume Controller.
- [SAN Volume Controller reports are incorrect](#)
The SAN Volume Controller reports are incorrect.
- [Probing a SAN Volume Controller cluster fails when the cluster ID changes](#)
When a SAN Volume Controller cluster ID changes, the first probe after the ID change fails. Subsequent probes complete successfully.
- [Setting the rate at which data is copied between volumes on storage systems that run IBM Spectrum Virtualize](#)
Set the synchronization rate to avoid performance problems on volumes on IBM® SAN Volume Controller, IBM Spectrum Virtualize for Public Cloud, IBM Spectrum Virtualize as Software Only, and IBM Storwize® storage systems, and on IBM FlashSystem® devices that run IBM Spectrum Virtualize.
- [Some capacity values are zero](#)
Storage systems that run IBM Spectrum® Virtualize with firmware 8.2 or earlier might show zero values for some capacity values.

All ports of a host lose access to the volume

This problem occurs with SAN Volume Controller.

Problem

Unassigning one or more ports of a host unassigns all ports of the host.

If you use the SAN Volume Controller user interface or the SAN Volume Controller CLI to create a host that has several ports, and then unassign one or more ports of a host using IBM Spectrum® Control, all ports of the host will lose access to the volume.

Action

Do not create hosts with several ports.

Error message: performance data files could not be correlated

This error occurs with the SAN Volume Controller.

Problem

For SAN Volume Controller subsystems, this error message can occur during performance data collection.

Action

This is usually a problem with mismatching timestamps for the I/O statistics dump files on the SAN Volume Controller itself. This problem can be resolved by setting the time zone properly on the cluster.

SAN Volume Controller reports are incorrect

The SAN Volume Controller reports are incorrect.

Problem

An example of an incorrect report is when the report shows 0 for the allocated volume space when the report should show a value.

Action

When you have hosts connected to storage subsystems that have multipathing enabled, install the multipathing subsystem device drivers (SDD) on the hosts.

Probing a SAN Volume Controller cluster fails when the cluster ID changes

When a SAN Volume Controller cluster ID changes, the first probe after the ID change fails. Subsequent probes complete successfully.

Tip: When a SAN Volume Controller cluster is rebuilt or recovered, a new cluster ID is generated. To ensure that the first probe after a cluster ID change is successful, complete the following steps.

1. Remove the cluster from IBM Spectrum® Control before you rebuild or recover the cluster.
2. Rebuild or recover the cluster.
3. Add the cluster to IBM Spectrum Control.

Setting the rate at which data is copied between volumes on storage systems that run IBM Spectrum Virtualize

Set the synchronization rate to avoid performance problems on volumes on IBM® SAN Volume Controller, IBM Spectrum Virtualize for Public Cloud, IBM Spectrum Virtualize as Software Only, and IBM Storwize® storage systems, and on IBM FlashSystem® devices that run IBM Spectrum Virtualize.

The synchronization rate on storage systems that run IBM Spectrum Virtualize is the rate at which the volume copies synchronize again after synchronization is lost. IBM Spectrum® Control can do tasks that significantly alter the structure of storage. For example, IBM Spectrum Control can add a mirrored volume copy, or migrate volumes from one pool to another by using the storage optimizer functions. When IBM Spectrum Control does these tasks, by default, the synchronization rate is set to 50%.

The synchronization rate can cause performance problems on all volumes on storage systems that run IBM Spectrum Virtualize. However, you can use the **tpctool** command to change the synchronization rate.

To verify the current synchronization rate, go the installation_dir\cli directory, then use the **getdscfg** command:

```
tpctool getdscfg -user admin_user_id -pwd admin_user_password -url localhost:9550
-property OptAutoController.SyncRate -context DeviceServer
```

If the synchronization rate is set to the default value of 50%, the **tpctool** command shows the following information:

Property	Context	Value
=====		
OptAutoController.SyncRate	DeviceServer	50

To set the value of the synchronization rate to 70%, use the **setdscfg** command:

```
tpctool setdscfg -user admin_user_id -pwd admin_user_password -url localhost:9550
-property OptAutoController.SyncRate -context DeviceServer 70
```

The new synchronization rate is used for all storage systems that run IBM Spectrum Virtualize that you add to IBM Spectrum Control. You cannot set this value independently for each resource.

To verify that the value of the synchronization rate is modified, use the **getdscfg** command again. If the synchronization rate is set to 70%, the **tpctool** command shows the following information:

Property	Context	Value
=====		
OptAutoController.SyncRate	DeviceServer	70

After you modify the value of the synchronization rate, stop and restart the Device server.

Related reference

- [setdscfg](#)

Some capacity values are zero

Storage systems that run IBM Spectrum® Virtualize with firmware 8.2 or earlier might show zero values for some capacity values.

Problem

This issue occurs because the capacity values for these storage systems were changed to rely on physical capacity values.

Action

Upgrade the firmware for IBM® Storage Virtualize to a newer version. This issue is resolved in newer versions of firmware, starting with the following versions:

- 8.1.3.6
- 8.2.1.4

For more information, see https://public.dhe.ibm.com/storage/san/sanvc/release_notes/813_releasenotes.html#APARs.

DS8000 troubleshooting

Use this section to troubleshoot and resolve DS8000® problems.

- [Host connections for DS8000 storage systems are not being displayed](#)
Host connections that were created by using the **mkhostconnect** command might not be displayed on the details page for DS8000 storage systems.
- [The user account is locked after the DS Storage Manager password for the HMC is changed](#)
If the DS Storage Manager password for the Hardware Management Console (HMC) is changed, you must update the password in IBM Spectrum® Control.
- [Get warning messages STA0044I, STA0035W, and STA0036I](#)
These warning messages occur when you perform an agent probe.

Host connections for DS8000 storage systems are not being displayed

Host connections that were created by using the **mkhostconnect** command might not be displayed on the details page for DS8000® storage systems.

Problem

On a DS8000 storage system, host connections that were created by using the **mkhostconnect** command might not be displayed on the details page for that storage system in IBM Spectrum® Control. Hosts that were configured with the **mkhost** command are displayed properly.

Action

To ensure that the host connections that were configured with **mkhostconnect** (and any related agentless servers) are displayed properly, complete the following steps:

1. Go to <https://www.ibm.com/support/pages/node/690153>.
2. To migrate the host connections, follow the process in the section called "The GUI Migration Process" on page 10.
3. In IBM Spectrum Control, schedule a probe to collect the latest metadata from the DS8000 storage system. When the probe is complete, the host connections for the storage system are displayed properly on its details page.

Tips:

- In the future, when you configure host connections in DS8000, use the **mkhost** command to ensure that the connections are shown in IBM Spectrum Control.
- In cases where multiple agentless servers are created for host connections that are on one server, you can multi-select those servers on the Servers page in IBM Spectrum Control and then right-click to merge them into a single agentless server.
- z/OS® hosts that use storage volumes from a DS8000 are not displayed as host connections in IBM Spectrum Control. This behavior occurs because z/OS hosts are not configured by using **mkhostconnect** or **mkhost**.

For more information about the changes for host configuration in the DS8000 Release 7.4 Storage Management GUI, see <https://www.ibm.com/support/docview.wss?uid=s8g1S1005012>.

The user account is locked after the DS Storage Manager password for the HMC is changed

If the DS Storage Manager password for the Hardware Management Console (HMC) is changed, you must update the password in IBM Spectrum® Control.

Problem

If you do not update this password in IBM Spectrum Control, the DS Storage Manager user account for the HMC might be locked when you attempt to connect to the storage system with the incorrect password.

Action

Update the password in the IBM Spectrum Control GUI as shown in the following table.

Interface	Action
IBM Spectrum Control	<p>Update the password for the storage system as shown in the following steps:</p> <ol style="list-style-type: none">1. In the menu bar, go to Storage > Block Storage Systems.2. Right-click the storage system that you want to update and click Connections > Modify Connection.3. In the Enter User Credentials window, click User Name and Password in the Authentication field.4. Enter the user name and password.5. Click OK.
IBM Spectrum Control	<p>This task is required only if both of the following conditions are true:</p> <ul style="list-style-type: none">• You are using the launch-in-context feature to start the element manager, DS Storage Manager, from IBM Spectrum Control.• You are not using single sign-on with LDAP authentication to connect to the element manager. LDAP authentication is required for IBM Spectrum Control to connect to System Storage® DS8000® 4.2 and later. <p>Update the password for the element manager as shown in the following steps. If you have multiple users who are accessing the element manager and their password was changed, you must update the password for each user.</p> <ol style="list-style-type: none">1. In the menu bar, go to Storage > Block Storage Systems.2. Right-click the storage system that you want to update and select Open Storage System GUI.3. Log on to IBM System Storage DS8000 Storage Manager and update the user password. Follow the instructions that are provided in product documentation at https://www.ibm.com/docs/en/ds8900/9.3.0.

Get warning messages STA0044I, STA0035W, and STA0036I

These warning messages occur when you perform an agent probe.

Problem

If a job log of an agent probe shows warnings similar to the following messages:

```
3/15/07 9:22:10 AM STA0044I: Reading capacity
3/15/07 9:22:10 AM STA0035W: Error reported by
device \\.\PhysicalDrive24
3/15/07 9:22:10 AM STA0036I: Sense code: xxxx
                        ASC:      xxxx
                        ASCQ:     xxxx
```

Action

There may be a problem with the operating system or the environment. The corresponding volumes should be checked.

Independent software vendors troubleshooting

Use this section to troubleshoot and resolve independent software vendor problems.

- [HDS HiCommand shows a different set of volumes](#)
This problem occurs with the Hitachi Data Systems.
- [Reports for an Hitachi Data Systems subsystem do not show current information](#)
The IBM Spectrum® Control reports do not show the current information for an Hitachi Data Systems (HDS) subsystem after the HDS Storage Navigator is used to create and assign LUNs.
- [Tool to dump MSCS cluster configuration](#)
This topic provides information on the dump tool for the MSCS cluster configuration.
- [Cannot collect performance data from EMC CLARiiON](#)
You cannot collect performance data from the EMC CLARiiON.
- [Error message: HWNPM2132W](#)
You receive this message when you are try to collect performance data from a Data ONTAP file system.
- [Assigning a volume for EMC CLARiiON fails](#)
If you try to assign a volume to a host for an EMC CLARiiON storage system and that volume is not defined on the EMC CLARiiON storage system, the assignment fails.
- [Incorrect password for SAN Volume Controller is accepted](#)
A valid password with extra characters is accepted when you add a SAN Volume Controller storage system to IBM Spectrum Control .
- [You cannot unassign volumes from a Hewlett Packard EVA device](#)
IBM Spectrum Control cannot unassign volumes from a Hewlett Packard EVA device.
- [Getting timeouts and probe failures when using a Brocade switch](#)
You are getting IBM Spectrum Control timeouts and probe failures when using a Brocade switch.
- [Resolving a problem connecting to ESX](#)
If a problem occurs with the connection to the VMware ESX hypervisor, the messages BTAVM2201E/BTAVM2202E, BTAVM2017E, and BTADS0001I are displayed in the probe result and trace logs. This message sequence indicates that the optical-fiber connector (FC) connection to the hypervisor was disabled .

HDS HiCommand shows a different set of volumes

This problem occurs with the Hitachi Data Systems.

Problem

The HDS **HiCommand** shows a different set of volumes for an Hitachi Data System subsystem from what is reported by IBM Spectrum® Control. This is a known problem with either the **HiCommand** CIMOM or the **HiCommand** GUI.

Action

Contact Hitachi Data Systems customer support to see if a fix is available.

Reports for an Hitachi Data Systems subsystem do not show current information

The IBM Spectrum® Control reports do not show the current information for an Hitachi Data Systems (HDS) subsystem after the HDS Storage Navigator is used to create and assign LUNs.

Problem

This problem occurs after you have used the HDS Storage Navigator to create and assign LUNs, add the HDS SMI-S agent, and then run a discovery and probe job.

Action

To get current information, follow these steps:

1. Go to the HDS HiCommand Device Manager that contains the SMI-S agent. Click **Resources > Subsystems** in the navigation tree.
2. Click on the HDS subsystem you want to refresh. You will see the **Refresh** button under Subsystem IP. Click **Refresh**.
3. Probe the HDS subsystem in IBM Spectrum Control.
4. You can now look at your reports for the HDS subsystem.

Tool to dump MSCS cluster configuration

This topic provides information on the dump tool for the MSCS cluster configuration.

Problem

When looking at an MSCS cluster problem, the current state of the clustering environment is often needed. Microsoft provides a tool to dump the MSCS cluster configuration into a set of files.

Action

For more information about the tool to dump the MSCS cluster configuration, search for the scripted system configuration gathering tools at <http://www.microsoft.com>

Cannot collect performance data from EMC CLARiiON

You cannot collect performance data from the EMC CLARiiON.

Problem

The EMC CIM agent incorrectly reports that it supports BSP even when the CIM agent has not been enabled to run the BSP service.

Action

To enable the CIM agent for performance data, follow these steps:

1. Run the **testsmiprvider** command to discover the Symmetrix devices.
 - a. Open a Command Prompt window. Go to the EMC directory:

```
<EMC_SMIS_Provider_base_dir>\symcli\storbin
```

Example:

```
C:\Program Files\EMC\SYMCLI\storbin
```

- b. Run the **testsmipprovider** command in the Command Prompt window. Provide the information for the Host, Connection Type, Port, Username, and Password fields. Use the default values unless you have changed them.
 - c. When you get to the Command Prompt window, run the **disco** command to discover the Symmetrix devices. The command runs and ends with an output of 0 (success). It does not show any discovered devices at this point.
 - d. Press the **Enter** key and then **q** to exit.
2. Use the **symcfg list** command to list the Symmetrix devices that have been discovered. This command displays each Symmetrix device that the **testsmipprovider** command discovered.
3. Register the EMC SMI-S provider in IBM Spectrum® Control as a CIM agent. Use the following values:

Host

Host name or IP address of the EMC SMI-S provider host.

Port and Protocol

- 5988 (unsecure - http)
- 5989 (secure - https)

Userid/password

The EMC SMI-S provider user ID and password that was defined when you configured the SMI-S provider. If user authentication is not enabled on the CIM agent, enter any values you want.

Description of the CIM Agent

A value that is used to identify the managed device or devices.

4. Run an IBM Spectrum Control CIMOM discovery.
5. To enable performance monitoring, run the **symcfg** command. For example:

```
symcfg authorization add -host <HostName>  
-username <UserName> -password <password>
```

6. Run the command in step 5 for each of the EMC controllers.

Error message: HWNPM2132W

You receive this message when you are try to collect performance data from a Data ONTAP file system.

Problem

The Data ONTAP SMI-S 3.0 agent has the following limitation: If a volume is offline, the performance monitor might fail with the message: **PM HWNPM2132W Performance data could not be collected for device <device>.**

Action

Check your vendor's documentation for any current information in this area.

Assigning a volume for EMC CLARiiON fails

If you try to assign a volume to a host for an EMC CLARiiON storage system and that volume is not defined on the EMC CLARiiON storage system, the assignment fails.

Problem

You cannot assign a volume to a host for an EMC CLARiiON storage system.

Action

You must manually define the host node WWN on the EMC CLARiiON storage system before you can complete the host port assignment on IBM Spectrum® Control.

Incorrect password for SAN Volume Controller is accepted

A valid password with extra characters is accepted when you add a SAN Volume Controller storage system to IBM Spectrum® Control .

Problem

The valid password with the extra characters should not be accepted. The entire password should be checked and not just the first eight characters.

Action

Enter an acceptable password.

You cannot unassign volumes from a Hewlett Packard EVA device

IBM Spectrum® Control cannot unassign volumes from a Hewlett Packard EVA device.

Problem

You cannot unassign volumes from a Hewlett Packard EVA device.

Action

To unassign volumes on this device, use the Hewlett Packard EVA element manager.

Getting timeouts and probe failures when using a Brocade switch

You are getting IBM Spectrum® Control timeouts and probe failures when using a Brocade switch.

Problem

When a Brocade i10000 switch has a faulty control processor card, the SMIS agent managing the switch can hang indefinitely. This issue causes timeouts and probe failures from the IBM Spectrum Control server.

Action

To resolve the issue, contact your switch provider.

Resolving a problem connecting to ESX

If a problem occurs with the connection to the VMware ESX hypervisor, the messages BTAVM2201E/BTAVM2202E, BTAVM2017E, and BTADS0001I are displayed in the probe result and trace logs. This message sequence indicates that the optical-fiber connector (FC) connection to the hypervisor was disabled .

Problem

When you run a probe on a VMware ESX hypervisor, you might receive the following sequence of error messages:

- Message **BTAVM2201E** indicates that the physical storage configuration of the hypervisor could not be collected.
- Message **BTAVM2202E** indicates that the logical storage configuration of the hypervisor could not be collected.
- Message **BTAVM2017E** indicates that the probe of the hypervisor failed.
- Message **BTADS0001I** indicates that the specified discovery request has completed, but with a return code of **99** The probe has failed.

The following example shows the error sequence, as generated on an VMware ESX hypervisor, version 5:

```
2012-04-10 05:10:01.883-0700 BTADS0000I Starting Discover Process Front End ,
with Device Server RUN ID 1025 , and Job ID 2182 .
2012-04-10 05:10:01.890-0700 BTAVM0008I Probe of hypervisor
tpcblade6-4.storage.server.domain.com has started.
2012-04-10 05:10:09.316-0700 BTAVM0015I Collection of the
physical storage configuration for hypervisor tpcblade6-4.storage
.server.domain.com has started.
2012-04-10 05:20:10.521-0700 BTAVM2011E The operation
performMethodInvocation could not complete within the time limit of
600000 milliseconds.
2012-04-10 05:20:10.564-0700 BTAVM2201E Probe: An error occurred
during the collection of the physical storage configuration.
2012-04-10 05:20:10.597-0700 BTAVM2017E Probe of the hypervisor
tpcblade6-4.storage.server.domain.com failed.
2012-04-10 05:20:10.607-0700 BTADS0001I Discover Process with
Device Server RUN ID 1025 and Job ID 2182 is complete with
Status= 4 , Return Code= 99 .
```

The point of failure can vary between different VMware ESX hypervisor versions. For example, a VMware ESX hypervisor, version 3 will fail during the collection of logical storage with **BTAVM2202E**, and a VMware ESX hypervisor, version 5 fails during the collection of physical storage with **BTAVM2201E**.

If messages of this general type are in the probe and the IBM Spectrum® Control device server trace, it is likely that the optical-fiber connector (FC) connection to the hypervisor has been disabled.

The device server trace log is located in the *TPC_Directory/device/log/traceTPCDeviceServer.log*. If this error condition has occurred, the trace log contains an entry similar to the following example:

```
2012-03-07 10:27:34.900-0800 Occured Exception on
https://mystorage.server.com:443/sdk:
com.ibm.tpc.vmmgr.client.VIException: InvocationTargetException.
    at com.ibm.tpc.vmmgr.client.VIClientWrapper.handleException
(VIClientWrapper.java:739)
```

Action

To resolve the problem, reconnect the optical-fiber connector (FC) connection, run the probe again, and refresh the data sources:

1. Add the ESX hypervisor to IBM Spectrum Control to monitor and discover.
2. Probe the ESX hypervisor.
3. Disable the switch port in which the ESX hypervisor is connected.
4. Unplug the cable from the switch or the ESX hypervisor.
5. Run a probe on the ESX hypervisor. The expected result is that the probe fails.
6. Reestablish the connection, either by enabling the port or by reconnecting the FC cable.
7. Scan the HBA on the ESX hypervisor and refresh the datastore objects on the hypervisor using the VMware Infrastructure (VI) client.
8. Run a probe on the ESX hypervisor.

Language troubleshooting

Learn how to troubleshoot and resolve problems with non-English versions of the product.

- [Changing the language in a web browser doesn't change the entire IBM Spectrum Control GUI](#)
When one of the IBM Spectrum® Control internal components is running in a language other than English, you can't change the IBM Spectrum Control GUI to English. However, it can be changed to any language other than English (the default language), although some elements in the GUI might be displayed in an incorrect language.
- [PDF files do not export correctly in languages and locations with non-Latin 1 code pages](#)
In the IBM Spectrum Control, PDF files do not export correctly in languages and locations where non-Latin 1 code pages are used.
- [Traditional Chinese characters not displayed correctly in GUI help panels](#)
This problem occurs when you are displaying Traditional Chinese characters in the IBM Spectrum Control GUI help panels.
- [Cannot read Korean language logs from GUI](#)
This problem occurs in Korean language environments.

Changing the language in a web browser doesn't change the entire IBM Spectrum Control GUI

When one of the IBM Spectrum® Control internal components is running in a language other than English, you can't change the IBM Spectrum Control GUI to English. However, it can be changed to any language other than English (the default language), although some elements in the GUI might be displayed in an incorrect language.

About this task

To display all GUI elements in the correct language, you must update the Java™ virtual machine (JVM) configuration options for the Web server and the Alert server.

Procedure

To modify the internal component to English, complete the following steps:

1. Stop the IBM Spectrum Control Web server and the Alert server.
For instructions on how to stop servers, see [Stopping the IBM Spectrum Control servers by using scripts](#).
2. Update the JVM language and region options for the Web server:
 - a. Open a command line and go to *installation_dir/wlp/usr/servers/webServer*, where *installation_dir* is the directory where IBM Spectrum Control is installed.
 - b. Edit the *jvm.options* file and add these lines:
 - `-Duser.language=en`
 - `-Duser.region=GB`
 - c. Save the file.
3. Update the JVM language and region options for the Alert server:
 - a. Open a command line and go to *installation_dir/wlp/usr/servers/alertServer*, where *installation_dir* is the directory where IBM Spectrum Control is installed.
 - b. Edit the *jvm.options* file and add these lines:
 - `-Duser.language=en`
 - `-Duser.region=GB`
 - c. Save the file.
4. Start the IBM Spectrum Control Web server and the Alert server.
For instructions on how to start servers, see [Starting the IBM Spectrum Control servers by using scripts](#).
5. Open a web browser and set its language to English.
For instructions on how to change the language in a web browser, see [Changing the language of the IBM Spectrum Control GUI](#).
6. Optional: Confirm the changes by viewing the log files.
 - a. Open a command line and go to *installation_dir/wlp/usr/servers/webServer/logs*.
 - b. Open *console.log* and confirm that its content is in English.
 - c. Open a command line and go to *installation_dir/wlp/usr/servers/alertServer/logs*.
 - d. Open *console.log* and confirm that its content is in English.

PDF files do not export correctly in languages and locations with non-Latin 1 code pages

In the IBM Spectrum® Control, PDF files do not export correctly in languages and locations where non-Latin 1 code pages are used.

Problem

When you export information from a page in the IBM Spectrum Control GUI to a PDF, the non-Latin 1 characters are stripped from the output. The following languages are affected:

- Chinese (Simplified)
- Chinese (Traditional)
- Czech
- Hungarian
- Japanese
- Korean
- Polish
- Russian

When you export information to CSV and HTML, the correct output is generated in all languages and locations.

Action

You must use IBM® Cognos® Analytics to generate reports and export these reports as PDF files. For more information about exporting reports as PDF files, see [IBM Cognos Business Intelligence knowledge documentation Version 11.2.0](#)

Traditional Chinese characters not displayed correctly in GUI help panels

This problem occurs when you are displaying Traditional Chinese characters in the IBM Spectrum® Control GUI help panels.

Problem

The Traditional Chinese characters are not displayed correctly in the IBM Spectrum Control GUI help panels.

Action

To work around this problem, follow these steps:

1. Download the file `mtsans_t.zip` from the following Web site: ftp://submit.boulder.ibm.com/download/typography/fonts/worldtype/archive/wts_/2002-02-26/.
2. Unzip the file `mtsans_t.zip` to access the unicode font file `mtsans_t.ttf` (Monotype Sans WT TC).
3. Install the font file `mtsans_t.ttf` on the Traditional Chinese Windows system.
4. Modify the file:

```
<TPC_install_dir>\jre\lib\fontproperties.zh_TW
```

Add the line:

```
filename.Monotype_Sans_WT_TC=MTSANS_T.TTF
```

Modify the `fontproperties.zh_TW` file with the following lines in bold highlight:

```
===== fontproperties.zh_TW =====
serif.0=Times New Roman

5. Save the file and redisplay the help panels in IBM Spectrum Control GUI.

Cannot read Korean language logs from GUI

This problem occurs in Korean language environments.

Problem

You will not be able to view the log files from the IBM Spectrum® Control GUI because of a Db2® JDBC driver problem.

Action

You will have to read the files using another text viewer like **Notepad**.

Resolving problems

If you experience an error with IBM Spectrum® Control, you can use problem determination to determine why an error occurred, and explain how to resolve the problem.

Overview

The diagnostic tips that you can perform vary from including how to view and package log files, how to use network connectivity tools, and how to identify known problems and resolutions.

The first step in the problem determination process is to describe the problem completely.

Problem descriptions help you and IBM® Software Support know where to start to resolve the problem. Answer the following questions:

- What are the symptoms of the problem?
- Where does the problem occur?
- When does the problem occur?
- Under which conditions does the problem occur?
- Can the problem be reproduced?

Describe the symptoms of the problem

When you describe a problem, the most obvious question is "What is the problem?" By using the following questions, you can create a more descriptive picture of the problem:

- What are the error codes and messages?
- How does the system fail? For example, is it a loop, hang, crash, performance degradation, or incorrect result?
- What is the business impact of the problem?

Describe where the problem occurs

Determining where the problem originates is not always easy, but it is one of the most important steps in resolving a problem.

The following questions help you focus on where the problem occurs to isolate the problem:

- Is the problem specific to one operating system, or is it common across multiple operating systems?
- Is the environment and configuration supported?
- Is the application active locally on the database server or on a remote server?
- Is a gateway involved?
- Is the database on a local or remote computer?

Part of identifying where a problem originates is understanding the environment in which it exists.

Completely describe the problem environment, including the operating system and version, all corresponding software and versions, and hardware information. Confirm that the system is running within an environment that is a supported configuration.

Describe when the problem occurs

Develop a detailed timeline of events that led up to failure.

You can get a detailed timeline of events by starting at the time an error was reported. Use the available logs.

To develop a detailed timeline of events, answer these questions:

- Does the problem happen only at a certain time of day?
- How often does the problem happen?
- What sequence of events leads up to the time that the problem occurred?
- Does the problem happen after an environment change such as upgrading or installing software or hardware?

These questions can help you set a frame of reference in which to investigate the problem.

Describe the conditions under which the problem occurs

Knowing which systems and applications are running at the time that a problem occurs is an important part of problem determination and troubleshooting. These questions about the operating system environment can help you identify the root cause of the problem:

- Does the problem always occur when the same task is being run?
- Must a certain sequence of events occur for the problem to occur?
- Do any other applications fail at the same time?

Can the problem be reproduced?

Problems that you can reproduce are often easier to debug and solve. However, problems that you can reproduce might have a disadvantage: If the problem has a significant business impact, you do not want it to recur.

If possible, re-create the problem in a test or development environment, which typically offers you more flexibility and control during your investigation.

Ask the following questions:

- Can the problem be re-created on a test system?
- Is the same type of problem encountered by multiple users or applications?
- Can the problem be re-created by running a single command, a set of commands, or a particular application?
- [IBM Spectrum Control tools](#)
Use the Service tool, the Repository copy tool and, the Tracing tool to help you diagnose errors with IBM Spectrum Control.
- [IBM Spectrum Control problem determination](#)
You can use this information to help you resolve IBM Spectrum Control problems.

IBM Spectrum Control tools

Use the Service tool, the Repository copy tool and, the Tracing tool to help you diagnose errors with IBM Spectrum® Control.

- [Repository copy tool](#)
You can use the Repository copy tool, **repocopy**, to export all the tables in the IBM Spectrum Control database repository for purposes of debugging problems.
- [Service tool overview](#)
The service tool collects information from all installed IBM Spectrum Control components. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM® Software Support.
- [Tracing servers and agents](#)
You can set trace levels for IBM Spectrum Control server and agent components. The tracing tool uses the IBM Logging Toolkit for C (CCLOG) for tracing server and agent data.

Repository copy tool

You can use the Repository copy tool, **repocopy**, to export all the tables in the IBM Spectrum® Control database repository for purposes of debugging problems.

You can send the exported data to IBM® Software Support to help debug problems.

Tip: If you want to export only performance data from the IBM Spectrum Control repository, you can create performance support packages. You can create performance support packages for storage systems or fabrics. For more information about exporting performance support packages, see [Exporting performance data for storage systems and fabrics](#).

- [Exporting repository data](#)
Use the Repository copy tool to export data from an existing repository into a text file.

Exporting repository data

Use the Repository copy tool to export data from an existing repository into a text file.

Procedure

To export repository data, follow these steps:

1. Go to the following default directory:

Windows operating systems:
c:\Program Files\IBM\TPC\data\server\tools

Linux® or AIX® operating systems:
/opt/IBM/TPC/data/server/tools

2. Issue the **repocopy** command:

Windows operating systems:
repocopy.bat

Linux or AIX operating systems:
repocopy

3. Select Export data from repository tables and click Next.
4. In the Options for Import/Export window, enter information in the following fields:

Directory for Export
Enter the directory where the comma-delimited file is saved.

Delimiter
Enter a delimiter for the delimited file format (a comma is the default).

Quote
Enter the symbol that contains string data (double quotation marks is the default).

IBM Spectrum® Control exports the data into the comma-delimited file that you specify, and places it in a file named *tablename.txt*. Click Next.

5. Select one of the following options and click Next.
 - Export by using DB2® native format.
 - Export by using text files (the preferred method).
6. Select one of the following options and click Next.
 - Export base tables (always export the base tables)
 - Export Performance Manager tables, if requested by IBM® Software Support
 - Export history tables, if requested by IBM Software Support.

The information that is detected in the server.config file is displayed in the Connection Properties window within the following fields:

- Database Types
- User name
- Password
- Driver Class
- Driver URL
- Database
- DB Creator
- Classpath

If you want to export data from a different database from the one listed in the server.config file, you can select the database from the Database Types list box. Manually enter the database information.

7. Click Finish.
8. Click Run.

Results

As you progress through the export process, messages are written to a progress log that is displayed. You can track the steps through the progress log. When the **repocopy** command is used with a remote database, the DB2 shared library is not available for loading the **libTSRMinsubd.so** file. You can ignore this message. Click OK and continue.

Service tool overview

The service tool collects information from all installed IBM Spectrum® Control components. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM® Software Support.

The service tool collects the following information:

- Host name
- IP address and configuration information
- Operating system and version. On the Windows operating system, a **msInfo.txt** report is also generated
- Java™ home, version, and class path
- Java Virtual Machine (JVM) implementation name and version
- Protocol statistics
- Internet Protocol network connections for IBM Spectrum Control, including listening ports
- Diagnostic information about the system and its services
- Listing of all library files, for example, server and library and agent and library
- HOSTS file
- IBM Spectrum Control version and license files

When the service tool is run on the system where the Data server or the Device server are installed, it also collects the following information:

- For the Data server, information about all of the remote and local graphical user interfaces (GUIs) that are associated with it
- For the Export server, information about this component configuration and logs
- For the Device server, Alert server, and web server, information about their profiles in IBM WebSphere® Application Server Liberty
- For the Data server, Device server, Alert server, web server, and data collector - all Javacore files, the most recent Java heap dump file, and the most recent snap trace file.

The service tool can collect Java core dump files for these IBM Spectrum Control components, but it *does not* by default. The values for the `javaCoreFiles`, `heapDumpFiles`, `snapFiles`, and `coreFiles` parameters in the `installation_dir/service/service.properties` file dictate which types of files and how many of each file type are collected by the service tool.

- All applied interim fixes
- Installation logs
- The contents of the `log` and `logs` directory, including subdirectories
- The contents of the `conf` and `config` directory
- Directory listing of the `lib` and `bin` directory
- The contents of the `log` and `conf` subdirectories of the `web` directory
- For the IBM Spectrum Control GUI, information about its profile in the embedded WebSphere Application Server Liberty
- Information from the `ipconfig /all` command on Windows operating systems
- Information from the `ipconfig -a` command on Linux® and AIX® operating systems
- Information from the `netstat -an` command on all operating systems

When the service tool is run on the system where the database repository is installed, it also collects the DB2® support information.

When the service tool runs on the Storage Resource agent computer, it collects the following information:

- All applied interim fixes
- Everything in the `config`, `log`, `nls`, `output`, and `service` directories, including subdirectories
- Everything in the `opt/IBM/CAP` directory on Linux and AIX operating systems
- Directory listing of the `ProgramData\Application Data\IBM\CAP` directory on Windows operating systems
- Directory listing of the `agent` directory
- Directory listing of the `bin` directory
- Listing of version numbers for the Storage Resource agent component
- Information from the `ipconfig /all` command on Windows operating systems
- Information from the `ifconfig -a` command on Linux and AIX operating systems
- Information from the `netstat -an` command on all operating systems

By default, the service data is collected in one of the following directories:

For Windows operating systems:

`installation_dir\service\data`

For Linux and AIX operating systems:

`installation_dir/service/data`

For more information about changing the default directory, see [How to customize the service tool](#).

You can run the service tool on IBM Spectrum Control regardless of whether you configured it on a single server or on multiple servers. The service tool automatically recognizes the installed components and collects service data about them. For more information about running the service tool for servers, see [Packaging log files from the command line and sending them to IBM Support](#).

- [Packaging log files from the command line and sending them to IBM Support](#)
To provide trace information to IBM Support about the performance of IBM Spectrum Control, you might be asked to package and send a set of log files. You can run the service tool from the command line to create the log package and then manually upload it to IBM Support.
- [Creating a compressed file for a Storage Resource agent](#)
Run the service tool on Storage Resource agents that were deployed by using the web-based GUI to create a compressed file that can be sent to IBM Software Support.
- [How to customize the service tool](#)
The default behavior of the service tool is to collect data about all IBM Spectrum Control components, but you can use the service tool to collect data about specific components. You can also use command-line parameters to specify a location to place the data that is collected, specify that the data is compressed, or to specify both.

Packaging log files from the command line and sending them to IBM Support

To provide trace information to IBM® Support about the performance of IBM Spectrum® Control, you might be asked to package and send a set of log files. You can run the service tool from the command line to create the log package and then manually upload it to IBM Support.

Before you begin

To package IBM Spectrum Control log files, you must have administrator authority on Windows operating systems or root authority on AIX® and Linux® operating systems. Before packaging or sending the log files, you must first open a support ticket with IBM Support. For information, see [Getting support](#).

In order to run the service tool when you log in by using a Windows domain user account, you must grant Db2® SYSADM authority to that Windows domain user account.

To run the service tool when you log in by using a domain user account, choose one of the following methods:

- Right-click the `service.bat` file and select Run as administrator.
Or
- Click Start > All Programs > Open Administrative Tools > Local Security Policy. For information about how to open Administrative Tools, see [Accessing administration tools](#).

- On the Local Security Policy window, disable User Account Control: Run all administrators in Admin Approval Mode.
- Restart your computer.

About this task

The compressed file contains data about the following IBM Spectrum Control components: Alert server, Data server, Device server, Web server, Storage Resource agent, DB2®, CLI, and installation.

Tip: You can customize the service tool to collect data about specific IBM Spectrum Control components. For more information, see [How to customize the service tool](#).

Procedure

To run the service tool for all components, follow these steps:

1. Log on to the system where IBM Spectrum Control is installed.
2. Go to the following directory:

Windows operating systems:
installation_dir\service

Linux or AIX operating systems:
installation_dir/service/

3. Run the following program:

Windows operating systems:
 service.bat

Linux or AIX operating systems:
 service.sh

A compressed file, SCServiceFiles_all.zip, is created in the following directory:

Windows operating systems:
installation_dir\service\data

Linux or AIX operating systems:
installation_dir/service/data/

4. Upload the log package by using one of the following methods:

If . . .	Then . . .
You are a US healthcare client	Blue Diamond data upload instructions .
The log file is < 200 MiB	Upload and attach the file to the case .
The log file is > 200 MiB	Enhanced Customer Data Repository (ECuRep) - Send data (FTP) .

Related tasks

- [Creating a compressed file for a Storage Resource agent](#)

Related reference

- [How to customize the service tool](#)

Creating a compressed file for a Storage Resource agent

Run the service tool on Storage Resource agents that were deployed by using the web-based GUI to create a compressed file that can be sent to IBM® Software Support.

Before you begin

You must have administrator authority on Windows operating systems or root authority on AIX® and Linux® operating systems.

Procedure

To run the service tool on the Storage Resource agents, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. Right-click the server where the Storage Resource agent is deployed, and select Logs, > Collect Agent Logs.

Results

The following compressed files are created:

Windows operating systems:
 C:\Program Files\IBM\TPC\data\log\SRATraces*SRA_computer_name*\SCServiceInfo.zip

AIX and Linux operating systems:
 /opt/IBM/TPC/data/log/SRATraces/*SRA_computer_name*/SCServiceInfo.zip

where `SRA_computer_name` represents the name of the computer on which the Storage Resource agent is located. If the compressed file cannot be created, a message indicates that the job was unsuccessful.

For more information about the error, see the server log file or the services script information file. The files are in one of the following default directories:

Server log file

This file is on the system where IBM Spectrum® Control is installed:

Windows operating systems:

`c:\Program Files\IBM\TPC\data\log`

AIX or Linux operating systems:

`/opt/IBM/TPC/data/log`

Services script information file

This file is on the computer on which the Storage Resource agent is installed:

Windows operating systems:

`c:\Program Files\IBM\TPC\SRA_computer_name\services\SCServiceInfo.log`

AIX or Linux operating systems:

`/opt/IBM/TPC/SRA_computer_name/services/SCServiceInfo.log`

For more information about customizing the data that is collected by the service tool, see [How to customize the service tool](#).

Related tasks

- [Packaging log files from the command line and sending them to IBM Support](#)

How to customize the service tool

The default behavior of the service tool is to collect data about all IBM Spectrum® Control components, but you can use the service tool to collect data about specific components. You can also use command-line parameters to specify a location to place the data that is collected, specify that the data is compressed, or to specify both.

Specifying help and output command-line parameters

To obtain information about the service tool usage, use the `-help` command-line parameter.

To specify the data that is collected by the service tool, use the following command-line parameters when you run service tool:

`-output directory_path`

Places the files that contain the data that was collected in a directory that you specify. If you specify a directory that does not exist on your system, that directory is created. If you do not use the `-output directory_path` parameter, the files are placed in the default directory:

Windows operating systems

`installation_dir\service\data`

Linux® or AIX® operating systems

`installation_dir/service/data`

Restriction: If you specify a directory, the directory path cannot contain spaces. This restriction refers to the `-output` option.

`-pmr`

The number of the PMR to which the support information is related. Use the following format to enter the number: `nnnnnn,nnn,nnn` where `n` represents a number, such as `12345,123,123`. If you enter a value for the `-pmr` parameter, the service tool automatically uses FTP to upload the service information to IBM®. If the service tool cannot upload the service information to IBM from the IBM Spectrum Control server, the generated file must be uploaded manually. The `-pmr` parameter is ignored if the `-nozip` parameter is used.

`-nozip`

When you use this parameter, the compressed collected data archives are no longer created. The service tool creates separate directories for each component for which data was collected. You can then create compressed archives for the collected files. In this way, you can control the size and content of each compressed file. To specify a directory other than the default directory, use the `-output directory_path` parameter.

Tip: You can specify more than one parameter, for example, `C:\Program Files\IBM\TPC\service>service -install -nozip`.

Specifying Javacore, Java heap dump, snap trace, and Java core dump file collection

By default, the service tool collects all Java™ core files, the most recent Java heap dump file, and the most recent snap trace file for the Data server, Device server, Alert server, web server, and data collector. The service tool can collect Java core dump files for these IBM Spectrum Control components, but it *does not* by default. You can edit the following parameters in the `installation_dir/service/service.properties` file in order to control which types of files and how many of each file type are collected by the service tool:

`coreFiles=0`

Specifies how many Java core dump files are collected. The default value is 0 because Java core dump files are generally very large. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

`javaCoreFiles=-1`

Specifies how many Javacore txt files are collected. The default value of -1 means that all Javacore txt files are collected. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

`heapDumpFiles=1`

Specifies how many Java heap dump files are collected. The default is to collect the most recent Java heap dump file. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

`snapFiles=1`

Specifies how many snap trace files are collected. The default is to collect the most recent snap trace file. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior..

Collecting data for specific IBM Spectrum Control components

You can use the service tool to collect data about specific IBM Spectrum Control components.

Use the following parameters to specify the components:

-all
All components. The default behavior is to collect data about all components.

-install
Installation component files.

-data
Data server component files.

-device
Device server component files.

-datacollector
Data collector component files.

-alert
Alert server component files.

-export
Export server component files.

-sra
Storage Resource agent component files.

-db
Db2® files.

-cli
Command-line interface files.

-gui
Collects data about GUI files.

If you collect information about a particular component, and you do not specify the -nozip parameter, you can identify the contents of a compressed service file from its name. For example, if you specify the -db -gui parameters but did not specify the -nozip parameter, a file named SCSERVICEFiles_db_gui.zip is created.

Warning: An existing compressed file is overwritten when another file of the same name is created. For example, if you run **C:\Program Files\IBM\TPC\service>service -db -gui**, a file named SCSERVICEFiles_db_gui.zip is created. If you rerun the tool with the same component options, a new file named SCSERVICEFiles_db_gui.zip is created. This new file overwrites the previously created file unless you specify the -nozip parameter, or use the -output parameter to specify a different path. If you specify the -nozip parameter, a directory is created for the components that you specified in the parameter. If you did not specify a specific component, data is collected for all installed components, and the data is placed in files in the following directory:

Windows operating systems:
installation_dir\service\data

Linux or AIX operating systems:
installation_dir/service/data

Files for particular components are then placed in a directory that corresponds to that component. Common files, such as license.txt, are placed in the following directory:

Windows operating systems:
installation_dir\service\data

Linux or AIX operating systems:
installation_dir/service/data

Restriction: You cannot specify a specific component as a command-line parameter when you specify the -all parameter. Also, when you specify a component that is not installed on the computer, the service tool displays an error message.

Tracing servers and agents

You can set trace levels for IBM Spectrum® Control server and agent components. The tracing tool uses the IBM® Logging Toolkit for C (CCLOG) for tracing server and agent data.

Setting server trace levels in the GUI

If you have Administrator permissions, you can turn on or off the trace recording for the individual services on each component server. By enabling or disabling the trace recording before you create logs, you can provide IBM Support with more information on specific component servers that might be causing the problem.

To enable or disable the trace recording for a component servers, complete the following steps:

1. In the menu bar, go to Home > System Management.
2. Click Component Servers in the Components section. In the Component Servers pane, you can view performance information for each component server. The current trace recording for each component server is highlighted.
3. Click On or Off to enable or disable tracing for each of the services of a component server.

Tracing a Storage Resource agent

To trace a Storage Resource agent, follow these steps:

1. In the menu bar, go to Servers, > Servers.
2. In the Servers pane, right-click a server and click View Properties.
3. Click the Agent tab and click Edit.
4. Specify the following values:

Agent Trace

Click Enabled.

Trace Level

The trace level can be one of the following values:

Minimum

The minimum debugging level. This option is the default and is always turned on. This option includes trace information for key locations in the code that includes first failure data capture. This setting does not capture any output data.

Medium

The medium debugging level. This setting does not capture any output data.

Maximum

The maximum debugging level. This option includes entry and exit information for every method in addition to all **DEBUG_MIN** statements. This option can impact performance.

Number of Trace Files

The maximum number of files that are used before the Data server starts reusing the tracing files. The default is eight files.

Trace File Size (MiB)

The maximum file size for the tracing files. The default is one MiB.

5. Click Save and then click Close.

Trace log file locations

The Java™ tracing information is stored in the locations that are shown in [Table 1](#) and [Table 2](#).

Table 1. Java trace log files

Class	Java trace log file
Storage Resource agent	<i>installation_directory/agent/log</i> <i>installation_directory/agent/log/</i> <i>name_of_server_SRA_communicates_with</i>
Server	<i>installation_directory/data/log/ServerTrace.log</i>

The Native tracing information is stored in the locations that are shown in [Table 2](#).

Table 2. Native trace log files

Class	Native trace log file
Server	<i>installation_directory/data/log/traceTPCDNativeServer_ yyyymmddhhmmssLOGx.log</i>
UnixStopServer	<i>installation_directory/data/log/traceTPCDNativeStopServer_ yyyymmddhhmmssLOGx.log</i>
ImportExport	<i>installation_directory/data/log/traceTPCDNativeImportExport_ yyyymmddhhmmssLOGx.log</i>

Messages are logged before the creation of a user-defined installation directory. Because the log directory is not initially available, installation messages are written to standard error log files. The standard error log is redirected to a temporary file. The temporary message log file is copied to the appropriate log directory, and the standard error log file is redirected to reflect the new message log file location

When an executable file is run, it creates the tracing files that are shown in [Table 3](#).

Table 3. Trace files for executable routines

Executable file	Platform	Trace log file location, file name, and description
udbexec.exe	Windows operating systems	<i>\hostname\traceTSRMNativeUdbexec_PID.log</i> <i>installation_directory\data\ca\</i> <i>traceTSRMNativeUdbexec_PID_ yyyymmddhhmmss.log</i>
ExecSvc.exe	Windows operating systems	<i>temp\traceTSRMNativeExecSvc.log</i> This executable routine runs only on the remote computer during a Windows push installation.
udbexec.exe ¹ or udbexec ²	All operating systems	<i>installation_directory/data/ca/</i> <i>traceTSRMNativeudbexec_pid_ yyyymmddhhmmss.log</i>
DbMonitor.exe ¹ or DbMonitor ²	All operating systems	This executable routine is run on Windows operating systems for all database monitoring activities. This executable routine generates trace files that are named based on the name of the active job. For example, the default database scan generates a trace file similar to the following file: <i>TPCUser.Default Db Scan.0001_dbmonitor.00009163.trace</i>

Notes:

- ¹ Use in Windows operating systems.
- ² Use in Linux® or AIX® operating systems.

Configuration files for tracing

There are two configuration files added for Java tracing: ServerTraceLog.config and AgentTraceLog.config. The nativelog.config file is used for native code tracing.

Table 4. Trace configuration files

File	Directory
Native code trace configuration file	<i>installation_directory/data/config/nativelog.config</i>
Java tracing configuration file	<i>installation_directory/data/config/ServerTraceLog.config</i>

nativelog.config file

During the installation or a maintenance upgrade of IBM Spectrum Control, a file that is named `nativelog.config` is created in the `installation_directory/data/config` directory.

This file is used to specify the default levels of tracing for the IBM Spectrum Control processes (for example, the server and the agent). Depending on which platform IBM Spectrum Control is installed, some of the items that are listed in this file might vary.

In particular, Windows installations do not have the `#StopAgent` section that Linux and AIX platforms have. The reason for the difference is because the agent service is started differently on these platforms. Settings in these files are separated into sections that represent IBM Spectrum Control processes. The trace settings per process are listed underneath the process they represent.

The definitions for the entries in the `nativelog.config` file are as follows:

```
# Agent
    A IBM Spectrum Control process. In this case, the agent process is specified.
agt.level=DEBUG_MIN
    The default trace level for the agent process.
agt.maxFiles=3
    The maximum number of trace files to be created or used.
agt.maxFileSize=20480000
    The maximum size of each trace file (in bytes).
```

The level of trace that is specified in this file is also applied to specific child processes run from their parent process. For example, the processes `udbexec.exe` and `MiniProbe.exe` can use the settings from the Agent section as their default trace level because these processes are run by the Agent process.

You can edit the contents of this file if you want to change the default level of tracing for a particular process. However, these changes do not take effect until that process is stopped and restarted again. For example, if you want to change the tracing level of the server from `DEBUG_MIN` to `DEBUG_MID`, you can modify the `nativelog.config` file. Restart the server to effect the change.

By modifying this file, you can ensure that each time the server is stopped and restarted, the specified trace level is applied.

Here is an example of the `nativelog.config` file for Windows operating systems:

```
# level: DEBUG_MIN || DEBUG_MID || DEBUG_MAX
# maxFiles: >= 2 && <= 100
# maxFileSize: >= 128000 && <= 102400000

# Agent
agt.level=DEBUG_MIN
agt.maxFiles=3
agt.maxFileSize=20480000

# Server
srv.level=DEBUG_MIN
srv.maxFiles=3
srv.maxFileSize=20480000

# ImportExport
impexp.level=DEBUG_MIN
impexp.maxFiles=3
impexp.maxFileSize=20480000
```

Here is an example of the `nativelog.config` file for Linux and AIX operating systems:

```
# level: DEBUG_MIN || DEBUG_MID || DEBUG_MAX
# maxFiles: >= 2 && <= 100
# maxFileSize: >= 128000 && <= 102400000

# Agent
agt.level=DEBUG_MIN
agt.maxFiles=3
agt.maxFileSize=20480000

# ImportExport
impexp.level=DEBUG_MIN
impexp.maxFiles=3
impexp.maxFileSize=20480000

# StopAgent
stpagt.level=DEBUG_MIN
stpagt.maxFiles=3
stpagt.maxFileSize=20480000
```

AgentTraceLog.config file

The definitions for the entries in the `AgentTraceLog.config` file are as follows:

```
ITSRM.logger.trace.Agent.logging=true
    The state of tracing for the agent. In this case, tracing is enabled.
ITSRM.logger.trace.Agent.level=DEBUG_MAX
    The trace level for the agent. DEBUG_MAX is the only level that produces trace information.
ITSRM.handler.file.maxFiles=8
    The maximum number of trace files to be created or used.
ITSRM.handler.file.maxFileSize=1024
    The maximum size of each trace file (in bytes).
```

ServerTraceLog.config file

The definitions for the entries in the ServerTraceLog.config file are as follows:

ITSRM.logger.trace.Server.logging=true

The state of tracing for the Server process. In this case, tracing is enabled.

ITSRM.logger.trace.Server.level=DEBUG_MAX

The trace level for the Server process. **DEBUG_MAX** is the only level that produces trace information.

ITSRM.handler.file.maxFiles=5

The maximum number of trace files to be created or used.

ITSRM.handler.file.maxFileSize=20480

The maximum size of each trace file (in bytes).

ITSRM.logger.trace.TivoliSRM-GUI.logging=false

The state of tracing for the stand-alone GUI process. In this case, tracing is disabled.

ITSRM.logger.trace.TivoliSRM-GUI.level=DEBUG_MAX

The trace level for the stand-alone GUI process.

ITSRM.logger.trace.TivoliSRM-CIMOM.logging=false

The state of tracing for the CIMOM process. In this case tracing, is disabled.

ITSRM.logger.trace.TivoliSRM-CIMOM.level=DEBUG_MAX

The trace level for the CIMOM process.

ITSRM.logger.trace.TivoliSRM-Agent.logging=false

The state of tracing for the Agent process. In this case, tracing is disabled.

ITSRM.logger.trace.TivoliSRM-Agent.level=DEBUG_MAX

The trace level for the Agent process.

ITSRM.logger.trace.Scheduler.logging=false

The state of tracing for the Scheduler process. In this case, tracing is disabled.

ITSRM.logger.trace.Scheduler.level=DEBUG_MAX

The trace level for the Scheduler process.

IBM Spectrum Control problem determination

You can use this information to help you resolve IBM Spectrum® Control problems.

- [Configuration files](#)
Use the parameters in IBM Spectrum Control configuration files to help resolve problems.
- [Log files](#)
When you have a problem, you can check several product log files.
- [Audit logs](#)
The audit logs provide an audit of most activities. The logs include the identification of users that initiate actions in the product.
- [Diagnosing IBM Spectrum Control problems](#)
You can use the log files, audit files, configuration files, and what steps to take, to diagnose a IBM Spectrum Control problem.

Configuration files

Use the parameters in IBM Spectrum® Control configuration files to help resolve problems.

The parameters in the configuration files are case-sensitive.

The default *installation_dir* for IBM Spectrum Control installations is as follows:

Windows operating systems:

c:\Program Files\IBM\TPC

Linux® or AIX® operating systems:

/opt/IBM/TPC

The default file locations for the configuration files for IBM Spectrum Control are as follows:

IBM Spectrum Control:

Windows operating systems:

installation_dir\config

Linux or AIX operating systems:

installation_dir/config

Data server:

Windows operating systems:

installation_dir\data\config

Linux or AIX operating systems:

installation_dir/data/config

Device server:

Windows operating systems:

installation_dir\device\conf

Linux or AIX operating systems:

installation_dir/device/conf

Storage Resource agent:

Windows operating systems:
installation_dir\agent\config\agent.config

Linux or AIX operating systems: operating systems:
installation_dir/agent/config/agent.config

Restriction: On Windows installations, if you installed IBM Spectrum Control by using a domain user account, you must disable User Account Control to edit the configuration files.

- [server.config file](#)
The following information lists the parameters that are set in the server.config file. These parameters include controller, logging, repository, and service.
- [scheduler.config file](#)
The following information lists the parameters that are set in the scheduler.config file. These parameters include concurrency parameters and jobs parameters.
- [TPCD.config file](#)
The list of parameters that are set in the TPCD.config file include server parameters and GUI parameters.
- [agent.config file](#)
The agent.config file contains configuration parameters for the Storage Resource agent. These parameters are set when the Storage Resource agent is installed. The parameters can also be changed manually by editing the file.

server.config file

The following information lists the parameters that are set in the server.config file. These parameters include controller, logging, repository, and service.

Controller parameters

name
The Data Manager server name is the name of the host computer.

port
The port on which the server listens for requests. The default is 9549.

maxConnections
The maximum number of concurrent sockets that the server opens. The default is 500.

routerThreads
The number of threads that redirect incoming requests to the appropriate service provider. The default is 1.

serviceThreads
The number of threads to allocate for the internal service provider of the server. The default is 2.

agentErrorLimit
The number of consecutive attempts to reach an agent before the agent is displayed as DOWN. The default is 3. When an agent is in this state, no attempts to connect are made until either the agent contacts the server or the agent status is manually changed to UP.

adminGroup
The name of the group a user must be a member of to perform administrative functions from the GUI, the default is **adm**.

commEncrypted
The switch that secures communication between the Server or Agent and the Server/GUI by encrypting the DataStream.

- **0** = Off. Do not encrypt the DataStream.
- **1** = On. Encrypt the DataStream.

FileSystemScan NFSTimeout
Determines the numbers of seconds that a Storage Resource agent waits for a status system call on a Network File System (NFS) before it times out.

hostAlias
This parameter is displayed if the HOST_ALIAS is not specific and represents the name of the server. The value for this parameter is used when multiple computers have the same name or the name cannot be determined.

Logging parameters

logsKept
The number of server logs to keep. The default is 5.

messagesPerLog
The maximum number of messages in a log. When this number is reached the log is closed and a new log is created. The default is 100,000.

Repository parameters

driver
The name of the JDBC driver to use, normally:

- Db2®: **COM.ibm.db2.jdbc.app.DB2Driver**

url
The URL used to connect to the database, normally:

- Db2: **jdbc:db2:database_name**

user

The user name that IBM Spectrum® Control uses to connect to the repository.

connectionPool

The number of database connections in a pool of reusable open connections. The default is 10.

Service parameters

name

Repeating section that indicates the service providers that are required to start.

The REQUIRED parameters are as follows:

- `TStorm.server.svp.GuiSvp`
- `TStorm.server.svp.AgentSvp`
- `scheduler.Scheduler`

scheduler.config file

The following information lists the parameters that are set in the scheduler.config file. These parameters include concurrency parameters and jobs parameters.

Concurrency parameters

maxSubmitThreads

The maximum number of threads to create that handle the submission of jobs. The default is 3.

maxCompleteThreads

The maximum number of threads to create to handle job completions. Initially creates a pool of half the number of threads specified that can grow to the maximum. The default is 3.

Jobs parameters

minutesAdvanced

The number of minutes in advance of scheduled time to begin the scheduling process. The default is 1. Use this option to allow for the processor time that is involved in scheduling a job so that the job starts close to the scheduled time.

delayLimitMinutes

Number of minutes after scheduled start time that the Scheduler continues to attempt to start a job for a selected resource, so that resource state is not in a down state or, connection status is not in a failed state. The default is 120.

Location of the scheduler.config file

The scheduler.config file is in the following directories:

Windows operating systems:

installation_dir\data\config

Linux® or AIX® operating systems:

installation_dir/data/config

TPCD.config file

The list of parameters that are set in the TPCD.config file include server parameters and GUI parameters.

The following list describes the server parameters:

threadPoolSize

Number of initial threads to create for handling requests. The default is 3.

abbreviatedProbe

Only SCSI commands are sent to disk drives for inquiry and disk capacity information. The default is 1.

maxThreads

Set the maximum number of threads for handling requests. The default is 8.

pingReceiveTimeout

Number of seconds to wait before it indicates that a ping failed. The default is 10.

skipAutoFS

Set to 1 if you want to skip the **automount** process during discovery on the Oracle Solaris Storage Resource agent. By default, discovery always processes **automount** on all Oracle Solaris Storage Resource agents managed by the Data server.

saveNonRoot

Set to 1 if you want to monitor non root exports. The default is 0.

If you do not set this parameter, the export paths that are not at the root of the file system are discarded. If the NAS server has only non root exports accessible to the agent, it will not be added. Restart the Data server for this setting to take effect.

batchPartitionWaitRetryCount

Specify the number of times that the Storage Resource agent tries to get a report partition before the Storage Resource agent fails with an error.

Large batch reports are generated in partitions. The partitions are placed on the IBM Spectrum® Control server, and the Storage Resource agent gets them from the server when the batch report is created.

The following list describes the GUI parameters:

threadPoolSize

Number of initial threads to create for handling user interface requests. The default is 3.

maxThreads

Set the maximum number of threads for handling user interface requests. The default is 10.

reportRowLimit

Maximum number of rows that are sent at a time to the user interface. If this number is exceeded, a More button is displayed over the table, along with a warning message. The default is 5000.

keepCachedReport

Number of minutes to retain incomplete reports in the tmp directory for the server. The default is 120.

agent.config file

The agent.config file contains configuration parameters for the Storage Resource agent. These parameters are set when the Storage Resource agent is installed. The parameters can also be changed manually by editing the file.

The following list contains the parameters for the agent.config file.

Servename

Fully qualified host name of the system on which the Data server is installed.

Portnumber

Port on which the Data server listens for communications from the Storage Resource agent. By default, the port is set to 9549.

IPAddress

IP address of the server on which the Data server is installed.

Log files

When you have a problem, you can check several product log files.

- **[Installation log files for IBM Spectrum Control](#)**

You can use the installation log files, that contain all the installation messages and traces that are generated during the installation process, to debug installation problems.

Related reference

- [Default locations of log files](#)

Installation log files for IBM Spectrum Control

You can use the installation log files, that contain all the installation messages and traces that are generated during the installation process, to debug installation problems.

The lax*-out.txt and lax*-err.txt files

The lax*-out.txt and lax*-err.txt files are Installation Anywhere log files that contain all of the traces that are generated by the IBM Spectrum® Control installer.

These log files are useful for debugging any issues that occurred before you clicked Install on the installer. You can find them in the following locations:

Windows operating systems (assuming you are installing as Administrator):

C:\Users\Administrator\AppData\Local\Temp\2

Linux® or AIX® operating systems:

/tmp

The msgTPCInstall.log and traceTPCInstall.log files

The msgTPCInstall.log and traceTPCInstall.log files are Message and Trace Installation logs that contain all of the installation messages and traces, after you clicked Install on the installer. You can find them in the following locations:

Windows operating systems:

TPC_installation_directory\TPC\logs

Linux or AIX operating systems:

TPC_installation_directory/logs

The agent*.log file

The agent*.log file is the storage resource agent installation log file. You can find it in the following locations:

Windows operating systems:

TPC_installation_directory\logs\install\sra

Linux or AIX operating systems:
`TPC_installation_directory/logs/install/sra`

The `componentInstall.log` and `componentInstallIS.log` files

The `componentInstall.log` and `componentInstallIS.log` files are the main IBM Spectrum Control log files for installation. `component` can be any of the following components:

- `ca`
- `cli`
- `data`
- `dbSchema`
- `device`
- `gui`
- `agent` (Storage Resource agent)

You can find the `componentInstall.log` and `componentInstallIS.log` files in the following location:

Windows operating systems:
`TPC_installation_directory\log\component\install`
Linux or AIX operating systems:
`TPC_installation_directory/log/component/install`

Audit logs

The audit logs provide an audit of most activities. The logs include the identification of users that initiate actions in the product.

These are the audit logs:

- Web server, `traceWebServer_<number>.log`, which is initiated by the GUI, where `<number>` is sequential from 0 to 9 with 0 used for the most recent log file.
- Data server, `AuditTrace.log`, which is initiated by using the GUI.
- Device server, `auditTPCDeviceServer.log`, which is initiated by the CLI.

Audit logging is performed as follows:

- GUI commands are logged in the Data and Web server audit log.
- CLI commands are logged in the Device server audit log.

The communication between the following services are not logged:

- Data server to Device server
- Data server to agents
- Device server to agents

The audit logs are in the following directories:

Web server audit log

`installation_dir\web\log\traceWebServer_<number>.log`, where `<number>` is sequential from 0 to 9 with 0 used for the most recent log file.
The Web server audit log includes the following information:

- Timestamp
- User ID
- Service and operation performed
- Key input and output parameters

For example:

```
2020-11-06 10:18:52.710-0700 [Default_Executor-thread-47] [TPCAuthenticationService.authenticate] [INFO] User db2inst1 is authenticated with password
```

```
2020-11-09 05:47:11.638-0700 [pool-9-thread-7] [JobManagerServiceImpl.actionRunNow] [INFO] argEntities: [SANEntityInfo [parent=null, entity.id=33027, entity.type=DISKSYSTEM, entityName=FLYER 7825410, message=null, osType=XIV]] jobType: 16
```

Data server audit log:

`installation_dir\data\log\AuditTrace.log`

The Data server audit log includes the following information:

- Timestamp
- User ID
- Service and operation performed

For example:

```
2016-04-19 05:59:00.954-0700 Username=TPCUser
Running Ping com.tiv.itsrm.TStorm.server.svp.JobHndlr
handle AgentRequestHandler52016-04-19 05:59:00.978-0700
Username=TPCUser
Running com.tiv.itsrm.TStorm.server.svp.Ping
com.tiv.itsrm.TStorm.server.svp.JobHndlr
handle com.tiv.itsrm.TStorm.server.svp.JobHndlr
2016-04-19 06:03:29.404-0700 Username=TPCUser
Create. Definition type=PROBE.
Name='Probe_linux_vcloud211.storage.tucson.abc.com'
com.tiv.itsrm.TStorm.server.svp.GuiProbeHndlr save()
```

```
GuiRequestHandler9
2016-04-19 06:09:01.029-0700 Username=TPCUser
Running Ping com.tivoli.itsrm.TStorm.server.svp.JobHndlr
handle AgentRequestHandler72016-04-19 06:09:01.031-0700
Username=TPCUser
Running com.tiv.itsrm.TStorm.server.svp.Ping
com.tiv.itsrm.TStorm.server.svp.JobHndlr
handle com.tiv.itsrm.TStorm.server.svp.JobHndlr
2016-04-19 06:23:00.159-0700 Username=TPCUser
```

This audit log exists immediately after the product is installed in your environment.

Device server audit log:

installation_dir\device\log\auditTPCDeviceServer.log

The Device server audit log includes the following information:

- Timestamp
- User ID
- IP address of client
- Service and operation performed
- Key input and output parameters

You can only generate the auditTPCDeviceServer.log file with the `tpctool`.

For example:

```
tpctool.bat lsvol -dev subsystem_ID+0 -l -url localhost:9550
-user <dbadmin> -pwd <db2admin password>
```

```
2016-04-06 00:07:22.004-0700 BTACS0047I
DiskManagerService.getStorageVolumesForSubsystem
performed by db2admin at 127.0.0.1.
Input parameters: [volume_ID x+0, {DETECTABLE=1}], output parameters:
[volume_ID x+9+subsystem_ID+0,
volume_ID x+9+subsystem_ID+0,volume_id+9+subsystem_ID+0,
volume_id x+9+subsystem_ID+0, 6
```

Tip: Not all commands are logged into the auditTPCDeviceServer.log file. For example:

```
tpctool.bat catdscfg -url localhost:9550 -user user name -pwd user password
tpctool.bat setdscfg -url localhost:9550 -user user name -pwd user password
-property SnmpRetryCount -context DeviceServer 999999999
```

This audit log does not exist immediately after you install the product; it is generated when you run your initial CLI command.

For more information, see [tpctool](#).

Diagnosing IBM Spectrum Control problems

You can use the log files, audit files, configuration files, and what steps to take, to diagnose a IBM Spectrum® Control problem.

When a problem occurs with IBM Spectrum Control, collect pertinent information to help diagnose the problem. The following topics help you gather the information that you need.

For specific troubleshooting topics, see the IBM Spectrum Control Information Center.

General information requirements for problem diagnosis

When a problem occurs with IBM Spectrum Control, gather the following information:

- An exact description of the problem.
- The function in use at the time that the problem occurs.
- The sequence of steps that resulted in the problem.
- The expected results from the failing step.
- Any error messages that you see.
- The date and time when the problem occurred.
- The log files that are collected with the service utility.
- The last time that inventory collection was run, which indicates that the repository is in synchronization with the real configuration.
- Whether the error is repeatable or it occurs intermittently.
- The answers to the following connectivity questions help you determine whether there is a communication issue between IBM Spectrum Control and the CIM Agent (or SMI-S provider) server:
 - Is there any firewall that is enabled interfering with the communication between the IBM Spectrum Control components and the SMI-S provider?
 - Is it possible to ping the SMI-S provider?
 - Is it possible to telnet to the SMI-S provider?
 - Is it possible to contact the SMI-S provider with a CIM browser?
 - Are the SMI-S provider in the local subnet or is a Directory Agent (DA) in another subnet used for discovery?
 - Is the DA on the remote subnet registered with IBM Spectrum Control?
 - Was the SMI-S provider Service Location Protocol (SLP) registration successful? Use the **slptool findsrvs** command.

When you schedule data collection, the actual start time of the job starts 1 minute earlier, which is the default, than the scheduled time. So, if you schedule data collection to run at 1:30 PM, the job actually starts at 1:29 PM. The 1:29 PM time stamp is displayed in the GUI for that job and in the job log files. The action takes into account the system processor time that is involved in scheduling a job so that the job actually starts close to the scheduled time.

The following information shows you how to diagnose problems with VMware ESX servers.
- [FlashCopy](#)
IBM Spectrum Control FlashCopy® support labels volumes as having a FlashCopy property of *source*, *target*, or *none* as appropriate.
- [tpctool](#)
tpctool is a stand-alone Java™ client and connects to the Device server only. *Tpctool* connects through TCP, HTTP, and SOAP to the web service APIs. The commands provide query, control, and reporting capabilities only. The commands do not initiate discovery, probes, or configuration and control of agents.
- [Fabric-specific problems](#)
You can use this information to troubleshoot fabric-specific problems.
- [SMI-S providers](#)
The following information provides details on how to troubleshoot CIM client or SMI-S provider problems.
- [Linux SRA probes hanging problem](#)
The Storage Resource agent (SRA) probes use Logical Volume Manager (LVM) commands on Linux® that can hang for various reasons, for example, if a disk is suspended.

Discovery

Use this information to troubleshoot discovery problems.

General information for problem diagnosis

For discovery problems, there are several service level logs to check:

- msgTPCDeviceServer.log
- traceTPCDeviceServer.log
- dmSvcTrace.log

These logs are in this directory: *installation_dir*\IBM\TPC\device\log.

You can get a core dump file in this directory: *installation_dir*\ewas\profiles\DeviceServerProfile\.

For Windows operating systems, follow these steps:

1. Go to this directory: *installation_dir*\device\apps\was\bin
2. Enter the following command:

```
wsadmin set jvm [$AdminControl completeObjectName
type=JVM,process=deviceServer1,*] $AdminControl invoke $jvm dumpThreads
```

For Linux® or AIX® operating systems, enter this command:

```
ps -ef | grep "IBM/TPC" | grep "ewas" | grep "deviceServer" |
awk '{print $2}' | xargs kill -3
```

The **setenv** command must be run before you run the **srmcp** command.

For Windows operating systems, follow these steps:

1. Go to this directory: *installation_dir*\device\bin\w32-ix86
2. Enter the following command: **setenv**.

For Linux or AIX operating systems, follow these steps:

1. Go to this default directory:

Linux systems:
installation_dir/device/bin/linux

AIX systems:
installation_dir/device/bin/aix

2. Run this command:

```
./setenv.sh
```

To discover the job activity, issue the following command:

```
srmcp -u user_ID -p password DiscoverService list jobs
```

To determine the Db2® activity, issue the following Db2 commands:

```
db2 list applications show detail > dbListApplicationDetails.out
db2 update monitor switches using statement on lock on table
db2 connect to tpcdb
db2 get snapshot for all on tpcdb > dbsnap.out
```

Common user errors

A discovery or probe operation does not complete. This condition can be caused by the following situations:

- There is a lock contention when IBM Spectrum® Control accesses the database tables.
- DB2® does not return information from a query.
- The SMI-S provider starts returning information and then stops.

To work around this problem, stop and start the Data server and Device server. Also, use the service tool to collect log information. For information about the service tool, see [Service tool overview](#).

Unable to discover filers in a Windows environment

If you are unable to discover filers in a Windows environment, check the following items:

- Check the discovery log file:
 - For initial discovery, check the probe_000001.log file.
 - For discovery jobs, check the associated discovery log file.
- If the log file contains the following information, check the authentication information that is entered in the Filer Login panel:

```
DIS0001I FULL command selected.
STA0246I Discovery started
STA0339I Discovery started for domain xxx
NAA0041E Local login failed -- SRM\db2admin
NAA0041E Local login failed -- SRM\db2admin
STA0249I Sending results to server
STA0250I Server saved results
```

This information indicates:

- Authentication that is entered for a single filer is validated.
- The default login and password, which is used for multiple filers, are not validated.
- Verify that the SNMP community specified in the discovery job is the SNMP community that is used by the filer.
- Check the TPCUser.Discovery*.trace log file. If the trace log file does not exist, set the agent trace to the maximum value and rerun discovery. The trace file for discovery contains helpful information about hosts that are found on the domain, which host is contacted that uses SNMP, the SNMP community name, and Windows API calls errors.

Unable to discover filers in a Linux or AIX environment

Check the following items:

- Ensure that the agent can communicate with the filer and can mount a file system from the filer.
- Verify that the SNMP community name specified in the discovery job is the SNMP community that is used by the filer.
- Ensure that the mounts on the agent system are current and not stale.
- Check the TPCUser.Discovery*.trace log file. If the trace log file does not exist, set the agent trace to the maximum value and rerun discovery. The trace file for discovery contains helpful information about what SNMP community name is used to communicate with the filer.

Other scenarios that can cause discovery problems

Other scenarios that might occur are as follows:

- If you see message STA0155E in the Windows discovery log file:

```
DIS0001I FULL command selected.
STA0246I Discovery started
STA0339I Discovery started for domain xxx
STA0155E Discovery was unable to find the Windows computers in the domain
or workgroup.
STA0249I Sending results to server
STA0250I Server saved results
STA0252I Discovery completed successfully.
```

If you receive these messages, turn on tracing to generate a discovery trace file. Check the trace log for error code 6118. If you see code 6118, start the Computer Browser service on the Windows system, if the service is not turned on. Then submit discovery again.

- For hosts that are on different Windows subnets but have the same workgroup name, IBM Spectrum Control considers the workgroup is on the same subnet and excludes one subnet when discovery is run. To work around this issue, disable the Storage Resource agent on one subnet and then run discovery again.

Discovery and probe completion codes

Use this information to interpret status and completion codes returned in messages from discovery and probe jobs.

Status and return codes

Discovery or probe process completion status and return codes are referenced in messages, for example:

- BTADS0001I Discover Process with Device Server RUN ID 153001 and Job ID 405024 is complete with Status= 1 , Return Code= 0

- BTADS0102E The discover process that has the Device server run ID 112003 and job ID 291022 completed with one or more errors. The process status is 4 and the return code is 8

Table 1. Status codes

Code	Value
0	Failed
1	Successful
2	Running
3	Warning
4	Partial failure
5	Cancelled
-1	Submitted
-2	Waiting

Table 2. Return codes associated with completion codes

Code	Value
0	Success
4	Warning
8	Failed

Monitoring service

The following information shows you how to troubleshoot monitoring service problems.

IBM Spectrum® Control shows an event for the discovery and control components for the following actions:

- When you add a resource.
- When you make resource status changes.
- When the resource is not detected.

IBM Spectrum Control provides an alert generation on behalf of the performance monitoring service when the threshold changes and there is a collection failure. The database table snapshot for a certain resource type is based on the request that is made to the performance monitoring service.

For general diagnosis of the problem, check these items:

- Make sure that the alert trigger condition is set up correctly.
- Make sure that the changes did happen.
- Check the alerts that are shown on the Alerts page in the IBM Spectrum Control GUI.

For specific diagnosis of the problem, check these items:

- Locate the Device server trace log and search for possible exceptions that are generated from the monitor service.
- If no errors and exceptions are found for the monitor service, it means that the monitor service is running without problems. Next, check to see whether some other component is causing the problem such as the Change Detection component.

Common usability problems

These items are some common user errors with the monitoring service:

Why do I not get the correct alert?

Check to see that you configured the correct trigger condition for the correct resource or resource type.

Why is overall performance slow?

Many database activities to form SNMP and Netcool®/OMNIBus events might affect overall performance if too many alerts get created. You can configure only the needed alerts to control the number of alerts.

Why am I losing an event or alert?

An event or alert might be lost because the required data is unavailable in the database or there are network communication problems. After the alert creation fails, the alert for this changed device is not re-created.

Why do I see unexpected alert definitions and unexpected alerts with the keyword Pre-defined in the name?

These alerts are shown when another application is subscribed to receive events from IBM Spectrum Control through the product API.

You can change the setting to hide Pre-defined alert definitions when you use the **tpctool** command:

```
tpctool setdsconf -user user_ID -pwd password -url localhost:9550
-property APIAlert.Visibility false
```

Logs and traces

When a problem occurs, you can set the trace level parameter `san.eventFactoryTrace.level = INFO` when you use the CLI command to get detailed trace information. Make sure that the created FabricAlert object is sent to the Data Server successfully.

The detailed trace information is saved in the following directory: `install_directory\data\log\traceTPCDeviceServer.log`

Use the service tool and repocopy tool to collect trace information for IBM Spectrum Control and the database.

When an expected alert is not presented, check the following items:

- The trace log to make sure that the resource changes are reported to the monitor service. For example, search the log for the corresponding API call.

- The correct alert population routine is used, and any other exception that is encountered during the process.
- Make sure that the alert object is sent to the Device server.

Performance monitoring

The following information shows you how to troubleshoot performance monitoring problems.

Tuning performance monitors for switches

When performance monitors for switches encounter timeout problems, you can change the attributes that affect the performance monitor. The performance monitor uses algorithms to collect performance information. The association algorithm is optimized for environments with larger numbers of switches that are managed by an SMI Agent or SNMP agent. The enumeration algorithm is optimized for environments with fewer switches that are managed by an SMI Agent or SNMP agent. IBM Spectrum® Control attempts to determine which algorithm to use based on the fabric configuration.

You can change the following attributes in the pm.conf file:

MinSwitchPortRatio

This attribute defines the minimum port ratio, for example, the ratio of monitored ports to total ports for a switch data source. This value is used to determine which algorithm to use for querying the performance statistics data for the ports through the SMI Agent or SNMP agent. The default cutoff value for the enumeration algorithm is 20%. If the cutoff value is less than 20% of the ports for an agent that are targeted for performance data collection, the association algorithm is used instead, if the MaxSwitchPortLimit is not exceeded. This parameter does not apply to Cisco SNMP agents.

MaxSwitchPortLimit

This attribute defines the maximum port limit, for example, the maximum number of ports to be monitored that use the association algorithm for switch SMI Agents. This value is used to determine which algorithm to use for querying the performance statistics data for the ports through the SMI agent. If not set, the default cutoff value for the association algorithm is 256 ports, so that performance data is not collected for more than 256 ports simultaneously that use the association algorithm. Instead, the enumeration algorithm will be used for any SMI agents after the limit is reached.

To change these attributes in the pm.conf file, go to the following directory: *SC_installion_directory/device/conf/pm.conf* and remove the number sign (#) from these attributes and modify your setting:

```
#com.ibm.tpc.perf.MinSwitchPortRatio = 0.4  
#com.ibm.tpc.perf.MaxSwitchPortLimit = 256
```

Save the file. You must restart the Device server for these changes to take effect.

Configuration History

Diagnose problems with the Configuration History view.

The Configuration History view is a variation of the topology viewer. The Configuration History view shows the current configuration and provides information about what the configuration looked like in the past. Use the snapshot selection panel in the Configuration History page to view changes that occurred in your storage environment between two or more periods.

The Configuration History views can show a resource two or more times. This condition might happen when a resource is removed manually from the database or is removed automatically according to the Data for missing resources setting on the History Retention page, and IBM Spectrum® Control rediscovers that resource again. IBM Spectrum Control assigns the resource to a different ID when it is rediscovered.

Limitations

The following items are not supported by Configuration History:

- Alert and performance overlays
- Pin and refresh settings actions

Diagnosing problems

Check the following conditions when you encounter a problem with Configuration History:

- Message log for the Device server. The log file is available in the following directory: *installation_dir/device/log/msgTPCDeviceServer.log*. The message prefix is HWNCC.
- Device Server trace log.

To turn on tracing for Configuration History in the Device server, complete these steps:

1. In the menu bar, go to Home > System Management.
2. Click Component Servers in the Components section. In the Component Servers pane, you can view performance information for each component server. The current trace level for each component server and the Device server services is highlighted.
3. Adjust the trace level for a component server or a Device server service by clicking Low, Medium, or High.

The output data is logged in the traceTPCDeviceServer.log file.

- Data Server trace log. For information about turning on tracing for the Data server, see [Tracing servers and agents](#). Select High to collect the most data possible for this server. The Data server log files are at this location: *installation_dir/data/log/ServerTrace.log* and *installation_dir/data/log/dbtrace.log*.

SMI-S fabric probe

The following information shows you how to diagnose problems with the SMI-S probes of fabrics.

IBM Spectrum® Control supports the SMI-S agent (also called the CIM agent or CIMOM) for the fabric. The SMI-S agent collects basic fabric, switch, and port information that is used for performance monitoring. For Brocade fabrics, full topology information and zoning information is also collected during the fabric probe.

For a list of switches and directors that are supported by IBM Spectrum Control, see the [IBM Spectrum Control interoperability matrix for switches](#). Search for the appropriate version of switch and director.

Common usability problems

SMI-S fabric usability issues include the following items:

Switch Vendor and Model are blank or unknown

Some switch vendors do not provide a distinguishable vendor name or model name through some of the fabric agents.

Switch performance monitoring job fails immediately

Check to see that a probe of the related fabric completed.

The Switch port, Index, Slot, or Enabled State option is blank for the Brocade switch

Check to see that an SMI-S agent is configured for this fabric, and check to see that a fabric probe completed.

CIMOM discovery failed

Check to see that the switch SMI-S agents are at the supported levels.

Network Advisor SMI Agent

For information about the Network Advisor SMI agent, see the following documents:

- *Brocade Network Advisor User Manual* that supports your version of Network Advisor.
- *Brocade SMI Agent User's Guide* for the version of the SMI Agent you are using.
- *Brocade Network Advisor (BNA) Integrated SMI Agent* for any problems that are encountered with this type of SMI Agent.

Things to note

When you have a problem with the SMI-S fabric probe, check these items:

- The following information is collected only through the SMI-S agent:
 - Brocade blades
 - Brocade Switch FCPort EnabledState and Index
- When a discovery is performed, IBM Spectrum Control finds fabrics and switches through the switch SMI-S agents. IBM Spectrum Control finds basic information for switches that are not registered with the SMI-S agent, if they are in a fabric with a switch that is registered with the agent. IBM Spectrum Control also finds and persists fabrics and the fabric-to-switch relationships.
- When a fabric is probed, the following actions occur:
 - SMI-S agent discovery is rerun.
 - When a backend fabric agent assignment is made, IBM Spectrum Control checks to see which SMI-S agents are available. The agents are sorted and the top agent in the list is run. The other agents in the list are run only if the fabric probe fails with the previous agent.
- Switch blade port index values
 - The switch blade port index values might be incorrect for Brocade switches where one of the following scenarios apply:
 - When a port swap operation is performed.
 - When the Extended Edge PID mode has been enabled on the director. For more information about the Extended Edge PID mode, see the Brocade document *Fabric OS Administrator's Guide*.

VMware ESX

The following information shows you how to diagnose problems with VMware ESX servers.

IBM Spectrum® Control supports the VMware Virtual Infrastructure that consists of the ESX server and VMware VirtualCenter. The ESX server is a true hypervisor product that can host multiple virtual machines that run independently of each other while they share hardware resources.

IBM Spectrum Control supports the following services:

- The Virtual Center discovery is the only successful criteria.
- Alerts are for probe only. No event, traps, or alarms from the Virtual Infrastructure are supported.
- IBM Spectrum Control supports reporting only. No active management of the Virtual Infrastructure is supported.
- The information that is obtained from VMware is equivalent to what is obtained through a read-only Storage Resource agent. It does not include scripts or file system (FS) extension.

To get detailed information for space and capacity reports, you must complete the following steps:

- Probe all the ESX servers.
- Install Storage Resource agents on all the virtual machines and probe them. Otherwise, you get a partial picture with incomplete capacity data.

Common usability problems

The following list shows some common user errors with VMware:

- There are new totals in the dashboard and reports.
- Note the indications for the hypervisor status.
- Differentiate Storage Resource agent for a virtual machine information from the ESX Server.

Dependencies

Some of the dependencies are as follows:

- VMware ESX 3.0.1 and Virtual Center 2.0.1 are required.
- A probe of the hypervisor is required for complete reporting.
- Hypervisors and Virtual Centers have HTTPS communication that is turned on and HTTP communication that is turned off by default.
- You require permission to browse through the data stores on the ESX server. For more information about how to check permissions to browse data stores, search the IBM Spectrum Control Knowledge documentation for *hypervisor permissions*.

Diagnosing the problem

When you troubleshoot a VMware problem, make a note of the following items: When you troubleshoot problems with VMware devices, make a note of the following items:

- View the job logs for probe create jobs that might indicate that tracing information is available.
- Look for trace messages in the general trace file: *installation_dir/device/log/traceTPCDeviceServer.log*
- Enable tracing for the Device server.
 1. In the menu bar, go to Home > System Management.
 2. Click Component Servers in the Components section.
 3. In the Device section, click On for each of the services of the Device server.

The output data is logged in the traceTPCDeviceServer.log file.

For more information about setting the trace levels of the component servers, see the online help for the System Management page.

FlashCopy

IBM Spectrum® Control FlashCopy® support labels volumes as having a FlashCopy property of *source*, *target*, or *none* as appropriate.

IBM Spectrum Control does not include the ability to create or manipulate FlashCopy relationships.

Diagnosing the problem

Most issues arise from one of two causes:

Missing data

The storage system does not report the FlashCopy data in a manner that IBM Spectrum Control expects. Missing data is most likely to occur in the event of the release of new microcode or CIM agents for a storage system.

For storage systems that use CIM agents, use a CIMOM browser to verify that those agents are aware of the FlashCopy relationships.

Tip: IBM® storage systems, such as DS8000® and XIV®, do not require CIM agents. These storage systems use native interfaces.

Improperly created FlashCopy relationships

A persistent FlashCopy relationship was not created. If the relationship is temporary, the relationship is probably no longer valid by the time IBM Spectrum Control probe requests the information. Verify that the management software of the storage system reports the FlashCopy relationship.

tpctool

tpctool is a stand-alone Java™ client and connects to the Device server only. *Tpctool* connects through TCP, HTTP, and SOAP to the web service APIs. The commands provide query, control, and reporting capabilities only. The commands do not initiate discovery, probes, or configuration and control of agents.

Tpctool is installed in the following default directories:

Windows operating systems:

installation_dir\cli

Linux® or AIX® operating systems:

installation_dir/cli

The Windows command to run the tool is *tpctool*. The Linux or AIX command to run the tool is **tpctool.sh**.

There are two distinct kinds of authentication:

- User authentication
- Super user or host-based authentication

The user authentication requires a user ID and password authenticated in the Device server authentication domain. Role-based authorization is enforced on a per command basis.

The super user or host authentication is for the tpc_superuser user ID. The password for this user ID bypasses role-based authorization. This action is the required authentication method for AIX-based Device servers.

Some of the control commands run for a long time. An example is the **mkvo1** command. It is not possible to determine the intermediate status of the command. If the *tpctool* client stops, for example the user presses Ctrl-C or the node crashes, all connections with the job are lost. It is not possible to reconnect to the host to check on the status of the command.

The Device server logs and trace files, assuming that tracing is on, are shown. For the disk commands, see this log:

DiskManagerService: dmSvcTrace.log

For the Fabric commands, see these logs for the Fabric Manager Service:

- TPCZoneControl.log
- msgTPCDeviceServer.log
- traceTPCDeviceServer.log

For the reporting commands, see this log:

PerformanceService: tracePerfMgr.log

For fabric reports, the commands pass through the Fabric service for authorization. For subsystem reports, the commands pass through the Disk service for authorization. For configuration commands, see this log:

ConfigService: traceTPCDeviceServer.log

For all other commands, see this log:

msgTPCDeviceServer.log

Here are some notes about passwords:

- You can use the GUI to change the Device server host authentication password.
- If you use the GUI to change the password, the password is updated in the database and the Device server is notified.
- The configuration file for all the Fabric agents must be manually changed.

Common usability problems

Here are some common usability problems with the *tpctool*:

- You do not know where the installation directory is. Is the installation directory in a nonstandard location?
- You did not set the *PATH* or *chdir* to the *installation_dir/cli* directory.
- Using *tpctool* on Linux or AIX operating systems instead of *tpctool.sh*.
- Did not provide the following parameters in the command:
 - **-url** *tpcserver:deviceserverport* where *tpcserver* is the hostname or IP address of the server that runs IBM Spectrum® Control and the *deviceserverport* default value is 9550, for example: localhost:9550
 - **-user**
 - **-pwd**

A common error message for *tpctool* is as follows:

AAJ000009E Error communicating to the App server.

This error message indicates an invalid port, invalid host, or that the Device server is unreachable. To distinguish what the problem is, you can set a debug flag that prints the Java stack if an exception occurs. Most errors are propagated to *tpctool* as exceptions. To set this flag:

Windows operating systems:

set TPCCLIDBG=1

Linux or AIX operating systems:

export TPCCLIDBG=1

For an invalid host, the host name is embedded in the message. For example:

```
[SOAPException: faultCode=SOAP-ENV:Client: msg=Error opening socket:
java.net.UnknownHostException:badhost:...]
```

For a valid host but an invalid port or when the Device server is down, an example of a message is as follows:

```
[SOAPException: faultCode=SOAP-ENV:Client: msg=Error opening socket:
java.net.ConnectException: Connection refused:...]
```

An invalid port is the most common problem.

If the Device server node is unreachable, an example of the message is as follows:

```
[SOAPException: faultCode=SOAP-ENV:Client: msg=Error opening socket:
java.net.SocketException: Operation timed out:
connect:could be due to invalid address:...]
```

srmcp commands

Before you run a **srmcp** command, you must run the **setenv** command.

Windows operating systems:

Follow these steps:

1. Go to this default directory: *installation_dir\device\bin\w32-ix86*
2. Run the following command: **setenv**.

Linux or AIX operating systems:

Follow these steps:

1. Go to this default directory on UNIX

Linux systems:

installation_dir/device/bin/linux

AIX systems:

installation_dir/device/bin/aix

2. Run this command:

```
./setenv.sh
```

You can use the following **srncmp** commands for SANEventCorrelatorFactory for fabric troubleshooting:

- To list the configured filters:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password SANEventCorrelatorFactory
list
```

- To add a filter with the specified values (any or all can be specified). You can specify just the enterprise, the OIDs, or a combination:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password SANEventCorrelatorFactory
add filter [enterprise=enterprise] [genericTrap=<number>]
[specificTrap=number] [OID=value]
```

- To specify an IP address that is filtered for the specified filter:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password SANEventCorrelatorFactory
add address ID IP_address
```

- To remove a specified filter:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password SANEventCorrelatorFactory
remove filter ID
```

- To remove the IP address from the filter list:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password SANEventCorrelatorFactory
remove address ID IP_address
```

Here is the **srncmp** command to change the host authentication password:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password ConfigService setAuthenticationPw
new_host_password
```

Here is the **srncmp** command to change the DB2® password (not the db2admin password) that the server uses:

```
cd installation_dir\device\bin\w32-ix86
srncmp -u user_ID -p password ConfigService setPw
new_host_password
```

Fabric-specific problems

You can use this information to troubleshoot fabric-specific problems.

Fabric discovery

You might encounter the following of problems when you discover the fabrics in a storage environment:

- An error in the logs. Typically the first error you see is the most important.
- Information in the GUI that is incorrect or unexpected.

For information about error messages, see [Message types](#). Follow the explanations, user responses, and administrator responses.

For problems related to the discovery of fabrics, follow these steps:

- Run the service tool. See [Service tool overview](#).
- Run the **repocopy** command to capture the IBM Spectrum Control database. Follow these steps:
 - Go to the following directory:

Windows operating systems:
`installation_directory\data\server\tools`

Linux® or AIX® operating systems:
`installation_directory/data/server/tools`

- Run the following command:

Windows operating systems:
`repocopy.bat`

Linux or AIX operating systems:
`repocopy.sh`

- Select Export data from repository tables.
- Select the directory for the export file location.
- Use the default values for delimiter and double quotation marks.
- Use the default values for the connection properties.

- g. Compress all the files in the output directory and send to the IBM Software Support.
3. Get more trace information. To turn on or change the tracing for the component servers and Device server services, follow these steps:
 - a. Go to Home > System Management.
 - b. Click Component Servers in the Components section. In the Component Servers pane, you can view performance information for each component server. The current trace level for each component server and the Device server services is highlighted.
 - c. Adjust the trace level for a component server or a Device server service by clicking Low, Medium, or High.
4. Correlate the time stamps in the job log.
5. Check the health of the Device server.
6. Check these files:
 - `installation_directory\device\log\traceTPCDeviceServer.log`
 - `installation_directory\device\log\msgTPCDeviceServer.log`

To check on incorrect information, check these items:

- Did IBM Spectrum Control receive an event? Look for the following items:
 - Events in the alerts.
 - ALR4100I: Received an SNMP trap notification from source.
- The health of the probe:
 - Look in the log file: `installation_directory\device\log\msg.probeFabricAgents.x.x.log`
 - Look for exceptions or error messages.
- If the population of the results into DB2® failed:
 - Check the following log file: `installation_directory\device\log\msg.probeFabricAgents.x.x.log`
 - Look for exceptions or error messages.

The following is a list of some of the known problems:

- Some unsupported devices like multi-protocol routers can cause failures during the discovery process.
- AIX HBA information is limited and provides only name, manufacturer, firmware, and model.
- HBA hardware and BIOS versions are not shown in the IBM Spectrum Control GUI.

HBAs not discovered by a Storage Resource agent

The Storage Resource agents do not use RNID and SCSI inquiries for remote HBA and resource identification. You need a Storage Resource agent on each system for which HBA information is needed. You need a native interface storage system or SIM-S Provider to identify the storage devices.

Check for any messages in the probe log for information about what might be the problem. You can also check the following items:

- If the supported HBA driver and API are installed. In some cases, the HBA driver includes the API. In other cases, the HBA driver and API must be installed separately. Contact your HBA vendor for information about the driver and API.
- If the HBA and API are at a level that is supported by IBM Spectrum Control. See <https://www.ibm.com/support/pages/node/388393>.
- There are some operating system restrictions for Storage Resource agent functions.

For more information about the requirements for the Storage Resource agent, see <https://www.ibm.com/support/pages/node/6249361#Agents>.

- Check to see whether the HBA is configured appropriately. For information about how to configure the HBA, contact your HBA vendor.

The HBA to port relationship is a logical concept. Sometimes one physical card might have more than one HBA port. Multiple ports in the same HBA share node WWN.

Probe failures

If the probe of a fabric fails, check the following items:

- Look at the probe job log and Device server message and trace log files. If the error message is in processing before the agent is called, the issue is with the agent assignment.
- Check for communication errors when the agent is called, any error response from the agent, or no response from the agent.
- Check the agent log files for error messages.

Fabric configuration

Check the following items for fabric configuration problems:

- Look at the GUI or CLI error code. See IBM Spectrum Control Messages for the error codes. The error codes have two parts: command failure code and native failure code.

Command failure code

The command failure code specifies which operation failed, such as an error that occurred while a zone is created.

Native failure code

The native failure code gives the reason for the error, such as *Already exists*.

- Whether the agent that is connected to the fabric is configured appropriately for zoning.

Check the following logs:

- Web server log files.
- `AuditTrace.log` in the Data Server log directory.
- `TPCZoneControl.log` in the Device server log directory.
- `msg.control.123.123.log` in the Device server log directory
- `traceTPCDeviceServer.log` in the Device server log directory

How to adjust log and trace levels

You can adjust the following trace levels in the `DataStore.properties` and `native.log.properties` files in the Device server conf directory.
Tip: Make a backup copy of the `DataStore.properties` file before you modify this file. A corrupt `DataStore.properties` file can cause IBM Spectrum Control to not start.

```
san.ControlTraceLogger.level=ALL
san.SanZoneControlTraceLogger.level=ALL
san.SanZoneControlAgentTraceLogger.level=ALL
```

Commands and tools for troubleshooting

- On the seed switch of the fabric, check for a transaction lock. For example, for the Brocade CLI, use the `cfgTransShow` and `cfgTransAbort` commands.
- Look for IBM Spectrum Control GUI or CLI instances that can be holding a transaction lock. It might be difficult to abandon the transaction lock on older switch models without rebooting the switch.

Fabric events

Some of the common reasons for not getting notification of external fabric events or not having fabric probes run automatically in response to events are as follows:

- Switches are not configured to send SNMP traps to the server.
- The fabric for which an event was received or fabrics that are discovered by the Storage Resource agent are not included in any probes that are defined by the user. An automatic probe of fabrics is done only for fabrics that are included in some probe definition.
- The switch is configured for a trap level that results in the filtering of the trap and not sent from the switch to the server. The trap that is sent from the switch to the server is filtered by the server because of default filter rules or filtering rules, or both, configured by the user.

To configure tracing to check that the traps are filtered, set the trace level parameter `dsn.eventFactoryTrace.level = INFO` by using the CLI command to get detailed trace information. Ensure that the created FabricAlert object is sent to the Data Server successfully.

The detailed trace information is saved in the following directory: `installation_directory\data\log\traceTPCDeviceServer.log`.

If you are not getting a fabric alert when you expected one, check if the information shown in IBM Spectrum Control reflects the change. Check that the appropriate types of alerts are defined for the fabric.

Check the following logs for error messages:

- `installation_directory\data\log\server_xxxx.log`
- `installation_directory\data\log\TPCD_xxxx.log`

CIM indications

Here is a list of some things to check when you are having issues with CIM indications from Network Advisor:

CIM indication not received

- Verify that SNMP registration is successful by the Network Advisor discovery dialog
- Verify if the configured SNMP port is blocked by a firewall
- Verify if the Management Information Base (MIB) capability for trap forwarding and tracking changes are configured properly

To get the Network Advisor logs, follow these steps:

1. Open the Network Advisor Server Management Console.
2. Go to the Technical Support Information tab.
3. Click Browse and select the log destination. Click capture.

Fabric data retention

Check for problems that are related to the removal of missing fabric resources and data in the following logs:

- `server_xxxxx.log`
- `TPCD_xxxxx.log`

These logs are in the following directory: `installation_directory\data\log\`

Related reference

- [Default locations of log files](#)

SMI-S providers

The following information provides details on how to troubleshoot CIM client or SMI-S provider problems.

XML requests and responses are written to the CIM client trace file that is in the following directory: `C:\Program Files\IBM\TPC\device\log\cim-xml-trace.txt`

The `cimxmlTracing` configuration parameter in the Db2® table must be set to true to collect tracing information.

To set the CIM client trace parameter `cimxmlTracing`, follow these steps:

1. Check the value of the `cimxmlTracing` attribute in the Db2 table by using the following command:

```
tpctool getdscfg -user user_ID -pwd password -url localhost:9550
-property cimxmlTracing
```

The `tpctool` command shows the following information:

Property	Context	Value
cimxmlTracing	CIM	false

If the value is false, set the attribute to true:

```
tpctool setdscfg -user user_ID -pwd password -url localhost:9550  
-context CIM -property cimxmlTracing true
```

Run the `getdscfg` command again to show the new value of the attribute:

Property	Context	Value
cimxmlTracing	CIM	true

2. After you modify the value of the attribute, stop and restart the Device server.

Linux SRA probes hanging problem

The Storage Resource agent (SRA) probes use Logical Volume Manager (LVM) commands on Linux® that can hang for various reasons, for example, if a disk is suspended.

Problem

When a Storage Resource agent is deployed on a Linux host, it starts several Linux commands, including **lvm pvs**. The Storage Resource agent probe can hang at the same point that the **lvm** command stopped working.

On the IBM Spectrum® Control web user interface, the Storage Resource agent probe remains in an In Progress state and does not give any indication that the probe is hung.

Action

To verify that the **lvm** command is causing the SRA to hang, look at the SRA trace log on the SRA deployment and check that the last command run is an **lvm** command.

To solve the issue, follow these steps:

1. Kill the hung SRA process.
2. Kill the hung **lvm** command.
3. Rerun the **lvm pvs** command from the command line.
4. Verify that the **lvm** command runs successfully by running the **pvdisk** command to display the volume details.
5. Restart the SRA deployment.

Getting support

For help with resolving issues with IBM Spectrum® Control, you can contact IBM® Support or use IBM self-help resources.

To get help from IBM Support and report issues with IBM Spectrum Control, complete these steps:

1. Log in to the [IBM Support portal](#). If you don't have an IBM ID, go to [Create your IBM account](#) and complete the form.
2. Click Open a case.
3. Complete the form.
4. Click Submit case.

Optionally, you can contact IBM Support by phone. In the U.S., call 1-800-426-4968. For other countries, go to <https://www.ibm.com/planetwide/>. When you open a case or contact IBM Support by phone, have the following information ready:

- The version, release, modification, and service level number of IBM Spectrum Control that you're using.
- The communication protocol (for example, TCP/IP), version, and release number that you're using.
- The activity that you were doing when the problem occurred, including the steps that you followed before the problem occurred.
- The exact text of any error messages.

Videos about the IBM Support portal: Watch a few short videos to learn more about the IBM Support portal:

- [Introducing a new customer portal](#)
- [Open and manage cases](#)
- [IBM Support Community: Search](#)
- [IBM Support Community: Forums](#)

Collecting and uploading service logs

To help close your case, IBM Support might need you to collect and upload your service logs. To complete this task, use one of the following methods:

- Package and send the logs from the System Management page. See [Packaging and sending log files from the System Management page](#).
- Package the logs from the command line and then manually upload the resulting .zip file. See [Packaging log files from the command line and sending them to IBM Support](#).

Using IBM self-help resources

Use the following resources to learn about and help troubleshoot issues that you might encounter in IBM Spectrum Control.

[IBM Support page for IBM Spectrum Control](#)

View, start, or contribute to IBM Spectrum Control community discussions, view supplemental resources, or chat with IBM Watson®.

[Fixes](#)

Find and download the latest fixes and updates for IBM Spectrum Control.

[Product updates and security fixes](#)

Find information about IBM Spectrum Control releases and downloads, security, subscribing to IBM announcements, collaborating with the IBM Spectrum Control team, reporting problems, and End of Support (EOS) details for specific releases of IBM Spectrum Control and related products.

[Social media](#)

Watch videos and read blogs to learn more about how to use IBM Spectrum Control to manage your storage environment.

Messages

View details about error, warning, and informational messages in IBM Spectrum® Control.

- [Introduction to messages](#)
The message ID can tell you more about the type of information you are dealing with.
- [Message types](#)
Read detailed information on specific messages.

Introduction to messages

The message ID can tell you more about the type of information you are dealing with.

Messages may be displayed onscreen or logged in text files. The log files for the Data Server are located in the `\install_dir\data\log` directory and the log files for the Device server are located in the `\install_dir\device\log` directory on the manager machine. You can optionally configure the maximum retention period for each log file.

The following example illustrates the message ID format:

BPCUI0053E

Where:

BPCUI

A 3- to 5-character prefix that identifies the message group.

0053

A 4- to 6-number message identifier.

E

The message type:

E

Error. An Error message indicates a situation where you need to take remedial action. The message help provides an explanation and suggests possible action.

W

Warning. A Warning message alerts you to a situation that may need your attention. The message help provides an explanation and suggests action or pointers for investigation.

I

Information. An Information message provides additional detail on the outcome of an action. No further action is required.

Message text variables are displayed in *italics*.

Message groups

The alphabetic identifier at the start of message IDs indicates their function.

Identifier	Function
AGT	Agent
ALR	Alert
BPCCA	Collector agent
BPCCM	Collector Managers
BPCDP	Data Processor
BPCIN	On premise installation
BPCRE	Alert server
BPCRS	Middleware
BPCSS	Scheduler
BPCUI	Web client
BTACD	Database verifier, SAN database service

Identifier	Function
BTACE	SAN event service, messaging middleware
BTACS	Service manager
BTADS	Fabric discovery
BTAEC	Event correlator factory
BTAHM	Host manager
BTAIC	In-band change agent
BTALG	Logging service
BTAMS	Messaging service
BTAQE	Query engine
BTASA	Scanner agent
BTASD	SAN manager daemon, fabric user interface
BTATG	UNIX CLI help
BTAVM	Hypervisor management
BTAZC	Zone control
BTM	Common Information Model Agent
BWN	Disk user interface
CMMNP	CLI infrastructure
CMMUI	CLI infrastructure
CNFG	Configuration
DIS	Discovery
EMSG	DS8000 master console
GEN	General
GPC	Performance User Interface
HWNAS	Agentless server
HWNAL	Authentication
HWNCA	Social, Mobile, Analytics and Cloud (SMAC)
HWNDA	Storage Resource Group
HWNEM	Element manager management
HWNFS	File system monitor
HWNLM	Host planner, security planner, and subsystem planner
HWNOP	Storage Optimizer
HWNPM	Performance Manager
HWNRM	Replication Manager
HWNSS	Single sign-on
JSS	Database
NAD	Storage Resource agents
NAG, NAS	NAS
SAA, SAG, SAS	SAN (some SAS messages are related to file system extension)
SRV	Server
STA, STG, STS	Base product (some STA and STS messages are related to file system extension)
VPLG	VASA provider

Related reference

- [Getting support](#)

AGT0165W Library : HBA_OpenAdapter(adapter name) failed.

Explanation

The HBA_OpenAdapter method failed for the specified adapter.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

AGT0166W The HBA API HBA_GetAdapterAttributes for adapter adapter name returned error error code.

Explanation

The HBA_GetAdapterAttributes API call failed with the indicated return code. Some of the standard codes are as follows: 1 - General Error 2 - Function is not supported 9 - SCSI check condition 10 - HBA is busy or reserved 11 - Request timed out 15 - Incompatible library and driver modules 16 - Multiple adapters have the same WWN 30 - Target busy.

Action

Contact your HBA vendor for support. If the behavior of the adapter with respect to the HBA_GetAdapterAttributes API is intended by the vendor, then ignore this warning message.

AGT0167W *Library : HBA_GetAdapterPortAttributes(adapter number, port) returned status.*

Explanation

The HBA_GetAdapterPortAttributes method failed for the adapter port with the specified status.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

AGT0168W *HBA data cannot be collected because the adapter name> adapter on the server does not support the HBA_GetAdapterAttributes function.*

Explanation

When a probe attempts to collect data about a server, this function call to the HBA API is not supported by the adapter on that server. Information about the Fibre Channel Storage Area Network that is typically provided by this function is not collected.

Action

For information about adapter support of the common HBA API, see the documentation that is provided by the vendor. If you require additional information, contact the HBA vendor. If the behavior of the adapter for the HBA_GetAdapterAttributes API call is intended by the vendor, you can ignore this warning message.

AGT0200E *Error waiting for process.*

Explanation

A error has occurred while waiting for a windows script to run.

Action

Contact IBM customer technical support.

No response is necessary. This message is for information only.

AGT0281W The cluster is not ready to be probed. Waiting *settle time* seconds to retry (*retry count/retries*).

Explanation

The cluster is not ready to be probed and will try a new attempt at a later time based on the left number of retries.

Action

Verify the status of Cluster Manager daemon (clstrmgrES) using the following command:

```
/usr/bin/lsrsc -ls clstrmgrES
```

If the output of the command indicates that the daemon is not running or the 'Current State:' line does not contain ST_INIT or ST_STABLE status, then start the Cluster Manager daemon using the following command:

```
startsrc -s clstrmgrES
```

AGT0282E Unable to probe the cluster.

Explanation

The cluster could not be probed after repeated attempts.

Action

Verify the status of Cluster Manager daemon (clstrmgrES) using the following command:

```
/usr/bin/lsrsc -ls clstrmgrES
```

If the output of the command indicates that the daemon is not running or the 'Current State:' line does not contain ST_INIT or ST_STABLE status, then start the Cluster Manager daemon using the following command:

```
startsrc -s clstrmgrES
```

AGT0283I The cluster is ready and the probe will proceed.

Explanation

The probe initialization process completed with success.

AGT0284E Agent *host name* does not accept scripts from server (scripts are '*Disabled*'). Script *script name* cannot run.

AGT0444I Switched fabric: *fabric ID* already found

Explanation

The fabric has already been discovered

AGT0445I Operation has been cancelled

Explanation

Operation was cancelled

AGT0446I Fabric discovery successfully found switch fabric.

Explanation

The fabric discovery process successfully found the switch fabric connected to the system

AGT0447I Fabric discovery did not find switch fabric.

Explanation

The fabric discovery process did not find switch fabric.

AGT0448I Fabric discovery is already running.

Explanation

The fabric discovery process was not performed because a fabric discovery process is already running.

AGT0449I Fabric discovery failed, unable to discover switch fabric.

Explanation

The fabric discovery process failed and was unable to determine if system is connected to switch fabric.

Action

The commands used to discover the switch fabric failed. Inspect previous messages to determine the command failure.

AGT0452E No Multipath Device mapped to ID *id*

Explanation

No corresponding SDD device was found for specified volume serial.

Action

Make sure that the volume with specified ID has been assigned and it is visible to the host.

AGT0453E Error when setting policy on device *device*: error

Explanation

An error was encountered when setting the multipath policy for specific device id.

Action

Refer to the agent log file for more details.

AGT0454I For Multipath DM driver, only Round Robin policy is available.

Explanation

For Multipath DM driver, only Round Robin policy is available.

Action

If different multipath policy is required, then a supported multipath driver that supports this policy is required.

AGT0455W Setting policy for Multipath EMC Powerpath driver is not supported.

Explanation

Multipath policy configuration is not supported for Multipath EMC Powerpath driver.

Action

Make sure that the multipath driver supports the requested multipath policy.

AGT0456E No supported multipath driver was found on this system.

Explanation

No supported multipath driver is installed on this system.

Action

Make sure that fully supported multipath driver is available on this system for Path Planner configurations.

AGT0457E Multipath policy configuration is not supported for this multipath driver.

Explanation

Multipath policy configuration is not supported for this multipath driver.

Action

Make sure that the multipath driver supports the requested multipath policy.

AGT0458I Setting *multipath policy* policy for following multipath devices: *devices*

Explanation

Setting the specified policy type for the specified multipath devices list.

Action

No action is required.

AGT0459I Executing Walk the Bus action for refreshing system configuration.

Explanation

The system is rescanned for renewing the configuration.

Action

No action is required.

AGT0460E Invalid source or target directory (*directory*). Source directory must be the installation image location. Target directory cannot be the same as source directory.

Explanation

The source and target directory cannot be the same.

Action

Please make sure that the Agent executable from the installation image location is being invoked and that the installation location specified for the install points to a different location than the one from where installation is being invoked.

AGT0461E Installation path contains an invalid character for the target platform: *character*

Explanation

The character *character* cannot be part of the installation path.

Action

Please choose an install directory which does not contain reserved or shell special characters on the platform where the installation is attempted.

AGT0462E At least one directory component in install location contains a reserved name for the target platform: *name*

Explanation

The name *name* cannot be part of the installation path.

Action

Please choose an install directory which does not contain reserved names on the platform where the installation is attempted.

AGT0463I DM Multipath driver is installed but not loaded.

Explanation

Ensure that the Device Mapper packages are installed on the system and available. Ensure the latest HBA drivers are installed.

Action

Verify whether the dm-multipath modules are loaded and the Multipathd Daemon has started automatically at boot time.

AGT0464I multipath.conf could not be found on the system.

Explanation

/etc/multipath.conf configuration file was not found on the system or it is not configured.

Action

The configuration can be done based on a sample multipath.conf configuration file. You can run /sbin/mpathconf to create or modify /etc/multipath.conf.

AGT0469I Not enough disk space on disk. At least sizeMB is required!

Explanation

Minimum disk space is required for the Storage Resource Agent on the IBM Spectrum Control server.

Action

Refer to the IBM Spectrum Control documentation.

AGT0484E Cannot obtain the hostname of the Storage Resource Agent.

Explanation

The hostname of Storage Resource Agent could not be determined.

Action

Contact IBM customer technical support.

AGT0485I The Storage Resource Agent on the IBM Spectrum Control server cannot be deleted.

Explanation

The Storage Resource Agent on the IBM Spectrum Control server is a required component.

Action

Refer to the IBM Spectrum Control documentation.

AGT0486W The available disk space is low on *disk*. It is recommended that at least *size* MB of disk space is available on the disk partition for successful operation of the Storage Resource agent.

Explanation

To enable the Storage Resource agent to operate efficiently, a minimum amount of available disk space is required. Check the product support matrix for information about the recommended disk space for Storage Resource agents.

Action

Increase the available disk space to the recommended values in the product support matrix.

AGT0487E Not enough disk space available on *disk*. At least 20 MB of available disk space is required to complete the probe. Increase the available disk space on the disk partition and then start the probe again.

Explanation

A probe cannot complete successfully unless at least 20 MB space is available on the disk partition. This space is required to write the probe logs.

Action

No additional action is required.

AGT0504I Validating user *user name*

Explanation

User name validation starts.

AGT0505I User *user name* validation succeeded.

Explanation

User name was validated.

AGT0506E User *user name* validation failed.

Explanation

User name validation failed

Action

Check that a valid user name is specified.

AGT0507W User *user name* does not exist, user will be created.

Explanation

User name does not exist, the user is created

Action

None

AGT0509I *User user name created successfully.*

Explanation

User was created successfully

AGT0510E *Failed to create user user name*

- [ALR0017E Host server name appears to be down. number of attempts attempt\(s\) to ping this host have failed.](#)
- [ALR0018W quota name user has exceeded a network storage usage quota of usage. This user is currently consuming amount of storage.](#)
- [ALR0019W quota name user on host server name has exceeded a server storage usage quota of usage. This user is currently consuming amount of storage.](#)
- [ALR0020W quota name user on host server name has exceeded a filesystem usage quota of <usage>valueon filesystem filesystem name. This user is currently consuming amount of storage.](#)
- [ALR0021W Run number number of job creator job name has failed on run number of total jobs total jobs.](#)
- [ALR0022I Server server name has been discovered.](#)
- [ALR0023W Run number number of job creator job name has failed.](#)
- [ALR0024W User user name on host server name has exceeded a table space usage quota of usage on table space rdbms type, table space instance. This user is currently consuming amount of storage.](#)
- [ALR0025W User user name on host server name has exceeded an RDBMS instance usage quota of quota on rdbms type instance instance name. This user is currently consuming amount of storage.](#)
- [ALR0026W User user name has exceeded a network database storage usage quota of quota. This user is currently consuming amount of storage.](#)
- [ALR0027W The log directory file name archived log directory value on host server name has exceeded the threshold value of threshold. This directory currently contains number of logs archived logs consuming amount of storage.](#)
- [ALR0028I A new table space name has been discovered on rdbms type instance on host server name. rdbms instance: database.](#)
- [ALR0029E value value has been dropped. RDBMS: value value, Host: host name.](#)
- [ALR0030E value value has been taken offline. RDBMS: value value, Host: host name.](#)
- [ALR0031W The free space on value: value, RDBMS: value value, host: host name, has fallen below the threshold value of value. The free space is value or value of the value capacity.](#)
- [ALR0032W The free space on table space: table space name, RDBMS: rdbms type instance, database: database, host: server name, is fragmented across number of extents extents. This exceeds the threshold value of threshold extents. The largest contiguous free extent is largest extent.](#)

- [ALR0033W](#) The largest free extent available on table space: table space name, RDBMS: rdbms type rdbms name, database: database name, host: server name, has fallen below the threshold value of threshold. The largest free extent is largest extent.
- [ALR0034W](#) Segment segment name of table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, is fragmented across number of extents extents. This exceeds the threshold value of threshold extents. This segment is a value type segment.
- [ALR0035W](#) Segment value of table/cluster value on host: host name, RDBMS: value value, database: value, is nearing the maximum number of extents available to it. This segment currently occupies value extents. The value additional extent(s) available to this segment falls below the defined threshold of value extent(s). The segment is a type type segment.
- [ALR0036W](#) Table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has exceeded a space usage quota of usage quota. This table is currently consuming amount of storage.
- [ALR0037W](#) Table/cluster value on host: host name, RDBMS: value value, database: database name, has exceeded a chained row quota of value. Statistics indicate that value rows or value of the total rows are chained.
- [ALR0038W](#) Segment name of table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has amount of unused, wasted space. This represents amount of the total space allocated to the segment, and exceeds the threshold value of threshold. This segment is a type type segment.
- [ALR0039E](#) Table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has been dropped.
- [ALR0040W](#) Filer filer name has been discovered. Spectrum Control will not monitor this filer until it has been licensed.
- [ALR0041W](#) The amount of log freespace available on instance: database, RDBMS: rdbms type, <rdbms>host: server name, has fallen below the threshold value of threshold. The amount of log freespace available is amount or percent of the total capacity.
- [ALR0042I](#) A new device has been discovered on rdbms instance instance on host server name. Device: device name, Capacity: capacity, File Name: filename.
- [ALR0043E](#) Device device name has been dropped from rdbms instance instance on host server name. Capacity: capacity, File Name: filename.
- [ALR0044W](#) The amount of device freespace available on value instance value on host value has fallen below the threshold value of value. The amount of device freespace available is value or value of the current capacity of value.
- [ALR0045W](#) The amount of device freespace available on device instance instance on host server name has gone above the threshold value of threshold. The amount of device freespace available is freespace or percent of the current capacity of total capacity.
- [ALR0046W](#) Database database name has not been backed up in the last number of days days. Last backup for the database was on date. RDBMS: rdbms type rdbms name, Host: server name.
- [ALR0047W](#) filer name filer type is no longer accessible from host entity.
- [ALR0048W](#) Storage Subsystem subsystem name is no longer accessible from host server name.
- [ALR0049W](#) disk array name disk array type has been discovered from host server name. Spectrum Control will not monitor this disk array until it has been selected as for monitoring from within the Storage Subsystem Administration GUI.
- [ALR0050W](#) The amount of cache on storage subsystem subsystem name has changed from old value to new value.
- [ALR0052W](#) Filesystem filesystem name on host server name will be automatically extended because its free space has fallen below the threshold of threshold. Current free space: current free space; Current capacity: current capacity; Target capacity: target capacity).
- [ALR0053W](#) Filesystem filesystem name on host server name needs extension but will not be because its current capacity of current capacity exceeds the specified limit of limit. Filesystem free space: freespace (current capacity of current capacity).
- [ALR0055I](#) Cluster resource group cluster resource group name was added to cluster cluster name on node node name.
- [ALR0056I](#) Cluster resource group cluster resource group name was removed from cluster cluster name on node node name.
- [ALR0057I](#) Cluster resource group cluster resource group name was moved in cluster cluster name from node node name to node node name.
- [ALR0076W](#) Performance monitor failure for device value.
- [ALR0500E](#) The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the critical-stress boundary value of boundary value%.
- [ALR0501W](#) The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the warning-stress boundary value of boundary value%.
- [ALR0502W](#) The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the warning-idle boundary value of boundary value%.

ALR0001I The amount of RAM on host *server name* has changed from *current value* to *new value*.

Explanation

The amount of RAM on the host server has changed from the current value to the new value.

ALR0002I The amount of virtual memory on host *server name* has changed from *current value* to *new value*.

Explanation

The amount of virtual memory on host server has changed from current value to the new value.

ALR0003I A new disk drive has been detected on host *server name*. Disk manufacturer/serial Number: *manufacturer/serial Number*.

Explanation

A new disk drive has been detected on the host server. The disk is identified by the specified Disk manufacturer/serial Number.

ALR0004E A previously visible disk drive can no longer be found on host *server name*. Disk manufacturer/serial number: *manufacturer/serial number*.

Explanation

A previously visible disk drive can no longer be found on the host server. The disk is identified by the specified Disk manufacturer/serial Number.

ALR0005I A new filesystem has been detected on host *server name*. Filesystem mount point: *mount point*.

Explanation

A new filesystem has been detected on the host server. The filesystem is identified by the specified Filesystem mount point.

ALR0006E A previously visible filesystem can no longer be found on host *server name*. Filesystem mount point: *mount point*.

Explanation

A previously visible filesystem can no longer be found on the host server. The filesystem is identified by the specified filesystem mount point.

ALR0007E A disk drive visible on host *server name* has predicted that a disk failure is imminent. Disk manufacturer/serial number: *manufacturer/serial number*.

Explanation

A disk drive visible on the host server has predicted that a disk failure is imminent. The disk is identified by the specified disk manufacturer/serial number.

ALR0008I The physical space definition of filesystem *filesystem name* on host *server name* has been reconfigured.

Explanation

The physical space definition of the specified filesystem on the specified host has been reconfigured.

ALR0009W The free space on filesystem *filesystem name* on host *server name* has fallen below the threshold value of *threshold*. The free space is *freespace* or *percent* of the filesystem capacity.

Explanation

The free space on identified filesystem on the host server has fallen below the threshold value that was designated.

ALR0010W The number of free inodes on filesystem *filesystem name* on host *server name* has fallen below the threshold value of *threshold*. The number of free inodes is *free inodes* or *percent* of the filesystem's total inodes.

Explanation

The number of free inodes on the identified filesystem on the identified host server has fallen below the threshold value that was designated.

ALR0011W A new grown defect has been detected on a disk visible to host *server name*. Disk manufacturer/serial Number: *disk manufacturer/serial number*, Current grown defects: *current*, Previous grown defects: *previous*.

Explanation

A new grown defect has been detected on a disk visible to the identified host server. The Disk is identified by the specified Disk manufacturer/serial Number.

ALR0012W The number of grown disk defects has exceeded the threshold value of *threshold*. Host: *server name*, Disk manufacturer/serial number: *disk manufacturer/serial number*, Current grown defects: *current*, Previous grown defects: *previous*.

Explanation

The number of grown disk defects has exceeded the threshold value defined.

ALR0013W A new monitored directory has been detected on host *server name*. Directory name: *directory name*, Directory Group: *directory group*.

Explanation

A new monitored directory has been detected on the identified host server.

ALR0014E A monitored directory has been removed from host *server name*. Directory name: *directory name*, Directory group: *directory group*.

Explanation

A monitored directory has been removed from the specified host server with the specified directory name and directory group.

ALR0015W Directory *directory* on host *server name* has exceeded its space usage quota of *quota*. The directory is currently consuming *usage* or *percent* of the filesystem capacity.

Explanation

The Directory specified on the host server has exceeded its space usage quota.

ALR0016W Filesystem *filesystem name* on host *server name* has violated a filesystem constraint. *number of files* file(s) consuming *space* or *percent* of the filesystem capacity are in violation of the conditions defined in this constraint. The constraint threshold is *threshold*. User *user name* has *number of files* files consuming *space* of storage. *violating owners*).

Explanation

The Filesystem specified on the host server has violated a filesystem constraint. A number of files that are consuming a specified amount or percentage of the filesystem capacity are in violation of the conditions defined in this constraint.

ALR0017E Host *server name* appears to be down. *number of attempts* attempt(s) to ping this host have failed.

Explanation

The Host server appears to be down. A number of attempts to ping this host have failed.

ALR0018W *quota name user* has exceeded a network storage usage quota of *usage*. This *user* is currently consuming *amount* of storage.

Explanation

A network storage usage quota has been exceeded.

ALR0019W *quota name user on host server name has exceeded a server storage usage quota of usage. This user is currently consuming amount of storage.*

Explanation

A server storage usage quota has been exceeded.

ALR0020W *quota name user on host server name has exceeded a filesystem usage quota of <usage>valueon filesystem filesystem name. This user is currently consuming amount of storage.*

Explanation

A filesystem usage quota has been exceeded.

ALR0021W *Run number number of job creator job name has failed on run number of total jobs total jobs.*

Explanation

A run of a job or schedule did not complete successfully on the specified servers. A run is a single invocation of a job. Depending on the type of job, this problem might occur if the IBM Spectrum Control servers are unavailable, the local area network is down, or communication with the target servers or Storage Resource agent cannot be established.

Action

Depending on the type of job, try the following actions to resolve the problem. Ensure that the IBM Spectrum Control servers are running and that the local area network is available. Verify that you have a network connection to the server on which the monitoring action will run. If a data collection job generated the warning, ensure that the Storage Resource agent on the target server is up and running. Check the log files of the servers for error messages that might help determine the problem. See the product information center for the location of these log files.

ALR0022I *Server server name has been discovered.*

Explanation

A new server has been discovered.

ALR0023W *Run number run number of job creator job name has failed.*

Explanation

A run of a job has failed.

ALR0024W *User user name on host server name has exceeded a table space usage quota of usage on table space rdbms type, table space instance. This user is currently consuming amount of storage.*

Explanation

The specified User on the host server has exceeded a table space usage quota on the specified table space.

ALR0025W User *user name* on host *server name* has exceeded an RDBMS instance usage quota of *quota* on *rdbms type* instance *instance name*. This user is currently consuming *amount* of storage.

Explanation

The specified User on the host server has exceeded an RDBMS instance usage quota.

ALR0026W User *user name* has exceeded a network database storage usage quota of *quota*. This user is currently consuming *amount* of storage.

Explanation

The specified User has exceeded a network database storage usage quota.

ALR0027W The *log directory file name* archived log directory value on host *server name* has exceeded the threshold value of *threshold*. This directory currently contains *number of logs* archived logs consuming *amount* of storage.

Explanation

The specified archived log directory on the host server has exceeded the specified threshold value.

ALR0028I A new *table space name* has been discovered on *rdbms type* instance on host *server name*. *rdbms instance: database*.

Explanation

A new table space has been discovered on the host server.

ALR0029E *value value* has been dropped. RDBMS: *value value*, Host: *host name*.

Explanation

The specified table space has been dropped.

ALR0030E *value value* has been taken offline. RDBMS: *value value*, Host: *host name*.

Explanation

The specified table space has been taken offline.

ALR0031W The free space on *value: value*, RDBMS: *value value*, host: *host name*, has fallen below the threshold value of *value*. The free space is *value* or *value* of the *value* capacity.

Explanation

The free space on the specified table space, RDBMS and host has fallen below the threshold value.

ALR0032W The free space on table space: *table space name*, RDBMS: *rdbms type instance*, database: *database*, host: *server name*, is fragmented across *number of extents* extents. This exceeds the threshold value of *threshold* extents. The largest contiguous free extent is *largest extent*.

Explanation

The free space on the specified table space, RDBMS, database and host is fragmented across multiple extents.

ALR0033W The largest free extent available on table space: *table space name*, RDBMS: *rdbms type rdbms name*, database: *database name*, host: *server name*, has fallen below the threshold value of *threshold*. The largest free extent is *largest extent*.

Explanation

The largest free extent available on table space, RDBMS, database and host has fallen below the threshold value.

ALR0034W Segment *segment name* of table/cluster *table name* on host: *server name*, RDBMS: *rdbms type rdbms name*, database: *database name*, is fragmented across *number of extents* extents. This exceeds the threshold value of *threshold* extents. This segment is a *value type* segment.

Explanation

A segment of the specified table/cluster on the specified host, RDBMS and database is fragmented across multiple extents.

ALR0035W Segment *value* of table/cluster *value* on host: *host name*, RDBMS: *value value*, database: *value*, is nearing the maximum number of extents available to it. This segment currently occupies *value* extents. The *value* additional extent(s) available to this segment falls below the defined threshold of *value* extent(s). The segment is a *type type* segment.

Explanation

The segment of the specified table/cluster on the specified host, RDBMS and database is nearing the maximum number of extents available to it.

ALR0036W Table/cluster *table name* on host: *server name*, RDBMS: *rdbms type rdbms name*, database: *database name*, has exceeded a space usage quota of *usage quota*. This table is currently consuming *amount* of storage.

Explanation

The Table/cluster on the specified host, RDBMS and database has exceeded a space usage quota.

ALR0037W Table/cluster *value* on host: *host name*, RDBMS: *value value*, database: *database name*, has exceeded a chained row quota of *value*. Statistics indicate that *value* rows or *value* of the total rows are chained.

Explanation

The Table/cluster on the specified host, RDBMS and database has exceeded a chained row quota.

ALR0038W Segment *name* of table/cluster *table name* on host: *server name*, RDBMS: *rd bms type rdbms name*, database: *database name*, has *amount* of unused, wasted space. This represents *amount* of the total space allocated to the segment, and exceeds the threshold value of *threshold*. This segment is a *type type* segment.

Explanation

The segment of the specified table/cluster on the specified host, RDBMS and database has wasted space.

ALR0039E Table/cluster *table name* on host: *server name*, RDBMS: *rd bms type rdbms name*, database: *database name*, has been dropped.

Explanation

The Table/cluster on the specified host, RDBMS and database has been dropped.

ALR0040W Filer *filer name* has been discovered. Spectrum Control will not monitor this filer until it has been licensed.

Explanation

The specified Filer has been discovered.

ALR0041W The amount of log freespace available on *instance: database*, RDBMS: *rd bms type* , *<rd bms>host: server name*, has fallen below the threshold value of *threshold*. The amount of log freespace available is *amount* or *percent* of the *total* capacity.

Explanation

The amount of log freespace available on the specified database, RDBMS and host has fallen below the threshold value.

ALR0042I A new device has been discovered on *rd bms* instance *instance* on host *server name*. Device: *device name*, Capacity: *capacity*, File Name: *filename*.

Explanation

A new device has been discovered on instance and host.

ALR0043E Device *device name* has been dropped from *rdbms* instance *instance* on host *server name*. Capacity: *capacity*, File Name: *filename*.

Explanation

The specified Device has been dropped from the specified instance and host.

ALR0044W The amount of device freespace available on *value* instance *value* on host *value* has fallen below the threshold value of *value*. The amount of device freespace available is *value* or *value* of the current capacity of *value*.

Explanation

The amount of device freespace available on the specified instance and host has fallen below the threshold value.

ALR0045W The amount of device freespace available on *device* instance *instance* on host *server name* has gone above the threshold value of *threshold*. The amount of device freespace available is *freespace* or *percent* of the current capacity of *total capacity*.

Explanation

The amount of device freespace available on the specified device on instance and host has gone above the threshold value.

ALR0046W Database *database name* has not been backed up in the last *number of days* days. Last backup for the database was on *date*.
RDBMS: *rdbms type* *rdbms name*, Host: *server name*.

Explanation

The specified Database has not been backed up in the last defined number of days.

ALR0047W *filer name* *filer type* is no longer accessible from *host entity*.

Explanation

The specified filer is no longer accessible.

ALR0048W Storage Subsystem *subsystem name* is no longer accessible from host *server name*.

Explanation

The specified storage subsystem is no longer accessible from the specified host server.

ALR0049W *disk array name* *disk array type* has been discovered from host *server name*. Spectrum Control will not monitor this *disk*

array until it has been selected as for monitoring from within the Storage Subsystem Administration GUI.

Explanation

The specified disk array has been discovered from the host server. Spectrum Control will not monitor this disk array until it has been selected for monitoring from within the storage subsystem Administration GUI.

ALR0050W The amount of cache on storage subsystem *subsystem name* has changed from *old value* to *new value*.

Explanation

The amount of Cache on the specified storage subsystem has changed.

ALR0052W Filesystem *filesystem name* on host *server name* will be automatically extended because its free space has fallen below the threshold of *threshold*. Current free space: *current free space*; Current capacity: *current capacity*; Target capacity: *target capacity* }.

Explanation

The specified Filesystem on the specified host will be automatically extended because its free space has fallen below the threshold defined.

ALR0053W Filesystem *filesystem name* on host *server name* needs extension but will not be because its current capacity of *current capacity* exceeds the specified limit of *limit*. Filesystem free space: *freespace (current capacity of current capacity)* .

Explanation

The specified Filesystem on the specified host needs to be extended but will not be because its current capacity exceeds the specified limit.

ALR0055I Cluster resource group *cluster resource group name* was added to cluster *cluster name* on node *node name* .

Explanation

The specified cluster resource group was added to the specified cluster on the specified node.

ALR0056I Cluster resource group *cluster resource group name* was removed from cluster *cluster name* on node *node name* .

Explanation

The specified cluster resource group was removed from the specified cluster on the specified node.

ALR0057I Cluster resource group *cluster resource group name* was moved in cluster *cluster name* from node *node name* to node *node name* .

Explanation

The specified cluster resource group was moved in the specified cluster to a different node.

ALR0076W Performance monitor failure for device value.

Explanation

The performance monitor for the specified device encountered an error and cannot continue collecting performance data.

Action

Check the performance monitor job log for additional information.

ALR0500E The Disk Utilization Percentage of array *array name* in storage system *storage system name* was measured to be *measured value*%. This violated the critical-stress boundary value of *boundary value*%.

Explanation

Disk Utilization Percentage measures the approximate utilization percentage of the arrays in monitored storage systems. This value represents the average percent of time that the disks associated with the array were busy. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array in the storage system has a Disk Utilization Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array. Either the array is experiencing a hardware or software related problem that is causing a drop in performance, or the array is being overloaded with too high a workload. If the workload is too high, moving some of the array's workload to other less busy arrays might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the array. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Note that some highly sequential workloads such as batch or backup processing might continually exceed the threshold because they drive the arrays to high utilization percentages. For these types of workloads, a high utilization indicates that the work is being performed very efficiently and is not a cause for concern. If this situation occurs for your workload, consider enabling the Sequential I/O Percentage filter. Use this filter to ignore any violations of the Disk Utilization Percentage threshold for highly-sequential workloads.

ALR0501W The Disk Utilization Percentage of array *array name* in storage system *storage system name* was measured to be *measured value*%. This violated the warning-stress boundary value of *boundary value*%.

Explanation

Disk Utilization Percentage measures the approximate utilization percentage of the arrays in monitored storage systems. This value represents the average percent of time that the disks associated with the array were busy. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array in the storage system has a Disk Utilization Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array. Either the array is experiencing a hardware or software related problem that is causing a drop in performance, or the array is being overloaded with too high a workload. If the workload is too high, moving some of the array's workload to other less busy arrays might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the array. In this case, increase the boundary value in the threshold definition to reduce the

number of unnecessary alerts.

Note that some highly sequential workloads such as batch or backup processing might continually exceed the threshold because they drive the arrays to high utilization percentages. For these types of workloads, a high utilization indicates that the work is being performed very efficiently and is not a cause for concern. If this situation occurs for your workload, consider enabling the Sequential I/O Percentage filter. Use this filter to ignore any violations of the Disk Utilization Percentage threshold for highly-sequential workloads.

ALR0502W The Disk Utilization Percentage of array *array name* in storage system *storage system name* was measured to be *measured value%*. This violated the warning-idle boundary value of *boundary value%*.

Explanation

Disk Utilization Percentage measures the approximate utilization percentage of the arrays in monitored storage systems. This value represents the average percent of time that the disks associated with the array were busy. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array in the storage system has a Disk Utilization Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array. This can happen if the application(s) using the array stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0503E The Disk Utilization Percentage of array *array name* in storage system *storage system name* was measured to be *measured value%*. This violated the critical-idle boundary value of *boundary value%*.

Explanation

Disk Utilization Percentage measures the approximate utilization percentage of the arrays in monitored storage systems. This value represents the average percent of time that the disks associated with the array were busy. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array in the storage system has a Disk Utilization Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array. This can happen if the application(s) using the array stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0504E The Total Back-end I/O Rate of array, MDisk, or MDisk Group Array, *MDisk, or MDisk Group name* in storage system *storage system name* was measured to be *measured value ops/s*, which violated the defined critical-stress boundary value of *boundary value ops/s*.

Explanation

Total Back-end I/O Rate measures the average number of I/O operations per second for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end I/O Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the array, MDisk, or MDisk Group is being overloaded with too high a workload. If this is the case, moving some of the array's or MDisk Group's workload to other less busy arrays or MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the array, MDisk, or MDisk Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0505W The Total Back-end I/O Rate of array, MDisk, or MDisk Group *Array, MDisk, or MDisk Group name in storage system storage system name* was measured to be *measured value ops/s*, which violated the defined warning-stress boundary value of *boundary value ops/s*.

Explanation

Total Back-end I/O Rate measures the average number of I/O operations per second for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end I/O Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the array, MDisk, or MDisk Group is being overloaded with too high a workload. If this is the case, moving some of the array's or MDisk Group's workload to other less busy arrays or MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the array, MDisk, or MDisk Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0506W The Total Back-end I/O Rate of array, MDisk, or MDisk Group *Array, MDisk, or MDisk Group name in storage system storage system name* was measured to be *measured value ops/s*, which violated the defined warning-idle boundary value of *boundary value ops/s*.

Explanation

Total Back-end I/O Rate measures the average number of I/O operations per second for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end I/O Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array, MDisk, or MDisk Group. This can happen if the application(s) using the array, MDisk, or MDisk Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays, MDisks, or MDisk Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0507E The Total Back-end I/O Rate of array, MDisk, or MDisk Group *Array, MDisk, or MDisk Group name in storage system storage system name* was measured to be *measured value ops/s*, which violated the defined critical-idle boundary value of *boundary value ops/s*.

Explanation

Total Back-end I/O Rate measures the average number of I/O operations per second for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end I/O Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array, MDisk, or MDisk Group. This can happen if the application(s) using the array, MDisk, or MDisk Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays, MDisks, or MDisk Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0508E The Total Back-end Data Rate of array, MDisk, or MDisk Group *Array, MDisk, or MDisk Group name in storage system storage system name* was measured to be *measured value* MiB/s, which violated the defined critical-stress boundary value of *boundary value* MiB/s.

Explanation

Total Back-end Data Rate measures the average number of mebibytes per second transferred for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end Data Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the array, MDisk, or MDisk Group is being overloaded with too high a workload. If this is the case, moving some of the array's or MDisk Group's workload to other less busy arrays or MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the array, MDisk, or MDisk Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0509W The Total Back-end Data Rate of array, MDisk, or MDisk Group *Array, MDisk, or MDisk Group name in storage system storage system name* was measured to be *measured value* MiB/s, which violated the defined warning-stress boundary value of *boundary value* MiB/s.

Explanation

Total Back-end Data Rate measures the average number of mebibytes per second transferred for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end Data Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the array, MDisk, or MDisk Group is being overloaded with too high a workload. If this is the case, moving some of the array's or MDisk Group's workload to other less busy arrays or MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the array, MDisk, or MDisk Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0510W The Total Back-end Data Rate of array, MDisk, or MDisk Group Array, MDisk, or MDisk Group name in storage system storage system name was measured to be measured value MiB/s, which violated the defined warning-idle boundary value of boundary value MiB/s.

Explanation

Total Back-end Data Rate measures the average number of mebibytes per second transferred for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end Data Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array, MDisk, or MDisk Group. This can happen if the application(s) using the array, MDisk, or MDisk Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays, MDisks, or MDisk Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0511E The Total Back-end Data Rate of array, MDisk, or MDisk Group Array, MDisk, or MDisk Group name in storage system storage system name was measured to be measured value MiB/s, which violated the defined critical-idle boundary value of boundary value MiB/s.

Explanation

Total Back-end Data Rate measures the average number of mebibytes per second transferred for arrays, MDisks, and MDisk Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array, MDisk, or MDisk Group in the storage system has a Total Back-end Data Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array, MDisk, or MDisk Group. This can happen if the application(s) using the array, MDisk, or MDisk Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays, MDisks, or MDisk Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0512E The Overall Back-end Response Time of MDisk MDisk name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-stress boundary value of boundary value ms/op.

Explanation

Overall Back-end Response Time measures the average number of milliseconds that it took to service each I/O operation for MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has an Overall Back-end Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less busy MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Due to internal cache management issues of some storage systems, it is possible that MDisk that are idle or almost idle have surprisingly large response times. Generally this is not a cause for concern, because application performance is rarely affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Total Back-end I/O Rate filter. Use this filter to ignore any violations of the Overall Back-end Response Time threshold for MDisk with very low I/O rates.

ALR0513W The Overall Back-end Response Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-stress boundary value of *boundary value ms/op*.

Explanation

Overall Back-end Response Time measures the average number of milliseconds that it took to service each I/O operation for MDisk. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has an Overall Back-end Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less busy MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Due to internal cache management issues of some storage systems, it is possible that MDisk that are idle or almost idle have surprisingly large response times. Generally this is not a cause for concern, because application performance is rarely affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Total Back-end I/O Rate filter. Use this filter to ignore any violations of the Overall Back-end Response Time threshold for MDisk with very low I/O rates.

ALR0514W The Overall Back-end Response Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-idle boundary value of *boundary value ms/op*.

Explanation

Overall Back-end Response Time measures the average number of milliseconds that it took to service each I/O operation for MDisk. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has an Overall Back-end Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the MDisk in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0515E The Overall Back-end Response Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined critical-idle boundary value of *boundary value ms/op*.

Explanation

Overall Back-end Response Time measures the average number of milliseconds that it took to service each I/O operation for MDisk. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has an Overall Back-end Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the MDisks in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0516E The Total I/O Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value ops/s*, which violated the defined critical-stress boundary value of *boundary value ops/s*.

Explanation

Total I/O Rate measures the average number of I/O operations per second for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the controller or I/O Group is being overloaded with too high a workload. If this is the case, moving some of the controller's or I/O Group's workload to other less busy controllers or I/O Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the controller or I/O Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0517W The Total I/O Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value ops/s*, which violated the defined warning-stress boundary value of *boundary value ops/s*.

Explanation

Total I/O Rate measures the average number of I/O operations per second for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the controller or I/O Group is being overloaded with too high a workload. If this is the case, moving some of the controller's or I/O Group's workload to other less busy controllers or I/O Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the controller or I/O Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0518W The Total I/O Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value ops/s*, which violated the defined warning-idle boundary value of *boundary value ops/s*.

Explanation

Total I/O Rate measures the average number of I/O operations per second for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or I/O Group. This can happen if the application(s) using the controller or I/O Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or I/O Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0519E The Total I/O Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value ops/s*, which violated the defined critical-idle boundary value of *boundary value ops/s*.

Explanation

Total I/O Rate measures the average number of I/O operations per second for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or I/O Group. This can happen if the application(s) using the controller or I/O Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or I/O Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0520E The Total Data Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value MiB/s*, which violated the defined critical-stress boundary value of *boundary value MiB/s*.

Explanation

Total Data Rate measures the average number of mebibytes per second transferred for controllers, and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total Data Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the controller or I/O Group is being overloaded with too high a workload. If this is the case, moving some of the controller's or I/O Group's workload to other less busy controllers or I/O Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the controller or I/O Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0521W The Total Data Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was

measured to be *measured value* MiB/s, which violated the defined warning-stress boundary value of *boundary value* MiB/s.

Explanation

Total Data Rate measures the average number of mebibytes per second transferred for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the controller or I/O Group is being overloaded with too high a workload. If this is the case, moving some of the controller's or I/O Group's workload to other less busy controllers or I/O Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the controller or I/O Group. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0522W The Total Data Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value* MiB/s, which violated the defined warning-idle boundary value of *boundary value* MiB/s.

Explanation

Total Data Rate measures the average number of mebibytes per second transferred for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or I/O Group. This can happen if the application(s) using the controller or I/O Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or I/O Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0523E The Total Data Rate of controller or I/O Group *Controller or I/O Group name* in storage system *storage system name* was measured to be *measured value* MiB/s, which violated the defined critical-idle boundary value of *boundary value* MiB/s.

Explanation

Total Data Rate measures the average number of mebibytes per second transferred for controllers and I/O Groups. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or I/O Group in the storage system has a Total I/O Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or I/O Group. This can happen if the application(s) using the controller or I/O Group stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or I/O Groups in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0524E The Write-cache Delay Percentage of controller or node *controller or node name* in storage system *storage system name* was measured to be *measured value*%, which violated the critical-stress boundary value of *boundary value*%.

Explanation

Write-cache Delay Percentage measures the approximate percentage of I/O operations that were delayed due to write-cache space constraints or other conditions on the controllers and nodes in monitored storage systems. This value represents the average percent of all I/O operations that experienced delays. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or node in the storage system has a Write-cache Delay Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this controller or node. Either the amount of cache installed on the controller or node is insufficient to handle its workload, or the controller or node is experiencing a hardware or software related problem that is causing cache slots to be occupied longer than necessary due to a drop in write performance, or the controller or node is being overwhelmed with too high a write workload. If the workload is too high, moving some of the controller's or node's workload to other less busy controllers or nodes might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the controller or node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Note there may be cases when the Write-cache Delay Percentage is high but the total number of delayed I/O operations is very low. Such cases are generally not a cause for concern, because application performance will rarely be affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Write-cache Delay I/O Rate filter. Use this filter to ignore any violations of the Write-cache Delay Percentage threshold for controllers or nodes with very low I/O rates.

ALR0525W The Write-cache Delay Percentage of controller or node *controller or node name* in storage system *storage system name* was measured to be *measured value*%, which violated the warning-stress boundary value of *boundary value*%.

Explanation

Write-cache Delay Percentage measures the approximate percentage of I/O operations that were delayed due to write-cache space constraints or other conditions on the controllers and nodes in monitored storage systems. This value represents the average percent of all I/O operations that experienced delays. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or node in the storage system has a Write-cache Delay Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this controller or node. Either the amount of cache installed on the controller or node is insufficient to handle its workload, or the controller or node is experiencing a hardware or software related problem that is causing cache slots to be occupied longer than necessary due to a drop in write performance, or the controller or node is being overwhelmed with too high a write workload. If the workload is too high, moving some of the controller's or node's workload to other less busy controllers or nodes might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the controller or node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Note there may be cases when the Write-cache Delay Percentage is high but the total number of delayed I/O operations is very low. Such cases are generally not a cause for concern, because application performance will rarely be affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Write-cache Delay I/O Rate filter. Use this filter to ignore any violations of the Write-cache Delay Percentage threshold for controllers or nodes with very low I/O rates.

ALR0526W The Write-cache Delay Percentage of controller or node *controller or node name* in storage system *storage system name* was measured to be *measured value*%, which violated the warning-idle boundary value of *boundary value*%.

Explanation

Write-cache Delay Percentage measures the approximate percentage of I/O operations that were delayed due to write-cache space constraints or other conditions on the controllers and nodes in monitored storage systems. This value represents the average percent of all I/O operations that experienced delays. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or node in the storage system has a Write-cache Delay Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or node. This can happen if the application(s) using the controller or node stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0527E The Write-cache Delay Percentage of controller or node *controller or node name* in storage system *storage system name* was measured to be *measured value%*, which violated the critical-idle boundary value of *boundary value%*.

Explanation

Write-cache Delay Percentage measures the approximate percentage of I/O operations that were delayed due to write-cache space constraints or other conditions on the controllers and nodes in monitored storage systems. This value represents the average percent of all I/O operations that experienced delays. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller or node in the storage system has a Write-cache Delay Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller or node. This can happen if the application(s) using the controller or node stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers or nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0528E The Cache Holding Time of controller *controller name* in storage system *storage system name* was measured to be *measured values*, which violated the critical-stress boundary value of *boundary values*.

Explanation

Cache Holding Time measures the average amount of time that data remains available in controller cache, in seconds. Shorter time periods indicate adverse performance. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller in the storage system has a Cache Holding Time value that is less than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this controller. Either the amount of cache installed on the controller is insufficient to handle its workload, or the controller is being overwhelmed with too high a workload. If the workload is too high, moving some of the controller's workload to other less busy controllers might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too high, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the controller. In this case, decrease the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0529W The Cache Holding Time of controller *controller name* in storage system *storage system name* was measured to be *measured*

values, which violated the warning-stress boundary value of boundary values.

Explanation

Cache Holding Time measures the average amount of time that data remains available in controller cache, in seconds. Shorter time periods indicate adverse performance. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller in the storage system has a Cache Holding Time value that is less than or equal to the warning-stress boundary, but greater than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this controller. Either the amount of cache installed on the controller is insufficient to handle its workload, or the controller is being overwhelmed with too high a workload. If the workload is too high, moving some of the controller's workload to other less busy controllers might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too high, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the controller. In this case, decrease the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0530W The Cache Holding Time of controller *controller name* in storage system *storage system name* was measured to be *measured values*, which violated the warning-idle boundary value of *boundary values*.

Explanation

Cache Holding Time measures the average amount of time that data remains available in controller cache, in seconds. Shorter time periods indicate adverse performance. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller in the storage system has a Cache Holding Time value that is greater than or equal to the warning-idle boundary, but less than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller. This can happen if the application(s) using the controller stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider increasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0531E The Cache Holding Time of controller *controller name* in storage system *storage system name* was measured to be *measured values*, which violated the critical-idle boundary value of *boundary values*.

Explanation

Cache Holding Time measures the average amount of time that data remains available in controller cache, in seconds. Shorter time periods indicate adverse performance. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified controller in the storage system has a Cache Holding Time value that is greater than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this controller. This can happen if the application(s) using the controller stopped working properly.

This type of threshold boundary should only be defined if the workload for the controllers in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider

increasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0532E The Total Port I/O Rate of port *port name* in storage system *storage system name* was measured to be *measured value* ops/s, which violated the defined critical-stress boundary value of *boundary value* ops/s.

Explanation

Total Port I/O Rate measures the average number of I/O operations per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port I/O Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0533W The Total Port I/O Rate of port *port name* in storage system *storage system name* was measured to be *measured value* ops/s, which violated the defined warning-stress boundary value of *boundary value* ops/s.

Explanation

Total Port I/O Rate measures the average number of I/O operations per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port I/O Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0534W The Total Port I/O Rate of port *port name* in storage system *storage system name* was measured to be *measured value* ops/s, which violated the defined warning-idle boundary value of *boundary value* ops/s.

Explanation

Total Port I/O Rate measures the average number of I/O operations per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port I/O Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0535E The Total Port I/O Rate of port *port name* in storage system *storage system name* was measured to be *measured value* ops/s, which violated the defined critical-idle boundary value of *boundary value* ops/s.

Explanation

Total Port I/O Rate measures the average number of I/O operations per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port I/O Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0536E The Total Port Data Rate of port *port name* in device *device name* was measured to be *measured value* MiB/s, which violated the defined critical-stress boundary value of *boundary value* MiB/s.

Explanation

Total Port Data Rate measures the average number of mebibytes per second transferred for storage system ports or switch ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Total Port Data Rate that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0537W The Total Port Data Rate of port *port name* in device *device name* was measured to be *measured value* MiB/s, which violated the defined warning-stress boundary value of *boundary value* MiB/s.

Explanation

Total Port Data Rate measures the average number of mebibytes per second transferred for storage system ports or switch ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Total Port Data Rate that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary, that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0538W The Total Port Data Rate of port *port name* in device *device name* was measured to be *measured value* MiB/s, which violated the defined warning-idle boundary value of *boundary value* MiB/s.

Explanation

Total Port Data Rate measures the average number of mebibytes per second transferred for storage system ports or switch ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Total Port Data Rate that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary, that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0539E The Total Port Data Rate of port *port name* in device *device name* was measured to be *measured value* MiB/s, which violated the defined critical-idle boundary value of *boundary value* MiB/s.

Explanation

Total Port Data Rate measures the average number of mebibytes per second transferred for storage system ports or switch ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Total Port Data Rate that is less than or equal to the critical-idle boundary, that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0540E The Overall Port Response Time of port *port name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-stress boundary value of *boundary value* ms/op.

Explanation

Overall Port Response Time measures the average number of milliseconds that it took to service each I/O operation for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has an Overall Port Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0541W The Overall Port Response Time of port *port name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op.

Explanation

Overall Port Response Time measures the average number of milliseconds that it took to service each I/O operation for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has an Overall Port Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0542W The Overall Port Response Time of port *port name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Overall Port Response Time measures the average number of milliseconds that it took to service each I/O operation for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has an Overall Port Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0543E The Overall Port Response Time of port *port name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Overall Port Response Time measures the average number of milliseconds that it took to service each I/O operation for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has an Overall Port Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0544E The Error Frame Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Error Frame Rate measures the average number of frame errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Error Frame Rate that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0545W The Error Frame Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Error Frame Rate measures the average number of frame errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Error Frame Rate that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0546W The Error Frame Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Error Frame Rate measures the average number of frame errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Error Frame Rate that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0547E The Error Frame Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Error Frame Rate measures the average number of frame errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Error Frame Rate that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0548E The Link Failure Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Link Failure Rate measures the average number of link errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Failure Rate that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port, for the connected port, or for the fibre link or GBICs. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Ensure that both ports are enabled and configured properly, then follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0549W The Link Failure Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Link Failure Rate measures the average number of link errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Failure Rate that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port, for the connected port, or for the fibre link or GBICs. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Ensure that both ports are enabled and configured properly, then follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0550W The Link Failure Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Link Failure Rate measures the average number of link errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Failure Rate that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0551E The Link Failure Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Link Failure Rate measures the average number of link errors that were received per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Failure Rate that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0552E The Total Port Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* frm/s, which violated the defined critical-stress boundary value of *boundary value* frm/s.

Explanation

Total Port Frame Rate measures the average number of frames transferred per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port Frame Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0553W The Total Port Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* frm/s, which violated the defined warning-stress boundary value of *boundary value* frm/s.

Explanation

Total Port Frame Rate measures the average number of frames transferred per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port Frame Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that the port is being overloaded with too high a workload. If this is the case, moving some of the port's workload to other less busy ports might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the workload for the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0554W The Total Port Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* frm/s, which violated the defined warning-idle boundary value of *boundary value* frm/s.

Explanation

Total Port Frame Rate measures the average number of frames transferred per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port Frame Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0555E The Total Port Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* frm/s, which violated the defined critical-idle boundary value of *boundary value* frm/s.

Explanation

Total Port Frame Rate measures the average number of frames transferred per second for ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Total Port Frame Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0556E The CPU Utilization Percentage of node *node name* in storage system *storage system name* was measured to be *measured value*%, which violated the critical-stress boundary value of *boundary value*%.

Explanation

CPU Utilization Percentage measures the approximate utilization percentage of the CPUs of the nodes in the monitored storage systems. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a CPU Utilization Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing an increase in CPU usage, or the node is being overloaded with too high a workload. If the workload is too high, moving some of the node's workload to other less busy nodes might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0557W The CPU Utilization Percentage of node *node name* in storage system *storage system name* was measured to be *measured value%*, which violated the warning-stress boundary value of *boundary value%*.

Explanation

CPU Utilization Percentage measures the approximate utilization percentage of the CPUs of the nodes in the monitored storage systems. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a CPU Utilization Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing an increase in CPU usage, or the node is being overloaded with too high a workload. If the workload is too high, moving some of the node's workload to other less busy nodes might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0558W The CPU Utilization Percentage of node *node name* in storage system *storage system name* was measured to be *measured value%*, which violated the warning-idle boundary value of *boundary value%*.

Explanation

CPU Utilization Percentage measures the approximate utilization percentage of the CPUs of the nodes in the monitored storage systems. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a CPU Utilization Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0559E The CPU Utilization Percentage of node *node name* in storage system *storage system name* was measured to be *measured*

value%, which violated the critical-idle boundary value of boundary value%.

Explanation

CPU Utilization Percentage measures the approximate utilization percentage of the CPUs of the nodes in the monitored storage systems. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a CPU Utilization Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0560E The Back-end Read Response Time of array or MDisk array or MDisk name in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined critical-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Read Response Time measures the average number of milliseconds that it took to service each read operation for arrays and MDisk. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Read Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array or MDisk. Either the array or MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array or MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the array or MDisk's workload to other less busy arrays or MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Due to internal cache management issues of some storage systems, it is possible that arrays or MDisk that are idle or almost idle have surprisingly large response times. Generally this is not a cause for concern, because application performance is rarely affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Back-end Read I/O Rate filter. Use this filter to ignore any violations of the Back-end Read Response Time threshold for arrays or MDisk with very low read I/O rates.

ALR0561W The Back-end Read Response Time of array or MDisk array or MDisk name in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Read Response Time measures the average number of milliseconds that it took to service each read operation for arrays and MDisk. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Read Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array or MDisk. Either the array or MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array or MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the array or MDisk's workload to other less busy arrays or MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Due to internal cache management issues of some storage systems, it is possible that arrays or MDisks that are idle or almost idle have surprisingly large response times. Generally this is not a cause for concern, because application performance is rarely affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Back-end Read I/O Rate filter. Use this filter to ignore any violations of the Back-end Read Response Time threshold for arrays or MDisks with very low read I/O rates.

ALR0562W The Back-end Read Response Time of array or MDisk array or MDisk name in storage system storage system name was measured to be *measured value ms/op*, which violated the defined warning-idle boundary value of *boundary value ms/op*.

Explanation

Back-end Read Response Time measures the average number of milliseconds that it took to service each read operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Read Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array or MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays or MDisks in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0563E The Back-end Read Response Time of array or MDisk array or MDisk name in storage system storage system name was measured to be *measured value ms/op*, which violated the defined critical-idle boundary value of *boundary value ms/op*.

Explanation

Back-end Read Response Time measures the average number of milliseconds that it took to service each read operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Read Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array or MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays or MDisks in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0564E The Back-end Write Response Time of array or MDisk array or MDisk name in storage system storage system name was measured to be *measured value ms/op*, which violated the defined critical-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Write Response Time measures the average number of milliseconds that it took to service each write operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Write Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array or MDisk. Either the array or MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array or MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the array or MDisk's workload to other less busy arrays or MDisks might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

Due to internal cache management issues of some storage systems, it is possible that arrays or MDisks that are idle or almost idle have surprisingly large response times. Generally this is not a cause for concern, because application performance is rarely affected due to the low I/O rates. To avoid unnecessary threshold alerts for such cases, consider enabling the Back-end Write I/O Rate filter. Use this filter to ignore any violations of the Back-end Write Response Time threshold for arrays or MDisks with very low write I/O rates.

ALR0565W The Back-end Write Response Time of array or MDisk *array or MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Write Response Time measures the average number of milliseconds that it took to service each write operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Write Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this array or MDisk. Either the array or MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the array or MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the array or MDisk's workload to other less busy arrays or MDisks might resolve the problem.

However this threshold indication is only as good as its defined boundary values. To avoid unnecessary threshold alerts for such cases, consider enabling the Back-end Write I/O Rate filter. Use this filter to ignore any violations of the Back-end Write Response Time threshold for arrays or MDisks with very low write I/O rates.

ALR0566W The Back-end Write Response Time of array or MDisk *array or MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-idle boundary value of *boundary value ms/op*.

Explanation

Back-end Write Response Time measures the average number of milliseconds that it took to service each write operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Write Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array or MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays or MDisks in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0567E The Back-end Write Response Time of array or MDisk *array or MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined critical-idle boundary value of *boundary value ms/op*.

Explanation

Back-end Write Response Time measures the average number of milliseconds that it took to service each write operation for arrays and MDisks. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified array or MDisk in the storage system has a Back-end Write Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this array or MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the arrays or MDisks in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0568E The Back-end Read Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined critical-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Read Queue Time measures the average number of milliseconds that each read operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Read Queue Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less busy MDisks might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0569W The Back-end Read Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-stress boundary value of *boundary value ms/op*.

Explanation

Back-end Read Queue Time measures the average number of milliseconds that each read operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Read Queue Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less

busy MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0570W The Back-end Read Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Back-end Read Queue Time measures the average number of milliseconds that each read operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Read Queue Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0571E The Back-end Read Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Back-end Read Queue Time measures the average number of milliseconds that each read operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Read Queue Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0572E The Back-end Write Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-stress boundary value of *boundary value* ms/op.

Explanation

Back-end Write Queue Time measures the average number of milliseconds that each write operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Write Queue Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less busy MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0573W The Back-end Write Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op.

Explanation

Back-end Write Queue Time measures the average number of milliseconds that each write operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Write Queue Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this MDisk. Either the MDisk is experiencing a hardware or software related problem that is causing a drop in performance, or the MDisk is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk's workload to other less busy MDisk might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the MDisk. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0574W The Back-end Write Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Back-end Write Queue Time measures the average number of milliseconds that each write operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Write Queue Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0575E The Back-end Write Queue Time of MDisk *MDisk name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Back-end Write Queue Time measures the average number of milliseconds that each write operation for an MDisk spent on the queue before being issued to the back-end storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified MDisk in the storage system has a Back-end Write Queue Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this MDisk. This can happen if the application(s) using the array or MDisk stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0576E The Port to Local Node Send Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Send Response Time measures the average number of milliseconds that it took to service each send operation to another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0577W The Port to Local Node Send Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Send Response Time measures the average number of milliseconds that it took to service each send operation to another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0578W The Port to Local Node Send Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Send Response Time measures the average number of milliseconds that it took to service each send operation to another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0579E The Port to Local Node Send Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Send Response Time measures the average number of milliseconds that it took to service each send operation to another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0580E The Port to Local Node Receive Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Receive Response Time measures the average number of milliseconds that it took to service each receive operation from another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0581W The Port to Local Node Receive Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Receive Response Time measures the average number of milliseconds that it took to service each receive operation from another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0582W The Port to Local Node Receive Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Receive Response Time measures the average number of milliseconds that it took to service each receive operation from another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0583E The Port to Local Node Receive Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Receive Response Time measures the average number of milliseconds that it took to service each receive operation from another node in the local storage system. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0584E The Port to Local Node Send Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that the node has to wait too long to send data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Send Queue Time measures the average number of milliseconds that each send operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Queue Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0585W The Port to Local Node Send Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op. Violation of this threshold boundary could mean that the node has to wait too long to send data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric.

Explanation

Port to Local Node Send Queue Time measures the average number of milliseconds that each send operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Queue Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this node. Either the node is experiencing a hardware or software related problem that is causing a drop in performance, or there is some congestion around the storage system's ports in the fabric, which is causing unreasonable delays. Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0586W The Port to Local Node Send Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Send Queue Time measures the average number of milliseconds that each send operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Send Queue Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0587E The Port to Local Node Send Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Send Queue Time measures the average number of milliseconds that each send operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

Check for errors on the ports, and if necessary follow your storage system's troubleshooting guidelines to determine the root of the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0590W The Port to Local Node Receive Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined warning-idle boundary value of *boundary value ms/op*.

Explanation

Port to Local Node Receive Queue Time measures the average number of milliseconds that each receive operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Queue Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0591E The Port to Local Node Receive Queue Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Port to Local Node Receive Queue Time measures the average number of milliseconds that each receive operation to another node in the local storage system spent on the queue before being issued. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Port to Local Node Receive Queue Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the node stopped working properly.

It makes little sense to enable an idle boundary for the queue time thresholds, because a zero or low queue time is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0592E The Non-preferred Node Usage Percentage of I/O Group *I/O Group name* in device *device name* was measured to be *measured value*%, which violated the critical-stress boundary value of *boundary value*%.

Explanation

Non-preferred Node Usage Percentage measures the approximate percentage of I/O operations that are not directed against the preferred node for each volume in an I/O Group. There is a small performance penalty when I/O does not go to the preferred node for each volume. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified I/O Group in the storage system has a Non-preferred Node Usage Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

Under normal conditions, the non-preferred node usage percentage should be zero for all I/O groups. The threshold violation might indicate either that a configuration problem exists for some of the host servers using storage from the storage system, or that some of the data paths from the host servers to the storage system through the fabric are currently not operational.

To determine which volumes are the culprit, the Non-preferred Node Usage Percentage metric is also available for volumes. The hosts that are using these volumes may not have multi-pathing software installed or configured properly, such that volume I/O is being directed to the non-preferred node of the I/O Group. Or if the host does not have redundant data paths to the storage system, it is possible that the host was connected or zoned to the incorrect node of the I/O Group. Correcting these configuration errors will usually resolve the problem.

ALR0593W The Non-preferred Node Usage Percentage of I/O Group *I/O Group name* in device *device name* was measured to be *measured value*%, which violated the warning-stress boundary value of *boundary value*%.

Explanation

Non-preferred Node Usage Percentage measures the approximate percentage of I/O operations that are not directed against the preferred node for each volume in an I/O Group. There is a small performance penalty when I/O does not go to the preferred node for each volume. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified I/O Group in the storage system has a Non-preferred Node Usage Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

Under normal conditions, the non-preferred node usage percentage should be zero for all I/O groups. The threshold violation might indicate either that a configuration problem exists for some of the host servers using storage from the storage system, or that some of the data paths from the host servers to the storage system through the fabric are currently not operational.

To determine which volumes are the culprit, the Non-preferred Node Usage Percentage metric is also available for volumes. The hosts that are using these volumes may not have multi-pathing software installed or configured properly, such that volume I/O is being directed to the non-preferred node of the I/O Group. Or if the host does not have redundant data paths to the storage system, it is possible that the host was connected or zoned to the incorrect node of the I/O Group. Correcting these configuration errors will usually resolve the problem.

ALR0594W The Non-preferred Node Usage Percentage of I/O Group *I/O Group name* in device *device name* was measured to be *measured value%*, which violated the warning-idle boundary value of *boundary value%*.

Explanation

Non-preferred Node Usage Percentage measures the approximate percentage of I/O operations that are not directed against the preferred node for each volume in an I/O Group. There is a small performance penalty when I/O does not go to the preferred node for each volume. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified I/O Group in the storage system has a Non-preferred Node Usage Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for this type of threshold, because a zero or low non-preferred node usage percentage is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0595E The Non-preferred Node Usage Percentage of I/O Group *I/O Group name* in device *device name* was measured to be *measured value%*, which violated the critical-idle boundary value of *boundary value%*.

Explanation

Non-preferred Node Usage Percentage measures the approximate percentage of I/O operations that are not directed against the preferred node for each volume in an I/O Group. There is a small performance penalty when I/O does not go to the preferred node for each volume. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified I/O Group in the storage system has a Non-preferred Node Usage Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for this type of threshold, because a zero or low non-preferred node usage percentage is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0596E The Peak Back-end Write Response Time of node *node name* in storage system *storage system name* was measured to be *measured value ms/op*, which violated the defined critical-stress boundary value of *boundary value ms/op*. If writes to disk are too slow, and writes are being received faster than they can be destaged to disk, then the nodes write-cache will eventually fill up. In

extreme cases, the node will stop caching write data, causing a significant performance degradation for the affected volumes.

Explanation

Peak Back-end Write Response Time measures the peak (worst) number of milliseconds that it took to service each MDisk write operation by a node. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Peak Back-end Write Response Time that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for one or more MDisks accessed by this node. To determine which of the MDisks are the culprits, this metric is also available for MDisks. Especially when the peak back-end write response time is in the dozens of seconds, it is likely that write requests are being received faster than they can be destaged to disk. Because the cache on the nodes is not infinite, eventually the storage system will have to switch to a mode where write I/Os are no longer cached for the MDisk, which can have a significant impact on application performance.

Possible causes for this condition might be that some of the MDisks are experiencing hardware or software related problems that are causing a drop in performance, or that the MDisk Group is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk Group's workload to other less busy MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0597W The Peak Back-end Write Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-stress boundary value of *boundary value* ms/op. If writes to disk are too slow, and writes are being received faster than they can be destaged to disk, then the nodes write-cache will eventually fill up. In extreme cases, the node will stop caching write data, causing a significant performance degradation for the affected volumes.

Explanation

Peak Back-end Write Response Time measures the peak (worst) number of milliseconds that it took to service each MDisk write operation by a node. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Peak Back-end Write Response Time that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for one or more MDisks accessed by this node. To determine which of the MDisks are the culprits, this metric is also available for MDisks. Especially when the peak back-end write response time is in the dozens of seconds, it is likely that write requests are being received faster than they can be destaged to disk. Possible causes for this condition might be that some of the MDisks are experiencing hardware or software related problems that are causing a drop in performance, or that the MDisk Group is being overloaded with too high a workload. If the workload is too high, moving some of the MDisk Group's workload to other less busy MDisk Groups might resolve the problem.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the node. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0598W The Peak Back-end Write Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined warning-idle boundary value of *boundary value* ms/op.

Explanation

Peak Back-end Write Response Time measures the peak (worst) number of milliseconds that it took to service each MDisk write operation by a node. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Peak Back-end Write Response Time that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0599E The Peak Back-end Write Response Time of node *node name* in storage system *storage system name* was measured to be *measured value* ms/op, which violated the defined critical-idle boundary value of *boundary value* ms/op.

Explanation

Peak Back-end Write Response Time measures the peak (worst) number of milliseconds that it took to service each MDisk write operation by a node. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified node in the storage system has a Peak Back-end Write Response Time that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this node. This can happen if the application(s) using the array or MDisk stopped working properly.

This type of threshold boundary should only be defined if the workload for the nodes in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0600E The Port Send Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value*%, which violated the critical-stress boundary value of *boundary value*%.

Explanation

Port Send Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy sending data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Send Utilization Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the Port Send Bandwidth Percentage metric is low or within normal bounds, but the Port Send Utilization Percentage metric is high for this port, then there might be some downstream congestion in the fabric along the datapath for this port. Check to make sure that the related switch ports are operational, and that the server HBA and the related switch ports have similar hardware capabilities as the subsystem port. Less capable ports at the server HBA or at the switches along the data path may artificially restrict the speed, so communication can only go as fast as the slowest link on the path.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0601W The Port Send Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the warning-stress boundary value of *boundary value%*.

Explanation

Port Send Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy sending data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Send Utilization Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the Port Send Bandwidth Percentage metric is low or within normal bounds, but the Port Send Utilization Percentage metric is high for this port, then there might be some downstream congestion in the fabric along the datapath for this port. Check to make sure that the related switch ports are operational, and that the server HBA and the related switch ports have similar hardware capabilities as the subsystem port. Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0604E The Port Receive Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the critical-stress boundary value of *boundary value%*.

Explanation

Port Receive Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy receiving data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Receive Utilization Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the Port Receive Bandwidth Percentage metric is low or within normal bounds, but the Port Receive Utilization Percentage metric is high for this port, then there might be some downstream congestion in the fabric along the datapath for this port. Check to make sure that the related switch ports are operational, and that the server HBA and the related switch ports have similar hardware capabilities as the subsystem port. Less capable ports at the server HBA or at the switches along the data path may artificially restrict the speed, so communication can only go as fast as the slowest link on the path.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0605W The Port Receive Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the warning-stress boundary value of *boundary value%*.

Explanation

Port Receive Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy receiving data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Receive Utilization Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is experiencing a hardware or software related problem that is causing a drop in performance, or the port is being overloaded with too high a workload. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the Port Receive Bandwidth Percentage metric is low or within normal bounds, but the Port Receive Utilization Percentage metric is high for this port, then there might be some downstream congestion in the fabric along the datapath for this port. Check to make sure that the related switch ports are operational, and that the server HBA and the related switch ports have similar hardware capabilities as the subsystem port. Less capable ports at the server HBA or at the switches along the data path may artificially restrict the speed, so communication can only go as fast as the slowest link on the path.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0606W The Port Receive Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the warning-idle boundary value of *boundary value%*.

Explanation

Port Receive Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy receiving data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Receive Utilization Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0607E The Port Receive Utilization Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the critical-idle boundary value of *boundary value%*.

Explanation

Port Receive Utilization Percentage measures the approximate utilization percentage of the ports in monitored storage systems. This value represents the average percent of time that the ports were busy receiving data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Port Receive Utilization Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0608E The Port Send Bandwidth Percentage of port *port name* in device *device name* was measured to be *measured value%*, which violated the critical-stress boundary value of *boundary value%*.

Explanation

Port Send Bandwidth Percentage measures the approximate bandwidth utilization percentage of the ports in monitored storage systems and switches, based on their current negotiated speed. This value represents the ratio of the current send data rate to the maximum send data rate achievable at the negotiated speed. Since fibre channel protocols are full-duplex, the sum of the send and receive bandwidth percentages can theoretically reach a maximum of 200%. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Port Send Bandwidth Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is being overloaded with too high a workload, or there are some congestion or configuration issues in the fabric. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the port's negotiated speed is much less than the physical capability of the port, check the port error metrics which are available for some type of ports, to determine if there are reliability issues with the fabric or the connections. High error counts can indicate hardware problems with some of the ports or switches in the fabric, or can

indicate bad cables or connector between some of the ports.

Also be aware that less capable ports at the subsystem or the server HBA or at the switches along the data path may artificially restrict the speed, so communication can only go as fast as the slowest link on the path. It is therefore usually advisable to have only ports with similar capability connected into a fabric.

However this threshold indication is only as good as its defined boundary values. If the specified boundary value is too low, IBM Spectrum Control might recognize many violations, even though there is really no underlying performance problem with the port. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0609W The Port Send Bandwidth Percentage of port *port name* in device *device name* was measured to be *measured value%*, which violated the warning-stress boundary value of *boundary value%*.

Explanation

Port Send Bandwidth Percentage measures the approximate bandwidth utilization percentage of the ports in monitored storage systems and switches, based on their current negotiated speed. This value represents the ratio of the current send data rate to the maximum send data rate achievable at the negotiated speed. Since fibre channel protocols are full-duplex, the sum of the send and receive bandwidth percentages can theoretically reach a maximum of 200%. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Port Send Bandwidth Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a performance problem exists for this port. Either the port is being overloaded with too high a workload, or there are some congestion or configuration issues in the fabric. If the workload is too high, moving some of the port's workload to other less busy ports might resolve the problem.

If the port's negotiated speed is much less than the physical capability of the port, check the port error metrics which are available for some type of ports, to determine if there are reliability issues with the fabric or the connections. In this case, increase the boundary value in the threshold definition to reduce the number of unnecessary alerts.

ALR0614W The Port Receive Bandwidth Percentage of port *port name* in device *device name* was measured to be *measured value*%, which violated the warning-idle boundary value of *boundary value*%.

Explanation

Port Receive Bandwidth Percentage measures the approximate bandwidth utilization percentage of the ports in monitored storage systems and switches, based on their current negotiated speed. This value represents the ratio of the current receive data rate to the maximum receive data rate achievable at the negotiated speed. Since fibre channel protocols are full-duplex, the sum of the send and receive bandwidth percentages can theoretically reach a maximum of 200%. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Port Receive Bandwidth Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system or switch are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0615E The Port Receive Bandwidth Percentage of port *port name* in device *device name* was measured to be *measured value*%, which violated the critical-idle boundary value of *boundary value*%.

Explanation

Port Receive Bandwidth Percentage measures the approximate bandwidth utilization percentage of the ports in monitored storage systems and switches, based on their current negotiated speed. This value represents the ratio of the current receive data rate to the maximum receive data rate achievable at the negotiated speed. Since fibre channel protocols are full-duplex, the sum of the send and receive bandwidth percentages can theoretically reach a maximum of 200%. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Port Receive Bandwidth Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

The threshold violation might indicate an unexpected drop in the workload for this port. This can happen if the application(s) using the port stopped working properly.

This type of threshold boundary should only be defined if the workload for the ports in a storage system or switch are guaranteed to always remain at a certain minimum level. Otherwise IBM Spectrum Control might recognize many violations, even though there is really no underlying problem with the applications. In these situations, consider decreasing the boundary value in the threshold definition, or disabling the boundary check by leaving the boundary value blank.

ALR0616E The CRC Error Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

CRC Error Rate measures the average number of frames that were received per second, where the cyclic redundancy check (CRC) value in the frame did not match the CRC value computed by the receiving port. This indicates accidental modification of the frame's data during transit, and can be used as an indicator of the relative quality of the port's connection. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an CRC Error Rate that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0617W The CRC Error Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-stress boundary value of *boundary value cnt/s*.

Explanation

CRC Error Rate measures the average number of frames that were received per second, where the cyclic redundancy check (CRC) value in the frame did not match the CRC value computed by the receiving port. This indicates accidental modification of the frame's data during transit, and can be used as an indicator of the relative quality of the port's connection. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an CRC Error Rate that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0618W The CRC Error Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-idle boundary value of *boundary value cnt/s*.

Explanation

CRC Error Rate measures the average number of frames that were received per second, where the cyclic redundancy check (CRC) value in the frame did not match the CRC value computed by the receiving port. This indicates accidental modification of the frame's data during transit, and can be used as an indicator of the relative quality of the port's connection. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an CRC Error Rate that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0619E The CRC Error Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined critical-idle boundary value of *boundary value cnt/s*.

Explanation

CRC Error Rate measures the average number of frames that were received per second, where the cyclic redundancy check (CRC) value in the frame did not match the CRC value computed by the receiving port. This indicates accidental modification of the frame's data during transit, and can be used as an indicator of the relative quality of the port's connection. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an CRC Error Rate that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0620E The Invalid Transmission Word Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Invalid Transmission Word Rate measures the average number of invalid transmission words that were detected by the port, per second. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Invalid Transmission Word Rate that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0621W The Invalid Transmission Word Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Invalid Transmission Word Rate measures the average number of invalid transmission words that were detected by the port, per second. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Invalid Transmission Word Rate that is greater than or equal to, the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the error rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0622W The Invalid Transmission Word Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Invalid Transmission Word Rate measures the average number of invalid transmission words that were detected by the port, per second. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Invalid Transmission Word Rate that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0623E The Invalid Transmission Word Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Invalid Transmission Word Rate measures the average number of invalid transmission words that were detected by the port, per second. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has an Invalid Transmission Word Rate that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the port error thresholds, because a zero or low error rate is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0624E The Zero Buffer Credit Timer of port *port name* in storage system *storage system name* was measured to be *measured value* microseconds, which violated the defined critical-stress boundary value of *boundary value* microseconds.

Explanation

Zero Buffer Credit Timer measures the number of microseconds during which it was impossible to send frames due to a lack of buffer credits at the port. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Zero Buffer Credit Timer value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the timer value remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0625W The Zero Buffer Credit Timer of port *port name* in storage system *storage system name* was measured to be *measured value* microseconds, which violated the defined warning-stress boundary value of *boundary value* microseconds.

Explanation

Zero Buffer Credit Timer measures the number of microseconds during which it was impossible to send frames due to a lack of buffer credits at the port. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Zero Buffer Credit Timer value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the timer value remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0626W The Zero Buffer Credit Timer of port *port name* in storage system *storage system name* was measured to be *measured value* microseconds, which violated the defined warning-idle boundary value of *boundary value* microseconds.

Explanation

Zero Buffer Credit Timer measures the number of microseconds during which it was impossible to send frames due to a lack of buffer credits at the port. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Zero Buffer Credit Timer value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Timer threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0627E The Zero Buffer Credit Timer of port *port name* in storage system *storage system name* was measured to be *measured value* microseconds, which violated the defined critical-idle boundary value of *boundary value* microseconds.

Explanation

Zero Buffer Credit Timer measures the number of microseconds during which it was impossible to send frames due to a lack of buffer credits at the port. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system or switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Zero Buffer Credit Timer value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Timer threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0628E The Zero Buffer Credit Percentage of port *port name* in storage system *storage system name* was measured to be *measured value*%, which violated the defined critical-stress boundary value of *boundary value*%.

Explanation

Zero Buffer Credit Percentage measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Zero Buffer Credit Percentage value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the timer value remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0629W The Zero Buffer Credit Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the defined warning-stress boundary value of *boundary value%*.

Explanation

Zero Buffer Credit Percentage measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Zero Buffer Credit Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the timer value remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the storage system, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0630W The Zero Buffer Credit Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the defined warning-idle boundary value of *boundary value%*.

Explanation

Zero Buffer Credit Percentage measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Zero Buffer Credit Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Percentage threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0631E The Zero Buffer Credit Percentage of port *port name* in storage system *storage system name* was measured to be *measured value%*, which violated the defined critical-idle boundary value of *boundary value%*.

Explanation

Zero Buffer Credit Percentage measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not

overrun the ability of the receiving port to receive that data. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system has a Zero Buffer Credit Percentage value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Percentage threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0632E The Discarded Frame Rate of port *port name* in switch *switch name* was measured to be *measured value%*, which violated the defined critical-stress boundary value of *boundary value%*.

Explanation

The Discarded Frame Rate measures the rate at which the port discarded frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Frame Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0633W The Discarded Frame Rate of port *port name* in switch *switch name* was measured to be *measured value%*, which violated the defined warning-stress boundary value of *boundary value%*.

Explanation

The Discarded Frame Rate measures the rate at which the port discarded frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Frame Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0634W The Discarded Frame Rate of port *port name* in switch *switch name* was measured to be *measured value%*, which violated the defined warning-idle boundary value of *boundary value%*.

Explanation

The Discarded Frame Rate measures the rate at which the port discarded frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Frame Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Discarded Frame Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0635E The Discarded Frame Rate of port *port name* in switch *switch name* was measured to be *measured value%*, which violated the defined critical-idle boundary value of *boundary value%*.

Explanation

The Discarded Frame Rate measures the rate at which the port discarded frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Frame Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Discarded Frame Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0636E The Loss of Sync Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined critical-stress boundary value of *boundary value cnt/s*.

Explanation

The Loss of Sync Rate measures the rate at which the port lost synchronization with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to mismatching port speeds between the partner ports, when auto-negotiation of link speed is disabled. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Sync Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected port. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0637W The Loss of Sync Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-stress boundary value of *boundary value cnt/s*.

Explanation

The Loss of Sync Rate measures the rate at which the port lost synchronization with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to mismatching port speeds between the partner ports, when auto-negotiation of link speed is disabled. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Sync Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected port. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0638W The Loss of Sync Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

The Loss of Sync Rate measures the rate at which the port lost synchronization with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to mismatching port speeds between the partner ports, when auto-negotiation of link speed is disabled. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Sync Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Loss of Sync Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0639E The Loss of Sync Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

The Loss of Sync Rate measures the rate at which the port lost synchronization with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to mismatching port speeds between the partner ports, when auto-negotiation of link speed is disabled. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Sync Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Loss of Sync Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0640E The Loss of Signal Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

The Loss of Signal Rate measures the rate at which the port lost communication with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to exceeding the maximum link distance between ports, for the type of connecting cable and light source. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Signal Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware problem exists either for this port or for the connected port. However it could also simply mean that the connected port was reset somehow, for example by rebooting the host containing the HBA. Therefore, isolated errors should be ignored in most cases, but if the rate remains

consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0641W The Loss of Signal Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

The Loss of Signal Rate measures the rate at which the port lost communication with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to exceeding the maximum link distance between ports, for the type of connecting cable and light source. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Signal Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware problem exists either for this port or for the connected port. However it could also simply mean that the connected port was reset somehow, for example by rebooting the host containing the HBA. Therefore, isolated errors should be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0642W The Loss of Signal Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

The Loss of Signal Rate measures the rate at which the port lost communication with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to exceeding the maximum link distance between ports, for the type of connecting cable and light source. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Signal Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Loss of Signal Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0643E The Loss of Signal Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

The Loss of Signal Rate measures the rate at which the port lost communication with its partner port. These types of errors usually indicate physical link problems, caused by faulty SFP modules or cables, or caused by faulty connections at the switch or patch panel. However in some cases this can also occur due to exceeding the maximum link distance between ports, for the type of connecting cable and light source. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Loss of Signal Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Loss of Signal Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0644E The Discarded Class 3 Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

The Discarded Class 3 Frame Rate measures the rate at which the port Discarded Class 3 Frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Class 3 Frame Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0645W The Discarded Class 3 Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

The Discarded Class 3 Frame Rate measures the rate at which the port Discarded Class 3 Frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Class 3 Frame Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0646W The Discarded Class 3 Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

The Discarded Class 3 Frame Rate measures the rate at which the port Discarded Class 3 Frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Class 3 Frame Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Discarded Class 3 Frame Rate threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0647E The Discarded Class 3 Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

The Discarded Class 3 Frame Rate measures the rate at which the port Discarded Class 3 Frames for any reason. Frames can be discarded due to many reasons, for example invalid addressing or header contents, or due to timeout caused by lack of buffer credits. Other error metrics may help in narrowing down the reason for the discards. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Discarded Class 3 Frame Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Discarded Class 3 Frame Rate threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0648E The Zero Buffer Credit Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Zero Buffer Credit Rate measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. The lack of buffer credits has a negative effect on the port's overall throughput, and can cascade from port to port causing congestion in the entire fabric. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Zero Buffer Credit Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0649W The Zero Buffer Credit Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Zero Buffer Credit Rate measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. The lack of buffer credits has a negative effect on the port's overall throughput, and can cascade from port to port causing congestion in the entire fabric. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Zero Buffer Credit Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0650W The Zero Buffer Credit Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Zero Buffer Credit Rate measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. The lack of buffer credits has a negative effect on the port's overall throughput, and can cascade from port to port causing congestion in the entire fabric. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Zero Buffer Credit Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0651E The Zero Buffer Credit Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Zero Buffer Credit Rate measures the percentage of time that the port was unable to send frames due to a lack of buffer credits at the port over a particular time interval. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. The lack of buffer credits has a negative effect on the port's overall throughput, and can cascade from port to port causing congestion in the entire fabric. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Zero Buffer Credit Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Zero Buffer Credit Rate threshold, because a zero or low time value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0652E The Class 3 Send Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s. This

violated the defined critical-stress boundary value of *boundary value cnt/s*.

Explanation

Class 3 Send Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the transmission port due to timeout caused by lack of buffer credits. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. If no credit is received, a timeout condition occurs and the waiting frame is discarded. Note that if egress and ingress ports are on the same blade, the Class 3 Receive Timeout Frame rate increases for the ingress port(s) at the same time the Class 3 Send Timeout Frame rate increases for the egress port.

A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch. This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Class 3 Send Timeout Frame Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0653W The Class 3 Send Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value cnt/s*. This violated the defined warning-stress boundary value of *boundary value cnt/s*.

Explanation

Class 3 Send Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the transmission port due to timeout caused by lack of buffer credits. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. If no credit is received, a timeout condition occurs and the waiting frame is discarded. Note that if egress and ingress ports are on the same blade, the Class 3 Receive Timeout Frame rate increases for the ingress port(s) at the same time the Class 3 Send Timeout Frame rate increases for the egress port.

A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch. This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Class 3 Send Timeout Frame Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0654W The Class 3 Send Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value cnt/s*. This violated the defined warning-idle boundary value of *boundary value cnt/s*.

Explanation

Class 3 Send Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the transmission port due to timeout caused by lack of buffer credits. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. If no credit is received, a timeout condition occurs and the waiting frame is discarded. Note that if egress and ingress ports are on the same blade, the Class 3 Receive Timeout Frame rate increases for the ingress port(s) at the same time the Class 3 Send Timeout Frame rate increases for the egress port.

A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch. This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Class 3 Send Timeout Frame Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Class 3 Send Timeout Frame Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0655E The Class 3 Send Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s. This violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Class 3 Send Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the transmission port due to timeout caused by lack of buffer credits. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0658W The Class 3 Receive Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s. This violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Class 3 Receive Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the receiving port due to timeout caused by lack of buffer credits at the transmitting port. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. If no credit is received, a timeout condition occurs and the waiting frame is discarded. Note that if egress and ingress ports are on the same blade, the Class 3 Receive Timeout Frame rate increases for the ingress port(s) at the same time the Class 3 Send Timeout Frame rate increases for the egress port.

A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch. This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Class 3 Receive Timeout Frame Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Class 3 Receive Timeout Frame Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0659E The Class 3 Receive Timeout Frame Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s. This violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Class 3 Receive Timeout Frame Rate measures the rate at which class 3 frames had to be discarded at the receiving port due to timeout caused by lack of buffer credits at the transmitting port. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port which is sending data does not overrun the ability of the receiving port to receive that data. When out of buffer credits, the port waits for a configurable amount of time (e.g. 500 ms) to receive credit and send the waiting frame. If no credit is received, a timeout condition occurs and the waiting frame is discarded. Note that if egress and ingress ports are on the same blade, the Class 3 Receive Timeout Frame rate increases for the ingress port(s) at the same time the Class 3 Send Timeout Frame rate increases for the egress port.

A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch. This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Class 3 Receive Timeout Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Class 3 Receive Timeout Frame Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0660E The Credit Recovery Link Reset Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which

violated the defined critical-stress boundary value of *boundary value cnt/s*.

Explanation

Credit Recovery Link Reset Rate estimates the rate at which link resets were performed in order to recover buffer credits. Link resets may be performed for other reasons, but this metric estimates the rate for only buffer credit recovery by ignoring any resets that may have been caused by loss of synchronization or loss of signal conditions. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Credit Recovery Link Reset Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0661W The Credit Recovery Link Reset Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-stress boundary value of *boundary value cnt/s*.

Explanation

Credit Recovery Link Reset Rate estimates the rate at which link resets were performed in order to recover buffer credits. Link resets may be performed for other reasons, but this metric estimates the rate for only buffer credit recovery by ignoring any resets that may have been caused by loss of synchronization or loss of signal conditions. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Credit Recovery Link Reset Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0662W The Credit Recovery Link Reset Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-idle boundary value of *boundary value cnt/s*.

Explanation

Credit Recovery Link Reset Rate estimates the rate at which link resets were performed in order to recover buffer credits. Link resets may be performed for other reasons, but this metric estimates the rate for only buffer credit recovery by ignoring any resets that may have been caused by loss of synchronization or loss of signal conditions. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Credit Recovery Link Reset Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Credit Recovery Link Reset Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0663E The Credit Recovery Link Reset Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Credit Recovery Link Reset Rate estimates the rate at which link resets were performed in order to recover buffer credits. Link resets may be performed for other reasons, but this metric estimates the rate for only buffer credit recovery by ignoring any resets that may have been caused by loss of synchronization or loss of signal conditions. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Credit Recovery Link Reset Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Credit Recovery Link Reset Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0664E The RDY Priority Override Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

RDY Priority Override Rate measures the rate at which sending R_RDY or VC_RDY signals was a higher priority for the port than sending frames. This condition occurs because of diminishing credit reserves in the transmitter at the other end of the fibre. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a RDY Priority Override Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0665W The RDY Priority Override Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

RDY Priority Override Rate measures the rate at which sending R_RDY or VC_RDY signals was a higher priority for the port than sending frames. This condition occurs because of diminishing credit reserves in the transmitter at the other end of the fibre. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a RDY Priority Override Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0666W The RDY Priority Override Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

RDY Priority Override Rate measures the rate at which sending R_RDY or VC_RDY signals was a higher priority for the port than sending frames. This condition occurs because of diminishing credit reserves in the transmitter at the other end of the fibre. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a RDY Priority Override Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the RDY Priority Override Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0667E The RDY Priority Override Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

RDY Priority Override Rate measures the rate at which sending R_RDY or VC_RDY signals was a higher priority for the port than sending frames. This condition occurs because of diminishing credit reserves in the transmitter at the other end of the fibre. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a RDY Priority Override Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the RDY Priority Override Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0668E The Port State Change Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Port State Change Rate measures the rate at which the port has changed state between online, offline, and faulty. This threshold can be used to help to identify flapping ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Port State Change Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0669W The Port State Change Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Port State Change Rate measures the rate at which the port has changed state between online, offline, and faulty. This threshold can be used to help to identify flapping ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Port State Change Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0670W The Port State Change Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Port State Change Rate measures the rate at which the port has changed state between online, offline, and faulty. This threshold can be used to help to identify flapping ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Port State Change Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Port State Change Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0671E The Port State Change Rate of port *port name* in switch *switch name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Port State Change Rate measures the rate at which the port has changed state between online, offline, and faulty. This threshold can be used to help to identify flapping ports. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the switch has a Port State Change Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Port State Change Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0672E The Primitive Sequence Protocol Error Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Primitive Sequence Protocol Error Rate measures the rate at which the port received unexpected primitive sequences. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Primitive Sequence Protocol Error Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0673W The Primitive Sequence Protocol Error Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Primitive Sequence Protocol Error Rate measures the rate at which the port received unexpected primitive sequences. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Primitive Sequence Protocol Error Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0674W The Primitive Sequence Protocol Error Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Primitive Sequence Protocol Error Rate measures the rate at which the port received unexpected primitive sequences. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Primitive Sequence Protocol Error Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Primitive Sequence Protocol Error Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0675E The Primitive Sequence Protocol Error Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Primitive Sequence Protocol Error Rate measures the rate at which the port received unexpected primitive sequences. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Primitive Sequence Protocol Error Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Primitive Sequence Protocol Error Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0676E The Link Reset Transmitted Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Link Reset Transmitted Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Transmitted Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0677W The Link Reset Transmitted Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-stress boundary value of *boundary value* cnt/s.

Explanation

Link Reset Transmitted Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Transmitted Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0678W The Link Reset Transmitted Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined warning-idle boundary value of *boundary value* cnt/s.

Explanation

Link Reset Transmitted Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Transmitted Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Link Reset Transmitted Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0679E The Link Reset Transmitted Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-idle boundary value of *boundary value* cnt/s.

Explanation

Link Reset Transmitted Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Transmitted Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Link Reset Transmitted Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0680E The Link Reset Received Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which violated the defined critical-stress boundary value of *boundary value* cnt/s.

Explanation

Link Reset Received Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Received Rate value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0681W The Link Reset Received Rate of port *port name* in device *device name* was measured to be *measured value* cnt/s, which

violated the defined warning-stress boundary value of *boundary value cnt/s*.

Explanation

Link Reset Received Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Received Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

Action

The threshold violation might indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can be ignored in most cases, but if the rate remains consistently high over time, this may be a cause for concern. Follow the trouble-shooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can be ignored in most cases, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can greatly reduce the number of unnecessary alerts.

ALR0682W The Link Reset Received Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined warning-idle boundary value of *boundary value cnt/s*.

Explanation

Link Reset Received Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Received Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Link Reset Received Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0683E The Link Reset Received Rate of port *port name* in device *device name* was measured to be *measured value cnt/s*, which violated the defined critical-idle boundary value of *boundary value cnt/s*.

Explanation

Link Reset Received Rate measures the rate at which the port encountered link resets. A threshold was defined on this metric, which causes the measured value to be compared to the defined boundaries for each set of performance statistics collected from the switch.

This message indicates that a threshold boundary violation occurred. In this case, the specified port in the storage system or switch has a Link Reset Received Rate value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

It makes little sense to enable an idle boundary for the Link Reset Received Rate threshold, because a zero or low value is the ideal and expected situation. It is recommended to disable the idle boundary checking by leaving the idle boundary values blank in the related threshold definition.

ALR0684E The Port Congestion Index of port *port_name* in device *device_name* was found to be *measured_value* Counts, which violated the defined critical-stress boundary value of *boundary_value* Counts.

Explanation

Port Congestion Index estimates the degree to which frame transmission was delayed due to a lack of buffer credits. This value is generally between 0 (no congestion) to 100, but can exceed 100 if buffer credit exhaustion persisted for an extended amount of time. A threshold is defined on this metric, which can be used to compare the value of Port Congestion Index with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified port in the storage system or switch has a Port Congestion Index value that is greater than or equal to the critical-stress boundary that was defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can generally be ignored, but if the rate remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0685W The Port Congestion Index of port *port_name* in device *device_name* was found to be *measured_value* Counts, which violated the defined warning-stress boundary value of *boundary_value* Counts.

Explanation

Port Congestion Index estimates the degree to which frame transmission was delayed due to a lack of buffer credits. This value is generally between 0 (no congestion) to 100, but can exceed 100 if buffer credit exhaustion persisted for an extended amount of time. A threshold is defined on this metric, which can be used to compare the value of Port Congestion Index with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified port in the storage system or switch has a Port Congestion Index value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary that was defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can generally be ignored, but if the rate remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0686W The Port Congestion Index of port *port_name* in device *device_name* was found to be *measured_value* Counts, which violated the defined warning-idle boundary value of *boundary_value* Counts.

Explanation

Port Congestion Index estimates the degree to which frame transmission was delayed due to a lack of buffer credits. This value is generally between 0 (no congestion) to 100, but can exceed 100 if buffer credit exhaustion persisted for an extended amount of time. A threshold is defined on this metric, which can be used to compare the value of Port Congestion Index with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified port in the storage system or switch has a Port Congestion Index value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary that was defined for the related threshold.

Action

A zero or low Port Congestion Index value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0687E The Port Congestion Index of port *port_name* in device *device_name* was found to be *measured_value* Counts, which violated the defined critical-idle boundary value of *boundary_value* Counts.

Explanation

Port Congestion Index estimates the degree to which frame transmission was delayed due to a lack of buffer credits. This value is generally between 0 (no congestion) to 100, but can exceed 100 if buffer credit exhaustion persisted for an extended amount of time. A threshold is defined on this metric, which can be used to compare the value of Port Congestion Index with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified port in the storage system or switch has a Port Congestion Index value that is less than or equal to the critical-idle boundary that was defined for the related threshold.

Action

A zero or low Port Congestion Index value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0688E The Link Quality Percentage of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

Link Quality Percentage estimates the relative quality of the connection of a switch port. The percentage is based on whether the port is an expansion port (E_port) or a fabric port (F_port), and on the numbers and types of errors that are detected by the port. A threshold is defined on this metric, which can be used to compare the value of the Link Quality Percentage with the defined boundaries for each set of performance statistics collected from the switch.

A threshold boundary violation occurred. The specified switch port has a Link Quality Percentage value that is less than or equal to the critical-stress boundary defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected port or cable. Isolated errors can generally be ignored, but if the percentage remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the switch, and for the connected resource (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0689W The Link Quality Percentage of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined warning-stress boundary value of *boundary_value*.

Explanation

Link Quality Percentage estimates the relative quality of the connection of a switch port. The percentage is based on whether the port is an expansion port (E_port) or a fabric port (F_port), and on the numbers and types of errors that are detected by the port. A threshold is defined on this metric, which can be used to compare the value of the Link Quality Percentage with the defined boundaries for each set of performance statistics collected from the switch.

A threshold boundary violation occurred. The specified switch port has a Link Quality Percentage value that is less than or equal to the warning-stress boundary, but greater than the critical-stress boundary defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected port or cable. Isolated errors can generally be ignored, but if the percentage remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0690W The Link Quality Percentage of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined warning-idle boundary value of *boundary_value*.

Explanation

Link Quality Percentage estimates the relative quality of the connection of a switch port. The percentage is based on whether the port is an expansion port (E_port) or a fabric port (F_port), and on the numbers and types of errors that are detected by the port. A threshold is defined on this metric, which can be used to compare the value of the Link Quality Percentage with the defined boundaries for each set of performance statistics collected from the switch.

A threshold boundary violation occurred. The specified switch port has a Link Quality Percentage value that is greater than or equal to the warning-idle boundary, but less than the critical-idle boundary defined for the related threshold.

Action

A high Link Quality Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0691E The Link Quality Percentage of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined critical-idle boundary value of *boundary_value*.

Explanation

Link Quality Percentage estimates the relative quality of the connection of a switch port. The percentage is based on whether the port is an expansion port (E_port) or a fabric port (F_port), and on the numbers and types of errors that are detected by the port. A threshold is defined on this metric, which can be used to compare the value of the Link Quality Percentage with the defined boundaries for each set of performance statistics collected from the switch.

A threshold boundary violation occurred. The specified switch port has a Link Quality Percentage value that is greater than or equal to the critical-idle boundary defined for the related threshold.

Action

A high Link Quality Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0692E The Invalid Link Transmission Rate of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

Invalid Link Transmission Rate measures the average number of invalid transmission words that were detected by the port, per second, in the absence of any synchronization or signal loss on the link. This is the rate of invalid transmission words during time intervals when the link is otherwise up and operating normally. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold is defined on this metric, which can be used to compare the value of Invalid Link Transmission Rate with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified storage system or switch port has an Invalid Link Transmission Rate value that is greater than or equal to the critical-stress boundary defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected port or cable. Isolated errors can generally be ignored, but if the percentage remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0693W The Invalid Link Transmission Rate of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined warning-stress boundary value of *boundary_value*.

Explanation

Invalid Link Transmission Rate measures the average number of invalid transmission words that were detected by the port, per second, in the absence of any synchronization or signal loss on the link. This is the rate of invalid transmission words during time intervals when the link is otherwise up and operating normally. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A

threshold is defined on this metric, which can be used to compare the value of Invalid Link Transmission Rate with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified storage system or switch port has an Invalid Link Transmission Rate value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected port or cable. Isolated errors can generally be ignored, but if the percentage remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the storage system or switch, and for the connected entity (storage system, switch, or server HBA).

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0694W The Invalid Link Transmission Rate of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined warning-idle boundary value of *boundary_value*.

Explanation

Invalid Link Transmission Rate measures the average number of invalid transmission words that were detected by the port, per second, in the absence of any synchronization or signal loss on the link. This is the rate of invalid transmission words during time intervals when the link is otherwise up and operating normally. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold is defined on this metric, which can be used to compare the value of Invalid Link Transmission Rate with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified storage system or switch port has an Invalid Link Transmission Rate value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary defined for the related threshold.

Action

A zero or low Invalid Link Transmission Rate value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0695E The Invalid Link Transmission Rate of port *port_name* in device *device_name* was found to be *measured_value*, which violated the defined critical-idle boundary value of *boundary_value*.

Explanation

Invalid Link Transmission Rate measures the average number of invalid transmission words that were detected by the port, per second, in the absence of any synchronization or signal loss on the link. This is the rate of invalid transmission words during time intervals when the link is otherwise up and operating normally. Transmission words are primitive elements used by the fibre channel protocol for transmission of data. A frame consists of between 10 and 537 transmission words. A threshold is defined on this metric, which can be used to compare the value of Invalid Link Transmission Rate with the defined boundaries for each set of performance statistics collected from the storage system or switch.

A threshold boundary violation occurred. The specified storage system or switch port has an Invalid Link Transmission Rate value that is less than or equal to the critical-idle boundary defined for the related threshold.

Action

A zero or low Invalid Link Transmission Rate value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0696E The Extreme I/O Concurrency Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

Extreme I/O Concurrency Percentage measures the percentage of I/O operations that were issued against the port when it already had a high number of outstanding open exchanges pending. This metric shows how often there was too much concurrent I/O occurring on the port. The number of concurrent exchanges for a port on a DS8000

storage system cannot exceed 2000. Approximately 1500 open exchanges for port is a high number for a DS8000 system. A threshold is defined on this metric, which can be used to compare the value of the Extreme I/O Concurrency Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an Extreme I/O Concurrency Percentage value that is greater than or equal to the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that there is a danger that the physical capability of the port on the DS8000 system might be exceeded. If the port reaches its maximum number of open exchanges, it responds to any additional I/O requests with a 'Busy' status. This usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

If the Extreme I/O Concurrency Percentage remains high for extended periods of time, check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the Extreme I/O Concurrency Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0697W The Extreme I/O Concurrency Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-stress boundary value of *boundary_value*.

Explanation

Extreme I/O Concurrency Percentage measures the percentage of I/O operations that were issued against the port when it already had a high number of outstanding open exchanges pending. This metric shows how often there was too much concurrent I/O occurring on the port. The number of concurrent exchanges for a port on a DS8000 storage system cannot exceed 2000. Approximately 1500 open exchanges for port is a high number for a DS8000 system. A threshold is defined on this metric, which can be used to compare the value of the Extreme I/O Concurrency Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an Extreme I/O Concurrency Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that there is a danger that the physical capability of the port on the DS8000 system might be exceeded. If the port reaches its maximum number of open exchanges, it responds to any additional I/O requests with a BUSY status. This usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

If the Extreme I/O Concurrency Percentage remains high for extended periods of time, check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the Extreme I/O Concurrency Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0698W The Extreme I/O Concurrency Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-idle boundary value of *boundary_value*.

Explanation

Extreme I/O Concurrency Percentage measures the percentage of I/O operations that were issued against the port when it already had a high number of outstanding open exchanges pending. This metric shows how often there was too much concurrent I/O occurring on the port. The number of concurrent exchanges for a port on a DS8000

storage system cannot exceed 2000. Approximately 1500 open exchanges for port is a high number for a DS8000 system. A threshold is defined on this metric, which can be used to compare the value of the Extreme I/O Concurrency Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an Extreme I/O Concurrency Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary defined for the related threshold.

Action

A zero or low Extreme I/O Concurrency Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0699E The Extreme I/O Concurrency Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-idle boundary value of *boundary_value*.

Explanation

Extreme I/O Concurrency Percentage measures the percentage of I/O operations that were issued against the port when it already had a high number of outstanding open exchanges pending. This metric shows how often there was too much concurrent I/O occurring on the port. The number of concurrent exchanges for a port on a DS8000 storage system cannot exceed 2000. Approximately 1500 open exchanges for port is a high number for a DS8000 system. A threshold is defined on this metric, which can be used to compare the value of the Extreme I/O Concurrency Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an Extreme I/O Concurrency Percentage value that is less than or equal to the critical-idle boundary defined for the related threshold.

Action

A zero or low Extreme I/O Concurrency Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0700E The I/O Busy Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

I/O Busy Percentage measures the percentage of I/O operations for which the port returned a 'SCSI Queue Full' or 'Busy' status to the host server. These statuses can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which causes the value of the I/O Busy Percentage to be compared to the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Busy Percentage value that is greater than or equal to the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that the physical capability of the port on the DS8000 system is being exceeded. When a 'Busy' status is returned by the port, this usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

If the I/O Busy Percentage remains high for extended periods of time, check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or consider making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the I/O Busy Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0701W The I/O Busy Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated

the defined warning-stress boundary value of *boundary_value*.

Explanation

I/O Busy Percentage measures the percentage of I/O operations for which the port returned a 'SCSI Queue Full' or 'Busy' status to the host server. These statuses can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Busy Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Busy Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that the physical capability of the port on the DS8000 system is being exceeded. When a 'Busy' status is returned by the port, this usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

If the I/O Busy Percentage remains high for extended periods of time, check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or consider making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the I/O Busy Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0702W The I/O Busy Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-idle boundary value of *boundary_value*.

Explanation

I/O Busy Percentage measures the percentage of I/O operations for which the port returned a 'SCSI Queue Full' or 'Busy' status to the host server. These statuses can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Busy Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Busy Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary defined for the related threshold.

Action

A zero or low I/O Busy Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0703E The I/O Busy Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-idle boundary value of *boundary_value*.

Explanation

I/O Busy Percentage measures the percentage of I/O operations for which the port returned a 'SCSI Queue Full' or 'Busy' status to the host server. These statuses can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Busy Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Busy Percentage value that is less than or equal to the critical-idle boundary defined for the related threshold.

Action

A zero or low I/O Busy Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0704E The I/O Overrun Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

I/O Overrun Percentage measures the percentage of I/O operations that had to be discarded by the port because the number of open exchanges exceeded the maximum. This can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Overrun Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Overrun Percentage value that is greater than equal to the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that the physical capability of the port on the DS8000 system is being exceeded. When an I/O operation is discarded, this usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or consider making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the I/O Overrun Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0705W The I/O Overrun Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-stress boundary value of *boundary_value*.

Explanation

I/O Overrun Percentage measures the percentage of I/O operations that had to be discarded by the port because the number of open exchanges exceeded the maximum. This can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Overrun Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Overrun Percentage value that is greater than or equal to the warning-stress boundary, but less than the critical-stress boundary defined for the related threshold.

Action

The threshold violation indicates that the physical capability of the port on the DS8000 system is being exceeded. When an I/O operation is discarded, this usually means that the requesting host server needs to redrive the I/O, which negatively affects the performance of the I/O for the host.

Check the workload of the affected DS8000 system to ensure that it is generally balanced across all the HA ports. If the workload is not balanced across all the ports, try to balance it. Ensure that multipath device drivers are installed and functioning properly on the host servers, so that I/O activity can be spread across multiple DS8000 ports.

If multipath drivers are functioning normally, consider configuring certain ports to allow access from only certain host servers, or consider making zoning changes between host and storage system ports. Sometimes, you might need to change the cabling or the fabric configuration.

If the workload is already balanced and the I/O Overrun Percentage remains high, consider installing more ports in the DS8000 system, or consider moving some of the workload to other storage systems.

ALR0706W The I/O Overrun Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-idle boundary value of *boundary_value*.

Explanation

I/O Overrun Percentage measures the percentage of I/O operations that had to be discarded by the port because the number of open exchanges exceeded the maximum. This can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen

when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Overrun Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Overrun Percentage value that is less than or equal to the warning-idle boundary, but greater than the critical-idle boundary defined for the related threshold.

Action

A zero or low I/O Overrun Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0707E The I/O Overrun Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-idle boundary value of *boundary_value*.

Explanation

I/O Overrun Percentage measures the percentage of I/O operations that had to be discarded by the port because the number of open exchanges exceeded the maximum. This can occur for ports on DS8000 storage systems when the number of open exchanges for the port has reached the maximum value of 2000. This situation can happen when there is too much concurrent I/O being driven to the port. A threshold is defined on this metric, which can be used to compare the value of the I/O Overrun Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has an I/O Overrun Percentage value that is less than or equal to the critical-idle boundary defined for the related threshold.

Action

A zero or low I/O Overrun Percentage value is the ideal situation. Disable the idle boundary checking by leaving the idle boundary values blank in the threshold definition for this port.

ALR0708E The Zero Send Buffer Credit Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined critical-stress boundary value of *boundary_value*.

Explanation

Zero Send Buffer Credit Percentage measures the percentage of time during which the port on a DS8000 storage system had depleted its send buffer credits. That is, the percentage of time when the receiving port had no credit to provide to the port on the DS8000 system. Buffer to Buffer Credit is used as a mechanism to enforce flow-control by the fibre channel protocol, and ensures that a transmitting port that is sending data does not overrun the ability of the receiving port to receive that data. The lack of buffer credits has a negative effect on the overall throughput of the port, and can cascade from port to port, causing congestion in the fabric. A threshold is defined on this metric, which can be used to compare the value of Zero Send Buffer Credit Percentage with the defined boundaries for each set of performance statistics collected from the storage system.

A threshold boundary violation occurred. The specified storage system port has a Zero Send Buffer Credit Percentage value that is greater than or equal to the critical-stress boundary defined for the related threshold.

The threshold violation may indicate that a hardware or configuration problem exists either for this port or for the connected fabric. Isolated errors can generally be ignored, but if the percentage remains consistently high, the errors may be a cause for concern.

Action

Contact your resource vendor for troubleshooting guidelines for the storage system, and for the connected entity (storage system, switch, or server HBA). One possible cause is a mismatch in the capability (maximum speed) of host server ports and the rest of the ports in the fabric. A port that is slow or behaving unpredictably can cause buffer credit exhaustion for the port it is connected to and all other ports in its path to the storage system.

Because isolated temporary errors can generally be ignored, consider enabling the alert suppression option "Suppress alerts unless the triggering condition has been violated continuously for a specified length of time" for this threshold. This can reduce the number of unnecessary alerts.

ALR0709W The Zero Send Buffer Credit Percentage of port *port_name* in storage system *device_name* was found to be *measured_value*, which violated the defined warning-stress boundary value of *boundary_value*.

Explanation

Zero Send Buffer Credit Percentage measures the percentage of time during which the port on a DS8000 storage system had depleted its send buffer credits. No action is required.

ALR4063I The connection from *switch or node switch name or WWN port port name or WWPN* to *switch or node switch name or WWN port port name or WWPN* has been discovered.

Explanation

The connection from the specified port of the specified switch or node to the specified port of the specified switch or node has been discovered.

Action

No action is required.

ALR4064W The connection from *switch or node switch name or WWN port port name or WWPN* to *switch or node switch name or WWN port port name or WWPN* is missing.

Explanation

The connection from the specified port of the specified switch or node to the specified port of the specified switch or node has gone missing.

Action

If this alert was unexpected, check the connection between the ports and check the status of the devices at both ends of the connection.

ALR4065I The connection from *switch or node switch name or WWN port port name or WWPN* to *switch or node switch name or WWN port port name or WWPN* has been rediscovered.

Explanation

The connection from the specified port of the specified switch or node to the specified port of the specified switch or node has been rediscovered.

Action

No action is required.

ALR4066I Switch *switch name or WWN* in fabric *fabric name or WWN* has been discovered.

Explanation

The specified switch in the specified fabric has been discovered.

Action

No action is required.

ALR4067W Switch *switch name or WWN* in fabric *fabric name or WWN* is missing.

Explanation

The specified switch in the specified fabric has gone missing.

Action

If this alert was unexpected, check the status of the switch and it's connections to the other switches in the fabric.

ALR4068I Switch *switch name or WWN* in fabric *fabric name or WWN* has been rediscovered.

Explanation

The specified switch in the specified fabric has been rediscovered.

Action

No action is required.

ALR4069I Port *port name or WWPN* in switch *switch name or WWN* has been discovered.

Explanation

The specified port in the specified switch has been discovered.

Action

No action is required.

ALR4070W Port *port name or WWPN* in switch *switch name or WWN* is missing.

Explanation

The specified port in the specified switch has gone missing.

Action

If this alert was unexpected, check the status of the switch. If the switch is a logical switch in a Virtual Fabric, check the port assignments for the Virtual Fabric.

ALR4071I Port *port name or WWPN* in switch *switch name or WWN* has been rediscovered.

Explanation

The specified port in the specified switch has been rediscovered.

Action

No action is required.

ALR4078I Alias *zone alias* has been added to inactive zone *zone name* in fabric *fabric name or WWN* .

Explanation

The specified alias has been added to the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4079W Alias *zone alias* has been removed from inactive zone *zone name* in fabric *fabric name or WWN* .

Explanation

The specified alias has been removed from the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4080I Alias *zone alias* has been readded to inactive zone *zone name* in fabric *fabric name or WWN* .

Explanation

The specified alias has been readded to the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4081I Zone member *zone member name* has been added to inactive zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been added to the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4082I Zone member *zone member name* has been removed from inactive zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been removed from the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4083I Zone member *zone member name* has been readded to inactive zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been readded to the specified inactive zone in the specified fabric.

Action

No action is required.

ALR4084I Zone *zone name* has been added to inactive zone set *zone set name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone has been added to the specified inactive zone set in the specified fabric.

Action

No action is required.

ALR4085I Zone *zone name* has been removed from inactive zone set *zone set name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone has been removed from the specified inactive zone set in the specified fabric.

Action

No action is required.

ALR4086I Zone *zone name* has been readdded to inactive zone set *zone set name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone has been readdded to the specified inactive zone set in the specified fabric.

Action

No action is required.

ALR4089W ZoneSet *zoneset name* in fabric *fabric name* or *WWN* has been deactivated. ZoneSet *zoneset name* has been activated.

Explanation

The specified zoneset in the specified fabric has been deactivated. Another zoneset has been activated.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4090W Active zone *zone name* in fabric *fabric name* or *WWN* is missing.

Explanation

The specified active zone in the specified fabric has gone missing.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4091I Active zone *zone name* in fabric *fabric name* or *WWN* has been discovered.

Explanation

The specified active zone in the specified fabric has been discovered.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4092I Active zoneset *zoneset name* in fabric *fabric name* or *WWN* has been discovered.

Explanation

The specified active zoneset in the specified fabric has been discovered.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4093E ZoneSet *zoneset name* in fabric *fabric name* or *WWN* has been deactivated. ZoneSet *zoneset name* has been activated.

Explanation

The specified zoneset in the specified fabric has been deactivated. No zoneset has been activated..

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4094I Active zone *zone name* in fabric *fabric name* or *WWN* has been rediscovered.

Explanation

The specified active zone in the specified fabric has been rediscovered.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4095I Active zoneset *zoneset name* in fabric *fabric name* or *WWN* has been rediscovered.

Explanation

The specified active zoneset in the specified fabric has been rediscovered.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4096I Zone member *zone member name* has been added to active zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been added to the specified active zone in the specified fabric.

Action

No action is required.

ALR4097I Zone member *zone member name* has been removed from active zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been removed from the specified active zone in the specified fabric.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4098I Zone member *zone member name* has been readded to active zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone member has been readded to the specified active zone in the specified fabric.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4099I Zone *zone name* has been added to active zone set *zone set name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone has been added to the specified active zone set in the specified fabric.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4103W The performance monitor's primary process is experiencing a high memory utilization.

Explanation

The IBM Spectrum Control server encountered a high memory utilization for a period of time, which may lead to stability problems.

Action

Check, if there was high activity on the server. If so, try to reduce the workload, for example by rescheduling probes or batch reports.

ALR4104W A database used by the system is reporting an alarm: *value*.

Explanation

The system database or the database manager hosting the system repository is reporting an alarm. The message returns a value of:

- DBM - database manager
- DB - repository database
- DBM, DB - both

Action

Check the status of the affected database.

ALR4105W Device server configuration should be changed to improve performance: *value*.

Explanation

A device server workload queue is reporting an alert. The value returned with this message identifies the queue. The queue length can be reduced by adjusting the device server configuration.

Action

Send this message, including the value, to IBM Technical Support.

ALR4106W The IBM Spectrum Control server is receiving a high number of external type of events received, which is either CIM for CIM indications or SNMP for SNMP traps. events, which may cause temporary performance degradation.

Explanation

The IBM Spectrum Control server encountered a high rate of incoming external events, which are potentially affecting IBM Spectrum Control performance.

Action

Check the environment for items, which are producing a unusual high number of events and correct the problem.

ALR4107I Zone *zone name* has been removed from active zone set *zone set name* in fabric *fabric name* or *WWN* .

Explanation

The specified zone has been removed from the specified active zone set in the specified fabric.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4108I The server *server name* at host *host name* successfully connected to the database after previous attempts failed.

Explanation

The specified server successfully connected to the database after previous attempts failed.

Action

No action is required.

ALR4112E The server *server name* at host *host name* failed to connect to the database.

Explanation

The database is not available. Restart the database if it is offline.

Action

Check that the database is operational and online, else contact IBM customer technical support.

Related reference

-  [Getting support](#)

ALR4109I Alias *zone alias* has been added to active zone *zone name* in fabric *fabric name* or *WWN* .

Explanation

The specified alias has been added to the specified active zone in the specified fabric.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4113E The IBM Spectrum Control server failed to connect to the database .

Explanation

An error occurred when IBM Spectrum Control tried to connect to the repository database.

Action

Verify that the database is operational and online.

ALR4110W Alias *alias name* has been removed from active zone *active zone name* in fabric *fabric name* .

Explanation

The specified alias is not available, because it has been removed from the active zone.

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4111I Alias *alias name* has been readdded to active zone *active zone name* in fabric *fabric name* .

Explanation

The specified alias has been readdded to the specified active zone in the specified fabric

Action

If this alert was unexpected, check the active zoneset definition of your fabric.

ALR4197W A new connection is detected.

Explanation

A new fabric connection is detected.

Action

No action is required.

ALR4198W The state for connection from *initial state* to *final state* has changed.

Explanation

A fabric connection is missing or rediscovered.

Action

If this alert was unexpected, check the connection between devices in the fabric.

ALR4199W The state for Fabric *fabric name* has changed.

Explanation

The specified fabric is missing or rediscovered.

Action

If this alert was unexpected, check if another fabric with the same set of switches has been discovered or gone missing. This would indicate that the principal switch changed on the fabric. Otherwise, check the status of the Data Sources which were managing the fabric.

ALR4224W The state has changed for Node *node name* .

Explanation

The state has changed for the specified node.

Action

No action is required.

ALR4225I Node *node name* has been discovered.

Explanation

The specified node has been discovered.

Action

No action is required.

ALR4226W Node *node name* has gone offline.

Explanation

The specified node is offline.

Action

No action is required.

ALR4227I Node *node name* has gone online.

Explanation

The specified node is online.

Action

No action is required.

ALR4241E Subsystem *storage subsystem name* has gone offline.

Explanation

The specified storage subsystem is offline.

Action

No action is required.

ALR4242I Subsystem *storage subsystem name* has gone online.

Explanation

The specified storage subsystem is online.

Action

No action is required.

ALR4243W The subsystem version has changed from *initial version* to *new version* on Subsystem *storage subsystem name* .

Explanation

The specified storage subsystem version has changed.

Action

No action is required.

ALR4244W The allocated capacity has changed from *initial capacity* to *new capacity* on Subsystem *storage subsystem name* .

Explanation

The specified storage subsystem allocated capacity has changed.

Action

No action is required.

ALR4245W The available capacity has changed from *initial capacity* to *new capacity* on Subsystem *storage subsystem name* .

Explanation

The specified storage subsystem available capacity has changed.

Action

No action is required.

ALR4246W Back-end capacity has changed from *initial capacity* to *new capacity* on Subsystem *storage subsystem name* .

Explanation

The specified storage subsystem back-end capacity has changed.

Action

No action is required.

ALR4247W Back-end controller *back-end controller name* for owning storage *subsystem name* has gone offline.

Explanation

The specified back-end controller on the specified subsystem is offline.

Action

No action is required.

ALR4248I Back-end controller *back-end controller name* for owning storage *subsystem name* has gone online.

Explanation

The specified back-end controller on the specified subsystem is online.

Action

No action is required.

ALR4249W Volume *volume name* on storage *subsystem name* has gone offline.

Explanation

The specified volume on the specified subsystem is offline.

Action

No action is required.

ALR4250I Volume *volume name* on storage *subsystem name* has gone online.

Explanation

The specified volume on the specified subsystem is online.

Action

No action is required.

ALR4251W The capacity has changed from *initial capacity* to *new capacity* for Volume *volume name* on Subsystem storage *subsystem name* .

Explanation

The capacity has changed for the specified volume on the specified subsystem .

Action

No action is required.

ALR4252W The state for Pool *pool name* on Subsystem storage *subsystem name* has changed to not detectable .

Explanation

The state for the specified pool on the specified subsystem has changed to not detectable.

Action

No action is required.

ALR4253I Pool *pool name* on Subsystem storage *subsystem name* has been discovered.

Explanation

The specified pool on the specified subsystem has been discovered.

Action

No action is required.

ALR4254W Pool *pool name* on Subsystem storage *subsystem name* has gone offline.

Explanation

The specified pool on the specified subsystem is offline.

Action

No action is required.

ALR4255I Pool *pool name* on Subsystem storage *subsystem name* has gone online.

Explanation

The specified pool on the specified subsystem is online.

Action

No action is required.

ALR4256W The pool capacity has changed from *initial capacity* to *new capacity* for Pool *pool name* on Subsystem storage *subsystem name* .

Explanation

The pool capacity has changed for the specified pool on the specified subsystem .

Action

No action is required.

ALR4257W The pool available space has changed from *initial capacity* to *new capacity* for Pool *pool name* on Subsystem storage *subsystem name* .

Explanation

The pool available space has changed for the specified pool on the specified subsystem .

Action

No action is required.

ALR4273E Server *server name* has gone offline.

Explanation

The specified server has gone offline .

Action

If this alert was unexpected, check the specified server.

ALR4274I Server *server name* has gone online.

Explanation

The specified server has gone online .

Action

No action is required.

ALR4278W The property for Subsystem storage *subsystem name* has changed.

Explanation

A port on the specified subsystem is newly discovered, missing, or rediscovered.

Action

No action is required.

ALR4300W The use count for Disk Drive *disk drive name* on Subsystem *subsystem name* has changed from *initial use count* to *final use count*.

Explanation

The specified disk drive's use count has changed as mentioned in the message description.

Action

No action is required.

ALR4301W Disk Drive *disk drive name* on Subsystem *subsystem name* has gone offline.

Explanation

The specified disk drive on the specified subsystem is offline.

Action

No action is required.

ALR4304W The state for Back-end Controller *back-end controller* for *subsystem* has changed from *initial state* to *final state* .

Explanation

The specified back-end controller is missing or has been rediscovered.

Action

No action is required.

ALR4305W The WWPN path count for Back-end Controller *back-end controller* for *system name* has changed from *initial state* to *final state* .

Explanation

The WWN path count for the specified Back-end Controller has changed.

Action

No action is required.

ALR4312W Notification has received from external device *device name*

Explanation

A notification was received from the specified external device.

Action

No action is required.

ALR4313W The endpoint version has changed from *initial state* to *final state* on Endpoint

Explanation

The specified endpoint version has been changed.

Action

No action is required.

ALR4314W Entity *entity name* has been discovered.

Explanation

A new entity (specified in the message) has been discovered.

Action

No action is required.

ALR4315I Hypervisor *hypervisor name* has been discovered.

Explanation

A new hypervisor has been discovered.

Action

No action is required.

ALR4316I Virtual machine *vm name* was added to hypervisor *hypervisor name* .

Explanation

The specified virtual machine has been added.

Action

No action is required.

ALR4317W Virtual machine *vm name* was removed from hypervisor *hypervisor name* .

Explanation

The specified virtual machine has been removed.

Action

No action is required.

ALR4318W New unmanaged hypervisor discovered.

Explanation

A new hypervisor has been discovered, it is not yet managed.

Action

No action is required.

ALR4319W Virtual machine added.

Explanation

A virtual machine was added.

Action

No action is required.

ALR4320W Virtual machine removed.

Explanation

A virtual machine was removed.

Action

No action is required.

ALR4321W Hypervisor *hypervisor* missing.

Explanation

The specified hypervisor is missing.

Action

No action is required.

ALR4322W Hypervisor missing.

Explanation

A hypervisor is missing.

Action

No action is required.

ALR4323I New disk *disk name* discovered for system *system name* .

Explanation

A new disk has been discovered.

Action

No action is required.

ALR4324W Disk *disk* not found for system *system* .

Explanation

The specified disk was not found for the mentioned system.

Action

No action is required. If the disk is expected to be found, please contact IBM customer technical support.

ALR4325W New volume *volume name* discovered for system *system name*

.

Explanation

A new volume has been discovered on the specified system.

Action

No action is required.

ALR4326W Volume *volume* not found for system *system*.

Explanation

The specified volume is not found on the system.

Action

No action is required. If the specified volume is expected to be found, please contact IBM customer technical support.

ALR4327W Zone Alias to Member Change

Explanation

A zone alias to member association is discovered, rediscovered, or is missing.

Action

No action is required.

ALR4328W The association between Zone Alias *zone alias* and Member *member* has changed.

Explanation

The specified zone alias does not include the specified member anymore.

Action

No action is required.

ALR4329I Zone member *zone member* has been added to zone alias *zone alias* in fabric *fabric* .

Explanation

The specified zone member has been added to the specified zone alias in the fabric.

Action

No action is required.

ALR4330W Zone member *zone member* has been removed from zone alias *zone alias* in fabric *fabric* .

Explanation

The specified zone member has been removed from the specified zone alias in the fabric.

Action

No action is required.

ALR4331I Zone member *zone member* has been readded to zone alias *zone alias* in fabric *fabric* .

Explanation

The specified zone member has been readded to the specified zone alias in the fabric.

Action

No action is required.

ALR4332W Storage Resource Agent Deployment Failed

Explanation

The deployment of the Storage Resource Agent has failed.

Action

Please check the logs and follow the SRA documentation related to the error code from the logs. Contact IBM customer technical support if this does not solve the problem.

ALR4333W Replication Session State Change alert received.

Explanation

The replication session state has changed.

Action

No action is required.

ALR4334W Replication Configuration Change alert received.

Explanation

The replication configuration has changed.

Action

No action is required.

ALR4335W Replication Suspending Event Notification alert received.

Explanation

Replication Suspending Event Notification alert.

Action

No action is required.

ALR4336W Replication Communication Failure alert received.

Explanation

The replication communication has failed.

Action

No action is required.

ALR4337W Replication Management Server State Change alert received

Explanation

The Replication Management server state has changed.

Action

No action is required.

ALR4338W Replication PPRC Path State Change alert received.

Explanation

Replication PPRC Path state has changed.

Action

No action is required.

ALR4339W The IBM Spectrum Control for Replication resource *resource nametriggered an alert with the following message:message text*

Explanation

Tivoli Storage Productivity Center for replication resource has triggered an alert with the specified message.

For more information about replication alerts, see IBM Spectrum Control Help -> Alerting -> Triggering conditions for alerts -> Triggering conditions for replication alerts in the online help.

Action

No action is required.

ALR4353W *number of affected datapaths* Data Paths from Host *host name* to Volume *volume name* on Subsystem *subsystem name* are no longer available.

Explanation

The specified number of datapaths from the specified host to the specified volume on the specified subsystem are no longer available.

Action

No action is required.

ALR4354I *number of affected datapaths* Data Paths from Host *host name* to Volume *volume name* on Subsystem *subsystem name* have been discovered..

Explanation

The specified number of datapaths from the specified host to the specified volume on the specified subsystem have been discovered.

Action

No action is required.

ALR4356E The mount state of specified file system changed to error level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSA0619C. This indicates that the system has detected a significant change in the use of a monitored resource. See the information center for the device for details.

Action

Correct the error or contact the device system administrator.

ALR4358I The mount state of specified file system changed to normal level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSA0621I. This indicates that the system has detected a significant change in the use of a monitored resource. See the information center for the device for details.

Action

No action is required.

ALR4359E The CPU usage reached the error level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSS1D0153C. This indicates that the CPU usage exceeded the error level. See the information center for the device for details.

Action

No action is required.

ALR4360W The CPU usage reached the warning level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF1D0152W. This indicates that the CPU usage exceeded the warning level. See the information center for the device for details.

Action

No action is required.

ALR4361I The CPU usage reached the normal level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF1D0151I. This indicates that the CPU usage has returned to a level below the warning threshold. See the information center for the device for details.

Action

No action is required.

ALR4362E The memory usage reached the error level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSS200825C. This indicates that the system memory usage exceeded the error level. See the information center for the device for details.

Action

Contact the device administrator.

ALR4364I The memory usage reached the normal level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF200828I. This indicates that the system memory usage has returned to a level below the warning threshold. See the information center for the device for details.

Action

No action is required.

ALR4365I The clustered CIFS is active.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF0010I. This indicates that the clustered CIFS is active. See the information center for the device for details.

Action

No action is required.

ALR4366W The clustered CIFS is disabled.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF0011W. This indicates that the clustered CIFS is disabled. See the information center for the device for details.

Action

No action is required.

ALR4367E The clustered CIFS status reached the error level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSF0011W. This indicates that the clustered CIFS status reached the error level. See the information center for the device for details.

Action

Contact the device system administrator.

ALR4368I The IBM Spectrum Scale is active.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSA0046I. This indicates that the IBM Spectrum Scale is active. See the information center for the device for details.

Action

No action is required.

ALR4369W The IBM Spectrum Scale status reached the warning level.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSA0050W. This indicates that the IBM Spectrum Scale status reached the warning level. See the information center for the device for details.

Action

No action is required.

ALR4370E The IBM Spectrum Scale is down.

Explanation

The IBM Spectrum Control server received an SNMP trap from the NAS device with the message EFSSA0047C. This indicates that the IBM Spectrum Scale is down. See the information center for the device for details.

Action

Contact the device administrator.

ALR4427I The file system *file system* has been detected on device *device display name*.

Explanation

The IBM Spectrum Control server found a filesystem on the device for the first time.

Action

No action required.

ALR4429I The capacity of file system *file system* has changed from *previous capacity* to *current capacity* on device *device NAS display name*.

Explanation

The capacity of the file system has changed.

Action

No action required.

ALR4433W The free space on file system *file system* has fallen below the threshold value of *threshold* on device *device nas display name*. The free space is *current free space value* or *relative free space value* of the file system capacity.

Explanation

A user defined file system threshold has been exceeded.

Action

No action required.

ALR4440W The state of the device type *node type node node name* changed from *old state* to *new state* on device *device display name*.

Explanation

The state of a node has changed.

Action

Contact the device administrator.

ALR4441I The state of the device type *node type node node name* changed from *old state* to *new state* on device *device display name*.

Explanation

The state of a node has changed.

Action

No action required.

ALR4442W The IBM Spectrum Scale status of *device type* node *node name* changed from *old state* to *new state* on device *display name*.

Explanation

The state of a node has changed.

Action

Contact the device administrator.

ALR4443I The IBM Spectrum Scale status of *device type* node *node name* changed from *old state* to *new state* on device *display name*.

Explanation

The state of a node has changed.

Action

No action required.

ALR4447I The fileset *fileset* was detected on *device type* device *device name*.

Explanation

The IBM Spectrum Control server found a fileset for the first time.

Action

No action required.

ALR4448I The fileset *fileset* was linked to *path* for *device type* device *device name*.

Explanation

The fileset was linked.

Action

No action required.

ALR4455I The fileset *fileset* was unlinked on *device type* device *device name*.

Explanation

The fileset was unlinked.

Action

No action required.

ALR4458W The number of free inodes on file system *path* has fallen below the threshold value of *threshold* on device *type device device name*. There are *current value* free inodes or *current value relative to maximum* of the maximum inodes.

Explanation

The file system is low on inodes.

Action

No action required.

ALR4460I Export *export name* detected on device *type device device name* with path *path*.

Explanation

A new export was detected for the network attached storage device.

Action

No action required.

ALR4461W The state of export *export name* changed from *previous state* to *current state* on device *type device device name*.

Explanation

The state of the export changed.

Action

No action required.

ALR4462W Export *export name* was reconfigured on device *type device device name*. Path changed from *previous path* to *current path*.

Explanation

The export was linked to a new path.

Action

No action required.

ALR4463W Export *export name* was reconfigured on device *type device device name*. Protocols changed from *previous list of protocols* to *current list of protocols*.

Explanation

The protocols configured for the share have been changed.

Action

No action required.

ALR4470W Export *export name* is missing from *device type* *device name*..

Explanation

An export that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4471I Export *export name* was rediscovered on *device type* *device name*..

Explanation

An export that was previously missing was found again by the current probe.

Action

No action required.

ALR4474W Fileset *fileset name* is missing from *device type* *device name*..

Explanation

A fileset that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4475I Fileset *fileset name* was rediscovered on *device type* *device name*..

Explanation

A fileset that was previously missing was found again by the current probe.

Action

No action required.

ALR4478W File system *File system name* is missing from *device type* *device name*..

Explanation

A file system that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4479I File system *File system name* was rediscovered on device *device device name*..

Explanation

A file system that was previously missing was found again by the current probe.

Action

No action required.

ALR4482W A *Quota type* *Quota limit type* quota was violated for the *path* file system on the device *device name device type* system. *Quota type resource name* is consuming usage and the *Quota limit type limit* is *threshold*.

Explanation

A quota violation was detected on the NAS system. Quotas define limits on the amount of storage and inodes that a user, group of users, or fileset can consume. Violations of quotas are detected when a probe schedule collects data about the NAS system using the `lsquota` command. By default, the NAS system will update these values daily. See the NAS documentation for details.

Action

Reduce the file system use or contact the device administrator to increase the quota limits.

ALR4496I New quota detected on file system *path* of *Device type* device *Device name*.

Explanation

A quota that was defined on the NAS has been detected for the first time by the IBM Spectrum Control server.

Action

No action required.

ALR4385E The status of NSD *NSD name* reached error level.

Explanation

NSD usage has reached an error level.

Action

Contact the device administrator.

ALR4386W The status of NSD *NSD name* reached warning level.

Explanation

NSD usage has reached a warning level.

Action

Contact the device administrator.

ALR4387I The status of NSD *NSD name* was set back to normal level.

Explanation

NSD usage was set back to normal level.

Action

No action required.

ALR4503I New NSD *NSD name* has been detected on device type *device* device display name.

Explanation

The IBM Spectrum Control server found an NSD on the device for the first time.

Action

No action required.

ALR4505W NSD *NSD name* is missing from device type *device* device name.

Explanation

An NSD that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4507W The state of NSD *NSD name* changed from *previous state* to *current state* on device type *device* device name.

Explanation

The state of the NSD has changed.

Action

No action required.

ALR4511E Alert condition for nodes has been selected. Select only nodes.

Explanation

When an alert condition for nodes is selected, you need to specify nodes.

Action

Specify one of more nodes.

ALR4512E Alert condition for clusters has been selected. Select only clusters.

Explanation

When an alert condition for clusters is selected, you need to specify clusters.

Action

Specify one of more clusters.

ALR4513E Alert condition for NSD has been selected. Select only NSD.

Explanation

When an alert condition for NSDs is selected, you need to specify NSDs.

Action

Specify one of more NSDs.

ALR4514E Alert condition for File set has been selected. Select only File set.

Explanation

When an alert condition for File sets is selected, you need to specify File sets.

Action

Specify one of more File sets.

ALR1022M A new unmanaged server or cluster discovered.

Explanation

A new unmanaged server or cluster discovered.

Action

No action required.

ALR1294W The server or cluster has gone offline.

Explanation

The server or cluster has gone offline.

Action

Contact the device administrator.

ALR1295W The server or cluster has gone online.

Explanation

The server or cluster has gone online.

Action

No action required.

ALR1296W The server or cluster property has changed.

Explanation

The server or cluster property has changed.

Action

Contact the device administrator.

ALR1245W A node state has changed.

Explanation

A node state has changed.

Action

Contact the device administrator.

ALR1246W A node was discovered.

Explanation

A node was discovered.

Action

No action required.

ALR4528I Cluster was discovered.

Explanation

The IBM Spectrum Control server found a cluster for the first time.

Action

No action required.

ALR4529I Cluster was removed.

Explanation

A cluster that was previously found during a probe was not found in the current probe.

Action

Contact the device administrator.

ALR4530I Cluster was rediscovered.

Explanation

A cluster that was previously missing was found again by the current probe.

Action

No action required.

ALR0078W =Performance monitor for device *value* failed to collect new data using data source *value*.

Explanation

The performance monitor for the specified device encountered an error and could not continue collecting performance data using specified data source

Action

Check to ensure that the data source is still operational, and restart it if necessary. Check the performance monitor job log for additional information.

ALR4391I Node *node name* is selected as cache gateway node.

Explanation

A node is selected as cache gateway node.

Action

No action required.

ALR4392I Node *node name* is unselected as cache gateway node.

Explanation

A node is unselected as cache gateway node.

Action

No action required.

ALR4393I Home system *home system name* detected on device *type* device *device name* with path *path*.

Explanation

A new home system was detected for the network attached storage device.

Action

No action required.

ALR4394I Home system has been removed from fileset *fileset name* on device *type* device *device name*.

Explanation

A home system was removed for the network attached storage device.

Action

No action required.

ALR4395W Home system *home system name* is missing from device type *device name*.

Explanation

A home system that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4396I Home system *home system name* was rediscovered on device type *device name*..

Explanation

A home system that was previously missing was found again by the current probe.

Action

No action required.

ALR4397I Cache fileset *cache fileset name* detected on device type *device name*.

Explanation

A new cache fileset was detected for the network attached storage device.

Action

No action required.

ALR4398W Cache fileset *cache fileset name* is missing from device type *device name*.

Explanation

A cache fileset that was previously found during a probe was not found in the current probe.

Action

No action required.

ALR4399I Cache fileset *cache fileset name* was rediscovered on device type *device name*.

Explanation

A cache fileset that was previously missing was found again by the current probe.

Action

No action required.

ALR4400I Cache fileset name has changed from *cache fileset name* to *cache fileset name* on device type device device name.

Explanation

A cache fileset name has changed.

Action

No action required.

ALR4401I Cache fileset *cache fileset name* state has changed from *old value* to *new value* on device type device device name.

Explanation

A cache fileset state has changed.

Action

No action required.

ALR4402I Cache fileset *cache fileset name* mode has changed from *old value* to *new value* on device type device device name.

Explanation

A cache fileset mode has changed.

Action

No action required.

ALR4403I Cache client *cluster name* is added to home system *home system name* on device type device device name.

Explanation

A cache client is added to a home system.

Action

No action required.

ALR4404I Cache client *cluster name* has been removed from home system *home system name* on device type device device name.

Explanation

A cache client is removed from a home system.

Action

No action required.

ALR4541E The available space is too low for pool *pool name* on storage system *storage system name*. The measured value *pool available space* violates the critical boundary of *user defined threshold value*.

Explanation

The thin provisioned pool available space is lower than a user defined critical boundary.

Action

No action required.

ALR4542W The available space is too low for pool *pool name* on storage system *storage system name*. The measured value *pool available space* violates the warning boundary of *user defined threshold value*.

Explanation

The thin provisioned pool available space is lower than a user defined warning boundary.

Action

No action required.

ALR4543E The allocation is too high for pool *pool name* on storage system *storage system name*. The measured value *pool virtual allocation* violates the critical boundary of *user defined threshold value*.

Explanation

The thin provisioned pool virtual allocation is higher than a user defined critical boundary.

Action

No action required.

ALR4544W The allocation is too high for pool *pool name* on storage system *storage system name*. The measured value *pool virtual allocation* violates the warning boundary of *user defined threshold value*.

Explanation

The thin provisioned pool virtual allocation is higher than a user defined warning boundary.

Action

No action required.

ALR4545E The shortfall percentage is too high for pool *pool name* on storage system *storage system name*. The measured value *pool shortfall percentage* violates the critical boundary of user defined threshold value.

Explanation

The thin provisioned pool shortfall percentage is higher than a user defined critical boundary.

Action

No action required.

ALR4546W The shortfall percentage is too high for pool *pool name* on storage system *storage system name*. The measured value *pool shortfall percentage* violates the warning boundary of user defined threshold value.

Explanation

The thin provisioned pool shortfall percentage is higher than a user defined warning boundary.

Action

No action required.

ALR4547I VMWare Cluster *cluster name* discovered on hypervisor *hypervisor name*.

Explanation

A VMware cluster discovery occurs when you add a vCenter as a data source, and one or more of the discovered hypervisors are members of a cluster. If a hypervisor that was added through the vCenter has become a member of a cluster after initial discovery through the vCenter, the cluster is discovered during the next data collection.

Action

No action required.

ALR4548W VMWare Cluster *cluster name* removed from hypervisor *hypervisor name*.

Explanation

A hypervisor that was added through the vCenter was removed as a member of a cluster after initial discovery through the vCenter, and was not added to another cluster.

Action

Check the VMWare environment to ensure that it was correct to remove the hypervisor from the cluster.

ALR4549I New cluster hypervisor relationship discovered.

Explanation

A new cluster hypervisor relationship has been discovered.

Action

No action required.

ALR4550W Cluster hypervisor relationship removed.

Explanation

A cluster hypervisor relationship has been removed.

Action

No action required.

ALR4551I Hypervisor *hypervisor name* was moved from VMWare Cluster *old cluster name* to VMWare Cluster *new cluster name*.

Explanation

A hypervisor that was added through the vCenter was removed as a member of a cluster after initial discovery through the vCenter, and has been added to another cluster.

Action

No action required.

ALR4552I Cluster hypervisor relationship moved.

Explanation

A cluster hypervisor relationship has been moved.

Action

No action required.

ALR4600I Fabric Name *fabric WWN* changed to *fabric WWN* .

Explanation

The specified fabric has changed WWN, due to Principal Switch change.

Action

No action is required.

ALR1349I A new path *path name* was discovered for disk *disk name* on host *host name*.

Explanation

A new access path was discovered for the specified disk.

Action

No action required.

ALR1350W The path *path name* was not found for disk *disk name* on host *host name*.

Explanation

An access path for a disk that was discovered previously can no longer be found.

Action

No action required.

ALR1351W The path *path name* for disk *disk name* on host *host name* is disconnected.

Explanation

The path is disconnected. This change might or might not affect the availability of the disk because there might be more than one path available.

Action

Check the configuration. Ensure that the volume associated with the path is still assigned to the host. Ensure that the SAN is still zoned correctly between the storage system and the host ports.

ALR4604I The *home system* home system was linked to *path* on resource type resource *resource name*.

Explanation

The home system fileset was linked to a path.

Action

This message is for informational purposes only. No action is required.

ALR4605I The *home system* home system was unlinked from a path on resource type resource *resource name*.

Explanation

The home system fileset was unlinked from a path.

Action

This message is for informational purposes only. No action is required.

ALR1352E The status of disk *disk name* on server *server name* has degraded to Error from *former status*.

Explanation

At least one permanent disk error was collected from the operating system logs on the specified server, or all paths that are associated with the specified disk are disconnected.

Action

Check the operating system logs on the specified server for the following types of disk error: SC_DISK_ERR1, SC_DISK_ERR2, SC_DISK_ERR3, and SC_DISK_ERR6. Check the configuration of the disk. Ensure that at least one path that is associated with the specified disk is connected.

ALR1353W The status of disk *disk name* on server *server name* has degraded to Warning from *former status*.

Explanation

At least one temporary disk error was collected from the operating system logs on the specified server, or some paths that are associated with the specified disk are disconnected.

Action

Check the operating system logs on the specified server for the SC_DISK_ERR4 disk error. Check the configuration of the disk. Ensure that all paths that are associated with the specified disk are connected.

ALR1354I The status of disk *disk name* on server *server name* has improved to Normal from *former status*.

Explanation

No errors were collected from the operating system logs on the specified server. All paths that are associated with the specified disk are connected.

Action

No action is required.

ALR4625I New *entity type*, *entity name*, added to system *type system name* .

Explanation

New entity added.

Action

No action is required.

BPCCA - Data collector installation messages

- [BPCCA0001I](#) The data collector started, connected to the storage management service, and is ready to process requests from the storage management service.
- [BPCCA0002E](#) The data collector failed to connect to the storage management service at server_url.
- [BPCCA0003E](#) The data collector started but detected a problem with the directory directory_name and must stop.
- [BPCCA0004E](#) The data collector cannot run because it is not configured correctly.
- [BPCCA0005E](#) The data collector failed to connect to the storage management service at server_url because the host name could not be resolved.
- [BPCCA0006E](#) The data collector failed to connect to the storage management service at server_url because of an unknown error.
- [BPCCA0007E](#) The data collector failed to connect to a service from the storage management system.
- [BPCCA0008E](#) The data collector failed to connect to the storage management service because of invalid credentials.
- [BPCCA0009I](#) The data collector connected to the storage management service. The data collector had failed to connect since date_and_time.
- [BPCCA0010E](#) The data collector in the directory_name directory of the host host_name was running and an attempt was made to start a second instance of the same data collector. The second instance of the data collector stopped.
- [BPCCA0011I](#) The data collector stopped because a user requested it to shut down.
- [BPCCA0012I](#) The data collector stopped to enable the installation of an upgraded version of the data collector.
- [BPCCA0013E](#) The storage management service did not allow the data collector to connect because another data collector was already connected to the service.
- [BPCCA0100I](#) The updateCollector utility started.
- [BPCCA0101E](#) The collector directory was not specified in the collectorDirectory.properties file.
- [BPCCA0102E](#) The collector directory directory_name that was specified in the collectorDirectory.properties file is invalid. The collector directory is the directory to which the updateCollector utility must copy the upgrade image files.
- [BPCCA0103E](#) The collector directory directory_name that was specified in the collectorDirectory.properties file cannot be used as the collector directory.
- [BPCCA0104E](#) The updateCollector utility started but there was a problem with the upgrade image directory current_directory.
- [BPCCA0105E](#) The collector directory directory_name that was specified in the collectorDirectory.properties file is a subdirectory of the upgrade image directory upgrade_image_directory_name.
- [BPCCA0106E](#) Cannot upgrade the data collector in the collector_directory_directory because the directory contains the following locked files: locked_files_list

- [BPCCA0107I](#) The content of the `directory_collector_directory` will be deleted and replaced with subdirectories and files from the `upgrade_image_directory`. Some configuration files, the `log_directory`, and the contents of the `log_directory` will not be deleted.
- [BPCCA0108E](#) The data collector service cannot be uninstalled from the operating system. The upgrade process cannot be completed.
- [BPCCA0109E](#) The `updateCollector` utility could not upgrade the data collector. The data collector service is now in an inconsistent state.
- [BPCCA0110E](#) The contents of the `collector_directory` could not be deleted. The upgrade process cannot be completed. The data collector might be in an inconsistent state.
- [BPCCA0111E](#) The files and directories of the data collector from the `directory_upgrade_image_directory` could not be copied into the `directory_collector_directory`. The upgrade process cannot be continued. The data collector might be in an inconsistent state.
- [BPCCA0112I](#) The data collector in the `directory_collector_directory` was upgraded successfully to version `downloaded_version`.
- [BPCCA0113E](#) The data collector in the `directory_collector_directory` could not be upgraded.
- [BPCCA0114I](#) The data collector was upgraded to the new version and will start automatically.
- [BPCCA0115I](#) The attempt to upgrade the data collector failed. The existing data collector will start automatically.
- [BPCCA0116E](#) The attempt to upgrade the data collector failed. You must download and install the latest version of the data collector.
- [BPCCA0117E](#) The upgraded data collector could not be installed as a service on the operating system. You must install the new data collector service manually.
- [BPCCA0118I](#) The data collector was upgraded to the new version and started successfully.
- [BPCCA0119I](#) The data collector could not be upgraded, but was not modified. The existing data collector was restarted successfully.
- [BPCCA0120E](#) The upgraded data collector did not start.
- [BPCCA0121E](#) The existing data collector did not restart.
- [BPCCA0122E](#) The data collector cannot authenticate to the HTTPS proxy server `proxy_server_hostname`.

BPCCA0001I The data collector started, connected to the storage management service, and is ready to process requests from the storage management service.

Explanation

The data collector is running and ready to process requests from the storage management service.

Action

No action is required.

BPCCA0002E The data collector failed to connect to the storage management service at `server_url`.

Explanation

The data collector failed to connect to the storage management service. This condition might occur if you do not have a network connection to the service or if a firewall is preventing network access to the service. The condition might also occur if the service is unavailable.

Action

Verify that you have a network connection to the server. Verify that a firewall is not preventing network access to product services and agents. Verify that the storage management service is available.

BPCCA0003E The data collector started but detected a problem with the directory `directory_name` and must stop.

Explanation

The data collector started in the directory where the downloaded collector image was extracted. However, the structure of the directory is damaged. For example, some of the required subdirectories such as `bin`, `jre`, or `lib` might have been deleted.

Action

Download and extract the data collector image again.

BPCCA0004E The data collector cannot run because it is not configured correctly.

Explanation

The data collector is not configured correctly. The configuration file was not loaded, or at least one required configuration parameter was missing or had an invalid value.

Action

Check the trace_0.log file in the log directory of the data collector. Check the error message text that is associated with the InitializationException message. Check the other log files to try to determine the problem.

BPCCA0005E The data collector failed to connect to the storage management service at `server_url` because the host name could not be resolved.

Explanation

The host name could not be resolved by a name server.

Action

Verify that the host name for the storage management service can be resolved from the computer where the data collector is running. Verify that the name server is configured correctly.

BPCCA0006E The data collector failed to connect to the storage management service at `server_url` because of an unknown error.

Explanation

An error occurred while connecting to the storage management service, but the root cause cannot be determined.

Action

Verify that the local area network is available and that a firewall is not preventing network access. If you still cannot resolve the error, go to the IBM Support page (<https://www.ibm.com/mysupport/>) where you can chat with an expert, browse troubleshooting topics and forums, open support cases, and access IBM Documentation.

BPCCA0007E The data collector failed to connect to a service from the storage management system.

Explanation

A service from the storage management system failed to start or encountered a problem and stopped.

Action

Go to the IBM Support page (<https://www.ibm.com/mysupport/>) where you can chat with an expert, browse troubleshooting topics and forums, open support cases, and access IBM Documentation.

BPCCA0008E The data collector failed to connect to the storage management service because of invalid credentials.

Explanation

The credentials of the data collector were not authenticated by the storage management service.

Action

Verify that the data collector has the correct credentials. If you still cannot resolve the error, go to the IBM Support page (<https://www.ibm.com/mysupport/>) where you can chat with an expert, browse troubleshooting topics and forums, open support cases, and access IBM Documentation.

BPCCA0009I The data collector connected to the storage management service. The data collector had failed to connect since *date_and_time*.

Explanation

The data collector was able to connect to the storage management service, however it previously encountered connection errors.

Action

No action is required.

BPCCA0010E The data collector in the *directory_name* directory of the host *host_name* was running and an attempt was made to start a second instance of the same data collector. The second instance of the data collector stopped.

Explanation

Only one instance of the data collector can run in a directory at a time.

Action

No action is required because the second instance of the data collector stopped.

BPCCA0011I The data collector stopped because a user requested it to shut down.

Explanation

No further information is available.

Action

BPCCA0012I The data collector stopped to enable the installation of an upgraded version of the data collector.

Explanation

No further information is available.

Action

BPCCA0013E The storage management service did not allow the data collector to connect because another data collector was already connected to the service.

Explanation

Multiple data collectors cannot connect simultaneously to the same storage management service.

Action

If you want to use a new data collector instead of the data collector that is already connected, stop the data collector that is already connected. The new data collector will connect to the storage management service.

BPCCA0100I The `updateCollector` utility started.

Explanation

The data collector downloaded a new version of the data collector into an upgrade image directory. The `updateCollector` utility will update the data collector with the version from the upgrade image directory, and then restart the data collector.

Action

No action is required.

BPCCA0101E The collector directory was not specified in the `collectorDirectory.properties` file.

Explanation

The collector directory is the directory to which the `updateCollector` utility must copy the upgrade image files. The collector directory is specified in the `collectorDirectory.properties` file.

Action

Verify that the collector directory is specified in the `collectorDirectory.properties` file. Verify that the `updateCollector` utility was started by the data collector and not by any other means.

BPCCA0102E The collector directory `directory_name` that was specified in the `collectorDirectory.properties` file is invalid. The collector directory is the directory to which the `updateCollector` utility must copy the upgrade image files.

Explanation

The collector directory is the directory to which the `updateCollector` utility must copy the upgrade image files. The collector directory is specified in the `collectorDirectory.properties` file. The collector directory must be a directory that already exists and must not be the root directory.

Action

Verify that the directory that is specified in the `collectorDirectory.properties` file exists and is not the root directory.

BPCCA0103E The collector directory `directory_name` that was specified in the `collectorDirectory.properties` file cannot be used as the collector directory.

Explanation

The collector directory is the directory to which the `updateCollector` utility must copy the upgrade image files. The collector directory is specified in the `collectorDirectory.properties` file. The collector directory cannot be a directory that is reserved for use by the operating system.

Action

Verify that the directory that is specified in the `collectorDirectory.properties` file is not reserved for use by the operating system.

BPCCA0104E The `updateCollector` utility started but there was a problem with the upgrade image directory `current_directory`.

Explanation

The updateCollector utility must be started from the upgrade image directory, that is, the directory to which the upgraded collector was downloaded.

Action

Verify that the updateCollector utility started from the upgrade image directory.

BPCCA0105E The collector directory *directory_name* that was specified in the collectorDirectory.properties file is a subdirectory of the upgrade image directory *upgrade_image_directory_name*.

Explanation

The collector directory is the directory to which the updateCollector utility must copy the upgrade image files. The collector directory is specified in the collectorDirectory.properties file. The collector directory cannot be a subdirectory of the upgrade image directory.

Action

Verify that the directory that is specified in the collectorDirectory.properties file is not a subdirectory of the upgrade image directory.

BPCCA0106E Cannot upgrade the data collector in the *collector_directory* directory because the directory contains the following locked files: *locked_files_list*

Explanation

The directory for the data collector that you want to upgrade contains some locked files. The files might be in use by other processes. The files cannot be deleted or overwritten. The data collector cannot be upgraded. The data collector, which has not been upgraded, will restart automatically.

Action

After the data collector restarts, try to upgrade the collector again from a browser.

BPCCA0107I The content of the directory *collector_directory* will be deleted and replaced with subdirectories and files from the *upgrade_image_directory* directory. Some configuration files, the log directory, and the contents of the log directory will not be deleted.

Explanation

No further information is available.

Action

No action is required.

BPCCA0108E The data collector service cannot be uninstalled from the operating system. The upgrade process cannot be completed.

Explanation

The updateCollector utility cannot uninstall the data collector service from the operating system.

Action

Run the `uninstallDataCollectorService.sh` script from the collector directory to uninstall the data collector service. Delete the contents of the collector directory, then download and install the latest version of the data collector.

BPCCA0109E The `updateCollector` utility could not upgrade the data collector. The data collector service is now in an inconsistent state.

Explanation

The `updateCollector` utility could not uninstall the data collector service from the operating system.

Action

If the collector directory has not been deleted, run the `uninstallDataCollectorService.bat` script. Alternatively, use a command window to run the `uninstallDataCollectorService.bat` script from the upgrade image directory. Use the absolute path to the collector directory with the `uninstallDataCollectorService.bat` command from the upgrade image directory.

If you still cannot uninstall the data collector service, get the name of the service from the Services tab on the Windows Task Manager. Use the Windows Server "sc" command with the name of the data collector service to delete the service. For example, run the following command:

```
sc delete datacollector1
```

Delete the contents of the collector directory, then download and install the latest version of the data collector.

BPCCA0110E The contents of the `collector_directory` directory could not be deleted. The upgrade process cannot be completed. The data collector might be in an inconsistent state.

Explanation

No further information is available.

Action

Delete the data collector files from the collector directory, then download and install the latest version of the data collector.

BPCCA0111E The files and directories of the data collector from the directory `upgrade_image_directory` could not be copied into the directory `collector_directory`. The upgrade process cannot be continued. The data collector might be in an inconsistent state.

Explanation

No further information is available.

Action

Delete the data collector files from the collector directory, then download and install the latest version of the data collector.

BPCCA0112I The data collector in the directory `collector_directory` was upgraded successfully to version `downloaded_version`.

Explanation

No further information is available.

Action

No action is required.

BPCCA0113E The data collector in the directory *collector_directory* could not be upgraded.

Explanation

The log files in the log directory of the data collector might contain information about why the upgrade failed.

Action

Check the message.log and the trace_0.log files in the log directory of the data collector. The existing data collector will restart automatically. If the existing data collector does not restart, you must download and install the latest version of the data collector.

BPCCA0114I The data collector was upgraded to the new version and will start automatically.

Explanation

No further information is available.

Action

No action is required.

BPCCA0115I The attempt to upgrade the data collector failed. The existing data collector will start automatically.

Explanation

No further information is available.

Action

After the existing data collector is restarted, try again to download and install the latest version of the data collector.

BPCCA0116E The attempt to upgrade the data collector failed. You must download and install the latest version of the data collector.

Explanation

The attempt to upgrade the data collector failed. It is likely that the data collector is now in an inconsistent state.

Action

Delete the existing collector directory and its contents, then download and install the latest version of the data collector.

BPCCA0117E The upgraded data collector could not be installed as a service on the operating system. You must install the new data collector service manually.

Explanation

The data collector was upgraded to the new version but the upgraded data collector could not be installed as a service in the operating system. You must install the new data collector service manually.

Action

Log into the computer that the data collector and its file are on. On a UNIX system, run `installDataCollectorService.sh` as a root user. On a Windows system, run `installDataCollectorService.bat` as a Windows administrator. If other security restrictions are enabled, you might need to use the "Run as administrator" option to run `installDataCollectorService.bat`.

BPCCA0118I The data collector was upgraded to the new version and started successfully.

Explanation

The data collector was upgraded to the new version that was downloaded. The upgraded data collector started successfully.

Action

No action is required.

BPCCA0119I The data collector could not be upgraded, but was not modified. The existing data collector was restarted successfully.

Explanation

No further information is available.

Action

Try again to download and install the latest version of the data collector.

BPCCA0120E The upgraded data collector did not start.

Explanation

The data collector was upgraded, but did not start. You must start the data collector from the operating system.

Action

Log into the computer that the data collector and its file are on. On a UNIX system, run the `dataCollector.sh` script to start the data collector. On a Windows system, start the service from the Services tab on the Windows Task Manager.

BPCCA0121E The existing data collector did not restart.

Explanation

The data collector was not upgraded. The existing data collector was not modified. The `updateCollector` utility tried to restart the existing data collector, but failed.

Action

To restart the data collector, log into the computer that the data collector and its file are on. On a UNIX system, run the `dataCollector.sh` script to start the data collector. On a Windows system, start the service from the Services tab on the Windows Task Manager.

Try again to download and install the latest version of the data collector.

BPCCA0122E The data collector cannot authenticate to the HTTPS proxy server `proxy_server_hostname`.

Explanation

The data collector cannot connect to the storage management service.

Action

The authentication credentials for the proxy server might have changed. Verify that the data collector has the correct credentials for HTTPS proxy server.

Verify that the data collector is configured correctly to access the HTTPS proxy server.

- [BPCIN0070E Errors occurred during the configuration of the IBM Spectrum Control data model in Tivoli Common Reporting. Review the log files for more information.](#)
- [BPCIN0071E An error occurred because the installation program could not find the Db2 DFTDBPATH variable. For more information, go to the IBM Knowledge Center and search for the message code.](#)
- [BPCIN0072E The validation for user name userID has failed. Check to see if this user name exists or if Db2 is running.](#)

- [BPCIN0074E](#) The port range validation failed because the port value is not numeric.
- [BPCIN0075E](#) An invalid GUID 0xFFFFFFFFFFFFFFFF was found. Update or uninstall the GUID.
- [BPCIN0076E](#) IBM Spectrum Control could not read the GUID. See the GUID installation log for an explanation of the error.
- [BPCIN0077E](#) The name specified for the database is not valid because it contains a space or is blank.
- [BPCIN0078E](#) The database name database_name is not valid. The name can only contain the following characters: a-z, A-Z or 0-9.
- [BPCIN0079E](#) The first character or characters in the database name are not valid. The name must not begin with a number or the letters: SYS, DBM, or IBM.
- [BPCIN0080E](#) The database name specified is not valid because an existing database has the same name: database_name.
- [BPCIN0081E](#) The database name database_name is too long. The name can be 1 - 8 characters in length with no spaces.
- [BPCIN0082E](#) The specified host name or IP address is not a remote host. Enter a remote host name or IP address.
- [BPCIN0083E](#) The server could not connect to the remote database. Verify that the port is correct and that the database is running on the remote server. Also verify that the internet protocol connection between the server and remote database is compatible.
- [BPCIN0084E](#) The database name is not valid because there is no database on the specified server with this name.
- [BPCIN0085E](#) The installation program was unable to connect to the remote database. Check the remote server to verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome>.
- [BPCIN0086E](#) The connection to the remote database failed because the user name or password is not valid.
- [BPCIN0087E](#) The remote host name or IP address is not valid.
- [BPCIN0088E](#) The database repository was not found on the remote server.
- [BPCIN0089E](#) The version "retrivedVersion" of the remote database repository is not at the correct level. Upgrade the remote database repository to version "requiredVersion", then upgrade the remaining components.
- [BPCIN0090E](#) The name specified for the database is not valid because it contains a space.
- [BPCIN0091E](#) The file path file_path specified is not an absolute path or is not a directory or the partition does not exists.
- [BPCIN0092E](#) The first directory directory_name specified is not valid.
- [BPCIN0093E](#) The path string path_string is too long. The path string cannot be longer than 242 bytes.
- [BPCIN0094E](#) The user name user_name does not have write permission on the specified database path: database_path.
- [BPCIN0095E](#) The user name user_name does not have write permission on the specified log location: log_location.
- [BPCIN0096E](#) The database path cannot be blank. Enter a valid database path.
- [BPCIN0097E](#) The log location cannot be blank. Enter a valid log location.
- [BPCIN0098E](#) Enter 10 or fewer paths.
- [BPCIN0099E](#) You have entered pathNumber directories. A maximum of 10 directories can be specified.
- [BPCIN0100W](#) The database log files and database are in the same location. Click Yes to change the database log files or database location. Click No to ignore this message.
- [BPCIN0101E](#) The location "location" that was specified contains Db2 logs or log files.
- [BPCIN0102E](#) The Db2 profile for the "db2_instance" instance was not run before installing IBM Spectrum Control.
- [BPCIN0103E](#) The user name userID is not in the system group adminGroup.
- [BPCIN0104I](#) Resuming a failed install and installing the remaining components.
- [BPCIN0105E](#) A reboot must be done before continuing with the installation.
- [BPCIN0106E](#) There are invalid header files in the installation images. You may might be using the AIX tar program instead of the GNU tar program to extract files from the installation images. For more information, see IBM Knowledge Center and search by the error message code.
- [BPCIN0107E](#) The database path exists in the database path list. You must specify a unique database path.
- [BPCIN0108E](#) An error occurred during the upgrade of the component. Review the log files in the following directory for an explanation of the error: location.
- [BPCIN0109E](#) An unexpected error occurred. IBM Spectrum Control cannot resolve this error. For more information, review the log files and go to the IBM Knowledge Center.
- [BPCIN0112I](#) Upgrading the components:upgrade_components.
- [BPCIN0116I](#) The system is upgrading the component component.
- [BPCIN0117I](#) The system completed the upgrade of the component component.
- [BPCIN0120E](#) The validation of user name and password could not be completed
- [BPCIN0121E](#) The installation type entered is not supported.
- [BPCIN0122E](#) The TPCCommon.dll or libTPCCommon.so library could not be found or loaded.
- [BPCIN0123E](#) The user has no administrative rights to install or uninstall IBM Spectrum Control.
- [BPCIN0124E](#) The operating system cannot find the Db2 Service name.
- [BPCIN0125E](#) The installation program cannot find the Db2 instance name. Check the Db2 instance configuration.
- [BPCIN0126E](#) Unable to find Db2 installation path. Check your Db2 configuration.
- [BPCIN0127E](#) The service name configuration parameter cannot be queried from the Db2 Database Manager.
- [BPCIN0129E](#) The version that is installed cannot be upgraded because it does not meet the minimum build version for the database repository. The minimum build version supported is build_version.
- [BPCIN0130E](#) The database administrator password in IBM Spectrum Control does not match the database administrator password for Db2. Run the changepasswords tool to update the database administrator password.
- [BPCIN0131E](#) An invalid host name or IP address was specified for the Device Server.
- [BPCIN0132E](#) The Device Server is not running at the specified host address or port: host_address.port port.
- [BPCIN0134E](#) The installation program could not stop the . Please manually stop the .
- [BPCIN0135E](#) Tivoli Storage Productivity Center version is installed. Before you can upgrade to version 5, you must upgrade Tivoli Storage Productivity Center to version 4.
- [BPCIN0136E](#) The version "retrivedVersion" of the remote database repository is not at the correct build level. Upgrade the remote database repository to the correct build level, then upgrade the remaining version "requiredVersion" components.
- [BPCIN0137E](#) The version "retrivedVersion" of the remote database repository is not at the correct build level. Ensure that the installation image for the remaining version "requiredVersion" components is at the same build level as the remote database repository, then upgrade the remaining components.
- [BPCIN0138E](#) The common user name password does not match the password for the existing user name user_name on the system. Run the changepasswords tool to change the common user name password for IBM Spectrum Control.
- [BPCIN0139I](#) The User Migration Tool completed successfully.
- [BPCIN0140E](#) The User Migration Tool could not be started. Start the User Migration Tool from the graphical user interface after the upgrade is finished.
- [BPCIN0143E](#) Errors occurred during the upgrade of the GUI. Review the log files for more information.
- [BPCIN0146E](#) The installation language specified is not a supported language.
- [BPCIN0148E](#) IBM Spectrum Control cannot be installed, because the physical memory size on this computer is too small. The minimum memory size is minMemoryProduction. Increase the physical memory on this computer and run the installation program again.
- [BPCIN0149W](#) The physical memory size on this computer is below the minimum requirements that are specified for a production system. The minimum memory size for a production system is minMemoryProduction. You must increase the physical memory on this computer and run the installation program again. If you install IBM Spectrum Control with lower memory, you can only use it in an evaluation environment.
- [BPCIN0150E](#) The installation program cannot determine the amount of physical memory on the system.
- [BPCIN0151E](#) You tried to install IBM Spectrum Control on an unsupported operating system. For more information on the supported operating systems, go to following link.

- [BPCIN0152E IBM Spectrum Control cannot determine if the operating system is supported.](#)
- [BPCIN0153E The installation program could not rename the jre folder. To continue the installation, stop all Java processes that access the jre directory: jre_folder.](#)

BPCIN0001I The system is installing IBM Spectrum Control.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0002I The system completed the installation of IBM Spectrum Control.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0003E The installation program could not find the file *file_name* in the installation image. For more information, go to the IBM Knowledge Center and search on the message code.

Explanation

The installation program could not find the file or files in the installation image. The file or files were not found because of one of the following reasons:

- An error occurred during the installation image download.
- A file was deleted from the installation image.
- An error occurred using a network drive.

Action

If the installation image was downloaded, verify that the installation image was downloaded correctly.

Correct the problem and click Resume to continue the installation.

If you cannot resolve the problem, contact IBM Software Support.

BPCIN0004E An error occurred during the installation of the *component_name* component. Review the log files in the *log_file_directory_name* directory for additional information.

Explanation

The specified IBM Spectrum Control component was not installed.

Action

Review the log files in one of the following directories:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Resolve the issue and run the installation program again. If you cannot resolve the problem, contact IBM Software Support.

BPCIN0005E Invalid characters "*characters*" were found in the installation path "*path*".

Explanation

The path that was specified for the installation contains characters that are not valid file-name characters.

The following characters are not valid in the installation path name:

- Parentheses ()
- Semicolon ;
- Question mark ?
- Exclamation point !
- Asterisk *
- Dollar sign \$
- Vertical bar |
- Double quotation mark "
- Less than <
- Greater than >
- Ampersand &

Action

Remove the special characters from the installation path name.

BPCIN0006E The location "*location*" that was specified for the installation is not empty. It might contain hidden items.

Explanation

The directory that was specified as the installation path contains files or folders.

Action

Select a directory that does not contain files or folders.

BPCIN0007E Directory *directory* is not writable.

Explanation

The directory that was selected for the installation is a read-only directory.

Action

Select a directory that is writable.

BPCIN0008E The installation location specified is blank. Enter an installation location.

Explanation

You must specify an installation location.

Action

Enter a valid path for the installation.

BPCIN0009E The host name or IP address is not valid for *name_with_spaces*.

Explanation

The host name or IP address that was specified is not valid because it is empty or contains one or more spaces.

Action

Enter a valid host name or IP address.

BPCIN0010E The port number field is blank. Enter a valid port number.

Explanation

The port number that was specified is not valid because the field is blank.

Action

Enter a valid port number.

BPCIN0011E Enter a fully qualified host name or IP address.

Explanation

The host name or IP address format that was specified is not valid because it is not a fully qualified host name or valid IP address.

An example of a fully qualified host name is: myuser.ibm.com.

Action

Enter a fully qualified host name or valid IP address.

BPCIN0012E Enter a valid port number.

Explanation

The port number that was specified is not valid.

Action

Enter a valid port number.

BPCIN0013E Enter a port number from 1 to 65535.

Explanation

The port number that was specified is not valid because it does not fall in the range from 1 to 65535.

Action

Enter a port number from 1 and 65535.

BPCIN0014E The user name cannot be blank or contain spaces. Enter a valid user name.

Explanation

The user name that was specified is not valid because it contains a space or is blank.

Action

Enter a valid user name that does not contain spaces or is blank.

BPCIN0015E The location for the license key file is blank. Enter a file location.

Explanation

The location that was specified for the license key file is not valid because it is blank.

Action

Enter a valid location for the license key file.

BPCIN0016E The file that was specified does not exist. Enter a valid license key file.

Explanation

A valid license key file must be specified.

Action

Enter a valid license key file.

BPCIN0017E The file that was specified is not a valid license key file.

Explanation

A valid license key file must be specified.

Action

Enter a valid license key file.

BPCIN0018E The installation path cannot end with the characters "*endCharacter*".

Explanation

The installation path that was specified is not valid because it ends with one or more of the following special characters:

- Comma ,
- Period .
- Double quotation mark "

Action

Remove the special characters from the installation path.

BPCIN0019I The system is installing the *component* component.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0020I The system completed the installation of the *component* component.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0021E An unexpected error occurred during the prevalidation of the *component*.

Explanation

The IBM Spectrum Control installation stopped because an error occurred during prevalidation. IBM Spectrum Control cannot resolve this error.

Action

To resolve this error, go to the IBM Spectrum Control support site, search for document "1302800", and contact IBM Software Support.

- [Getting support](#)

BPCIN0022E The port range *port_start - port_end* is not available because the port or ports *port* are already used by other applications. The next available port range is *available_start_port - available_end_port*.

Explanation

One or more ports in the port range are not available because the port or ports are used by another application.

Action

Specify an available port range.

BPCIN0023E The password is incorrect. It cannot be blank or contain spaces. Enter a valid password.

Explanation

The password is not valid because it is blank or contains one or more spaces.

Action

Enter a valid password.

BPCIN0024E The user name *userID* cannot contain the following special characters: *characters*.

Explanation

The user name that was specified cannot contain special characters.

Action

Enter a valid user name.

BPCIN0025E The password *password* cannot contain spaces or any of the following special characters: *characters*.

Explanation

The password cannot contain special characters.

Action

Enter a valid password.

BPCIN0026E The installation location selected does not have enough space.

Explanation

The location that was selected does not have enough space for the installation.

Action

Select a different location with more space.

BPCIN0027E The user name *userID* is not in the administrative group *adminGroup*.

Explanation

The user name to install IBM Spectrum Control must be in the administrative group.

Action

Add the user name to the administrative group and continue with the installation.

BPCIN0028E The validation for user name *userID* has failed. Check to see if this user name exists.

Explanation

The validation for the specified user name has failed because the user name might not exist on the system.

Action

Check to see if the user name exists on the system. Correct the problem and run the installation program again.

BPCIN0029E The password that was entered does not match the password for user *user_name* on the system. Please try again.

Explanation

The password must match the user name that exists on the system before you can specify the password and user name for installation.

Action

Verify that the password and user name matches on the system and then continue with the installation.

BPCIN0031E The configuration of *component* failed. Review the installation log file.

Explanation

An error occurred while configuring the specified component.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For UNIX or Linux operating system: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem and run the installation program again.

BPCIN0032E The host name field is empty. Enter the fully qualified host name or IP address.

Explanation

The host name must be a fully qualified host name or IP address.

Action

Enter the fully qualified host name or IP address.

BPCIN0033E The specified host name or IP address cannot be identified.

Explanation

The specified host name or IP address is not the correct host name or IP address.

Action

Enter the correct host name or IP address.

BPCIN0034E The installation location is not an absolute path.
Enter an absolute path.

Explanation

The installation location must be an absolute path and not a relative path.

An example of an absolute path for Windows is: C:\Program Files\IBM\TPC.

An example of an absolute path for UNIX or Linux is: /opt/IBM/TPC.

Action

Enter an absolute path.

BPCIN0035W The installation program cannot validate the host name because the fully qualified domain name (FQDN) cannot be retrieved for the host.

Explanation

The host name cannot be validated because the local fully qualified domain name cannot be retrieved for the host. Either the host name is incorrect or the DNS is providing an invalid configuration.

Action

Review and correct the Domain Name System (DNS) configuration on the host system or specify a valid host name. Continue with the installation.

BPCIN0043E The last port number must be a port number from 1 to 65535.

Explanation

The last port number must be a port number from 1 and 65535.

Action

Specify a port number from 1 to 65535.

BPCIN0044E The installation location that was specified uses a Windows reserved name. Enter a different installation location.

Explanation

The installation location cannot be a Windows reserved name. For information about Windows reserved names, see the Microsoft website.

Action

Enter an installation location that does not specify a Windows reserved name and run the installation program again.

BPCIN0045E The installation location cannot contain special shell characters *special_characters* in the installation path *path*.

Explanation

The installation location cannot contain special shell characters in the installation path.

Action

Enter an installation location that does not contain special shell characters and run the installation program again.

BPCIN0046E The installation location contains special characters *special_characters* that are not supported by the operating system in the installation path *path*.

Explanation

The installation location contains special characters that are not supported by the operating system.

Action

Enter an installation location that does not contain special characters and run the installation program again.

BPCIN0047E The IBM Db2 database manager must be active to continue the installation process.

Explanation

The Db2 database manager must be active to continue the installation process.

Action

Ensure that the Db2 instance is running before installing IBM Spectrum Control. Enter the following command from a command prompt window: db2start. Run the installation program again.

BPCIN0048E IBM Spectrum Control cannot be installed because Db2 is not installed on the system or the Db2 configuration is not valid.

Explanation

Db2 must be installed before you can install IBM Spectrum Control.

Action

Install Db2 on the system and then run the IBM Spectrum Control installation program again.

BPCIN0049E The Db2 *db2Version* is not supported. The minimum supported Db2 versions are *minDB2Version*.

Explanation

Before you can install IBM Spectrum Control, a supported version of Db2 must be installed on the system.

Action

For information about the versions of Db2 that are supported, go to the IBM Knowledge Center and search for "software requirements database repository". Install or upgrade the required Db2 version and run the installation program again.

BPCIN0050E An error occurred when the installation program tried to verify that the Db2 database manager is running. The error message is: *error_message*.

Explanation

An error occurred when IBM Spectrum Control tried to verify that the Db2 database manager is running. It is possible that the shell environment is not set up correctly for Db2.

Action

Go to the IBM Knowledge Center and search on the text string "Starting Installation". Follow the instructions on sourcing the Db2 profile then run the installation program again.

BPCIN0051E An error occurred when the installation program tried to find an available database named *dbName*.

Explanation

The installation program cannot recover from this error.

Action

Contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0052I The name of the database to be created is *dbName*.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0053E An error occurred when creating the database *dbName*. Review the log files for more information.

Explanation

The installation program cannot recover from the installation error.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For UNIX or Linux operating system: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem. If you cannot correct the problem, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0055E Db2 is not installed or the Db2 profile was not sourced before installing IBM Spectrum Control.

Explanation

Db2 must be installed before installing IBM Spectrum Control. For AIX or Linux systems, you must source the Db2 profile before installing IBM Spectrum Control.

Action

If Db2 is not installed, install Db2. If you are running on AIX or Linux, go to the IBM Knowledge Center and search on the text string "Starting Installation". Follow the instructions on sourcing the Db2 profile then run the installation program again.

BPCIN0056E The user name *userID* does not have write permission on the default database path configuration parameter **DFTDBPATH:** *dftdbpath*.

Explanation

An error occurred because the specified user name does not have write permission on the default database path configuration parameter. For the installation, IBM Spectrum Control must have write permission on this parameter.

Action

Set the write permission for the specified user name on DFTDBPATH {1}. For more information about how to set this parameter, go to the IBM Knowledge Center and search on the parameter.

BPCIN0057E The user name *userID* is not in an operating system group that has Db2 SYSADM authority. Before you run your DB2 installation, validate that the Windows Server Hostname is 15 characters or less in length.

Explanation

An error occurred because the specified user name is not in an operating system group that has Db2 SYSADM authority.

The problem also could be due to the Windows Server Hostname more than 15 characters in length.

Action

Add the specified user name to an operating system group that has Db2 SYSADM authority.

Before you run your DB2 installation, validate that the Windows Server Hostname is 15 characters or less in length.

BPCIN0059W There are long file names in the IBM Spectrum Control installation images.

Explanation

The reason for the long file names could be a result of using an incorrect version of the AIX tar program. Use the GNU tar program to extract files. The AIX tar program might truncate long file names, which can cause errors in the IBM Spectrum Control installation.

Action

Use the GNU tar program, instead of the native AIX tar program, to extract files from the IBM Spectrum Control installation images.

BPCIN0060E An error occurred during the uninstallation of component. Review the log files for more information.

Explanation

The uninstallation program cannot recover from the uninstallation error.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: %HOMEPATH% directory
- For UNIX or Linux operating systems: \$HOME directory

The log files are:

- msgTPCStdout.txt
- msgTPCStderr.txt

BPCIN0061E An invalid host name or IP address was specified for the Data server.

Explanation

The installation program requires a fully qualified host name or valid IP address for the Data server.

An example of a fully qualified host name is: `myuser.ibm.com`.

An example of a valid IP address is: `127.0.0.1`.

Action

Enter a fully qualified host name or valid IP address for the Data server.

BPCIN0062E The IPv6 internet protocol is not enabled on the specified host computer.

Explanation

To use the IPv6 internet protocol for a host computer, you must have this support enabled.

Action

Enable the IPv6 internet protocol on the specified host computer and run the installation program again.

BPCIN0063E The Data server is not running. For more information, go to the IBM Knowledge Center and search on the message code.

Explanation

The installation program cannot continue because the Data server is not running.

Action

Verify that the Data server is running:

- For Windows operating systems, open the Windows Services window and see if the following service is running: IBM Spectrum Control - Data Server.
- For UNIX operating systems, check to see if the TSRM process is running.
- To verify that the TSRM process is running, run the following command: `ps -ef|grep TSRM`.

If the Data server is not running, start the Data server and run the installation program again.

To start the Data server on Windows, run this command `TPC_installation_directory\scripts\startTPCData.bat`.

To start the Data server on UNIX, run this command `TPC_installation_directory/scripts/startTPCData.sh`.

`TPC_installation_directory` is where IBM Spectrum Control is installed.

BPCIN0064E The Data Server is not running at the specified host address or port: host *host_address*, port *port*. For more information, go to the IBM Knowledge Center and search for the message code.

Explanation

The Data Server is not running at the specified host or port or the address details are incorrect.

Action

Verify the host address details. If they are correct, verify that the Data server is running:

- For Windows operating systems, open the Windows Services window and see if the following service is running: IBM Spectrum Control - Data Server.
- For UNIX operating systems, check to see if the TSRM process is running.
- To verify that the TSRM process is running, run the following command: `ps -ef|grep TSRM`.

If the Data server is not running, start the Data server and run the installation program again.

To start the Data server on Windows, run this command `TPC_installation_directory\scripts\startTPCData.bat`.

To start the Data server on UNIX, run this command `TPC_installation_directory/scripts/startTPCData.sh`.

`TPC_installation_directory` is where IBM Spectrum Control is installed.

BPCIN0066E Errors occurred during the installation of the IBM Spectrum Control GUI. Review the log files for more information.

Explanation

The connection with WebSphere Application Server Liberty failed.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: `TPC_installation_directory\logs\`
- For UNIX or Linux operating system: `TPC_installation_directory/logs/`

`TPC_installation_directory` is where IBM Spectrum Control is installed.

The log files are:

- `msgTPCInstall.log`
- `traceTPCInstall.log`

Correct the problem and run the installation program again. If you cannot correct the problem, contact IBM Software Support.

BPCIN0068E Errors occurred during the uninstallation of the IBM Spectrum Control GUI. Review the log files for more information.

Explanation

Errors occurred when the uninstallation program tried to delete the WebSphere Application Server Liberty data source object.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: %HOMEPATH% directory
- For UNIX or Linux operating systems: \$HOME directory

The log files are:

- msgTPCStdout.txt
- msgTPCStderr.txt

Correct the problem and run the installation program again. If you cannot correct the problem, contact IBM Software Support.

Related reference

BPCIN0069E Errors occurred during the configuration of Tivoli Common Reporting for IBM Spectrum Control. Review the log files for more information.

Explanation

IBM Spectrum Control could not configure the database for Tivoli Common Reporting.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For UNIX or Linux operating system: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem and run the installation program again. If you cannot correct the problem, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0070E Errors occurred during the configuration of the IBM Spectrum Control data model in Tivoli Common Reporting. Review the log files for more information.

Explanation

Errors occurred when the installation program tried to import the IBM Spectrum Control data model to Tivoli Common Reporting.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For UNIX or Linux operating system: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem and run the installation program again. If you cannot correct the problem, contact IBM Software Support.

Related reference

BPCIN0071E An error occurred because the installation program could not find the Db2 DFTDBPATH variable. For more information, go to the IBM Knowledge Center and search for the message code.

Explanation

DFTDBPATH is a Db2 variable that contains the default file path used to create the databases managed by the database manager. The installation program cannot recover from this error.

Action

Contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0072E The validation for user name *userID* has failed. Check to see if this user name exists or if Db2 is running.

Explanation

The validation for the specified user name has failed because the user name might not exist on the system or Db2 is not running.

Action

Check to see if the user name exists on the system or if Db2 is running. Correct the problem and run the installation program again.

BPCIN0074E The port range validation failed because the port value is not numeric.

Explanation

The port range validation failed because the port value is not numeric.

Action

Enter a numeric value for the port.

BPCIN0075E An invalid GUID 0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF was found. Update or uninstall the GUID.

Explanation

An invalid GUID 0xFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFFF was found.

Action

Update or uninstall the GUID and run the installation program again.

BPCIN0076E IBM Spectrum Control could not read the GUID. See the GUID installation log for an explanation of the error.

Explanation

IBM Spectrum Control could not read the GUID. See the GUID installation log for an explanation of the error.

Action

Review the guidInstallOutput.log file for an explanation of the error. The log file is located in the following default directory:

- For Windows operating systems: %temp% directory
- For UNIX or Linux operating system: /tmp directory

Correct the problem and run the installation program again. If you cannot correct the problem, contact IBM Software Support.

BPCIN0077E The name specified for the database is not valid because it contains a space or is blank.

Explanation

The database name that was specified is not valid because it contains a space or is blank.

Action

Enter a valid database name.

BPCIN0078E The database name *database_name* is not valid. The name can only contain the following characters: a-z, A-Z or 0-9.

Explanation

The database name can have the following characters:

- a-z
- A-Z
- 0-9

Action

Enter a valid database name.

BPCIN0079E The first character or characters in the database name are not valid. The name must not begin with a number or the letters: SYS, DBM, or IBM.

Explanation

The first character or characters in the database name must not begin with:

- A number
- The letters: SYS, DBM, or IBM

The valid characters for the database name are:

- a-z
- A-Z
- @, #, or \$

Action

Enter a valid database name.

BPCIN0080E The database name specified is not valid because an existing database has the same name: *database_name*.

Explanation

You cannot specify a database name that has the same name as an existing database.

Action

Enter another database name.

BPCIN0081E The database name *database_name* is too long. The name can be 1 - 8 characters in length with no spaces.

Explanation

The database name that was specified is too long. The value can be 1 - 8 characters in length with no spaces.

Action

Enter a valid database name.

BPCIN0082E The specified host name or IP address is not a remote host. Enter a remote host name or IP address.

Explanation

The specified host name or IP address must be a remote host name or IP address.

Action

Enter a remote host name or IP address.

BPCIN0083E The server could not connect to the remote database. Verify that the port is correct and that the database is running on the remote server. Also verify that the internet protocol connection between the server and remote database is compatible.

Explanation

The server could not connect to the remote database. The reason for this issue can be:

- The port specified does not match the port in the Db2 configuration file for the remote database
- The database is not running on the remote server
- The internet protocol connection between the server and remote database is not compatible

Action

Verify that the remote database port is correct and that the database is started. Run the installation program again. To verify the database port, run the following command from a command window: db2 get dbm cfg. This command opens the Db2 database manager configuration file. Search for "SVCENAME." Open the services file in this directory:

- For the Windows operating system, see %WINDOWS%\system32\drivers\etc\services.
- For the UNIX or Linux operating system, see /etc/services.

For information about valid internet protocol configurations, go to the IBM Knowledge Center and search for "Valid configurations for IPv4 and IPv6 systems."

BPCIN0084E The database name is not valid because there is no database on the specified server with this name.

Explanation

You must specify a database that exists.

Action

Check the remote system for a valid database.

BPCIN0085E The installation program was unable to connect to the remote database. Check the remote server to verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> .

Explanation

An error occurred when the installation program tried to create a JDBC connection to the remote database. A reason for this error might be that the database was not started on the remote server.

Action

Check the remote server and verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for "Troubleshooting Db2 Server."

BPCIN0086E The connection to the remote database failed because the user name or password is not valid.

Explanation

You must specify a valid user name and password to connect to the remote database.

Action

Check your remote database for a valid user name and password.

BPCIN0087E The remote host name or IP address is not valid.

Explanation

You must specify a valid fully qualified host name or IP address.

Action

Check your remote host for the host name or IP address.

BPCIN0088E The database repository was not found on the remote server.

Explanation

The database repository must be installed on the remote server.

Action

Install the database repository on the remote server and run the installation program again.

BPCIN0089E The version "*retrivedVersion*" of the remote database repository is not at the correct level. Upgrade the remote database repository to version "*requiredVersion*", then upgrade the remaining components.

Explanation

The remote database repository is not at the correct version. Upgrade the remote database repository to the correct version, then upgrade the remaining components.

Action

Upgrade the remote database repository to the correct version, then upgrade the remaining components.

Install the correct version of the database repository on the remote server and run the installation program again.

BPCIN0090E The name specified for the database is not valid because it contains a space.

Explanation

The database name that was specified is not valid because it contains a space.

Action

Enter a valid database name.

BPCIN0091E The file path *file_path* specified is not an absolute path or is not a directory or the partition does not exists.

Explanation

The file path specified must be an absolute path and not a relative path.

An example of an absolute path for Windows is: C:\Program Files\IBM\TPC.

An example of an absolute path for UNIX or Linux is: /opt/IBM/TPC.

Action

Enter a valid value for the path.

BPCIN0092E The first directory *directory_name* specified is not valid.

Explanation

The first directory in the path has a name in the form SQLNNNNN, where NNNNN is a value from 00001 to 99999.

Action

Enter a valid value for the path.

BPCIN0093E The path string *path_string* is too long. The path string cannot be longer than 242 bytes.

Explanation

The path string is longer than 242 bytes.

Action

Enter a valid value for the path.

BPCIN0094E The user name *user_name* does not have write permission on the specified database path: *database_path*.

Explanation

The specified user name does not have write permission on the specified database path.

Action

Set the write permission for the specified user name on the database path. For information about how to set this parameter, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for the db2extsec command.

BPCIN0095E The user name *user_name* does not have write permission on the specified log location: *log_location*.

Explanation

The specified user name does not have write permission on the specified log location.

Action

Set the write permission for the specified user name for the log location. For information about how to set this parameter, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for the db2extsec command.

BPCIN0096E The database path cannot be blank. Enter a valid database path.

Explanation

You must specify a database path.

Action

Enter a valid database path.

BPCIN0097E The log location cannot be blank. Enter a valid log location.

Explanation

You must specify a log location.

Action

Enter a valid log location.

BPCIN0098E Enter 10 or fewer paths.

Explanation

The maximum number of allowed database locations has been reached

Action

Enter 10 or fewer paths.

BPCIN0099E You have entered *pathNumber* directories. A maximum of 10 directories can be specified.

Explanation

The maximum number of allowed database locations has been exceeded

Action

A maximum of 10 directories can be specified.

BPCIN0100W The database log files and database are in the same location. Click Yes to change the database log files or database location. Click No to ignore this message.

Explanation

To ensure that the log files are on a physical disk that does not have high I/O activity, change the database log files or database location. For instance, avoid placing the logs on the same disk as the operating system or high volume databases. In this way, data is logged more efficiently because the logging process does not have to wait for other I/O to complete.

Action

Change the database log path or database location.

BPCIN0101E The location "*location*" that was specified contains Db2 logs or log files.

Explanation

The directory that was specified contains Db2 logs or log files. The directory must not contain Db2 logs or log files. Examples of Db2 logs or log files are: S0000000.LOG, S0000001.LOG, or SQLLPATH.TAG.

Action

Select a directory that does not contain Db2 logs or log files.

BPCIN0102E The Db2 profile for the "*db2_instance*" instance was not run before installing IBM Spectrum Control.

Explanation

The Db2 profile must be run before you install IBM Spectrum Control with the specified Db2 instance.

Action

For UNIX and AIX systems, run the Db2 profile with the specified Db2 instance before you install IBM Spectrum Control.

BPCIN0103E The user name *userID* is not in the system group *adminGroup*.

Explanation

The user name to install IBM Spectrum Control must be in the system group.

Action

Add the user name to the system group and continue with the installation.

BPCIN0104I Resuming a failed install and installing the remaining components.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0105E A reboot must be done before continuing with the installation.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0106E There are invalid header files in the installation images. You may might be using the AIX tar program instead of the GNU tar program to extract files from the installation images. For more information, see IBM Knowledge Center and search by the error message code.

Explanation

The AIX tar program can result in invalid header files, because this tar program places the header files in the installation images. This can cause errors in the installation.

Action

Use the GNU tar program rather than the native AIX tar program to extract files from the installation images.

Download, install, and use the GNU tar program, version 1.14 or later. The GNU tar program can be downloaded from <http://www-03.ibm.com/systems/power/software/aix/linux/toolbox/alpha.html>. The GNU tar program must be installed as the default tar utility in the installation path. The default installation location for this tar program is /usr/local/bin.

BPCIN0107E The database path exists in the database path list. You must specify a unique database path.

Explanation

You must specify a unique database path and cannot reuse an existing path.

Action

Enter a valid database path.

BPCIN0108E An error occurred during the upgrade of the *component*. Review the log files in the following directory for an explanation of the error: *location*.

Explanation

The specified component was not upgraded because of errors. One possible cause of these errors is the Windows Administrator user that is installing the upgrade does not have Windows Debug Programs rights.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For UNIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is the directory where the product is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

To verify that the Windows Administrator user has Debug Programs rights, go to Administrative Tools > Local Security Policy > Local Policies > User Rights Assignment and right click Debug programs in the Policy list. If necessary, add the administrator user or group. Log off Windows and log back in again.

Correct any other problems identified in the log files and run the installation or upgrade program again. If you cannot resolve the problem, contact IBM Software Support.

Related reference

- [Enabling and disabling legacy protocol \(SSLv3 and MD5 hash\)](#)

BPCIN0109E An unexpected error occurred. IBM Spectrum Control cannot resolve this error. For more information, review the log files and go to the IBM Knowledge Center.

Explanation

An error occurred during the installation program.

Action

Review the log files in one of the following directories:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Resolve the issue and run the installation program again. If the problem persists, contact IBM Software Support.

Related reference

BPCIN0112I Upgrading the components: *upgrade_components*.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0116I The system is upgrading the *component* component.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0117I The system completed the upgrade of the *component* component.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0120E The validation of user name and password could not be completed

Explanation

An error occurred when validating the user name and password

Action

Verify that the user name and password matches the operating system user name and password. Continue with the installation.

BPCIN0121E The installation type entered is not supported.

Explanation

The installation type entered is not supported.

Action

Enter a valid installation type. Continue with the installation.

BPCIN0122E The `TPCCommon.dll` or `libTPCCommon.so` library could not be found or loaded.

Explanation

The `TPCCommon.dll` or `libTPCCommon.so` library could not be located or loaded .

Action

Check the IBM Spectrum Control installation image for the missing libraries and make sure that they are in the installation image. Continue with the installation.

BPCIN0123E The user has no administrative rights to install or uninstall IBM Spectrum Control.

Explanation

A user must have administrative rights to install or uninstall IBM Spectrum Control.

Action

Log in with a valid user name that has the correct administrative rights to install or uninstall IBM Spectrum Control.

BPCIN0124E The operating system cannot find the Db2 Service name.

Explanation

The database instance information cannot be found.

Action

Check the Db2 instance configuration.

BPCIN0125E The installation program cannot find the Db2 instance name. Check the Db2 instance configuration.

Explanation

The name of the Db2 instance cannot be found.

Action

Check the Db2 instance configuration.

BPCIN0126E Unable to find Db2 installation path. Check your Db2 configuration.

Explanation

The Db2 installation path cannot be found on your system.

Action

Check your Db2 configuration.

BPCIN0127E The service name configuration parameter cannot be queried from the Db2 Database Manager.

Explanation

The service name configuration parameter cannot be queried from the Db2 Database Manager.

Action

Check your Db2 instance configuration.

BPCIN0129E The version that is installed cannot be upgraded because it does not meet the minimum build version for the database repository. The minimum build version supported is *build_version*.

Explanation

The upgrade failed when you attempted to upgrade to a different build within the same version of software. The installed version does not meet the minimum build requirements for the database repository.

Action

If the database does not meet the minimum build requirements, check the version.txt file. The version.txt file displays the version that you have installed on your system. To display the version.txt file, go to the following directory:

- For Windows operating systems: TPC_installation_directory
- For AIX or Linux operating system: TPC_installation_directory

TPC_installation_directory is where IBM Spectrum Control is installed.

Upgrade the software that is installed to the minimum build version or later before upgrading to the current build.

BPCIN0130E The database administrator password in IBM Spectrum Control does not match the database administrator password for Db2. Run the changepasswords tool to update the database administrator password.

Explanation

The database administrator password in IBM Spectrum Control must match the database administrator password for Db2.

Action

Run the changepasswords tool to change the password for the database administrator user.

In a command prompt, go to the following directory:

- For Windows operating systems: TPC_installation_directory\service\
- For AIX or Linux operating system: TPC_installation_directory/service/

TPC_installation_directory is where IBM Spectrum Control is installed.

Run this command:

- For Windows operating systems: changepasswords.bat
- For AIX or Linux operating system: changepasswords.sh

Run the installation program again.

For information about the changepasswords tool, go to the IBM Knowledge Center and search for "using password tool".

BPCIN0131E An invalid host name or IP address was specified for the Device Server.

Explanation

The installation program requires a fully qualified host name or valid IP address for the Device server.

An example of a fully qualified host name is: myuser.example.mycompany.com.

An example of a valid IP address is: 127.0.0.1.

Action

Enter a fully qualified host name or valid IP address for the Device server.

BPCIN0132E The Device Server is not running at the specified host address or port: host *host_address*, port *port*.

Explanation

The Device server is not running at the specified host or port or the address details are incorrect.

Action

Verify the host address details. If they are correct, verify that the Device server is running:

- For Windows operating systems, open the Windows Services window and see if the following service is running: IBM Spectrum Control - Device Server.
- For AIX or Linux operating systems, run this command: `ps -ef|grep deviceServer`. If the server is running, you will see a list of processes.

If the Device server is not running, start the Device server and run the installation program again.

To start the Device server on Windows, run this command `TPC_installation_directory\scripts\startTPCDevice.bat`.

To start the Device server on AIX and Linux, run this command `TPC_installation_directory/scripts/startTPCDevice.sh`.

TPC_installation_directory is where IBM Spectrum Control is installed.

BPCIN0134E The installation program could not stop the . Please manually stop the .

Explanation

The installation program could not stop the server.

Action

Try to manually stop the server and continue with the installation or upgrade.

BPCIN0135E Tivoli Storage Productivity Center version is installed. Before you can upgrade to version 5, you must upgrade Tivoli Storage Productivity Center to version 4.

Explanation

You cannot upgrade Tivoli Storage Productivity Center version 3 directly to version 5. You must first upgrade version 3 to version 4, then upgrade version 4 to version 5.

Action

For information about upgrading to version 4, see the Tivoli Storage Productivity Center Knowledge center version 4.2.2. Search for Upgrading and migrating the Tivoli Storage Productivity Center family. After you upgrade to version 4, upgrade to version 5.

BPCIN0136E The version "*retrivedVersion*" of the remote database repository is not at the correct build level. Upgrade the remote database repository to the correct build level, then upgrade the remaining version "*requiredVersion*" components.

Explanation

The remote database repository is not at the correct build level. Upgrade the remote database repository to the correct build level, then upgrade the remaining components.

Action

Upgrade the remote database repository to the correct build level, then upgrade the remaining components.

BPCIN0137E The version "*retrivedVersion*" of the remote database repository is not at the correct build level. Ensure that the installation image for the remaining version "*requiredVersion*" components is at the same build level as the remote database repository, then upgrade the remaining components.

Explanation

The remote database repository is not at the correct build level. Ensure that the installation image for the remaining components is at the same build level as the remote database repository, then upgrade the remaining components.

Action

Ensure that the installation image for the remaining components is at the same build level as the remote database repository, then upgrade the remaining components.

BPCIN0138E The common user name password does not match the password for the existing user name *user_name* on the system. Run the `changepasswords` tool to change the common user name password for IBM Spectrum Control.

Explanation

Before you can run the installation program, the password specified must match the password for the user name that exists on the system.

Action

Verify that the password specified and the user name password on the system matches. If the passwords do not match, run the `changepasswords` tool.

Run the `changepasswords` tool to change the password for the common user name.

In a command prompt, go to the following directory:

- For Windows operating systems: `TPC_installation_directory\service\`
- For AIX or Linux operating system: `TPC_installation_directory/service/`

Where `TPC_installation_directory` is where IBM Spectrum Control is installed.

Run this command:

- For Windows operating systems: `changepasswords.bat`
- For AIX or Linux operating system: `changepasswords.sh`

Run the installation program again.

For information about the `changepasswords` tool, go to the IBM Knowledge center and search for "Using the password tool".

BPCIN0139I The User Migration Tool completed successfully.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCIN0140E The User Migration Tool could not be started. Start the User Migration Tool from the graphical user interface after the upgrade is finished.

Explanation

The upgrade will continue. You can start the User Migration Tool after the upgrade completes.

Action

No action is required.

BPCIN0143E Errors occurred during the upgrade of the GUI. Review the log files for more information.

Explanation

The upgrade program could not update the TPC-GUI.war file.

Action

Review the log files in one of the following directories:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where the product is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem and run the upgrade program again. If you cannot correct the problem, contact IBM Software Support.

Related reference

BPCIN0146E The installation language specified is not a supported language.

Explanation

You must specify a language that is supported.

Action

Specify one of the following languages:

- cs - Czech
- de - German
- en - English
- es - Spanish
- fr - French
- it - Italian
- ja - Japanese
- ko - Korean
- pl - Polish
- pt_BR - Brazilian Portuguese
- hu - Hungarian
- ru - Russian
- zh_CN - Simplified Chinese
- zh_TW - Traditional Chinese

BPCIN0148E IBM Spectrum Control cannot be installed, because the physical memory size on this computer is too small. The minimum memory size is *minMemoryProduction*. Increase the physical memory on this computer and run the installation program again.

Explanation

The minimum memory size requirements for IBM Spectrum Control have not been met.

Action

Increase the physical memory on this computer and run the installation program again.

BPCIN0149W The physical memory size on this computer is below the minimum requirements that are specified for a production system. The minimum memory size for a production system is *minMemoryProduction*. You must increase the physical memory on this computer and run the installation program again. If you install IBM Spectrum Control with lower memory, you can only use it in an evaluation environment.

Explanation

The suggested memory size requirements for IBM Spectrum Control are not met.

Action

Increase the physical memory on this computer and run the installation program again. If you install IBM Spectrum Control with lower memory, you can only use it in an evaluation environment.

BPCIN0150E The installation program cannot determine the amount of physical memory on the system.

Explanation

The installation program cannot determine the amount of physical memory on the system for this installation.

Action

Contact IBM Software Support.

Related reference

BPCIN0153E The installation program could not rename the jre folder. To continue the installation, stop all Java processes that access the jre directory: *jre_folder*.

Explanation

An error occurred while renaming JRE .

Action

Please ensure that all java processes accessing the jre directory are stopped.

BPCIN0159E The web server data source creation failed.

Explanation

An error occurred while creating web server data source.

Action

For more information about the error, review the log files in one of the following directories:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

After you resolve the issue, run the installation program again. If you cannot resolve the issue, contact IBM Software Support.

BPCIN0163E The service name configuration parameter cannot be queried from the Db2 Database Manager. Reboot the machine after Db2 installation. SQL Error Message is *sqlerrmsg*

Explanation

The service name configuration parameter cannot be queried from Db2 Database Manager.

Action

Check your Db2 instance configuration.

BPCIN0164E The service name configuration parameter cannot be queried from the Db2 Database Manager. SQL Error Message is *sqlerrmsg*

Explanation

The service name configuration parameter cannot be queried from Db2 Database Manager.

Action

Check your Db2 instance configuration.

BPCIN0165E The password for user name has expired. You must change the password, or select another user name, to install IBM Spectrum Control.

Explanation

The password for the entered user name has expired. Please ensure that the password of the entered user account is not expired.

Action

Change password for corresponding user name.

BPCIN0166W The password for user name cannot be checked for expiration. Please ensure that it is not expired.

Explanation

The password cannot be checked for expiration. Please ensure manually that it is not expired

Action

Expired password will cause an error during installation.

BPCIN0167E You cannot upgrade the license to the same or lower level.

Explanation

If the license key file provided is the same or lower than the installed IBM Spectrum Control license type, you cannot upgrade your license.

Action

Specify a higher license level.

BPCIN0168E An error occurred while checking the user name and password. Review the log files for more information.

Explanation

An error occurred while checking the user name and password.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

Correct the problem and run the installation program again. If you cannot resolve the problem, contact IBM Software Support.

- [Getting support](#)

BPCIN0169E The location "*location*" that should be specified for the license is not correct.

Explanation

Specify a valid location for the license file.

Action

Select a license file.

BPCIN0170E IBM Spectrum Control cannot upgrade the license because the upgrade must be done on the server system.

Explanation

To upgrade your license, you must upgrade the license on the IBM Spectrum Control servers system.

Action

Before you upgrade the license, ensure that you have the IBM Spectrum Control servers installed on your system.

BPCIN0173E An error occurred during the deployment of the *file_name* file.

Explanation

The IBM Spectrum Control installation program could not deploy the war file specified in the message text.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

After you resolve the issue, you must run the installation program again. If you cannot resolve this issue, contact IBM Software Support.

BPCIN0176E An error occurred during Db2 catalog creation, and the catalog was not created.

Explanation

The catalog entry either exists or the Db2 command is not available.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: TPC_installation_directory\logs\
- For AIX or Linux operating systems: TPC_installation_directory/logs/

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCInstall.log
- traceTPCInstall.log

If the log file indicates that the catalog entry exists, remove the catalog entry. To remove the catalog entry, run the following commands:

- db2 uncatalog node node_name
- db2 uncatalog db database_alias_name
- db2 terminate

BPCIN0177E You cannot upgrade IBM Spectrum Control with a license key file that is at a lower level than the installed license key file.

Explanation

If the license key file you are using to upgrade is a lower level than the installed key file, you cannot upgrade.

Action

To upgrade, you must use a license key file with a higher level.

BPCIN0178E The provided license key *file_name* is invalid.

Explanation

The provided license key is invalid.

Action

Provide a valid license file.

BPCIN0179E An error occurred during Db2 catalog deletion, and the catalog was not removed.

Explanation

The catalog entry exists, but it could not be deleted or the Db2 command is not available.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: %HOMEPATH% directory
- For UNIX or Linux operating systems: \$HOME directory

TPC_installation_directory is where IBM Spectrum Control is installed.

The log files are:

- msgTPCStdout.txt
- msgTPCStderr.txt

BPCIN0181E The web server data source testing has failed.

Explanation

An error occurred during the web server data source testing.

Action

An error occurred during the web server data source testing. If the problem continues, contact IBM Support.

Related reference

-  [Getting support](#)

BPCIN0182E TPC-GUI.war data source testing failed.

Explanation

An error occurred while testing the TPC-GUI.war data source.

Action

Review the installation log files.

BPCIN0184E The remote database repository already contains data. Install a new IBM Spectrum Control remote database repository first, then install the remaining IBM Spectrum Control components.

Explanation

The remote database repository must not contain data associated with another installation.

Action

Install a new IBM Spectrum remote database repository first, then install the remaining IBM Spectrum Control components.

BPCIN0185E The remote database repository for version *oldVersion* is incompatible with IBM Spectrum Control Version *requiredVersion*. Upgrade remote database repository to Version *requiredVersion* first, and then install the remaining IBM Spectrum Control components.

Explanation

The remote database repository is incompatible with IBM Spectrum Control.

Action

Install a IBM Spectrum Control remote database repository first, then install the remaining IBM Spectrum Control components.

BPCIN0190E You cannot use non-standard characters, such as a space between characters or an underscore, in a host name. You must

enter a host name with standard characters and try again.

Explanation

You cannot use non-standard characters, such as a space between characters or an underscore, in a host name.

Action

You must enter a host name with standard characters and try again.

BPCIN0191E You cannot install Db2 in a directory that starts with the letter a.

Explanation

If the directory in which you want to install Db2 starts with the letter a, for example, C:\abc\IBM\ABCD, the installation will fail.

Action

Select a directory that does not begin with the letter a, such as C:\ABC\IBM\ABCD.

BPCIN0193E The version "*retrivedVersion*" of the remote database repository is not at the correct level. Install a new Version "*requiredVersion*" remote database repository at the correct level, then install the remaining IBM Spectrum Control components.

Explanation

The remote database repository is not at the correct level. Install a new IBM Spectrum Control remote database repository at the correct level, then install the remaining IBM Spectrum Control components.

Action

Install a new IBM Spectrum Control remote database repository at the correct level, then install the remaining IBM Spectrum Control components.

BPCIN0195E The version "*retrivedVersion*" of the database repository *dbHost* is not at the correct build level. Install a new Version "*requiredVersion*" database repository at the correct build level, then install the remaining IBM Spectrum Control components.

Explanation

The database repository for IBM Spectrum Control is not at the correct build level. Install a new IBM Spectrum Control database repository at the correct build level, then install the remaining IBM Spectrum Control components.

Action

Install a new database repository at the correct build level, then install the remaining IBM Spectrum Control components.

BPCIN0198E The path to installation image "*installDirectory*" contains the invalid character "*unallowedCharater*". You must change the directory name so that it contains valid characters.

Explanation

The path to the installation image contains invalid characters.

Action

You must select a valid installation directory.

BPCIN0199E The installation program cannot validate the host name because the fully qualified domain name (FQDN) cannot be retrieved for the host.

Explanation

The host name cannot be validated because the local fully qualified domain name cannot be retrieved for the host. Either the host name is incorrect or the DNS is providing an invalid configuration.

Action

Review and correct the Domain Name System (DNS) configuration on the host system or specify a valid host name. Continue with the installation.

BPCIN0200E The installation program does not allow host name specified as IP address. Please ensure that a fully qualified domain name (FQDN) is provided.

Explanation

The installation program does not allow host name specified as IP address. That's because SSO and LIC function will not work, if the system is not configured with FQDN.

Action

Review and correct the Domain Name System (DNS) configuration on the host system or specify a valid host name. Continue with the installation.

BPCIN0202E Runtime errors have occurred during the IBM Spectrum Control preinstallation process. The installation program cannot recover from this error.

Explanation

The installation program cannot recover from this error.

Action

Contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0203E The installation program does not support backslash character in the user name. In case it is a Windows domain account, please specify just the user name without using the "Domain_name\\" prefix.

Explanation

The installation program does not support backslash character in the user name. In case it is a Windows domain account, please specify just the user name without using the "Domain_name\\" prefix.

Action

Enter a valid user name and continue with the installation.

BPCIN0205E The IBM Spectrum Control installation program could not find the directory "*installDirectory*" on the installation image. For more information, go to the IBM Knowledge Center and search on the message code.

Explanation

The installation program could not find the directory or directories on the installation image for one of the following reasons:

- An error occurred during the installation image download.
- A directory was deleted from the installation image.
- An error occurred with a network drive.

Action

If you downloaded an installation image, verify that this image was downloaded correctly.

Correct the problem and restart the installation.

If the problem persists, contact IBM Software Support.

Related reference

-  [Getting support](#)

BPCIN0206E The IBM Spectrum Control installation program was unable to retrieve a fully qualified domain name (FQDN) for the host. You must configure the host system with an FQDN.

Explanation

The host name could not be validated because the local FQDN could not be retrieved for the host. The host name is either incorrect or the Domain Name System (DNS) is providing an invalid configuration.

Action

Correct the DNS configuration on the host system or specify a valid host name and continue with the installation.

BPCIN0207E You cannot upgrade when the stand-alone GUI is running. Stop the stand-alone GUI and click OK to continue the upgrade or click Quit to exit the installation program.

Explanation

You cannot upgrade when the stand-alone GUI is running. To continue the upgrade, stop the stand-alone GUI .

Action

Stop the stand-alone GUI and click OK to continue the upgrade or click Quit to exit the installation program.

BPCIN0208E The fully qualified domain name(FQDN) retrieved for the host contains non-standard characters, such as a space between characters or an underscore. You must configure the host system with an FQDN that contains standard characters.

Explanation

You cannot use non-standard characters, such as a space between characters or an underscore, in a host name.

Action

Configure the host system with an FQDN that contains standard characters and continue with the installation.

BPCIN0209E The installation program does not allow a user that is present in both the Windows Domain and the local Operating System repositories. Install with a user name that is only present in one of these repositories.

Explanation

The installation program does not allow a user name that present in both the Windows Domain (or Active Directory) and local Operating System repositories.

Action

Ensure that the specified user is present in either the Windows Domain or the local Operating System repositories.

BPCIN0210E The Db2 "*sourcedDB2profile*" profile has not been loaded in the .profile file for user *commonUser*. This profile must be loaded before you install IBM Spectrum Control.

Explanation

The Db2 profile must be loaded before you install IBM Spectrum Control with the specified Db2 instance.

Action

For UNIX and AIX operating systems, before you install IBM Spectrum Control, load the Db2 profile in the .profile file of the user name employed to install the IBM Spectrum Control database component.

BPCIN0211E The technology level or the service pack level of this operating system is not supported and must be upgraded to a supported level. The detected operating system version is *os_version*

Explanation

IBM Spectrum Control cannot be installed on this system because the technology level or the service pack level of this operating system is not supported. The technology level or the service pack level must be upgraded to a supported level.

Action

For information about supported operating systems, go to the IBM Knowledge Center and search for "software requirements for operating systems."

BPCIN0214E Cannot complete a fresh install without a valid license.

Explanation

Cannot complete a fresh install without a valid license.

Action

You must download an install image with a license.

BPCIN0215E The path *extractorDirectory* where IBM Spectrum Control is extracted has *extractorDirLength* characters and the maximum number of characters allowed is 260. You must shorten this path.

Explanation

The Windows operating system imposes a maximum length of 260 characters for a file path.

Action

You must shorten the path to the directory where IBM Spectrum Control is extracted.

BPCIN0217E The Windows registry check indicates that .NET 3.5 or higher is not available on this Windows server. You must install .NET 3.5 or higher to continue. To install .NET 3.5 type the following commands in a 64 bit windows powershell: `Import-Module ServerManager` `Add-WindowsFeature as-net-framework`

Explanation

You must install .NET 3.5 to continue.

Action

To install .NET 3.5, type the following commands:

BPCIN0219E The domain configuration is invalid. To resolve the issue, complete the following steps: Disable the Windows Firewall service. Start or restart the Computer Browser service on this domain member computer and on the domain controller computer. If the service has a Stopped or Disabled status on the domain controller computer, you must restart Computer Browser service on the domain member computer after you start the service on the domain controller computer. In a Windows command window, run the `net view` command and verify that there are no errors. Reinstall IBM Spectrum Control.

Explanation

The domain configuration is invalid.

Action

The domain configuration is invalid. To resolve the issue, complete the following steps:

1. Disable the Windows Firewall.
2. Start the Computer Browser service.
3. In a command window, run the "net view" command and verify that there are no errors in the output.
4. Reinstall IBM Spectrum Control.

BPCIN0220E The current login user *loginuser* is not an administrator or a member of the domain administrator group. The installation program cannot start.

Explanation

This user name is not an administrator or a member of the domain administrator group.

Action

To start the installation program, you must add this user name to the domain administrator group.

BPCIN0221E The user name *userID* is not a part of the local administrator group.

Explanation

The user name must be in the local administrator group to install IBM Spectrum Control.

Action

Add the user name to the local administrator group and continue with the installation.

BPCIN0222E The current login user *loginuser* is not an administrator or a member of the local administrator group. The installation program cannot continue.

Explanation

This user name is not an administrator or a member of the local administrator group.

Action

To continue the installation program, you must add this user to the local administrator group.

BPCIN0223E The current login user *loginuser* is not a member of the local Db2 administrator group. The installation program cannot start.

Explanation

This user name is not an administrator or a member of the domain administrator group.

Action

To start the installation program, you must add this user name to the local Db2 administrator.

BPCIN0224E The user *userID* is a domain account and cannot be used to log in to Db2. You must enter a separate user name for Db2.

Explanation

This error message is displayed if you specify a domain user account for the common user when you install IBM Spectrum Control, but a local user account was previously created during the Db2 installation. The error occurs when you click Next on the Single Server Installation Information page during the installation of IBM Spectrum Control.

Action

To resolve this error and gain access to Db2, complete the following steps:

1. On the Single Server Installation Information page, click Configure Database repository.
2. On the Configure the Database Repository page, enter the Db2 user name without a Windows domain name prefix, enter the password for the Db2 user, and click Validate.

3. When the validation is complete, click OK to return to the Single Server Installation Information page.
4. Click Next on the Single Server Installation Information page to continue the installation.

BPCIN0225E The current logged in user *loginuser* does not have Db2 SYSADM authority. To provide the user with Db2 SYSADM authority, log in by using a user name with SYSADM authority and run the following commands: `db2cmd db2set -g DB2_GRP_LOOKUP=local,TOKENLOCAL db2 force application all db2stop db2start`

Explanation

The current user is not in an operating system group with Db2 SYSADM authority.

Action

The current user is not in an operating system group with Db2 SYSADM authority. For more information on acquiring user group information in the Windows operating system, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for "access token" For more information about the `sysadm_group` parameter, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for "sysadm_group"

BPCIN0226E Login as a windows domain user in order to install IBM Spectrum Control using a windows domain account.

Explanation

Login as a windows domain user in order to install IBM Spectrum Control using a windows domain account.

Action

Login as a windows domain user in order to install IBM Spectrum Control using a windows domain account.

BPCIN0229E The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services must be stopped before you can continue. After you upgrade, you must restart these services.

Explanation

The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services are running on Windows and can cause the upgrade to fail.

Action

To stop the Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services, click Start > Control Panel > Administrative Tools > Services.

BPCIN0230E The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services must be stopped before you can continue. After you uninstall IBM Spectrum Control, you must restart these services if the required reboot is postponed.

Explanation

The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services are running and can cause the IBM Spectrum Control uninstallation to fail.

Action

To stop the Monitoring Agent for Windows - Watchdog and Monitoring Agent for Windows - Primary services, click Start > Control Panel > Administrative Tools > Services.

BPCIN0231E Tivoli Common Reporting is not installed on your system. You must install it to continue with the IBM Spectrum Control installation.

Explanation

Jazz for Service Management is already installed. In order to continue with the IBM Spectrum Control installation and to have Cognos BI Reports installed, you must install Tivoli Common Reporting.

Action

Install Tivoli Common Reporting and reinstall IBM Spectrum Control.

BPCIN0233E Jazz for Service Management is not installed in the specified location. Reenter the correct installation location for Jazz for Service Management.

Explanation

Reenter the correct installation location for Jazz for Service Management.

Action

Reenter the correct installation location for Jazz for Service Management and reinstall IBM Spectrum Control.

BPCIN0234E The Jazz for Service Management user credentials that you entered were incorrect. Check the user credentials and try again.

Explanation

The Jazz for Service Management user credentials that you entered were incorrect.

Action

Check the user credentials and try again.

BPCIN0235W The Jazz for Service Management and Tivoli Common Reporting servers are not running. To start the servers, run the following command: *file* It takes a few minutes for these servers to start up and initialize. Wait for a few minutes before resuming the installation.

Explanation

Jazz for Service Management is not running.

Action

Start the Jazz for Service Management server.

BPCIN0236W The Tivoli Common Reporting server is not running. If you have already started the server , wait for a few more minutes. It takes a while for the server to start up and initialize. Otherwise, you can start the server by running this command: *file*

Explanation

Start the the Tivoli Common Reporting server.

Action

The Tivoli Common Reporting server is not running.

BPCIN0238E The Tivoli Common Reporting server at *tcrlocation* cannot be reached. If the Jazz for Service Management server has not completed startup, wait for a few more minutes and then click OK. It takes a while for the server to start and initialize. Otherwise, if the Jazz for Service Management server is started but Tivoli Common Reporting still cannot be reached, restart the Jazz for Service Management server using the following commands: *stopServer -username username -password password startServer*

Explanation

An error occurred connecting to the Tivoli Common Reporting server.

Action

Restart Tivoli Common Reporting by restarting the Jazz for Service Management server. To verify Tivoli Common Reporting is reachable, run the following command: *trcmd -checkstatus -reportingEngine [-minutestowait minutes]*. You must authenticate with *-user user -password password*.

BPCIN0239E The Tivoli Common Reporting server configuration cannot be exported.

Explanation

An error occurred while exporting the Tivoli Common Reporting server configuration.

Action

Restart the Tivoli Common Reporting server.

BPCIN0240E The Tivoli Common Reporting server configuration file "*configuration file*" was not created.

Explanation

An error occurred while exporting the Tivoli Common Reporting server configuration.

Action

Restart the Tivoli Common Reporting server.

BPCIN0241E The Tivoli Common Reporting configuration cannot be upgraded.

Explanation

An error occurred while upgrading the Tivoli Common Reporting server configuration.

Action

Restart the Tivoli Common Reporting server.

BPCIN0242E The Windows registry check indicates that .NET 3.5 is not available on this Windows 2012 server. You must install .NET 3.5 to continue. To install .NET 3.5 type the following commands in a 64 bit windows powershell: `Import-Module ServerManager Add-WindowsFeature as-net-framework`

Explanation

You must install .NET 3.5 to continue.

Action

To install .NET 3.5, type the following commands in a 64 bit windows powershell: `Import-Module ServerManager Add-WindowsFeature as-net-framework`

BPCIN0244E An error occurred while enumerating the local administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used instead of a user name.

Explanation

An error occurred while enumerating the local administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a SID. An example of a SID is S-1-5-21-337177553-1671989427-887411491-500. This string is used instead of a user name and is a reference or a link to a domain user who no longer exists on the domain controller computer.

Action

An error occurred while enumerating the local administrator group membership. On the current computer, on the Properties page of this group, you must remove the user names that are displayed with a SID. An example of a SID is S-1-5-21-337177553-1671989427-887411491-500. This string is used instead of a user name and is a reference or a link to a domain user who no longer exists on the domain controller computer.

BPCIN0245E An error occurred while enumerating the local Db2 administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used instead of a user name.

Explanation

An error occurred while enumerating the local Db2 administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500. This string is used instead of a user name

and is a reference or link to a domain user name that no longer exists on the domain controller computer.

Action

An error occurred while enumerating the local Db2 administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500. This string is used instead of a user name and is a reference or link to a domain user name that no longer exist on the domain controller computer.

BPCIN0246E Tivoli Storage Productivity Center *version is installed. Before you can upgrade to version 5, you must upgrade Tivoli Storage Productivity Center to version 4.*

Explanation

You cannot upgrade Tivoli Storage Productivity Center version 4.1 directly to version 5.2. You must first upgrade version 4.1 to version 4.2x or 5.1, then upgrade version 4.2x or 5.1 to version 5.2.

Action

For information about upgrading to version 4.2x, see the Tivoli Storage Productivity Center Knowledge center version 4.2.2. Search for Upgrading and migrating the Tivoli Storage Productivity Center family. After you upgrade to version 4.2x, upgrade to version 5.x.

BPCIN0247E An error occurred during the domain check prevalidation process. Verify that the domain controller computer is available and then restart this domain member machine.

Explanation

An error occurred during the domain check prevalidation process. Verify that the domain controller computer is available and then restart this domain member machine.

Action

An error occurred during the domain check prevalidation process. Verify that the domain controller computer is available and then restart this domain member machine.

BPCIN0248E The IBM Spectrum Control installation program supports only fully qualified user names on Windows domain member machines. Specify the user name *userID* by using the "Domain_name\\" or the "Machine_name\\" prefix. The detected domain name is "*domainName*".

Explanation

The installation program supports only fully qualified user names on Windows domain member machines. Specify the user name by using the "Domain_name\\" or the "Machine_name\\" prefix.

Action

Enter a valid user name and continue with the installation.

BPCIN0250W Before you can upgrade the database repository, you must first stop the Data server, Device server, Alert server, Export server, and Web GUI server on the remote server. For more information about stopping IBM Spectrum Control servers use the following link.

Explanation

You must stop the servers before upgrading the database repository.

Action

Scripts to stop and start servers are provided in SC_installation_directory/scripts.

BPCIN0252E Db2 has been installed by using a domain user account. The IBM Spectrum Control installation software does not allow the Db2 user name *userID* because this user name exists in both the Windows domain and the local operating system repositories. Specify a Db2 user name that exists only in the Windows Domain registry.

Explanation

The installation software does not allow a Db2 user name that exists in both the Windows domain and local operating system repositories.

Action

Specify a Db2 user name that exists only in the Windows Domain registry.

BPCIN0253W All IBM Spectrum Control components are installed.
GUIModeMessage

Explanation

Action

BPCIN0254W IBM Spectrum Control servers are installed on *remoteHost*.

Explanation

The IBM Spectrum Control servers are already installed on the remote computer.

Action

Click quit to exit the installation program.

BPCIN0255E The database *dbName* must be upgraded to the current version. For more information about upgrading Db2, go to the IBM Knowledge Center and search for "Upgrading Db2"

Explanation

The Db2 database must be upgraded to the current version that is supported.

Action

BPCIN0256W If you continue upgrading to IBM Spectrum Control, the reports you have from Tivoli Storage Productivity Center Version *oldVersion* will be deleted. When you uninstall Tivoli Integrated Portal, the Authentication Services Server is also uninstalled. If you have storage subsystems that are configured to use LDAP

authentication through the Authentication Services Server, before you upgrade the product and uninstall Tivoli Integrated Portal, reconfigure the storage subsystems so that these subsystems do not use LDAP authentication. Click OK to continue or Cancel to select another option.

Explanation

Action

BPCIN0257E The Db2 database installation on *dbPath* path was made when the creation of 8.3 filenames was disabled on this server. The IBM Spectrum Control installation will fail when Db2 is installed to a path with spaces and 8.3 filenames were not enabled when it was installed.

Explanation

The installation may fail.

Action

Install Db2 in a folder that does not have a blank space in the name and run the IBM Spectrum Control installation program again.

BPCIN0258E The LDAP configuration export did not succeed. For more information, review the log files, and in the LDAP export command output, search for "exportLDAPRepositories".

Explanation

The LDAP configuration export did not succeed because of exceptions when running the WebSphere wsadmin command.

Action

The LDAP configuration export did not succeed. For more information, review the log files. In the LDAP export command output, search for "exportLDAPRepositories outputStream cmd result" or for "exportLDAPRepositories errorStream cmd result".

BPCIN0260E The connection to the local database failed because the user name or password is not valid.

Explanation

You must specify a valid user name and password to connect to the local database.

Action

Check your local database for a valid user name and password.

BPCIN0261E The installation program was unable to connect to the local database. Check the server to verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome>.

Explanation

An error occurred when the installation program tried to create a JDBC connection to the local database. A reason for this error might be that the database was not started on the server.

Action

Check the server and verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at <http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome> and search for "Troubleshooting Db2 Server."

BPCIN0262E The IBM Spectrum Control upgrade process has stopped because Jazz for Service Management and Tivoli Integrated Portal are using the same ports. To continue, you must install Jazz for Service Management and Tivoli Common Reporting again and use ports that are different from the ports that are used by Tivoli Integrated Portal.

Explanation

The upgrade has been stopped because Jazz for Service Management and Tivoli Integrated Portal are using the same ports.

Action

The IBM Spectrum Control upgrade process has stopped because Jazz for Service Management and Tivoli Integrated Portal are using the same ports. To continue, you must install Jazz for Service Management and Tivoli Common Reporting again and use ports that are different from the ports that are used by Tivoli Integrated Portal."

BPCIN0264E The version of the database repository component cannot be queried from the Db2 Database Manager. SQL Error Message is *sqlerrmsg*

Explanation

The version of the database repository cannot be queried from Db2 Database Manager.

Action

Check your Db2 instance configuration.

BPCIN0265E An error occurred during the prevalidation of the component because the *file_name* is missing.

Explanation

The IBM Spectrum Control installation stopped during prevalidation because the file is missing. This file is required to complete the prevalidation.

Action

To resolve this error, locate the file and run the installation program again. If the problem persists, contact IBM Software Support.

BPCIN0266E Db2 has been installed by using a domain user name. The user name *dbuser* is not a member of the domain Db2 administrator group *domainDB2AdminGroup*, so the IBM Spectrum Control installation program cannot start.

Explanation

Db2 has been installed by using a domain user name, but this user name is not a domain administrator or a member of the domain Db2 administrator group.

Action

To start the IBM Spectrum Control installation program, you must add this user name to the domain Db2 administrator group.

BPCIN0267E The password *password* cannot start with the following special characters: *characters*.

Explanation

The password cannot be used because it starts with special characters that are invalid.

Action

Enter a valid password.

BPCIN0268E The installation program could not stop the .You must manually stop the by running the script.

Explanation

The installation program could not stop the server.

Action

Try to stop the server manually and continue with the installation or upgrade.

BPCIN0269E The Jazz(tm) for Service Management installation image Version "*retrivedVersion*" is not at the correct build level.

Explanation

The Jazz(tm) for Service Management installation image is not at the correct build level. Download and install the latest build.

Action

The Jazz(tm) for Service Management installation image is not at the correct build level. For more information about accessing the latest Jazz(tm) for Service Management build, follow the instructions in the IBM Spectrum Control download document.

BPCIN0272E "*installDirectory*" cannot be found where the Jazz(tm) for Service Management installation files are extracted. Extract the Jazz(tm) for Service Management installation files to a local directory before you start the Jazz(tm) for Service Management installation program.

Explanation

A directory or file is missing from the local directory where you extracted the Jazz(tm) for Service Management installation files.

Action

After you extract the Jazz(tm) for Service Management installation files to a local directory, enter this local directory path on the "Install Jazz(tm) for Service Management" page.

If you cannot resolve the problem, contact IBM Software Support.

BPCIN0275E A 32-bit version of Db2 has been detected. IBM Spectrum Control can only be installed with a 64-bit version of Db2. Install a supported 64-bit version of Db2, and install IBM Spectrum Control again.

Explanation

IBM Spectrum Control can only be installed with a 64-bit version of Db2.

Action

Install a supported 64-bit version of Db2 and install IBM Spectrum Control again.

BPCIN0276E A required system library could not be loaded. Review the log files for more information about this error.

Explanation

All required system libraries must be installed on AIX or Linux systems.

Action

If you are running on AIX or Linux, go to the IBM Knowledge Center and search on "Starting Installation". Follow the instructions on installing the required libraries then run the installation program again.

BPCIN0277W The Jazz(tm) for Service Management installation image that you selected is not the latest version. Click Yes to continue with the current version and not install or upgrade reports. Click No to install or upgrade to Jazz(tm) for Service Management Version "*latest_JazzSM_available_version*" and Tivoli Common Reporting Version "*latest_TCR_available_version*".

Explanation

The Jazz(tm) for Service Management installation image that you selected is not the latest version. Download and install or upgrade to the latest version.

Action

The Jazz(tm) for Service Management installation image that you selected is not the latest version. For more information about installing or upgrading to the latest version of Jazz(tm) for Service Management and Tivoli Common Reporting, go to the IBM Knowledge Center and search for "Install Jazz".

BPCIN0279W IBM Spectrum Control does not support the version of Jazz(tm) for Service Management that is installed on this computer. You must upgrade to Jazz(tm) for Service Management *minJazzSMVersion* before you can continue.

Explanation

Before you can install or upgrade Cognos BI Reports, a supported version of Jazz(tm) for Service Management must be installed on the system.

Action

For information about the Jazz(tm) for Service Management supported version, go to the IBM Spectrum Control download document. Install or upgrade the required Jazz(tm) for Service Management version and run the installation program again.

BPCIN0281E The current version of the Tivoli Common Reporting installation image is not at the correct level.

Explanation

The current version of the Tivoli Common Reporting installation image is not at the correct level. Download and install the latest version.

Action

The current version of the Tivoli Common Reporting installation image is not at the correct level. For information about installing the latest version of Jazz(tm) for Service Management, see the instructions in the IBM Spectrum Control download document.

BPCIN0282E The installation package for Tivoli Common Reporting Version 3.1.0.1 cannot be found on your computer. To continue installing IBM Spectrum Control, download the installation package for Tivoli Common Reporting Version 3.1.0.1 in the same directory where you downloaded the installation package for Tivoli Common Reporting Version 3.1.0.2.

Explanation

To generate Cognos BI Reports in IBM Spectrum Control, you must install Jazz for Service Management Version 1.1.0.3. To install Jazz for Service Management Version 1.1.0.3, you must download the installation packages for Tivoli Common Reporting Version 3.1.0.2 and Version 3.1.0.1. Tivoli Common Reporting 3.1.0.2 is a Fix Pack and cannot be installed by itself.

Action

To continue installing IBM Spectrum Control, download the installation package for Tivoli Common Reporting Version 3.1.0.1 in the same directory where you downloaded the installation package for Tivoli Common Reporting Version 3.1.0.2.

BPCIN0283E You cannot upgrade "*latest_version*" to the lower version "*lower_version*".

Explanation

You must download a higher version of the product.

Action

To continue upgrading, download a higher version of the product.

BPCIN0284E The Jazz for Service Management installation directory does not have execution rights. You can add execution rights to the directory by running the following command:
`chmod -R u+x "JazzSM_build_folder"`

Explanation

The Jazz for Service Management installation directory does not have execution rights. You can add execution rights to the directory by running the following command:
`chmod -R u+x JazzSM_build_folder`

Action

After you extract the Jazz(tm) for Service Management installation files to a local directory, check that the directory and the files have execution rights

If you cannot resolve the problem, contact IBM Software Support.

BPCIN0285E The `getDB2Inst.sh "user_name"` command is displaying a "null" result because the Db2 profile was not sourced for user "user_name" or the environment for "user_name" has been corrupted.

Explanation

The `getDB2Inst.sh` command is displaying a "null" result for one of the following reasons:

- You did not source the Db2 profile before the installation of IBM Spectrum Control.
- The environment for the specified user has been corrupted.

To resolve this issue, run the `"su - user -c "echo $DB2INSTANCE" "` command and ensure that the correct Db2 instance name is displayed.

Action

The `getDB2Inst.sh` command is displaying a "null" result for one of the following reasons:

- You did not source the Db2 profile before the installation.
- The environment for the specified user has been corrupted.

To resolve this issue, run the `"su - user -c "echo $DB2INSTANCE" "` command and ensure that the correct Db2 instance name is displayed.

BPCIN0286W The operation of the storage resource agent is limited on the operating system of the local server. Total Disk Space and Available Disk Space on this server cannot be determined.

Explanation

The storage resource agent will not scan all local volumes.

Action

Only a subset of local storage data will be available.

BPCIN0287E Directory *directory* is located on a memory based file system (RAM disk) and cannot be used for installing IBM Spectrum Control.

Explanation

The directory that is selected for the installation is located on a memory based file system (RAM disk). Everything in this folder is deleted after a system reboot.

Action

Select a directory that is not located on a memory based file system (RAM disk).

BPCIN0288E The upgrade process detected an error with the previously installed version of the product. The installation directory of the previously installed version of the product contains corrupted files. Remove or fix the corrupted files and run the upgrade process again. See the `lax*-out.txt` and `lax*-err.txt` log files in the system temporary directory for details of the error.

Explanation

The previously installed version of the product has some corrupted configuration files. See the lax*-out.txt and lax*-err.txt log files, in %temp% on Windows operating systems or in /tmp on AIX or Linux operating systems, for details. Also, check the TPC.log file in the installation directory of the previous version of the product for more information. Remove or fix the corrupted files to fix the upgrade error and run the upgrade process again.

Action

If you cannot fix the problem, contact IBM Software Support.

BPCIN0289E You must install Db2 before you can install Cognos BI Reports. Ensure that Db2 is already installed on the system and the db2profile is sourced.

Explanation

Db2 must be installed on the local system and you must source the db2profile if you want to install Cognos BI Reports.

Action

No further information is available

BPCIN0290E The IBM Spectrum Control installation image is corrupted. Extract the IBM Spectrum Control installation image again into an empty directory.

Explanation

This message is for informational purposes only.

Action

This message is for informational purposes only.

BPCIN0291E You need to define 'localhost' in the 'hosts' file that is used by Jazz for Service Management and restart the host system.

Explanation

Jazz for Service Management cannot start if localhost is not defined correctly in the 'hosts' file.

Action

This message is for informational purposes only.

BPCIN0293E The IBM Spectrum Control installation program cannot find the license folder. Ensure the license folder is extracted into "extractorDir".

Explanation

The installation cannot continue until the license folder is available in the IBM Spectrum Control installation folder.

Action

Extract the license folder from the downloaded installation files into the IBM Spectrum Control installation folder.

BPCIN0295E Tivoli Storage Productivity Center *old_version* is installed. Before you upgrade to IBM Spectrum Control version *new_version*, you must upgrade to Tivoli Storage Productivity Center version 5.2.7.

Explanation

You cannot upgrade directly from Tivoli Storage Productivity Center 4.2.X or earlier to IBM Spectrum Control 5.2.8 or later. Upgrade to version 4.2.2, then upgrade to Tivoli Storage Productivity Center version 5.2.7.

Action

For information about upgrading to version 4.2.2, go to the product documentation at http://www-01.ibm.com/support/knowledgecenter/SSNE44_4.2.2/com.ibm.tpc_V422.doc/fqz0_t_upgrading_all.html. After you upgrade to version 4.2.2, upgrade to 5.2.7.

BPCIN0296E The installation program could not rename the *short_name* directory because the folder is in use by other processes. Quit the installation program and stop all processes that access the directory *full_path*.

Explanation

An error occurred while renaming a directory.

Action

Stop all processes that are accessing the directory and start the installation program again.

BPCIN0297E The *user_name* user does not have the full control permission for the *folder_path* folder.

Explanation

The user who is running the installation program must have the full control permission for the specified folder.

Action

Assign the full control permission to the folder for the user who is logged on to run the installation program.

BPCIN0298E The *user_name* fenced user does not have full permissions for the *directory_path* database directory.

Explanation

The fenced user must have read, write, and execute permissions for the directory.

Action

Use the `chmod` command to assign full permissions to the directory for the fenced user.

BPCIN0299E The installation location "*install_location*" has a naming conflict with a file or folder named *folder_path*. Rename

the *folder_path* file or folder.

Explanation

The installation location causes conflicts on the Windows operating system with an existing file or folder.

Action

Rename the specified file or folder.

BPCIN0300E The value *db2_variable_existing_value* is not allowed for the Db2 variable DB2_LIMIT_FENCED_GROUP. Use the `db2set -g DB2_LIMIT_FENCED_GROUP=OFF` command to change the value of the variable to OFF.

Explanation

The value ON or YES is not allowed for the variable DB2_LIMIT_FENCED_GROUP.

Action

Use the `db2set -g DB2_LIMIT_FENCED_GROUP=OFF` command to change the value of the variable DB2_LIMIT_FENCED_GROUP to OFF.

BPCIN0301E The *versionFile* file is empty. Extract IBM Spectrum Control again and make sure the *version.txt* file contains a valid build string.

Explanation

The build failed to add a version string to the *version.txt* file.

Action

Extract IBM Spectrum Control again and make sure the *version.txt* file contains a valid build string.

BPCIN0302E Db2 Advanced Enterprise Server Edition is not supported. Install Db2 Enterprise Server Edition and then proceed with your installation.

Explanation

Before you can install IBM Spectrum Control, a supported version of Db2 Enterprise Server Edition must be installed.

Action

Install a supported version of Db2 Enterprise Server Edition and run the installation program again. For a list of Db2 Enterprise Server Edition versions that are supported, go to <http://www-01.ibm.com/support/docview.wss?uid=swg27039833#Databases>.

BPCIN0303W Your storage environment has switches with obsolete data sources. Configure up-to-date data sources after you upgrade.

Explanation

The upgrade process identified switches with one of the following obsolete data sources:

- Brocade switches that are managed by using SNMP.
- Cisco switches that are managed by using a Storage Resource agent or an SMI agent.

Action

Configure up-to-date data sources after you upgrade IBM Spectrum Control. To monitor switches, provide the following credentials:

- For Brocade switches that use a version of Fabric OS earlier than 8.2.1, provide credentials for a Brocade Network Advisor.
- For Brocade switches that use Fabric OS 8.2.1 or later, provide credentials for the switches.
- For Cisco switches, provide SNMP credentials.

BPCIN0304E You cannot upgrade from a Basic Edition license.

Explanation

The Basic Edition license is no longer supported and upgrades with the Basic Edition license are not supported. Upgrade your current product license and then upgrade to IBM Spectrum Control. Please contact IBM Software Support for more details.

Action

The Basic Edition license is no longer supported and upgrades with the Basic Edition license are not supported. Upgrade your current product license and then upgrade to IBM Spectrum Control.

BPCIN0306W The Storage Resource agent registered successfully with the Data server but some problems occurred after the registration. Review the log files in the *SRA_log_name* directory for additional information.

Explanation

The Storage Resource agent registered successfully with the Data server but there were some problems after the registration.

Action

Review the Storage Resource agent log files for more information. If the problem persists, contact IBM Software Support.

BPCIN0307W You are currently connected to devices using a CIM interface. This upgrade might require new certificates to be generated on your CIM managed devices to continue monitoring them. To resolve this issue, go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>

Explanation

To create new certificates for your CIM managed device go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>

Action

To create new certificates for your CIM managed device go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>

BPCIN0307E The security certificates for the Web server have expired. Renew the security certificates and run the installation program again. See the *lax*-out.txt* and *lax*-err.txt* log files in the system temporary directory for details of the error and how to resolve the issue.

Explanation

The trust.p12 and key.p12 keystores in the directories and the WebServerNode for the WAS WebServer might contain the expired certificates.

Action

Renew the security certificates and run the installation program again. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue. You can search for areInvalidWASSecurityCertificates in the latest lax*-out.txt to see details about the error and how to renew the certificates.

BPCIN0308W Brocade switches that use SNMP services were detected. SNMP data sources are no longer used to manage Brocade fabrics and switches. Instead, you must use the embedded SMI agent in Brocade Network Advisor.

Explanation

You must use the embedded SMI agent in Brocade Network Advisor to collect metadata about switches after you upgrade to IBM Spectrum Control V5.2.10 or later. Brocade switches that used SNMP services before the upgrade will display as unreachable. To collect metadata about those switches, you must configure them to use the SMI agent in Brocade Network Advisor. The metadata that was collected for these switches before you upgraded to V5.2.10 is retained.

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of Brocade Network Advisor. If you don't already have a license for Brocade Network Advisor, you can purchase it from Broadcom before February 2020 and use it as an SMI agent for IBM Spectrum Control. After that time, it will no longer be available for purchase, although it will be supported by Broadcom until 2022. For more information about end of support for Brocade Network Advisor, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

Action

Follow these steps to configure your Brocade switches to use the Brocade Network Advisor SMI agent:

- If you do not have Brocade Network Advisor, download and install the Brocade version. Select the SMI Agent Only option during installation.
- In the IBM Spectrum Control GUI, go to Network -> Switches.
- Select one or more switches and select Actions-> Connection-> Modify Connection.
- Enter the switch information and save.
- Go to Actions -> Data Collection > Schedule to schedule data collections for the switches.

BPCIN0309E The port configuration export did not succeed. For more information, review the log files, and in the port export command output, search for "exportCurrentPorts".

Explanation

The port configuration export did not succeed because of exceptions when running the WebSphere wsadmin command.

Action

The port configuration export did not succeed. For more information, review the log files. In the port export command output, search for "exportCurrentPorts outputStream cmd result" or for "exportCurrentPorts errorStream cmd result".

BPCIN0310E Spectrum Control installation requires that the Administrators group in Windows is assigned "Debug programs" privilege. Check this setting, log out of and back into Windows, and try again.

Explanation

"Debug programs" rights in the Windows security policy are not assigned to the Administrators group. Check the current value. "Debug programs" can be found under Administrative Tools > Local Security Policy > Local Policies > User Rights Assignment.

Action

Assign the "Debug programs" right to the Administrators group, log out and log back in again, and run the installation program again. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for further details of the error and how to resolve the issue.

BPCIN0311E Spectrum Control installation requires the wmic command to work. Check this command, ensure the service "Windows Management Instrumentation" is running and try again.

Explanation

The wmic command does not work because the service "Windows Management Instrumentation" is not running.

Action

Check if the wmic command works ok and if the service "Windows Management Instrumentation" is running. You can run "wmic os get osarchitecture" from a command line as Administrator to see the error message. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0312E Spectrum Control installation requires that wmic command to work. Check this command, ensure service "Windows Management Instrumentation" is working, disable any antivirus and try again.

Explanation

wmic command does not work because service "Windows Management Instrumentation" is not working or an antivirus is running.

Action

Check if wmic command and service "Windows Management Instrumentation" are working and disable any antivirus. You can run as Administrator "wmic os get osarchitecture" from a command line to see the error message. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0313E Spectrum Control installation requires that wmic command to work. Check this command and the PATH environment variable and try again.

Explanation

wmic command does not work because either does not exist or the folder that contains it is not in the PATH environment variable.

Action

Check if wmic command works. You can run as Administrator "wmic os get osarchitecture" from a command line to see the error message. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0314E Spectrum Control installation requires that wmic command to work. Check this command and try again.

Explanation

wmic command does not work because the exit code is not successful.

Action

Check if wmic command works. You can run as Administrator "wmic os get osarchitecture" from a command line to see the error message and then "echo %ERRORLEVEL%" to see the exit code. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0315E Spectrum Control installation requires that chcp command to work. Check this command and try again.

Explanation

chcp command does not work because the exit code is not successful.

Action

Check if chcp command works. You can run as Administrator "chcp" from a command line to see the error message and then "echo %ERRORLEVEL%" to see the exit code. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0316E The IBM Spectrum Control upgrade process does not support custom materialized query tables (MQTs). Remove any MQTs from the database and run the upgrade process again.

Explanation

No further information is available.

Action

See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0317E The IBM Spectrum Control upgrade process does not support missing vendor information from the .com.zerog.registry.xml file. Add the missing information and run the upgrade process again. See the lax*-out.txt and lax*-err.txt log files to resolve the issue.

Explanation

No further information is available.

Action

See the lax*-out.txt and lax*-err.txt log files in your system temporary directory for details on the error and how to resolve the issue.

BPCIN0318E The IBM Spectrum Control upgrade process does not support duplicated users user in IBM WebSphere Application Server related to the Web server. Remove the duplicate user from a federated repository other than the localOS default repository; run the upgrade process again.

Explanation

No further information is available.

Action

One possible cause is that the LDAP repository is defined in the WebSphere Application Server WebServer that contains the duplicate user. See the lax*-out.txt and lax*-err.txt log files in the temporary directory of your system for details on the error and how to resolve the issue.

BPCIN0319E The currently installed version of AIX XL C/C++ RUNTIME is not supported. You must upgrade to a supported level. The

version that was detected is *version*.

Explanation

IBM Spectrum Control cannot be installed on this system because the version of AIX XL C/C++ RUNTIME is not supported. You must upgrade AIX XL C/C++ RUNTIME to a supported level to continue.

Action

For information about version of AIX XL C/C++ RUNTIME, go to <http://www-01.ibm.com/support/docview.wss?uid=swg21975779>.

BPCIN0320E PAM (Pluggable Authentication Modules) isn't installed on your system. Installing PAM would resolve the issue.

Explanation

No further information is available.

Action

See the `lax*-out.txt` and `lax*-err.txt` log files in your system temporary directory for details on the error and how to resolve the issue.

BPCIN0321E An error occurred when restoring authorities before creating the database *dbName*. Review the log files for more information.

Explanation

The installation program cannot recover from the installation error.

Action

Review the log files in the following directory for an explanation of the error:

- For Windows operating systems: `TPC_installation_directory\logs\`
- For UNIX or Linux operating system: `TPC_installation_directory/logs/`

`TPC_installation_directory` is where IBM Spectrum Control is installed.

The log files are:

- `msgTPCInstall.log`
- `traceTPCInstall.log`

Correct the problem. If you cannot correct the problem, contact IBM Software Support.

BPCIN0323E The Data Server port has different values in the configuration files. Verify that the port value is correct in the `installDir/data/config/server.config` file, and the `installDir/config/InstallVariable.properties` file. Also, verify that the `PORT_NUMBER` column where `SERVER_TYPE` is `serverType` is correct in the `T_RES_Server` database table.

Explanation

Verify that the correct port number value is the same in the files and the data base table.

Action

Add the correct port number value in the files and the data base table and run the installer program again. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCIN0324W The current certificate used to secure the connection of the IBM Spectrum Control Data server and the Storage Resource agents cannot be replaced with the latest certificate that provides higher security. After you complete the upgrade, you can create new certificates by following the information in the following link.

Explanation

Action

Update the Data server keystore to use SHA256 signing algorithm by following the steps documented in following link.
"https://www.ibm.com/support/knowledgecenter/SS5R93_5.3.6/com.ibm.spectrum.sc.doc/fqz0_r_create_custom_certificate_ssl.html"

BPCIN0325E IBM Tivoli Storage Productivity Center *old_version* is installed. Before you can upgrade to IBM Spectrum Control *new_version*, you must upgrade to IBM Spectrum Control 5.3.0 or later. For more information about upgrading to IBM Spectrum Control 5.4.0 or later, go to the following link:

Explanation

You cannot directly upgrade from IBM Tivoli Storage Productivity Center 5.2.17.4 or earlier to IBM Spectrum Control 5.4.0 or later. You must upgrade to 5.3.0 or later, then upgrade to 5.4.0 or later.

Action

For information about upgrading to IBM Spectrum Control 5.4.0, go to the product documentation at https://www.ibm.com/support/knowledgecenter/SS5R93_5.4.0/ and search for "Preparing for an upgrade."

BPCIN0328E The IBM Spectrum Control installation requires the `LD_LIBRARY_PATH` environment variable be set. Set this environment variable and try the installation again. If you ran `setup.bin` from the IBM Spectrum Control installation directory with `sudo` and the `LD_LIBRARY_PATH` variable was properly set, then try the `sudo -E LD_LIBRARY_PATH=$LD_LIBRARY_PATH ./setup.bin` command.

Explanation

The IBM Spectrum Control installation does not work because an environment variable is not properly set.

Action

Verify that the environment variables are properly set. See the `lax*-out.txt` and `lax*-err.txt` log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0329E The IBM Spectrum Control installation requires that the `LIBPATH` environment variable be set. Set this environment variable and try the installation again.

Explanation

The IBM Spectrum Control installation does not work because an environment variable is not properly set.

Action

Verify that the environment variables are properly set. See the `lax*-out.txt` and `lax*-err.txt` log files in the system temporary directory for details of the error and how to resolve the issue.

BPCIN0330E An SQL exception was created when querying the Db2 Database Manager. The SQL error message is: *sqlerrmsg*.

Explanation

The required data cannot be queried from Db2 Database Manager.

Action

Verify that your Db2 instance is configured correctly. If you cannot resolve the problem, contact IBM Software Support.

BPCIN0331E The *tpcregFile* file is not valid because it contains a failed or partial upgrade to a previous IBM Spectrum Control Version *newTPCVersion*. Continue with the incomplete upgrade before you try to upgrade to the new IBM Spectrum Control Version *varNewUpgradeVersion*.

Explanation

Continue with the incomplete upgrade before you try to upgrade to the new IBM Spectrum Control Version.

Action

Check the `.tpcreg` file for more details and review the installation log files.

Review the `.tpcreg` file in one of the following directories:

- For Windows operating systems: `TPC_installation_directory_uninst\`
- For AIX or Linux operating systems: `TPC_installation_directory/_uninst/`

`TPC_installation_directory` is where IBM Spectrum Control is installed.

See the `lax*-out.txt` and `lax*-err.txt` log files, in `%temp%` on Windows operating systems or `/tmp` on AIX or Linux operating systems, for details.

BPCIN0335E The IBM Spectrum Control installation requires you install the `libstdc++` package on the AIX operating system. Download and install the `libstdc++` package and start the installation again. You can download the package here:

<https://www.ibm.com/developerworks/aix/library/aix-toolbox/alpha.html>.

Explanation

Action

BPCIN0336E The version of the `libstdc++` package you installed is lower than the minimum required Version *minVersion*. Download and upgrade the `libstdc++` package and start the installation again. You can download the package here:
<https://www.ibm.com/developerworks/aix/library/aix-toolbox/alpha.html>.

Explanation

Action

BPCIN0337E The *componentServer* password failed to validate. Check that you entered the password correctly and try again.

BPCDP0003E No performance data is available at the current time for this resource.

Explanation

The data collector did not provide any performance data at the current time.

Related reference

- [Getting support](#)

BPCDP0004I Performance data was retrieved and persisted but aggregation of data to higher-level components didn't complete because the relationship to the higher-level components couldn't be determined.

Explanation

Performance statistics for some high-level components are aggregated from base component statistics. For example, pool statistics are aggregated from volumes belonging to the pool, and the volume to pool relationship is needed to do such an aggregation. The relationship data might not be available if the device probe hasn't yet completed. When this relationship can't be determined, statistics for the pool can't be aggregated.

BPCDP0005E Could not save the performance data that was collected from the resource.

Explanation

The data processor was unable to persist the performance data for this time period.

BPCDP0006I Performance data at *date and time* timestamp was processed and saved successfully for the resource.

Explanation

The performance data was collected at the indicated time. The saved information was either received from the data collector, or was computed based on the information received from the data collector.

Action

None. No action is required.

BPCDP0007E The resource is missing. The resource is required.

Explanation

The data collector did not provide a required property to the data processor. Without this property, the data processor can't process performance data for this time period.

Related reference

- [Getting support](#)

BPCDP0008E Identifying information for the resource is missing. This information is required.

BPCSS0000E An error occurred while collecting performance data from the device. The collection is being attempted by a different collector.

Explanation

There are multiple reasons why this condition could be encountered. Generally the error is something that could be specific to one collector and not occur on other collectors.

Some examples are as follows:

1. The data collector cannot resolve the hostname of the subsystem.
2. Network communication between the data collector and the device is blocked.

Action

If this problem persists and it is not caused by the data collector being down, consider reducing the data collection frequency.

BPCSS0001W The data collection is taking longer than expected.

Explanation

The amount of time that has elapsed since the last performance sample was collected and processed is longer than expected considering the selected collection interval.

This error might be a result of all collectors that can contact the device are down. Or because the amount of time required to collect and process the data is more than the collection interval.

Action

Confirm that the data collectors are running and are able to connect to the server. Try reducing the collection frequency. If the problem persists, contact IBM Support.

Related reference

- [Getting support](#)

BPCSS0002E Currently, there is no data collector available for this device.

Explanation

No data collector has been found that has successfully been able to connect to the device.

Action

Verify that the device is running and fully operational.

If it is in a hung state, it might be necessary to reboot the device.

Ensure that the IP address and hostname are correct and that the user has the required permissions to complete the task.

BPCSS0005I Performance monitor is starting at an interval of *interval interval units*. This action was requested by *user name*.

Explanation

Performance statistics are collected from the device.

BPCSS0008I Collection can no longer continue due to invalid credentials. Use the 'Modify Connection' dialog to fix the storage system credentials and resume collection.

Explanation

Access is denied by the storage system with the credentials currently specified.

The credentials usually consist of a username and password, but can also encompass other security related parameters such as ssh keys, depending on the type of device being accessed and, where applicable, the access method selected.

Action

Go to the Block Storage Systems overlay, and right click on the storage system.

Hover over 'Connections' and select 'Modify Connection' to fix the credentials for the device.

Ensure that the user entered has the correct permissions for collection, and that the password, passphrase, or ssh key file for the device are correct.

BPCSS0009E Failed to save the performance monitor schedule.

Explanation

For more information about the cause of the error, see the trace logs.

Action

Try updating the performance monitor schedule again. If the problem persists, contact IBM Support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BPCSS0010E A job cannot be run for resource *resourceName* because there is a job already running for the resource.

Explanation

A new job cannot be run for a schedule definition if a previous job from that schedule definition did not finish running. Only one running job per schedule at a time is permitted.

Action

Stop the job or wait for the job to finish and try again.

BPCSS0011W The schedule change was saved but the update to the active collection did not happen.

Explanation

The schedule changes take effect the next time the job is started.

Action

Restart the job to force the update.

BPCSS0012I Performance monitor is stopped. This action was requested by *user name*.

Explanation

The performance monitor is stopped and no performance data are collected for this device until the performance monitor is restarted.

Action

Restart the performance monitor, as needed.

BPCSS0013I Performance monitor is stopped.

Explanation

The performance monitor is stopped and no performance data are collected for this device until the performance monitor is restarted.

Action

Restart the performance monitor, as needed.

BPCSS0014I Performance monitor is starting at an interval of *interval interval units*.

Explanation

Performance statistics are collected from the device.

BPCSS0015I Performance monitor collection interval was updated to *interval interval units*. This action was requested by *user name*.

Explanation

Performance statistics are collected at the new interval.

BPCSS0016I Performance monitor collection interval was updated to *interval interval units*.

Explanation

Performance statistics are collected at the new interval.

BPCSS0017I Performance monitor is enabled. This action was requested by *user name*.

Explanation

Performance statistics are collected.

BPCSS0018I Performance monitor is enabled.

Explanation

Performance statistics are collected.

BPCSS0019I Performance monitor is disabled. This action was requested by *user name*.

Explanation

Performance statistics collection is disabled.

BPCSS0020I Performance monitor is disabled.

Explanation

Performance statistics collection is disabled.

BPCSS0021W Performance monitor is starting. The initial attempt to start collection failed so it is retried. This action was requested by *user name*.

Explanation

Performance monitor started but the collector failed to start the collection. The server continues to look for a collector that can perform the collection.

BPCSS0022W Performance monitor is starting. The initial attempt to start collection failed so it is retried.

Explanation

Performance monitor started but the collector failed to start the collection. The server continues to find a collector that can perform the collection.

BPCSS0023I Performance monitor collection interval is enabled and updated to *interval interval units*. This action was requested by *user name*.

Explanation

Performance statistics are collected at the new interval.

BPCSS0024I Performance monitor collection interval is enabled and updated to *interval interval units*.

Explanation

Performance statistics are collected at the new interval.

BPCSS0025E Access to the agent or device is denied. Ensure that valid credentials are specified for agent *agent name*.

Explanation

When retrieving performance statistics for the device, access is denied by the device or the device agent.

Therefore, no performance statistics could be retrieved.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the correct agent address is specified. Ensure that the specified credentials are valid and allow access to the device or agent for performance data collection.

The credentials usually consist of a user name and password, but can also encompass other security-related parameters such as ssh keys or authentication tokens.

The type of credentials used depends on the type of device or agent that is being accessed and, where applicable, the access method selected.

BPCSS0026E New performance data is not yet available for the device. Statistics with time stamps later than *time stamp* could not be found.

Explanation

In case performance data is cached by the device or device agent, the performance manager ensures that the most recently retrieved performance statistics are indeed newer than the previously retrieved statistics.

If the time stamp in the message is "null", then no statistics were previously retrieved, and the performance manager is unable to get ANY statistics for the device.

No performance data is inserted for the device in this time period. The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational.

It might be necessary to restart either device or agent, if it is in a hung state.

Ensure that if the device has multiple clocks (for example for multiple nodes or controllers), that the clocks are synchronized to within a few minutes.

BPCSS0027E The performance monitor failed due to an internal error.

Explanation

If the error is recoverable, the performance manager attempts to restart.

This failure might be temporary, and can result in a temporary disruption of performance data collection for the device.

Action

From the Resources menu, click Storage Systems.

Check the status of the performance monitors.

If the performance monitor is stopped, right-click the storage system, click Data Collection, and then click Start Performance Monitor.

If you still can't complete the action, contact IBM Support.

BPCSS0029E Cannot connect to the device with the address *IP address*.

Explanation

The storage device with this IP address cannot be reached.

Action

Ensure that the IP address of the storage device is correct and that the device is running properly.

If the problem persists, contact IBM Support

Related reference

- [📄 Default locations of log files](#)

BPCSS0030E Cannot connect to the SNMP data source *IP address*.

Explanation

A test connection cannot be established to the data source at the specified IP address.

This error might occur if the data source is not available or the SNMP community is entered incorrectly. The SNMP community name is shared by one or more SNMP hosts and is used to authenticate messages that are received by those hosts.

BPCSS0031E Cannot authenticate with the provided user credentials.

Explanation

The user name or password entered for the device is not correct.

Action

Make sure that the user name and password are correct for the device that is being added.

Reenter the user name or password and click Add again.

If you are adding a Storwize V7000 Unified storage system, specify the IP address of the block component, not the filer component.

BPCSS0032E Passphrase is incorrect for subsystem *param1*.

Explanation

The passphrase for the truststore is incorrect.

Action

Provide the correct passphrase.

BPCSS0033E Passphrase is required. Specify one for subsystem *param1*.

Explanation

The passphrase for the truststore is missing.

Action

Provide the missing passphrase.

BPCSS0034E Verify that the private key that was provided for subsystem *param1* was in the OpenSSH file format. If it is in another format, it needs to be converted before it can be used.

Explanation

Action

BPCSS0035E The user does not have the required authority to complete the task or command.

Explanation

The level of authority that is required for the task or command depends on the type of resource that the user is managing.

This error can occur in the following situations:

- For IBM SONAS resources, if the user is an rssh restricted account and can issue only a restricted set of commands on the resource.
- For IBM Spectrum Scale, if the user that is used to log on to the cluster node does not have privileges to monitor the GPFS cluster. The user must have root privileges on the cluster node or have privileges to run a set of specified administration commands using the sudo command. For information about monitoring IBM Spectrum Scale without requiring root privileges, go to the IBM Knowledge Center at http://www.ibm.com/support/knowledgecenter/search/tpch_t_configuring_sudo_access?scope=SSQRB8.

Action

Ensure that the user has the required permissions to complete the task.

BPCSS0036E Cannot connect to the storage system or cluster.

Explanation

The device that is being added might not be up and running.

Also, the IP address, host name, or user credentials entered for the storage system or cluster might not be valid.

Action

Verify that the device is up and running.

Also, make sure that the IP address, host name, and user credentials are correct for the device that is being added. Reenter the values and click Add again.

BPCSS0037W The device cannot be reached.

Explanation

The current attempt to retrieve a set of performance data from the device failed.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and data source (if applicable) are operational.

Also, ensure that a network path exists between the IBM Spectrum Control server and the device or data source, including any appropriate firewall pass-throughs.

If nothing is wrong with the device or device agent, or with the network path, try canceling and restarting the performance monitor job.

If the problem is still not resolved, contact IBM Support.

Related reference

- [🔗 Getting support](#)

BPCSS0038E The device or device agent did not respond within the allotted time.

Explanation

When retrieving performance statistics for the device, the requested performance data was not returned before the timeout expired.

Either the device or agent is unresponsive, or is much slower than expected.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational.

It might be necessary to restart either device or agent, if it is in a hung state.

If you have reason to believe that the device and agent are operational but are slower than expected, you can also attempt to increase the timeout value that is used by the performance manager, which is set in configuration file `device/conf/pm.conf`.

BPCSS0039E The host name or IP address {0} is not valid.

Explanation

The IP address or host name entered for the device is not valid.

Action

Make sure that the IP address and host name are valid for the device being added.

Reenter the IP address or host name and click Add again.

BPCSS0040E The host name or IP address is not valid.

Explanation

The IP address or host name entered for the device is not valid.

Action

Make sure that the IP address and host name are valid for the device being added.

Reenter the IP address or host name and click Add again.

BPCSS0041E Cannot connect to the device.

Explanation

The storage device with this IP address cannot be reached.

Action

Ensure that the IP address of the storage device is correct and that the device is running properly.

If the problem persists, contact IBM Support

Related reference

- [Default locations of log files](#)

BPCSS0042E Cannot connect to the SNMP data source.

Explanation

A test connection cannot be established to the data source at the specified IP address.

This error might occur if the data source is not available or the SNMP community is entered incorrectly.

The SNMP community name is shared by one or more SNMP hosts and is used to authenticate messages that are received by those hosts.

BPCSS0043E Passphrase is incorrect.

Explanation

The passphrase for the truststore is incorrect.

Action

Provide the correct passphrase.

BPCSS0044E Passphrase is required.

Explanation

The passphrase for the truststore is missing.

Action

Provide the missing passphrase.

BPCSS0045E Access to the device is denied. Ensure that valid credentials are specified.

Explanation

When retrieving performance statistics for the device, access is denied by the device or the device agent.

Therefore, no performance statistics could be retrieved. No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the correct agent address is specified, and that the specified credentials are valid and allow access to the device or agent for performance data collection.

The credentials usually consist of a user name and password, but can also encompass other security-related parameters such as ssh keys or authentication tokens, depending on the type of device or agent that is being accessed and, where applicable, the access method selected.

BPCSS0046E Verify that the private key that was provided was in the OpenSSH file format. If it is in another format, it needs to be converted before it can be used.

Explanation

Action

BPCSS0047E New performance data is not yet available for the device.

Explanation

In case performance data is cached by the device or device agent., the performance manager ensures that the most recently retrieved performance statistics are indeed newer than the previously retrieved statistics.

If the time stamp in the message is "null", then no statistics were previously retrieved, and the performance manager is unable to get ANY statistics for the device.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational.

It might be necessary to restart either device or agent, if it is in a hung state.

Ensure that if the device has multiple clocks (for example for multiple nodes or controllers), that the clocks are synchronized to within a few minutes.

BPCSS0048E The parameter for the Performance Manager API is invalid.

Explanation

The parameter value passed as argument on the Performance Manager API call is invalid.

The method called returns this error indicator.

Action

Refer to the method or class documentation to determine the allowed values for the particular parameter.

Modify the caller of this method to pass a valid value to the API.

BPCSS0049E Schedule is not enabled for the resource *resource*.

Explanation

Schedule is not enabled. Cannot be started.

Action

In order to be started the job should be enabled first.

BPCSS0050W Performance data could not be collected for device *device name* because the device or data source cannot be reached (reason *reason code*). The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

The immediate operation of the running performance monitor is unaffected.

The reason code can be used to help identify the exact cause of the problem encountered:

- Reason Code 0 indicates that the exact reason for the failure could not be determined.
- Reason Code 1 indicates a bad target (device or data source) address. This condition can occur when the user-specified host name or IP address, or the target port number are invalid such that they would cause the formation of an invalid URL or IP address. This type of failure is rare and can usually also be identified by a `java.net.UnknownHostException` printed in the trace logs.
- Reason Code 2 indicates the problem to be an unknown target address. This condition can occur when a host name rather than an IP address was specified as target address, and:
 - either the network is down,
 - the specified host name cannot be resolved (for example, the name server cannot be contacted, or the name server is down, or the specified host name is not known to the name server), or
 - the specified host name can be resolved by the name server but no longer exists on the network.

This type of failure can usually also be identified by a `java.net.UnknownHostException` printed in the trace logs.

- Reason Code 3 indicates the problem to be an unreachable target address. This condition can occur when an IP address rather than a host name is specified as target address, and either the network or a part of the network is down or is blocked by a firewall (the host cannot be contacted), or the specified IP address does not exist on the network. This type of failure can usually also be identified by a `java.net.NoRouteToHostException` in the trace logs.
- Reason Code 4 indicates the problem to be an unresponsive target. This condition can occur when the target server is powered off, or when the server is not listening on the port, which is the target of the communication. For example, when the web server or SMI-S provider is not operational. This type of failure can

usually also be identified by a `java.net.ConnectException` printed in the trace logs.

- Reason Code 5 indicates a communication timeout for communication that uses UDP rather than TCP, for example when you use SNMP data sources. This condition can occur when the target server cannot be reached, or when the SNMP data source is disabled on the target server, or when the SNMP port (161) is blocked by a firewall.

Action

If the problem persists for an hour or longer, ensure that your device and data source (if applicable) are operational.

Also, ensure that a network path exists between the IBM Spectrum Control server and the device or data source, including any appropriate firewall pass-throughs.

If nothing is wrong with the device or device agent, or with the network path, try canceling and restarting the performance monitor job.

If the problem is still not resolved, contact IBM Support.

Related reference

- [Getting support](#)

BPCSS0051E The device or device agent did not respond within the allotted time (*timeout value*seconds).

Explanation

When retrieving performance statistics for the device, the requested performance data did not return before the timeout expired.

Either the device or agent is unresponsive, or is much slower than expected.

No performance data is inserted for the device in this time period.

The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational.

It might be necessary to restart either device or agent, if it is in a hung state.

If you have reason to believe that the device and agent are operational but are slower than expected, you can also attempt to increase the timeout value that is used by the performance manager, which is set in configuration file `device/conf/pm.conf`.

BPCSS0052W Performance data continuity is broken. The device might have been reset or rebooted. *record count* performance data records were discarded.

Explanation

This message indicates that invalid performance information was received from the device.

In general, performance information is represented as a set of ever-increasing counters, and actual statistics are computed by taking the difference between two consecutive sets of such counters.

However if a counter appears to have decreased instead of increased between consecutive sets, the information is unusable and is discarded.

Note that counters can be expected to decrease if they are reset to zeroes, which might happen normally when a device is reset or rebooted (for example when new firmware is loaded), or in some cases when a device agent (CIMOM for example) is reset or rebooted.

In those situations, this warning message can be safely ignored.

If this warning occurs when no reset or reboot has occurred, the device or device agent might be generating incorrect performance statistics, and you might have to contact your device vendor for further instructions.

Action

Determine if the device or device agent has been reset or rebooted.

Those situations include loading of new firmware, or fail-over and fail-back scenarios for ESS, DS6000, and DS8000 storage subsystems.

In any of these cases, the reset of performance counters is expected behavior, and this warning message can be safely ignored.

If not one of these cases, the device might be generating incorrect performance data, which might or might not lead to inaccurate performance reports.

Contact your device vendor for further instructions in those cases.

BPCSS0053W No valid performance data was provided by the monitored resource. Zero performance data records were inserted into the database.

Explanation

The performance monitor contacted the resource and tried to collect data. However, the resource did not provide valid performance counter information.

If message HWNPM2124W is also displayed, the resource was able to provide performance data, but it was determined to be invalid and discarded.

Action

The operation of the performance monitor is not affected, and it will attempt to retrieve performance data again for the next sample interval.

If the monitored resource continues to provide no performance data, ensure it is fully operational.

Where appropriate, also ensure that performance functionality is enabled for the resource.

BPCSS0054E A timeout occurred while polling the performance statistics for this device: *device name*

Explanation

The performance collection did not complete in specified time.

Action

The operation of the performance monitor is not affected, and it will attempt to retrieve performance data again for the next sample interval. If the monitored resource continues to receive timeout, ensure that it is fully operational. If appropriate, also ensure that performance functionality is enabled for the resource.

BPCSS0055E Performance data was not collected for device *device name* due to error *error trace*. The current samples are skipped.

Explanation

The performance collection encountered an unknown error.

Action

The operation of the performance monitor is not affected, and it will attempt to retrieve performance data again for the next sample interval. If the monitored resource continues to receive timeout, ensure that it is fully operational. If appropriate, also ensure that performance functionality is enabled for the resource.

BPCSS0056E The last performance Data Collection was not readable for device *device name*, the collection failed with error *error trace*.

Explanation

The read operation of the last collected performance data failed.

Action

The last collected performance data might be corrupted. Restart the Data Collection or add the device again.

BPCSS0057E Cannot connect to the switch with the provided IP address, host name, protocol, and port.

Explanation

One or more of the following details for the switch are incorrect: IP address, host name, protocol, port.

Action

Enter the correct IP address, host name, protocol, and port for the switch. Make sure that the switch meets the minimum version requirements and is configured to use the specified protocol.

BPCSS0058E Cannot authenticate to the switch with the provided user name and password.

Explanation

One or more of the following details for the switch are incorrect: User name, password.

Action

Enter the correct user name and password for the switch.

BPCSS0059E The specified user name does not have the required permissions for the switch.

Explanation

The user name is a valid user on the switch, but does not have the chassis-role permission.

Action

Specify another user name that has the chassis-role permission. Alternatively, enter another user name and password for the switch.

BPCSS0112I The probe was stopped. This action was requested by user *name*.

Explanation

Metadata will not be collected about the device until the probe is restarted.

Action

Restart the probe, as needed. To start a probe, complete these steps:

1. From the menu bar, go to the resource list page for a resource type. For example, to start a probe for a block storage system, select Resources > Block Storage Systems.
2. Right-click the resource and select Data Collection > Start Probe.

BPCSS0113I The probe is stopped.

Explanation

No metadata will be collected about the device until the probe is restarted.

Action

Restart the probe, as needed. To start a probe, complete these steps:

1. From the menu bar, go to the resource list page for a resource type. For example, to start a probe for a block storage system, select Resources > Block Storage Systems.
2. Right-click the resource and select Data Collection > Start Probe.

BPCSS0114I The probe is starting at an interval of *interval interval units*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device.

BPCSS0115I The probe interval was updated to *interval*. This change was requested by *user name*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device at the new interval.

BPCSS0116I The probe interval was updated to *interval*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device at the new interval.

BPCSS0117I The probe is enabled. This action was requested by *user name*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device.

BPCSS0118I The probe is enabled.

Explanation

The probe will collect status, configuration, and capacity metadata about the device.

BPCSS0119I The probe is disabled. This action was requested by *user name*.

Explanation

Status, configuration, and capacity metadata will not be collected about the device.

BPCSS0120I The probe is disabled.

Explanation

Status, configuration, and capacity metadata will not be collected about the device.

BPCSS0123I The Probe collection interval is enabled and updated to *interval*. This action was requested by *user name*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device at the new interval.

BPCSS0124I Probe interval is enabled and updated to *interval*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device at the new interval.

BPCSS0105I Probe is starting at an interval of *interval interval units*. This action was requested by *user name*.

Explanation

The probe will collect status, configuration, and capacity metadata about the device at the new interval.

BPCUI0000E The action can't be completed because the following error occurred: *Error message text.*

Explanation

The specified error occurred while processing a request.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available and a firewall is not preventing network access to product services and agents.
- Check the status of the product servers and database repository on the Home > System Management page.
- On Windows, verify that the related database services are active.
- Check for error messages in the log files for the servers.

If the problem persists, check the product's log files for error messages that might help determine the problem. For information about the location of log files, check the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

BPCUI0001E An action could not be completed and the following error message was generated: *TPCRemoteException message*

Explanation

The action could not be completed because of an error related to the Device server component.

Action

Try the following actions:

- Check the status of the Device server on the Home > System Management page.
- Check for error messages in the log file of the Device server.
- Verify that that the database repository is up and running.
- Try the action again.

Related reference

BPCUI0002E Failed to retrieve the requested data because the service is unavailable.

Explanation

Data cannot be retrieved from the database repository. This problem might occur if the database repository is unavailable or communication with the database cannot be established.

Action

Verify that the database repository is up and the related database service is active. Ensure that all required servers are running and that the local area network is available. Verify that you have a network connection to the server on which the database repository is located. Check the log files of the servers for error messages that might help determine the problem. See the product information center for the location of these log files.

BPCUI0003E The NAPI with the IP address *Napi IP* was not added because of an Internal Error

Explanation

Action

BPCUI0004E The SSH private key for the NAPI *Napi IP* could not be uploaded

Explanation

Action

BPCUI0005E The action cannot be completed because the following internal error has occurred: *message*.

Explanation

An error occurred while processing a user request.

Action

Wait a few minutes and try again. If you still can't complete the action, go to your Products and services page (<https://myibm.ibm.com/products-services/>) on IBM Marketplace. Click the down-arrow for the Storage Insights offering, click Support, and then choose an option.

BPCUI0007E The discovery job failed to complete.

Explanation

No storage resources were detected because the discovery job did not complete.

Action

Check the Device server log files for error messages that might help determine why the discovery job failed. For the location of the log files, go to IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/> and view the Reference section.

BPCUI0009E The SSH key could not be loaded for the following reason: *IOException message*

Explanation

Upload of the file failed. Please retry the upload.

BPCUI0010E The host name or IP address that you entered is a *resource_type*, but you selected to add a different type of storage system.

Explanation

The model of the storage system that you add must match the type of storage system that you selected to add.

BPCUI0011E The Device Server did not discover any device

Explanation

The Device Server did not discover any device

BPCUI0012E Cannot connect to the device with the address *Ip Address*.

Explanation

The storage device with this IP address cannot be reached.

Action

Verify that the provided user name, password, and address for the device are correct. Make sure that the Device server is running and that the local area network is available. If the problem persists, check the Device server log files for error messages that might help determine the problem.

BPCUI0019E No data is available for this selection.

Explanation

No data is available for this selection.

BPCUI0025E Probe job *job Id* failed.

Explanation

The probe job failed. The log will provide detailed information.

Action

BPCUI0029E Invalid parameter *param* passed.

Explanation

An invalid parameter was passed.

Action

BPCUI0030I This task was already executed.

Explanation

You are attempting to execute, schedule, or delete a task that was already executed. The task was possibly executed by another user.

Action

No action is required.

BPCUI0032E An unexpected response was received from the server.

Explanation

To find the cause of the issue, further investigation is required.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available.
- Check the status of the product servers on the Home > System Management page.
- Verify that the database repository is available.
- Verify that the related database service is active.
- Check for error messages in the log files for the servers.

If you need more information, go to the IBM Knowledge Center and check the Administering section. You can access the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93>. If you cannot resolve the issue, contact IBM Support.

BPCUI0034E Invalid number of runs to keep for each schedule. The number should be between *param1* and *param2*.

Explanation

The entered number of runs to keep is not in the valid range. Please enter a valid number.

Action

BPCUI0035E Invalid number of days' worth of log-files to keep. The number should be between *param1* and *param2*.

Explanation

The entered number of days' worth of log-files to keep is not in the valid range. Please enter a valid number.

Action

BPCUI0036E The schedule id *scheduleID* associated with this job is no longer valid. It might have been deleted. Refresh the view and try again.

Explanation

The requested schedule does not exist in the database. It was either deleted in the meantime or the provided schedule id is not valid

Action

BPCUI0037E The replication server is not installed or is unavailable.

Explanation

The replication server cannot be reached. This condition might occur if the server is not installed or is unavailable.

Action

Verify that the replication server is installed and the local area network is available. If the server is installed, ensure that it is running and then try to add the resource again. If the server is not installed, run the product's installation program to install it and then try to add the resource again.

BPCUI0038E Invalid number of days to retain alerts. The number should be between *param1* and *param2*.

Explanation

The entered number day to retain alerts is not in the valid range. Please enter a valid number.

Action

BPCUI0039E A Storage Resource agent cannot be found.

Explanation

This problem might occur if a Storage Resource agent was not installed locally or was disabled.

Action

Verify that a Storage Resource agent is installed locally and is enabled. To determine if an agent is enabled on a server, go to the Servers page in the product, locate the server, and check the value in the Agent State column.

BPCUI0040E Parsing results from a call to the Data server failed with the following error message: *param1*.

Explanation

An issue was encountered while trying to parse results that were returned from a call to the Data server. This could be due to corrupted data sent from the data server, or to network problems, or other causes.

Action

Verify that the Data server is running properly and that the network is not experiencing difficulties.

BPCUI0042E Communication with the Data Server failed with the following error: *param1*

Explanation

Unable to contact the data server.

Action

Use the above error message to identify the cause of the problem. Verify that the data server, service, and port are all running properly and that database repository and the network are working properly.

BPCUI0043E Cannot connect to the Data server.

Explanation

The user interface cannot communicate with the Data server. This error might occur if the Data server is down, the Data server is in maintenance mode while updating agents or the local area network between the user interface and the Data Server is unavailable.

Action

Verify that the Data Server is up and running. Ensure that the Data server is not in maintenance mode and that the local area network is available. If the problem persists, check the Data server log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

If not already done, set the maximum level of tracing for the Data server to aid in resolution of the problem.

BPCUI0044E The entity was not found in the database.

Explanation

This error might occur if the entity was already deleted.

Action

BPCUI0045E Host name length exceeds the 255 character limit

Explanation

The host name must be less than or equal to 255 characters

Action

BPCUI0046E Report '*configurationId*' not found

Explanation

Post installation script may have failed.

Action

BPCUI0047E Parameter '*parameterName*' is not defined in report *configurationId*

Explanation

Parameter name could be incorrect or the parameter is not defined in report.

Action

BPCUI0048E No property is not defined for report *configurationId*'

Explanation

Parameter name could be incorrect or the parameter is not defined in report.

Action

BPCUI0049E No such property *propertyName* for report *configurationId*'

Explanation

Parameter name could be incorrect or the parameter is not defined in report.

Action

BPCUI0050E *variableName* can not be overridden

Explanation

Value for reportOutputFormat can be modified.

Action

BPCUI0051E *variableName* not valid report output format.

Explanation

PDF,XML,CSV,HTML,SINGLEXLS,SPREADSHEETML,XLWA are valid report output format.

Action

BPCUI0052E *variableName* not reachable

Explanation

TCR URL may not be reachable.

Action

BPCUI0053E Cannot authenticate with the provided user credentials.

Explanation

The user name or password that was entered for the device is not correct.

Action

Make sure that the user name and password are correct for the device that is being added. Reenter the user name or password and click Add again. If you are adding a Storwize V7000 Unified storage system, specify the IP address of the block component, not the filer component.

BPCUI0054E The host name or IP address {0} is not valid.

Explanation

The IP address or host name that was entered for the device is not valid.

Action

Make sure that the IP address and host name are valid for the device that is being added. Reenter the IP address or host name and click Add again.

BPCUI0055E Cannot connect to the storage system.

Explanation

This problem might be caused by the following conditions:

- For DS8000 storage systems, this problem might occur because the DS8000 ESSNI server is not available or is not allowing connections.
- For all storage systems, this problem might be caused by the values for connection protocols. IBM Spectrum Control uses different connection protocols to connect to resources. The default values of the connection protocols were changed for different releases of the products, which might cause connection failures.

Action

To resolve the problem, try the following actions:

- For DS8000 storage systems, verify that the ESSNI server is up and running. Use a tool such as ping to verify that the ESSNI server can be reached from the system where the Device server is installed.

If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)
- [Enabling and disabling legacy protocol \(SSLv3 and MD5 hash\)](#)

BPCUI0056E Cannot connect to the storage system or cluster.

Explanation

The device that is being added might not be up and running. Also, the IP address, host name, or user credentials that was entered for the storage system or cluster might not be valid.

Action

Verify that the device is up and running. Also, make sure that the IP address, host name, and user credentials are correct for the device that is being added. Reenter the values and click Add again.

BPCUI0058I No supported resources were discovered on the data source *data_Source_Address*.

Explanation

The resources that were discovered on the specified data source are not supported.

Action

For a list of data sources that you can use with the product, go to the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>.

BPCUI0060I File *param* was successfully uploaded to the Data Server.

Explanation

The file the user selected was successfully uploaded to the Sata Server.

Action

The file should be placed on the Data Server and ready to be used by the deployment job.

BPCUI0061E Upload file type *param* is not supported.

Explanation

The upload file type is not supported.

Action

Check the upload file type and provide a correct file type.

BPCUI0062E The requested action failed with the following error message: *error message*

Explanation

The requested action did not complete, and the specified error message was returned.

Action

BPCUI0063E Cannot find jobs for *scheduleId param* and *deviceId param*. No logs are displayed.

Explanation

Jobs related to the schedule and device are not available.

Action

Verify that the schedule was run for the device.

BPCUI0064E A log file cannot be displayed for the job.

Explanation

The selected job does not have an associated job log file.

Action

Verify that the database repository is up and the related database service is active. Ensure that all required product servers are running and that the local area network is available. To check the status of the servers, go to the Home > System Management page.

You can also check the log files of the servers for error messages that might help determine the problem.

For information about how to determine if the database repository is active, if the product servers are running, and the location of log files, go to the IBM Knowledge Center and check the Administering section. You can access the IBM Knowledge Center for the product at <http://www.ibm.com/support/knowledgecenter/SS5R93>.

BPCUI0065E The job log file cannot be accessed. The log file may have been manually removed or may have been deleted because it was older than *retain_days* days or it exceeded the maximum number of *no_of_lofs* runs.

Explanation

The job log file cannot be accessed. The log file may have been manually removed or may have been deleted because it was older than the specified number of days or it exceeded the maximum number of runs.

Action

Verify that the log file exists in the specified location.

BPCUI0067E The schedule for collecting status and asset data cannot be created.

Explanation

If you can't schedule a probe to collect data about a resource, it might mean that the product servers are down or the local area network is not available.

Action

Ensure that all required product servers are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

BPCUI0068E A proposed schedule for collecting status and asset data cannot be created.

Explanation

No further explanation required.

Action

Ensure that all required product servers are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

BPCUI0069E The proposed schedule for collecting status and asset data cannot be deleted.

Explanation

No further explanation required.

Action

Ensure that all required product servers are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

BPCUI0071E The task *task_name* could not be completed.

Explanation

An error prevented the task from completing. For further details, consult the system log file.

Action

Check the trace.log file in the logs directory for entries mentioning the failed task. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCUI0072E Cannot connect to the Device server. Verify that the database service and Device server are running, and that the Device server is accessible.

Explanation

The Device server is unavailable. This error might occur if the Device server is down or the local area network is unavailable.

Action

Verify that the database service and Device server are up and running. Ensure that you have a network connection to the server on which the Device server is located. Try the action again.

BPCUI0073E Can't make a connection to the *storage_resource* storage resource.

Explanation

The connection to the resource with the host name or IP address that was specified was unsuccessful.

Action

Complete the following tasks:

- Check that the correct host name or IP address of the storage resource was entered.
- Check whether you have a network connection to the storage resource that was specified.
- Check whether the server that hosts the product is up and running.

BPCUI0074E The wizard could not set an attribute for the storage resource.

Explanation

The wizard could not set a user-defined attribute for the storage resource because an error occurred on the Device server. Examples of user-defined attributes include the location and display name of the storage resource.

Action

Ensure that the Device server is running and that the local area network is available. If the problem persists, check the Device server log files for error messages that might help determine the problem. See the product information center to view the locations of the log file.

BPCUI0075E The certificate wasn't saved on the server.

Explanation

Certificates are saved to a repository called a truststore. The certificate for this device could not be saved to the truststore.

Action

Ensure that all required product servers are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

BPCUI0076W The initial job to collect status and asset data did not start.

Explanation

The wizard cannot start a job for collecting status and asset data from the storage resource.

Action

Ensure that the Device server is running and that the local area network is available. If the first scheduled job to collect status and asset data also does not start, check the Device server log files and Data server log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0077E A failure occurred loading the certificate.

Explanation

Loading of a certificate to the truststore failed for an unknown reason.

Action

Contact IBM

Related reference

- [Getting support](#)

BPCUI0078I The certificate was loaded successfully.

Explanation

The user has successfully loaded a certificate into the server's truststore.

Action

No action is required.

BPCUI0079E The SSL certificate is not in the expected format.

Explanation

Loading of a certificate to the truststore failed because the certificate was not in the x.509 format.

Action

Ensure that the certificate being loaded is in the X.509 format.

BPCUI0084W The wizard could not retrieve the default interval information for performance monitoring.

Explanation

The wizard could not retrieve the default interval information for the device from the Device server. The interval value represents the number of minutes over which performance data is averaged.

Action

Ensure that the Device server is running and that the local area network is available. Check the Device server log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0085E The user name or password for the *hypervisor or vCenter* hypervisor or vCenter Server is invalid.

Explanation

The user name or password is not valid for the specified hypervisor or vCenter Server.

Action

To resolve the problem, try the following actions:

- Ensure that you specified the correct host name, user name, and password for the hypervisor or vCenter Server.
- Verify that the local area network is available and that you can connect to the hypervisor or vCenter Server.
- Ensure that the Device server is running.
- Check the Device server log files for error messages that might help to determine the problem. For the location of these log files, search the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

BPCUI0086E The SSL certificate is invalid for the *hypervisor or vCenter hypervisor or vCenter Server*, or the firewall is blocking access to it.

Explanation

The product cannot communicate with the hypervisor or vCenter Server.

Action

To resolve the problem, try the following actions:

- Ensure that the SSL certificate file is valid for the hypervisor or vCenter Server.
- Verify that the local area network is available and that you can connect to the hypervisor or vCenter Server.
- Ensure that any required firewall authorization was granted.
- Ensure that the Device server is running.
- Check the Device server log files for error messages that might help to determine the problem.

If you need more information, go to the IBM Knowledge Center and check the "Administering" section. You can access the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/welcome>.

BPCUI0087E The version of the *hypervisor or vCenter hypervisor or vCenter Server* is not supported.

Explanation

You can manage only the supported versions of hypervisors and vCenter Servers.

Action

Check the product support site at www.ibm.com/support/docview.wss?uid=swg27039840 for a list of hypervisor and vCenter Server versions that are supported.

BPCUI0088E The host name, protocol, or port for the *hypervisor or vCenter hypervisor or vCenter Server* is invalid, or the hypervisor or vCenter Server is unreachable.

Explanation

The specified host name, protocol, or port number is invalid and cannot be used to communicate with the hypervisor or vCenter Server, or the hypervisor or vCenter Server is unreachable.

Action

To resolve the problem, try the following actions:

- Ensure that you specified the correct host name, protocol, and port number for the hypervisor or vCenter Server.
- Verify that the local area network is available and that you can connect to the hypervisor or vCenter Server.
- Ensure that the Device server is running.
- Check the Device server log files for error messages that might help to determine the problem. For the location of these log files, search the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

BPCUI0089W Cannot retrieve a valid set of data collection intervals for performance monitoring.

Explanation

Monitored devices have a specific set of intervals that determine how often their performance data can be collected. For this device, the interval information could not be retrieved from the Device server.

Action

Ensure that the Device server is running and that the local area network is available. Check the Device server log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0090I All alerts were removed.

Explanation

This message is for informational purposes only

Action

No further action is required

BPCUI0091W *error_count* of *total_count* alerts were not removed.

Explanation

>Not all the acknowledged alerts were removed in the alert log..

Action

>Ensure that the local area network is available. Verify that the Device server and Data server are running, and that the database is operational. Check the product log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0093I No data path is available for *deviceNameVariable*.

Explanation

The selected device either does not have a data path or the devices for the data path are not known to the system.

Action

There is no action if the device does not have a data path. If the device is part of a data path, ensure the other devices are added to the system and probed.

BPCUI0094E Authorization failed due to an internal error.

Explanation

The authorization infrastructure was not initialized successfully.

Action

Contact IBM support.

BPCUI0098E The current user is not authorized to perform the requested function.

Explanation

The role assigned to the current user does not have sufficient privileges to perform the requested function.

Action

Request additional privileges from the storage administrator.

BPCUI0099E The storage resource is not available.

Explanation

The storage resource is not being monitored and cannot be displayed. This problem might occur if a bookmark in the web browser was used to access the page for the storage resource, but that resource is no longer being monitored.

This problem might also occur if the product servers are down or the local area network is not available.

Action

To resolve the problem, try the following actions:

- Remove the bookmark for the storage resource from the web browser.
- Monitor the resource again. To add the storage resource for monitoring, go to the Storage Systems page in the GUI and select Add Storage System. See the online help for information about how to add a storage resource for monitoring.

If the storage resource is being monitored and you receive this error message, try the following actions:

- Ensure that all required product servers and services are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.
- Check for error messages in the log files for the servers.

If you need more information, go to the IBM Knowledge Center and check the Administering section. You can access the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93>. If the problem continues, contact IBM Software Support.

BPCUI0108I All informational alerts were marked as acknowledged.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BPCUI0110W Some informational alerts were not marked as acknowledged.

Explanation

Not all of the informational alerts were marked as acknowledged in the alert log.

Action

Ensure that the local area network is available. Verify that the Device server and Data server are running, and that the database is operational. Check the product log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0111I All alerts were marked as acknowledged.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BPCUI0112I *success_count* alerts were removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BPCUI0113I The alert was removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BPCUI0114I All acknowledged alerts were removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BPCUI0116W Some acknowledged alerts were not removed.

Explanation

Not all of the acknowledged alerts were removed from the alert log.

Action

Ensure that the local area network is available. Verify that the Device server and Data server are running, and that the database is operational. Check the product log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0120W Some acknowledged alerts were not marked as unacknowledged.

Explanation

Not all the acknowledged alerts were changed to unacknowledged in the alert log.

Action

Ensure that the local area network is available. Verify that the Device server and Data server are running, and that the database is operational. Check the product log files for error messages that might help determine the problem. See the product information center to view the locations of these log files.

BPCUI0121E Unable to communicate with the product server. Make sure that the server is running properly.

Explanation

The most recent request that was sent to the Web server did not complete. This problem might occur if communication with the server cannot be established, or if the local area network is unavailable.

Action

To resolve this problem, try the following actions:

- Go to the Home-System Management page in the GUI and ensure that the Web server is active.
- Verify that the local area network is available.
- Verify that you have a network connection to the computer on which the server is located.
- Check the log files for error messages that might help determine the problem. If you need more information, go to IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93> and check the Administering section.

If the problem continues, contact IBM Software Support.

BPCUI0122E No job log file was created for this job run.

Explanation

The server did not create a job log for the job run.

Action

Ensure that all required product servers and services are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

BPCUI0123E The action cannot be completed.

Explanation

An error occurred when the server tried to process a request. This message might occur when a request is not handled correctly by the internal framework.

Action

Ensure that all required product servers and services are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page.

Check the log files of the servers and web-based GUI for error messages that might determine the problem. See the product documentation for the location of the log files.

BPCUI0124E An unexpected error occurred during the execution of the action.

Explanation

While executing the action, an unexpected error occurred.

Action

Contact IBM Support.

- [Getting support](#)

BPCUI0129I Alerts that were migrated from a previous version of the product are not shown on this page.

Explanation

Alerts are generated when certain conditions are detected on monitored resources. The version of the product that detected an alert determines where information about the alert is displayed. Alerts that were generated in recent versions of the product are displayed on the Alerts page and also on the detail pages of their associated resource. Alerts that were generated in older versions of the product, also called migrated alerts, are only displayed on the Alerts page.

Action

If you migrated alerts from a previous version, go the Alerts page to view the full list of all historical alerts for the resource that is being displayed. To access the Alerts page, click the link in the message or select Alerts from the menu.

This warning message is shown only if one or more migrated alerts still exist in the database. When all migrated alerts are either manually deleted or become old enough to be deleted automatically, this warning is no longer displayed. Alternatively, you can suppress the warning message by clicking Don't show this again in the warning message window.

BPCUI0130E The alerts cannot be acknowledged because they were deleted.

Explanation

None of the alerts were marked as acknowledged in the alert log because these no longer exist in the database.

Action

No further action is required.

BPCUI0131E The alerts cannot be unacknowledged because they were deleted.

Explanation

None of the alerts were marked as unacknowledged in the alert log because these no longer exist in the database.

Action

No further action is required.

BPCUI0132W *success_count* alerts were marked as acknowledged. *unsuccess_count* alerts cannot be marked as acknowledged because they were deleted.

Explanation

Not all of the alerts were marked as acknowledged in the alert log because these no longer exist in the database.

Action

No further action is required.

BPCUI0133W *success_count* alerts were marked as unacknowledged. *unsuccess_count* alerts cannot be marked as unacknowledged because

they were deleted.

Explanation

Not all of the alerts were marked as unacknowledged in the alert log because these no longer exist in the database.

Action

No further action is required.

BPCUI0134E The alert cannot be acknowledged because it was deleted.

Explanation

The alert was not marked as acknowledged in the alert log because this no longer exist in the database.

Action

No further action is required.

BPCUI0135E The alert cannot be unacknowledged because it was deleted.

Explanation

The alert was not marked as unacknowledged in the alert log because this no longer exist in the database.

Action

No further action is required.

BPCUI0136E The device was not removed because the action is not supported for devices of type *devType*.

Explanation

An internal operating error occurred. Check the logs for an indication of an error or exception and contact IBM customer support.

Action

Check the logs for an indication of an error or exception and contact IBM customer support.

BPCUI0137E Input text provided has invalid character(s): *characters*. Input text: *text*

Explanation

Action

Please do not use the characters which are not allowed in the input.

BPCUI0141E Host name or IP address *hostname* specified on line *line* of file *file* is not valid.

Explanation

The specified host name or IP address in the file is not valid.

Action

Enter a valid host name or IP address. Host names must be less than 255 characters in length, contain letters 'a' through 'z' or digits '0' through '9'. Hyphens are allowed as long as it is not the leading or trailing character in the host name.

BPCUI0143E Host port WWPN *wwpn* specified on line *line* of file *file* is not valid.

Explanation

The specified WWPN in the file is not valid.

Action

Enter a valid host port WWPN. WWPNs must be 16 hexadecimal characters in length with no other characters.

BPCUI0144E Duplicate server *name* specified on lines *line1* and *line2* of file *file*.

Explanation

The file contains duplicate entries for the same server.

Action

Ensure the file contains one entry per server to create.

BPCUI0145E Could not parse file *file*.

Explanation

The attempt to parse the file failed.

Action

Verify the correct file was specified or the file is in the correct format.

BPCUI0146E Could not parse file *file*. Invalid entry on line *line*.

Explanation

The attempt to parse the file failed.

Action

Verify the correct file was specified or the file is in the correct format.

BPCUI0148I Successfully deleted server *server_name*.

Explanation

The server was successfully deleted.

Action

No action is required.

BPCUI0149I Successfully modified ports of server *server_name*.

Explanation

The ports of the server were successfully modified.

Action

No action is required..

BPCUI0150I The server was created.

Explanation

The server was created.

Action

The server was created.

BPCUI0151E The host name or IP address is associated with another resource.

Explanation

The same host name or IP address cannot be used to connect to different resources.

Action

Enter a host name or IP address that is not associated with a resource that was already added for monitoring.

BPCUI0152I The data source *data_Source_Address* was successfully added as a data source for monitoring. The following new resources were detected:

Explanation

You cannot configure resources that are already being monitored. Only resources that are newly discovered or are not included in a data collection schedule can be added for monitoring.

Action

No action is required.

BPCUI0155W You cannot provision volumes because there is no Fibre Channel host port information for at least one server.

Explanation

To provision a volume to a server by using the Provision Storage wizard, the server must have at least one Fibre Channel host port. If you are provisioning to a single server, the server does not have a Fibre Channel host port. If you are provisioning to multiple servers, at least one of the servers does not have a Fibre Channel host port.

Action

To request volumes by using the Provision Storage wizard, ensure that all the selected servers have Fibre Channel host ports.

BPCUI0156W You cannot provision volumes to servers that use different operating systems.

Explanation

To provision a volume to multiple servers by using the Provision Storage wizard, the servers must all be running the same operating system type.

Action

To provision volumes to multiple servers, make sure that you select servers that all run the same operating system type. The OS Type column on the Servers page displays the operation system type.

BPCUI0157W You cannot provision volumes to servers and virtual machines at the same time. To provision volumes, ensure that you select either only servers or only virtual machines.

Explanation

By using the Provision Storage wizard, you can provision volumes to multiple servers or to multiple virtual machines. You cannot, however, provision to a combination of servers and virtual machines.

Action

When you open the Provision Storage wizard from the Servers page, make sure that you select only servers or only virtual machines. The Virtual Machines column on the Servers page indicates whether the server is a virtual machine.

BPCUI0158I Volumes are assigned to the hypervisors that host virtual machines. Volumes are not assigned directly to virtual machines.

Explanation

When you provision volumes for one or more virtual machines that do not have NPIV ports, the volumes are assigned to the hypervisors that host the virtual machines.

Action

To assign volumes to virtual machines, wait until the provisioning operation completes. Then, use the hypervisor manager to assign the hypervisor disks to the virtual machines.

BPCUI0159W You cannot provision volumes because at least one of the hypervisors that host the virtual machines is not being monitored. Ensure that all the hypervisors that are hosting the virtual machines that were selected for provisioning were probed.

Explanation

When you provision volumes for one or more virtual machines that do not have NPIV ports, the volumes are assigned to the hypervisors that host the virtual machines. If you are requesting storage for a single virtual machine, that hypervisor that hosts the virtual machine is not being monitored. If you are requesting storage for multiple virtual machines, one or more of the hypervisors that are hosting the virtual machines are not being monitored.

Action

When you request volumes for virtual machines that do not have NPIV ports, make sure all of the hypervisors that host the virtual machines were probed.

BPCUI0160E Duplicate port WWPN *wwpn* specified on lines *line1* and *line2* of file *file*.

Explanation

The file contains duplicate entries for the same server port.

Action

Ensure the file contains ports that are not assigned to more than one server.

BPCUI0162W File *file* does not contain any servers to create.

Explanation

The specified file does not contain any servers to create.

Action

Specify a file which includes entries for servers to create.

BPCUI0166W Optimization cannot be done in place to the subsystem since storage subsystem *param1* and/or its pools belong to more than one capacity pool. Following are capacity pools the subsystem is associated with: *param2*

Explanation

Optimization cannot be done in place to the subsystem since storage system and/or storage pools from the system belong to more than one capacity pools.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0167W Optimization cannot be done in place to the subsystem since storage subsystem *param1* and/or its pools are not part of any capacity pool.

Explanation

Optimization cannot be done in place to the subsystem since storage system and/or storage pools from the system do not belong to any capacity pool.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0168W Optimization cannot be done in place to the server *param1* since storage subsystems or storage pools associated with luns assigned to the server belong to more than one capacity pool. Following are associated capacity pools: *param2*

Explanation

Optimization cannot be done in place to the server since storage systems and/or storage pools associated with luns assigned to the server belong to more than one capacity pools.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0169W Optimization cannot be done in place to the server *param1* since storage subsystems or storage pools associated with luns assigned to the server are not part of any capacity pool.

Explanation

Optimization cannot be done in place to the server since storage system and/or storage pools associated with luns assigned to the server do not belong to any capacity pool.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0170W Optimization cannot be done in place to the storage entity *param1* since storage subsystems or storage pools associated with it belong to more than one capacity pool. Following are associated capacity pools: *param2*

Explanation

Optimization cannot be done in place to the entity since storage systems and/or storage pools associated belong to more than one capacity pools.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0171W Optimization cannot be done in place to the storage entity *param1* since storage subsystems or storage pools associated with it are not part of any capacity pool.

Explanation

Optimization cannot be done in place to the entity since storage system and/or storage pools associated with it do not belong to any capacity pool.

Action

Specify a target capacity pool for optimization or if you want to use in place optimization, refer to the documentation for proper configuration.

BPCUI0172E The operation timed out while waiting for a response from the server.

Explanation

The server did not respond to a request from the GUI. This message is displayed if the server does not respond within the length of time defined for the timeout value.

Action

Ensure that all required servers are running, and that the local area network is available. Verify that you have a network connection to the server that the database repository is located on. Verify that the database repository is up and the related database service is active.

BPCUI0173E File *file* does not exist or is empty.

Explanation

The file does not exist in the specified location or is empty.

Action

Either create the file or select a new one with servers to create.

BPCUI0174E The device does not support the credential mechanism used.

Explanation

The device does not support the credential mechanism used.

Action

Choose another credential mechanism.

BPCUI0175E A required parameter is missing.

Explanation

The highlighted field is missing a required value. As a result, a required parameter in the server request was missing or empty.

Action

Enter a valid value in the highlighted field.

BPCUI0176E The highlighted field contains an invalid value.

Explanation

The highlighted field contains an invalid value. As a result, a parameter in the server request contained an invalid value.

Action

Enter a valid value in the highlighted field.

BPCUI0177E The highlighted field contains a value that is outside of the allowed range. The value must be between *minVal* and *maxVal*.

Explanation

The highlighted field contains a value that is outside of the allowed range. As a result, a parameter in the server request is outside of the allowed range.

Action

In the highlighted field, enter a value that is within the allowed range.

BPCUI0178E A service class with the same name and type already exists.

Explanation

The specified service class name is not unique. A service class with the same name and type already exists in the database and cannot be duplicated.

Action

Enter a different name for the service class you are creating.

BPCUI0179I The service class was created.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCUI0180I Based on the known configuration of storage system host connections, fabric zone aliases, and HBA ports, additional ports may have been added to the selection below.

Explanation

Based on the input host name or WWPN, additional ports were found in the storage system host connection configuration, fabric zone alias configuration, or HBA port configuration.

Action

Remove unwanted WWPNs by clicking the remove icon. Add additional WWPNs by typing them in then clicking the Add button.

BPCUI0181I You selected to add a *expectedDevice* resource, but a *foundDevice* resource was detected and will be added.

Explanation

One or more resources that are managed by the data source are of a different type than expected. However, the resource will still be added for monitoring if you enter its information. For example, if you select to add a SAN Volume Controller, but the discovered resource is a Storwize V7000, this message is displayed. In this case, the Storwize V7000 storage system will be added.

Action

To add the resource that was discovered, continue to enter its information. To add the intended resource, click Add Storage System again and enter the correct IP address for the resource.

BPCUI0182I The data source *data_Source_Address* was added as a data source for monitoring. No new resources were detected.

Explanation

Only resources that are newly discovered or are not included in a data collection schedule can be added for monitoring.

Action

Enter the IP address or host for a different data source or resource to continue.

If you want to modify resources that are already monitored, go to the list page for the resource. For example, to modify a storage system, in the navigation pane select Storage Resources > Storage Systems. Then, right-click the resource and select View Properties. In the properties notebook, modify the values for the resource.

BPCUI0183E The text in the highlighted field exceeds the *maxLength* character limit.

Explanation

The text in the highlighted field is too long.

Action

Enter text in the highlighted field that does not exceed the character limit.

BPCUI0185W Unable to lookup the IP Address for Host Name *hostName*. Enter the IP Address manually.

Explanation

Unable to lookup the IP Address for the given host name.

Action

Manually enter the IP Address.

BPCUI0189I Configuration of SRA deployment and probe schedules were done successfully.

Explanation

Configuration of deployment probe schedules were done successfully.

Action

None.

BPCUI0190W Configuration of SRA finished with some warnings or errors. Check the detail messages.

Explanation

Configuration user trying to make finish with warnings or errors..

Action

Check the accompanying message to take further actions.

BPCUI0191E An internal error occurred while testing conneciton to *param1*.

Explanation

This type of error is usually caused by unexpected run time condition like when Data/Device Server is down or communication to the servrs are interrupted unexpectedly.

Action

Please check the log file for the errors. Correct them and retry the operation.

BPCUI0192E The supplied service class type is invalid.

Explanation

An Invalid service class type was passed to the server.

Action

Contact IBM Software support.

BPCUI0198E The authentication to the SMI-S provider failed.

Explanation

The credentials that you supplied for the connection are incorrect.

BPCUI0199E An `SSLHandshakeException` or `SSLProtocolException` has occurred. This exception might be due to an invalid SLP registration, e.g. 'http' instead of 'https'.

Explanation

An `SSLHandshakeException` or `SSLProtocolException` has occurred.

BPCUI0201E There is a pending delete in process for this SMI-S provider.

Explanation

The specified SMI-S provider is currently being deleted.

BPCUI0202I Success

Explanation

The operation was successful.

BPCUI0203E The selected resources were not removed.

Explanation

None of the resources were removed.

Action

Review the listed of detailed messages for further information.

BPCUI0204W *successfulDeletes* of *attemptedDeletes* of the selected resources were removed.

Explanation

Removing the resources were partially successful, but some warnings occurred.

Action

Review the listed of detailed messages for further information.

BPCUI0205W *successfulDeletes* selected resources were removed, however warnings did occur.

Explanation

The resources were removed however some warnings did occur.

Action

Review the listed of detailed messages for further information.

BPCUI0209E A database operation cannot be completed.

Explanation

An SQL error was encountered when attempting to complete an action on the database repository.

Action

Verify that that the database repository is running properly and the related database service is active. Ensure that all required servers are running and that the local area network is available. Verify that you have a network connection to the server on which the database repository is located. To check the status of the servers, go to the Home > System Management page. Check the log files of the servers for error messages that might help determine the problem. See the product information center for the location of these log files.

BPCUI0210I Device *param1* supports performance monitoring.

Explanation

Performance monitoring is supported on this device.

Action

BPCUI0211E No performance data is available for a resource.

Explanation

A resource is not being managed by the storage management service, so no performance data is available for that resource.

Action

To monitor the storage resource, go to the Storage Systems page in the GUI and select Add Storage System. See the online help for information about how to add a storage resource for monitoring.

BPCUI0212E There is no Secure Shell running at this host/IP.

Explanation

SSH is not running on this host/IP.

Action

Enable SSH on this host/IP and make sure it is running

BPCUI0213E Unsupported Secure Shell protocol was used.

Explanation

Action

BPCUI0214E Invalid public key location for subsystem *param1*.

Explanation

Action

BPCUI0215E Invalid public key format for subsystem *param1*.

Explanation

Action

BPCUI0216E Passphrase was incorrect for subsystem *param1*.

Explanation

Action

BPCUI0217E Unable to transfer the key(s) to the server *param1*.

Explanation

Action

BPCUI0218E The specified private key file format is not supported. Please convert it to Open SSH (.pem) key file format for subsystem *param1*.

Explanation

Action

BPCUI0219E The specified key file or key file name is already linked to another user.

Explanation

Action

BPCUI0220E The IP address that was entered was the address of the management console for the storage system. You must enter the valid IP address of the block component of the storage system.

Explanation

Action

Enter the IP address of the block component. Try to add the storage system again.

BPCUI0221E The IP address you entered is the address of another device's management console.

Explanation

Action

BPCUI0222E The IP address you entered points to a device of another type.

Explanation

This error might occur in situations such as the following:

- You are trying to add a storage system of a certain type, but you enter the IP address for a different type of storage system
- You are trying to add a storage system, but you enter the IP address of a switch
- You are trying to add a storage system, for example IBM Spectrum Scale, but the storage system software is not installed on the device

Action

To resolve the problem, try the following actions:

- Ensure that the host name or IP address is valid for the device type that you are adding
- Ensure that the device is operational
- Try to add the device again

BPCUI0223E Passphrase is required. Specify one for subsystem *param1*.

Explanation

The passphrase for the truststore is missing.

Action

Provide the missing passphrase

BPCUI0224E Cannot connect to a resource because of an SSL certificate error. Troubleshooting information: <http://www.ibm.com/support/docview.wss?uid=swg21976237>

Explanation

This communication problem might be caused by an error with the SSL certificate on the resource.

Action

To learn about how to troubleshoot the problem, go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>.

BPCUI0225I The agent log files for *server_Name* have been collected and copied to *log_Location*.

Explanation

The server successfully collected the Storage Resource agent log files and saved them to the specified location.

BPCUI0226I Discovery of *data_source* is taking longer than expected. Click Close to run the discovery in the background.

Explanation

The process for discovering the resources that are managed by the data source is taking longer than expected. This delay might occur because the network connection is slow, the data source is running slowly, or the data source manages many resources.

Action

To close the window but continue the discovery process in the background, click Close. Try to add the resource again when the discovery is complete.

BPCUI0227E Thin provisioning must be enabled when compression is enabled.

Explanation

The service class cannot be created because compression is enabled but thin provisioning is disabled. It is not possible to create a compressed volume that is not also thin provisioned.

Action

Enable thin provisioning when compression is enabled.

BPCUI0229I 1 resource was added to *name*.

Explanation

The indicated number of resources are now members of the Capacity Pool.

Action

None.

BPCUI0231I *count* resources were added to *name*.

Explanation

The indicated number of resources are now members of the Capacity Pool.

Action

None.

BPCUI0233E The specified host name is already associated with an existing server.

Explanation

You cannot add a server with same host name as a server that is already being monitored.

Action

Enter a host name for a server that is not already being monitored.

BPCUI0234E The specified IP address is already associated with an existing server.

Explanation

You cannot add a server with same IP address as a server that is already being monitored.

Action

Enter an IP address for a server that is not already being monitored.

BPCUI0235E The specified host name and IP address are already associated with an existing server.

Explanation

You cannot add a server with same IP address and host name as a server that is already being monitored.

Action

Enter a host name and IP address for a server that is not already being monitored.

BPCUI0236E The disabling of the agents failed.

Explanation

None of the selected agents were disabled due to errors.

Action

Review the individual detailed error messages.

BPCUI0237E Errors occurred when attempting to disable some of the agents.

Explanation

Disabling some of the agents was successful, however errors did occur on others.

Action

Review the individual detailed error messages.

BPCUI0238W Warnings occurred when attempting to disable *warningCount* of the agents.

Explanation

The agents were successfully disabled, but warnings did occur

Action

Review the individual detailed warning messages.

BPCUI0239I *attemptedCount* of the *selectedCount* selected agents were disabled.

Explanation

All agents that could be disabled did so successfully.

Action

No action.

BPCUI0240E The agents were not enabled.

Explanation

None of the selected agents were enabled due to errors.

Action

Review the individual detailed error messages.

BPCUI0241E Errors occurred when attempting to enable some of the agents.

Explanation

Enabling some of the agents was successful, however errors did occur on others.

Action

Review the individual detailed error messages.

BPCUI0242W Warnings occurred when attempting to enable *warningCount* of the agents.

Explanation

The agents were successfully enabled, but warnings did occur.

Action

Review the individual detailed warning messages.

BPCUI0243I *attemptedCount* of the *selectedCount* selected agents were enabled.

Explanation

All agents that could be enabled did so successfully.

Action

No action.

BPCUI0244I The credentials of an agent were updated.

Explanation

The agent credentials were successfully updated

Action

No action required.

BPCUI0245I The credentials of *updateCount* agents were updated.

Explanation

The agent credentials were successfully updated

Action

No action required.

BPCUI0246E Cannot authenticate to the file module with the provided user credentials.

Explanation

The user name or password that was entered for the file module is not correct.

Action

Make sure that the user name and password are correct for the file module that is being added. Reenter the user name or password and click Add again.

BPCUI0247E Unknown file module key user.

Explanation

The key user that was entered for the file module was not found.

Action

Make sure that the key user is correct for the file module that is being added. Reenter the key user and click Add again.

BPCUI0248E The SSH key could not be loaded for the following reason: *IOException message*

Explanation

Upload of the file failed. Please retry the upload.

BPCUI0249E Passphrase is incorrect.

Explanation

Action

BPCUI0250E Passphrase is required.

Explanation

The passphrase for the truststore is missing.

Action

Provide the missing passphrase

BPCUI0251E Cannot connect to the storage system or cluster.

Explanation

The device that is being added might not be up and running. Also, the IP address, host name, or user credentials that was entered for the storage system or cluster might not be valid.

Action

Verify that the device is up and running. Also, make sure that the IP address, host name, and user credentials are correct for the device that is being added. Reenter the values and click Add again.

BPCUI0252E The host name or IP address {0} is not valid.

Explanation

The IP address or host name that was entered for the device is not valid.

Action

Make sure that the IP address and host name are valid for the device that is being added. Reenter the IP address or host name and click Add.

BPCUI0253E Cannot connect to the data source for the resource with the address *ip_address*.

Explanation

The data source for the storage resource cannot be contacted.

BPCUI0254E Invalid private key location.

Explanation

BPCUI0255W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

You are attempting to add one or more resources to a capacity pool, but the resources are already assigned to another capacity pool. If you continue, the resources will be reassigned to the capacity pool you specified.

Action

BPCUI0256W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

When a storage system is added to a capacity pool, all of its internal resources (storage pools, NSDs, and file systems) are indirectly assigned to that capacity pool. You are attempting to add one or more resources to a capacity pool, but the resources are already indirectly assigned to another capacity pool at the storage system level. If you continue, the resources will be reassigned to the capacity pool you specified. In addition, the storage system will no longer be assigned to its capacity pool. The storage system resources that are not being reassigned will instead be directly assigned to the storage system's original capacity pool.

BPCUI0257W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

You are attempting to add one or more resources to a capacity pool, but the resources are already assigned to another capacity pool. Some of the resources are directly assigned to a capacity pool, and some are indirectly assigned to a capacity pool at the storage system level. If you continue, the resources will be reassigned to the capacity pool you specified.

BPCUI0258W The following internal resources of a storage system you are attempting to add are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

When a storage system is added to a capacity pool, all of its internal resources (storage pools, NSDs, and file systems) are indirectly assigned to that capacity pool. You are attempting to add one or more storage systems to a capacity pool, but one or more of the storage-system internal resources are already assigned to another capacity pool. If you continue, the resources will be reassigned at the storage system level to the capacity pool you specified.

BPCUI0259W The following storage systems and storage-system internal resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

You are attempting to add storage systems to a capacity pool, but one or more of the storage systems and one or more storage-system internal resources (storage pools, NSDs, and file systems) are already assigned to another capacity pool. If you continue, the resources will be reassigned to the capacity pool you specified. At least one of the storage systems you are attempting to add is already assigned to another capacity pool. If you continue, the storage system will be reassigned to the capacity pool you specified. When a storage system is added to a capacity pool, all of its internal resources (storage pools, NSDs, and file systems) are indirectly assigned to that capacity pool. At least one of the storage systems you are attempting to add has one or more internal resources that are already assigned to another capacity pool. If you continue, the resources will be reassigned at the storage system level to the capacity pool you specified.

BPCUI0260E The specified private key file format for the file module is not supported. Please convert it to Open SSH (.pem) key file.

Explanation

Action

BPCUI0261E The service class was not found in the database.

Explanation

This error might occur if the service class was already deleted.

Action

BPCUI0262E The capacity pool was not found in the database.

Explanation

This error might occur if the capacity pool was already deleted.

Action

BPCUI0263E The scheduling of the agent upgrade jobs failed.

Explanation

None of the selected agents were scheduled for upgrade due to errors.

Action

Review the individual detailed error messages.

BPCUI0264E Errors occurred when attempting to schedule the upgrade jobs of some of the agents.

Explanation

Upgrade scheduling of some of the agents was successful, however errors did occur while scheduling some of the upgrades.

Action

Review the individual detailed error messages.

BPCUI0265W Warnings occurred when scheduling the upgrade of *warningCount* of the agents.

Explanation

The agents were successfully scheduled for upgrade, but warnings did occur.

Action

Review the individual detailed warning messages.

BPCUI0266I *attemptedCount* of the selected agents were scheduled for upgrade.

Explanation

All agents that could be upgraded were successfully scheduled for upgrade.

Action

No action.

BPCUI0267I The upgrade agent job was successfully scheduled for *hostName*.

Explanation

Action

No admin response required.

BPCUI0268W Deleting a capacity pool does not affect any volumes or shares that were provisioned from the capacity pool. However, the volumes or shares are no longer associated with the capacity pool. Associations with the following volumes or shares will be removed:

Explanation

This message is for informational purposes only

Action

No action is required.

BPCUI0269W The following volumes are associated with the service class *scName*. When the volumes were created, they satisfied the requirements of the service class. If you modify the service class, the volumes are still associated with the service class, but might not satisfy the new requirements of the service class. Depending on your changes to the service class, users might incorrectly assume that the volumes have properties that they do not possess.

Explanation

BPCUI0270W The following shares are associated with the service class *scName*. When the shares were created, they satisfied the requirements of the service class. If you modify the service class, the shares are still associated with the service class, but might not satisfy the new requirements of the service class. Depending on your changes to the service class, users might incorrectly assume that the shares have properties that they do not possess.

Explanation

BPCUI0271W The following volumes are associated with the service class *scName*. If you delete the service class, the volumes are no longer associated with any service class.

Explanation

BPCUI0272W The following shares are associated with the service class *scName*. If you delete the service class, the shares are no longer associated with any service class.

Explanation

BPCUI0273E The action does not support the specified type of device.

Explanation

An internal operating error occurred. Check the logs for an indication of an error or exception and contact IBM customer support.

BPCUI0274I The connection test to resource *data_Source_Name* was successful.

Explanation

The connection between the server and the target resource was successfully tested.

Action

No action is required.

BPCUI0275I To collect data about zoning or complete zoning actions during provisioning, you must deploy Storage Resource agents to one or more servers that are on the fabric.

Explanation

A Storage Resource agent is required to collect data and complete zoning actions for a fabric.

Action

To deploy Storage Resource agents to a server, go to the Servers > Servers page, click Add Server, and select Deploy an agent for full server monitoring.

BPCUI0276I Agent *agentName* was disabled.

Explanation

The named agent was disabled.

Action

No action.

BPCUI0277I Agent *agentName* was enabled.

Explanation

The named agent was enabled.

Action

No action.

BPCUI0278I The credentials for *agentName* were updated.

Explanation

The credentials of the named device were successfully updated.

Action

No action.

BPCUI0279I There is no job defined for the device *Name*. Please create a job first before running it again.

Explanation

Corresponding job definition for the device cannot be found. Please create a new job definition and try running the job again.

Action

Create a job definition first and attempt the action again.

BPCUI0280I No switches are managed by the *data_Source_Address* data source.

Explanation

The specified data source is not managing any switches. No switch can be detected during the discovery process.

Action

Ensure that information about the data source was entered correctly and that the data source is managing switches. Add the data source again.

BPCUI0282I The resources that are managed by *data_Source_Address* are already known. One or more resources were added.

Explanation

Any resources that are already known are not added again for monitoring. However, one or more new resources were added. The new resources might collect additional information about the managed resources or might collect redundant information about the managed resources.

Action

No further action is required.

BPCUI0284I No fabrics are managed by the *data_Source_Address* data source.

Explanation

The specified data source is not managing any fabrics. No fabric can be detected during the discovery process.

Action

Ensure that information about the data source was entered correctly and that the data source is managing fabrics. Add the data source again.

BPCUI0286I The fabrics that are managed by *data_Source_Address* are already being monitored.

Explanation

You cannot add fabrics that were previously added and configured for monitoring.

Action

To modify a fabric that is being monitored, go to the list page for the fabric. For example, in the navigation pane, select Network Resources > Fabrics. Then, right-click the fabric and select View Properties. In the properties notebook, modify the values for the fabric.

BPCUI0289W The following network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these NSDs to a different capacity pool?

Explanation

When a file system is added to a capacity pool, all of the NSDs on which the file system resides are indirectly assigned to that capacity pool. You are attempting to add one or more file systems to a capacity pool, but one or more of the related NSDs are already assigned to another capacity pool. If you continue, the NSDs will be reassigned at the file system level to the capacity pool you specified.

BPCUI0290W The following file systems and network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?

Explanation

At least one of the file systems you are attempting to add is already assigned to another capacity pool. If you continue, the file system will be reassigned to the capacity pool you specified.

When a file system is added to a capacity pool, all of the NSDs on which the file system resides are indirectly assigned to that capacity pool. At least one of the file systems you are attempting to add has one or more related NSDs that are already assigned to another capacity pool. If you continue, the resources will be reassigned at the file system level to the capacity pool you specified.

BPCUI0291W The following network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these NSDs to a different capacity pool?

Explanation

When a storage system is added to a capacity pool, all free NSDs in the storage system are indirectly assigned to that capacity pool. When a file system is added to a capacity pool, all of the NSDs on which the file system resides are indirectly assigned to that capacity pool. You are attempting to add one or more NSDs to a capacity pool, but they are already indirectly assigned to another capacity pool at the storage system level or the file system level. If you continue, the NSDs will be reassigned to the capacity pool you specified. In addition, the storage system or file system will no longer be assigned to its capacity pool. The NSDs that are not being reassigned will instead be directly assigned to the storage system's or file system's original capacity pool.

BPCUI0292E The host name or IP address *ip_address_or_hostname* cannot be reached.

Explanation

This problem might occur if the local area network is down, the resource cannot be reached by a ping (ICMP) command, or a firewall is preventing communication between the server and the resource.

Action

To resolve this problem, try the following actions:

- Verify that the IP address or host name of the resource is valid.
- Verify that the local area network is available.
- Ensure that a firewall is not preventing network access.

Try to add the storage resource again by going to the Storage Systems page in the GUI and selecting Add Storage System.

BPCUI0293I A probe is started for *deviceName*.

Explanation

A data collection job is started to gather probe data for the resource.

BPCUI0294I A performance monitor is started for *deviceName*.

Explanation

A data collection job is started to gather performance data for the resource.

BPCUI0295I The performance monitor is stopped for *deviceName*.

Explanation

The performance monitor is stopped for the resource

BPCUI0297W One resource was added to *capacity_pool_name*. One resource could not be added because it could not be found.

Explanation

One or more resources could not be added to the selected capacity pool because they are no longer in the database.

Action

No action is required.

BPCUI0298W *count* resources were added to *capacity_pool_name*. One resource could not be added because it could not be found.

Explanation

One or more resources could not be added to the selected capacity pool because they are no longer in the database.

Action

No action is required.

BPCUI0299W One resource was added to *capacity_pool_name*. *count_Not_Found* resources could not be added because they could

not be found.

Explanation

One or more resources could not be added to the selected capacity pool because they are no longer in the database.

Action

No action is required.

BPCUI0300W *count* resources were added to *capacity_pool_name*.
count_Not_Found resources could not be added because they could not be found.

Explanation

One or more resources could not be added to the selected capacity pool because they are no longer in the database.

Action

No action is required.

BPCUI0301E Failed to assign the *role name* role.

Explanation

An internal error occurred when trying to assign a role to a list of groups.

BPCUI0302E Failed to retrieve the existing role assignments.

Explanation

An internal error occurred when trying retrieve the existing group to role assignments.

BPCUI0303E Failed to remove all role assignments from the specified groups.

Explanation

An internal error occurred when remove all role assignments from the specified groups.

BPCUI0304W An error occurred when saving the user-defined properties of the *resourceType*.

Explanation

The user-defined properties for one or more resources cannot be saved because of an error on the server. Examples of user-defined properties include the location and display name of the resource. After the resource is added, you can set these properties either on the resource details page or in the properties notebook for the resource.

Action

To set user-defined properties for a resource, go to the resource list page, right-click the resource, and select View Properties. On the properties notebook, click Edit to change the properties and click Save.

For example, to specify the name of a switch, select Network Resources > Switches from the navigation pane. On the Switches page, right-click the switch and select View Properties. On the properties notebook for the switch, click Edit and enter 64 characters or less in the Name field. Click Save.

You can also specify these properties on the details page for a resource. To access the details page, select Network Resources > Switches from the navigation pane, right-click a resource, and select View Details.

BPCUI0305E A capacity pool with the same name already exists.

Explanation

The specified capacity pool name is not unique. A capacity pool with the same name already exists and cannot be duplicated.

Action

Enter a different name for the capacity pool you are want to create.

BPCUI0306W The selected resource was removed, however warnings did occur.

Explanation

The resource was removed however some warnings did occur.

Action

Review the list of detailed messages for further information.

BPCUI0307E The schedule could not be deleted.

Explanation

The schedule could not be deleted.

Action

Check log file for error messages that might help determine the problem.

BPCUI0308I The resource does not have a connection configured. To add a connection to the resource, click Add Storage System.

Explanation

The data source for the resource might have been removed. You must add a connection to the resource again.

Action

Use the Add dialog for the resource to add the connection again.

BPCUI0309I A probe schedule is defined for *deviceName*.

Explanation

A probe schedule is defined for the device.

BPCUI0310I A performance monitor schedule is defined for *deviceName*.

Explanation

A performance monitor schedule is defined for the device.

BPCUI0311I Probe and performance monitor schedules are defined for *deviceName*.

Explanation

Probe and performance monitor schedules are defined for the device.

BPCUI0312I SNMP Discovery of switches is taking longer than expected. Click Close to run the discovery in the background.

Explanation

The process for discovering switches via SNMP is taking longer than expected. This delay might occur because the network connection is slow, the data source is running slowly, or the data source is managing many resources.

Action

To close the window but continue the discovery process in the background, click Close. Try to add the resource again when the discovery is complete.

BPCUI0313I An upgrade is started for server *deviceName*.

Explanation

An upgrade job was started for a server.

BPCUI0314E Failed to retrieve the list of user groups from the WebSphere user repository.

Explanation

An internal error occurred when attempting to retrieve a list of groups from the WebSphere user repository.

BPCUI0315E Failed to retrieve the list of user groups from user repository due to an invalid search string.

Explanation

The search string specified by the user is invalid preventing the query from being submitted to WebSphere.

Action

Specify a valid search string.

BPCUI0316W Failed to update the role cache maintained by the Device server.

Explanation

The role cache maintained by the Device server was not updated.

Action

Restart the Device server.

BPCUI0317E Access can not be removed, because at least one Administrator user must remain in the system.

Explanation

Access can not be removed, because at least one Administrator user must remain in the system.

Action

First add another group having Administrator role and then retry the action.

BPCUI0318E The group mapping can not be modified, because at least one Administrator user must remain in the system.

Explanation

The group mapping can not be modified, because at least one Administrator user must remain in the system.

Action

First add another group having Administrator role and then retry the action.

BPCUI0319I A task is started for resource *resourceName*.

Explanation

A task is started for the specified resource.

BPCUI0320I Probe and performance monitor schedules are defined for *deviceName*. A performance monitor is scheduled to collect performance data after the probe is done.

Explanation

Probe and performance monitor schedules are defined for the device. Performance monitor is disabled and will start after the probe is done.

BPCUI0321I A task is paused for resource *resourceName*.

Explanation

A task is paused for the specified resource.

BPCUI0322E A task could not be paused for resource *resourceName*.

Explanation

A task could not be paused for the specified resource.

BPCUI0323I A task is resumed for resource *resourceName*.

Explanation

A task is resumed for the specified resource.

BPCUI0324E A task could not be resumed for resource *resourceName*.

Explanation

A task could not be resumed for the specified resource.

BPCUI0325E Failed to retrieve the list of users from the WebSphere user repository.

Explanation

An internal error occurred when attempting to retrieve a list of users from the WebSphere user repository.

BPCUI0326E Failed to retrieve the list of users from user repository due to an invalid search string.

Explanation

The search string specified by the user is invalid preventing the query from being submitted to WebSphere.

Action

Specify a valid search string.

BPCUI0327E Failed to get the roles associated with the current user.

Explanation

An internal error occurred when attempting to retrieve the roles associated with the current user.

BPCUI0328I A task is saved.

Explanation

A task is saved.

BPCUI0329I A task was successfully deleted.

Explanation

The task was successfully deleted.

Action

No action is required.

BPCUI0330E The user *user* is not authorized to access the product.

Explanation

The user is not a member of a group that is assigned to a role that is authorized to access the product.

Action

Assign a role to the user's group that provides access to the product.

BPCUI0331I A task is cancelled for resource *resourceName*.

Explanation

A task is cancelled for the specified resource.

BPCUI0332E An unexpected error occurred. The task for schedule *schedule name* could not be paused or resumed.

Explanation

The task type associated with the schedule is not valid.

Action

Refresh the page to check whether the task was completed. If the problem persists, use the Service tool to collect trace data and send it to IBM Software Support.

BPCUI0333E An unexpected error occurred. The task for schedule *schedule name* could not be be paused.

Explanation

The task was not running or the task was completed before the task was paused.

Action

Refresh the page to check whether the task was completed. If the problem persists, use the Service tool to collect trace data and send it to IBM Software Support.

BPCUI0334E An unexpected error occurred. The task for schedule *schedule name* could not be resumed.

Explanation

The task was not paused or the task was completed.

Action

Refresh the page to check whether the task was completed. If the problem persists, use the Service tool to collect trace data and send it to IBM Software Support.

BPCUI0335E The volumes cannot be converted or moved because the target pools do not have sufficient available space.

Explanation

The target pools do not have sufficient available space to complete the operation.

Action

Select target pools with sufficient available space to complete the operation.

BPCUI0336I The ability to provision with block storage devices is only available with the advanced license.

Explanation

The product is installed with the basic license and the functional is unavailable to enable this feature the advance license must be installed.

BPCUI0338E Insufficient user privileges to service the REST request.

Explanation

A request to the REST interface was made by a user who did not have sufficient role privileges.

BPCUI0339E An unexpected error occurred while authorizing the REST request.

Explanation

An internal operating error occurred. Check the logs for an indication of an error or exception and contact IBM customer support.

BPCUI0340I A task was successfully renamed.

Explanation

The task was successfully renamed.

Action

No action is required.

BPCUI0341E The task could not be renamed.

Explanation

The task could not be renamed because the new name already exists.

Action

Enter a different name for the task. Ensure that you have the proper authorization to rename a task.

BPCUI0342E The task could not be renamed because the specified name already exists.

Explanation

The task name that you entered already exists.

Action

Enter a unique name for the task.

BPCUI0343I Performance monitoring is unavailable for resource *resource name* because the resource was not probed.

Explanation

To effectively monitor the performance of a resource, a probe must collect asset and configuration information about that resource.

Action

Schedule a probe to collect information about the resource. After the probe completes, run the performance monitor again.

BPCUI0344W The following service classes allow provisioning only from the *capacity pool* capacity pool: *service classes*. If you delete this capacity pool, the service classes will allow provisioning from any available storage.

Explanation

The capacity pool is the only capacity pool that is associated with one or more service classes. Currently, storage requests that require any of these service classes can be satisfied only by resources in the capacity pool. By removing the capacity pool, you remove this restriction from the service classes.

Action

Identify the reason why each service class specifies the capacity pool restriction. Determine whether removing the restriction is acceptable.

BPCUI0346I The Storage Resource agent that is deployed on the server cannot be uninstalled.

Explanation

The Storage Resource agent cannot be uninstalled.

Action

Ensure that all required servers are running, and that the local area network is available. Verify that you have a network connection to the server that the agent is located on. Wait a few minutes and try again. If none of these actions help resolve the problem, contact IBM Software Support.

BPCUI0347I All servers were removed except for the product server. Entries for the product server resources might still be displayed in the GUI until all the associated removals are complete.

Explanation

You have attempted to remove a number of servers including the Storage Resource agent that is installed on the product server. The agent on the product server cannot be removed.

Action

No further action is required.

BPCUI0348W You cannot provision volumes because at least one of the selected hosts was not found in the database. Ensure that all hosts that are selected for provisioning are being monitored.

Explanation

To request volumes for a server or hypervisor, the server or hypervisor must be added to the database.

Action

Make sure that the server or hypervisor is known. If it is not, add the server or hypervisor using the Add dialog for that type of resource.

BPCUI0349W You cannot provision volumes because not all of the selected hosts appear to have Fibre Channel connectivity.

Explanation

Typically, you cannot request volumes for servers or hypervisors that do not have fabric connectivity. However, if all of the selected hosts have Fibre Channel Port WWPNs and none appear to have fabric connectivity, it is possible that the fabrics were not probed. In this case, you can use the Provision Storage function to request volumes even though the hosts appear to have no fabric connectivity. However, if only some, but not all, of the selected servers or hypervisors appear to have Fibre Channel connectivity, provisioning volumes is not supported.

Action

To request volumes for servers or hypervisors, ensure that either all or none of the selected servers or hypervisors appear to have Fibre Channel connectivity to a managed fabric.

BPCUI0350W You cannot provision volumes because the hypervisors that host the virtual machines use different operating systems.

Explanation

When you provision volumes for one or more virtual machines, the volumes are assigned to the hypervisors that host the virtual machines. To provision a volume to multiple virtual machines, the hypervisors that host the virtual machines must all be running the same operating system type.

Action

To provision volumes to multiple virtual machines, make sure the hypervisors that host the virtual machines all run the same operating system type. The OS Type column on the Hypervisors page displays the operating system type.

BPCUI0351W You cannot provision volumes because there is no Fibre Channel host port information for at least one hypervisor.

Explanation

When you provision volumes for one or more virtual machines that do not have NPIV ports, the volumes are assigned to the hypervisors that host the virtual machines. If you are provisioning to a single virtual machine, the hypervisor that is managing the virtual machine does not have a Fibre Channel host port. If you are provisioning to multiple virtual machines, at least one of the hypervisors that is managing the virtual machines does not have a Fibre Channel host port.

Action

To provision volumes to virtual machines that do not have NPIV ports, ensure that all the hypervisors that are managing the selected virtual machines have Fibre Channel host ports.

BPCUI0352W You cannot provision volumes because not all of the hypervisors that host the virtual machines appear to have Fibre Channel connectivity.

Explanation

When you provision volumes for one or more virtual machines that do not have NPIV ports, the volumes are assigned to the hypervisors that host the virtual machines. Typically, you cannot provision volumes for hypervisors that do not have fabric connectivity. However, if all of the hypervisors that host the virtual machines have Fibre Channel Port WWPNs and none appear to have fabric connectivity, it is possible that the fabrics were not probed. In this case, you can use the Provision Storage function to provision volumes even though the hypervisors appear to have no fabric connectivity. However, if only some, but not all, of the hypervisors that host the virtual machines appear to have Fibre Channel connectivity, provisioning volumes is not supported.

Action

To provision volumes to virtual machines that do not have NPIV ports, ensure that either all or none the hypervisors that are managing the selected virtual machines appear to have Fibre Channel connectivity to a managed fabric.

BPCUI0355W You cannot provision volumes because no block-storage service class exists.

Explanation

When you request volumes by using the Provision Storage wizard, you specify your storage requirements by selecting a block-storage service class. There are currently no block-storage service classes, so you cannot provision volumes.

Action

BPCUI0356W You cannot provision shares because no file-storage service class exists.

Explanation

When you request network-attached storage (NAS) shares by using the Provision Storage wizard, you specify your storage requirements by selecting a file-storage service class. There are currently no file-storage service classes, so you cannot provision shares.

Action

BPCUI0357W You cannot provision volumes because you do not have permission to provision by using any block-storage service class.

Explanation

When you request volumes by using the Provision Storage wizard, you specify your storage requirements by selecting a block-storage service class. If you do not have Administrator privileges, you must have permission to provision by using at least one block-storage service class. You do not have permission to provision by using any block-storage service class, so you cannot provision volumes.

Action

BPCUI0358W You cannot provision shares because you do not have permission to provision by using any file-storage service class.

Explanation

When you request network-attached storage (NAS) shares by using the Provision Storage wizard, you specify your storage requirements by selecting a file-storage service class. If you do not have Administrator privileges, you must have permission to provision by using at least one file-storage service class. You do not have permission to provision by using any file-storage service class, so you cannot provision shares.

Action

BPCUI0359E The credentials for the servers were not updated.

Explanation

None of the credentials for the selected servers were updated.

Action

Review the listed of detailed messages for further information.

BPCUI0360W The credentials for *successfulUpdates* of *attemptedUpdates* of the selected servers were updated.

Explanation

Updating the credentials of the servers was partially successful, but some errors occurred.

Action

Review the listed of detailed messages for further information.

BPCUI0361W The credentials for the selected server was updated, however warnings did occur.

Explanation

The credentials for the selected server was updated, however warnings did occur.

Action

Review the list of detailed messages for further information.

BPCUI0362W The credentials for *successfulUpdates* selected servers were updated, however warnings did occur.

Explanation

The credentials were updated however some warnings did occur.

Action

Review the listed of detailed messages for further information.

BPCUI0363E Cannot connect to the SNMP data source *IP_Address*.

Explanation

A test connection cannot be established to the data source at the specified IP address. This error might occur if the data source is not available or the SNMP community was not entered correctly. The SNMP community name is shared by one or more SNMP hosts and is used to authenticate messages that are received by those hosts..

BPCUI0364I The performance monitor schedule was updated for *deviceName*.

Explanation

A performance monitor schedule was updated for the device.

Action

No further action is required.

BPCUI0366W The server *serverName* was not updated because it does not support the action.

Explanation

The server was not updated because it is an agentless server or it is a server with an agent whose present configuration cannot support the action. Examples of such server actions would be attempting to update the server's credentials when the server is a RXA agent or stopping a server that is already stopped.

BPCUI0367W You cannot provision volumes to virtual machines with NPIV ports and virtual machines without NPIV ports at the same time. To provision volumes to virtual machines, ensure that you select either only virtual machines with NPIV ports or only virtual machines without NPIV ports.

Explanation

By using the Provision Storage wizard, you can provision volumes to multiple virtual machines. You cannot, however, provision to a combination of virtual machines with NPIV ports and virtual machines without NPIV ports. This restriction exists because volumes are assigned directly to a virtual machine only if the virtual machine has an NPIV port. Otherwise, the volume is assigned to the hypervisor that hosts the virtual machine. You cannot provision volumes to servers (including virtual machines) and hypervisors at the same time.

Action

When you open the Provision Storage wizard from the Servers page, make sure that you select only virtual machines with NPIV ports or only virtual machines without NPIV ports.

BPCUI0368W You cannot provision volumes because none of the selected hosts appear to have Fibre Channel connectivity and the automatic zoning option is enabled. Disable the automatic zoning option in your zoning policy.

Explanation

Typically, you cannot request volumes for servers or hypervisors that do not have fabric connectivity. However, because all of the selected hosts have Fibre Channel Port WWPNs and none appear to have fabric connectivity, it is possible that the fabrics were not probed. For this reason, you can use the Provision Storage dialog to request volumes even though the hosts appear to have no fabric connectivity. However, automatic zoning must first be disabled.

Action

Either probe the fabrics or modify the zoning policy to disable automatic zoning. To modify the zoning policy, go to Advanced Analytics - Provisioning - Set Zoning Policy.

BPCUI0369W You cannot provision volumes because none of the hypervisors that manage the selected virtual machines appear to have Fibre Channel connectivity and the automatic zoning option is enabled. Disable the automatic zoning option in your zoning policy.

Explanation

Typically, you cannot request volumes for servers or hypervisors that do not have fabric connectivity. However, because all of the hypervisors that are managing the selected virtual machines have Fibre Channel port WWPNs and none appear to the product to have fabric connectivity, it is possible that the fabrics were not probed. For this reason, you can use the Provision Storage dialog to request volumes even though the hosts appear to have no fabric connectivity. However, you must disable automatic zoning.

Action

Either probe the fabrics or modify the zoning policy to disable automatic zoning. To modify the zoning policy, click Advanced Analytics - Provisioning - Set Zoning Policy.

BPCUI0370E The display name *displayName* is already assigned to resource *resource Name*.

Explanation

The display name of a resource must be unique.

Action

Enter a unique display name for the resource.

BPCUI0372I The selected hosts do not appear to have Fibre Channel connectivity. In the resulting provisioning task, ensure that the recommended storage system is connected to the hosts before you run the task. Also, be aware that all fabric-related options will be ignored.

Explanation

Typically, you cannot request volumes for servers or hypervisors that do not have fabric connectivity. However, because all of the selected hosts have Fibre Channel Port WWPNs and none appear to have fabric connectivity, it is possible that the fabrics were not probed. For this reason, you can use the Provision Storage dialog to request volumes even though the hosts do not appear to have fabric connectivity. However, all of the fabric-related options, such as number of paths, redundant fabrics, and automatic zoning, will be ignored.

Action

If a provisioning task cannot be created, ensure that the hosts are connected to the recommended storage system before you run the task. You must manually configure the fabric. Alternatively, make sure the hosts have fabric connectivity and probe the fabrics.

BPCUI373I Volumes are assigned to the hypervisors that host virtual machines. Volumes are not assigned directly to virtual machines that do not have NPIV ports. None of the hypervisors that manage the virtual machines appear to have Fibre Channel connectivity. In the resulting provisioning task, ensure that the recommended storage system is connected to the hypervisors before you run the task. Also, be aware that all fabric-related options will be ignored.

Explanation

Typically, you cannot request volumes for servers or hypervisors that do not have fabric connectivity. However, because all of the hypervisors that are managing the selected virtual machines have Fibre Channel port WWPNs and none appear to the product to have fabric connectivity, it is possible that the fabrics were not probed. For this reason, you can use the Provision Storage wizard to request volumes even though the hypervisors appear to have no fabric connectivity. However, all of the fabric-related options (number of paths, redundant fabrics, and automatic zoning) will be ignored.

Action

If a provisioning task cannot be created, ensure that the hypervisors are connected to the recommended storage systems before you run the task. You must manually configure the fabric. Alternatively, make sure that the hypervisors have fabric connectivity and probe the fabrics. To assign volumes to virtual machines, wait until the provisioning operation completes. Then, use the hypervisor manager to assign the hypervisor disks to the virtual machines.

BPCUI0374E Schedule is not enabled for the resource *resource*.

Explanation

Schedule is not enabled. Cannot be started.

Action

In order to be started the job should be enabled first.

BPCUI0375E Performance data is not available.

Explanation

Performance data can't be collected, because the Device server is not available.

Action

To check the status of the Device server, complete these steps:

- From the Home menu, click System Management.
- In the navigation pane, click Components.

If the Device server is stopped, restart it.

BPCUI0376E Invalid number of days to keep configuration history. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0377E Invalid number of days to keep data for removed resources. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0378E Invalid number of days to keep sample performance data. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0379E Invalid number of days to keep hourly performance data. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0380E Invalid number of days to keep daily performance data. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0381E Failed to update the performance data retention settings.

Explanation

The performance data retention settings on the History Retention page could not be saved.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available.
- Check the status of the Device server on the Home > System Management page.
- Restart the Device server on the Home > System Management page.
- Verify that that the database repository is up and running.
- Try to save the performance data retention settings again.

BPCUI0382E Performance monitoring is unavailable for resource *resource name*.

Explanation

Performance monitoring is not supported for the device.

Action

Performance monitoring is not supported for the device.

BPCUI0383E Failed to update the history retention settings.

Explanation

The history retention settings on the History Retention page could not be saved.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available.
- Check the status of the Device server on the Home > System Management page.
- Restart the Device server on the Home > System Management page.
- Verify that that the database repository is up and running.
- Try to save the history retention settings again.

BPCUI0384E Failed to retrieve the history retention settings.

Explanation

The most recent history retention settings could not be displayed on the History Retention page.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available.
- Check the status of the Device server on the Home > System Management page.
- Restart the Device server on the Home > System Management page.
- Verify that the database repository is up and running.
- Reload the History Retention page.

BPCUI0385E Invalid number of runs to keep log files for each schedule. The number should be between *minimum value* and *maximum value*.

Explanation

The input values were not in a valid range.

Action

Retry again with input values within the valid range.

BPCUI0386E A job cannot be run for resource *resourceName* because there is a job already running for the resource. Wait for the job to finish and try again.

Explanation

A new job cannot be run for a schedule definition if a previous job from that schedule definition did not finish running. Only one running job per schedule at a time is permitted.

Action

BPCUI0387I The selected resources support different performance monitor intervals. If you select multiple resources, intervals that are common to all resources are displayed in the interval list.

Explanation

The selected resources do not support the same set of performance monitor intervals. For example, you select two storage systems. Storage_System_a supports performance monitor intervals of 5 minutes, 10 minutes, and 15 minutes. Storage_System_b supports intervals of 10 minutes, 15 minutes, and 20 minutes. The interval list displays intervals of 10 minutes and 15 minutes.

Action

To configure a performance monitor with an interval that is not in the interval list, you can schedule the performance monitor for a single resource or a group of resources of the same type.

BPCUI0388E The probe schedule cannot be created for resource {0} because not all the information was provided. If you are configuring a probe for a resource for the first time, you must enter values for the probe status, time, and frequency fields.

Explanation

You attempted to create a probe schedule but not all the information was provided. If you are configuring a probe for a resource for the first time, you must enter values for the probe status, time, and frequency fields.

Action

When you create a probe schedule, enter all the information that is required. If you are modifying probe schedules for multiple resources at the same time, do not include resources that are not configured for probe data collection.

BPCUI0389E The performance monitor schedule cannot be created because not all the information was provided. If you are configuring a performance monitor for a resource for the first time, you must enter values for the performance monitor status and interval fields.

Explanation

You attempted to create a performance monitor but not all the information was provided. If you are configuring a performance monitor for a resource for the first time, you must enter values for the performance monitor status and interval fields.

Action

When you create a performance monitor schedule, enter all the information that is required. If you are modifying performance monitors schedules for multiple resources at the same time, do not include resources that are not configured for performance monitor data collection.

BPCUI0390I The service logs were successfully created.

Explanation

The service logs zip file were successfully created on the server.

Action

The user can either download the logs by clicking the link on the message or they can download later from the System Management Overview page.

BPCUI0391I The connection test to data source *data source* was successful. A probe is running. The health status is unknown until the probe is finished.

Explanation

The previous state of the monitored device was either unreachable or unknown. The health status of the device is unknown until the currently running probe updates the status.

Action

No action is required.

BPCUI0392I The connection test to the data source *data source* was successful.

Explanation

The connection test was successful. However, to view the most recent information about the resource, you must run a probe.

Action

BPCUI0393E The user *user_name* does not have sufficient privileges to deploy the vSphere Web Client extensionr.

Explanation

The user must have Administrator privileges to deploy the vSphere Web Client extension.

Action

Specify a vSphere user name with Administrator privileges.

BPCUI0394E The user *user_name* does not have permission to log in to the vCenter Server system.

Explanation

The user does not have permission to log in to the vCenter Server system.

Action

Specify a user with permission to log in to the vCenter Server system.

BPCUI0395E This version of the vCenter Server *server_name* does not support the deployment of the vSphere Web Client extension for the product.

Explanation

This version of vCenter Server does not support the deployment of the vSphere Web Client extension.

Action

Deploy the required vSphere Web Client extension on vCenter Server version 5.1 or later.

BPCUI0396E The user *user_ID* does not have the required role. The role associated with this user must be Administrator, Monitor, or External Application.

Explanation

To access the vSphere Web Client extension and VASA functionality, the user ID must have one of the following roles: Administrator, Monitor, or External Application.

Action

Specify a user ID with one of the required roles.

BPCUI0397E The vCenter Server user name or password is invalid.

Explanation

The user name or password is not valid.

Action

Ensure that you enter the correct user name and password.

BPCUI0398E The user name or password is invalid.

Explanation

The user name or password is not valid.

Action

Ensure that you enter the correct user name and password.

BPCUI0399I The server was started.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCUI0400E Failed to retrieve the system management information from the Data server.

Explanation

An error occurred when attempting to retrieve the system management information from the Data server.

Action

Verify that the Data server is running.

BPCUI0402E Failed to retrieve the server status of the Data server.

Explanation

An error occurred when attempting to retrieve the server status of the Data server.

Action

Verify that the Data server is running.

BPCUI0403E The SMI-S provider service is not available.

Explanation

The service that is accessed by the SMI-S provider is not available.

Action

Make sure that the service accessed by the SMI-S provider is started and operational.

BPCUI0404E An error occurred while updating the trace log configuration file. The original file *file* was deleted and could

not be restored. A backup of this file may be available at *backup file*.

Explanation

An error occurred during the process of updating the Performance Management trace log configuration file. The original file was deleted and needs to be restored. This will not impact the current operation of the Performance Manager but the file is needed prior to restarting the Device server.

Action

Restore the backup of the Performance Management configuration file, if possible. Otherwise contact IBM support.

Related reference

- [Getting support](#)

BPCUI0405E Failed to set the trace settings from the Data server.

Explanation

An error occurred when attempting to save the trace settings from the Data server.

Action

Verify that the Data server is running.

BPCUI0406E Cannot start the server. The start script reported the following error: *error*

Explanation

An error occurred when executing the start script for the server.

Action

Retry the operation or manually start the server.

BPCUI0407E Cannot start the server. Unable to locate the start script *path to script*.

Explanation

The script required to start the server could not be found on the local filesystem.

Action

Verify that the script exists at the specified location.

BPCUI0408E Cannot start the server. Unable to execute the start script *path to script*.

Explanation

The script required to start the server could not be executed.

Action

Verify that the script is configured with the required file permissions so that it can be run by the product.

BPCUI0409W The server is taking a long time to start. If the server status continues to show an error status after a reasonable interval, try to start the server again.

Explanation

The server is in the process of starting but it is taking a long time.

Action

To resolve this issue, try the following actions:

1. Wait for the Alert server to start. If the Alert server does not start after a reasonable amount of time, try restarting the server.
2. Make sure the database is running properly.
3. Make sure the network is functioning properly.
4. Make sure the server or file system has not run out of disk space.
5. In some rare cases, the following directories or files might be missing or corrupt:
 - (installation_directory)/alert/conf directory
 - (installation_directory)/wlp/usr/servers/alertServerjvm.optionsIf this is the case, restore these directories and files from the installation image.

BPCUI0410E Cannot stop the server. The stop script reported the following error: *error*

Explanation

An error occurred when executing the stop script for the server.

Action

Retry the operation or manually stop the server.

BPCUI0411W The server is taking a long time to stop. If the server status continues to show that it is still running try to stop the server again after a reasonable interval.

Explanation

The server is in the process of stopping but it is taking a long time to stop.

Action

BPCUI0412E Cannot stop the server. Unable to locate the stop script *path to script*.

Explanation

The script required to stop the server could not be found on the local filesystem.

Action

Verify that the script exists at the specified location.

BPCUI0413E Cannot stop the server. Unable to execute the stop script *path to script*.

Explanation

The script required to stop the server could not be executed.

Action

Verify that the script is configured with the required file permissions so that it can be run by the product.

BPCUI0414W It is taking a long time for the services to start. If the server status continues to show an error status after a reasonable interval, try to start the services again. If the problem persists then restart the server.

Explanation

The request to start the services has been issues but it is taking a long time for them to start.

Action

BPCUI0415E Failed to start the service *service name*.

Explanation

An error occurred when attempting to start the specified service of the Data server.

Action

Retry to start the service. If the error continues to occur try restarting the Data server.

BPCUI0416I The server was stopped.

Explanation

This message is for informational purposes only.

Action

No action is required.

BPCUI0417I The services of the server were started.

Explanation

The user initiated the starting of internal server services that were not running

Action

The services have been started, no further action is required.

BPCUI0418E The action cannot be completed because the data source that is managing this resource cannot be reached.

Explanation

A test connection cannot be established to the data source that is managing this resource.

Action

Ensure that the data source is available. Ensure that the network is available and that you have a network connection to the data source. Verify that a firewall is not preventing network access to the data source. Try the action again. If the problem persists, try adding the data source again.

BPCUI0419E A Storage Resource agent is already deployed for this server and has a status of Pending deployment or Failed deployment. Use the Servers page to resolve the deployment errors or modify the deployment schedule.

Explanation

The Storage Resource agent is already added. Use the Servers page to check the status of the agent deployment.

Action

On the Servers page, if the server has a status of Pending deployment, you can cancel the deployment or modify the deployment schedule. If the server has a status of Failed deployment, you can cancel the deployment or resolve the errors that caused the deployment to fail and then deploy the agent again.

BPCUI0420E A file access error occurred when the system attempted to back up or modify the tracing configuration file *configuration file*.

Explanation

The action to change tracing levels first backs up, and then modifies, the tracing configuration file. The error occurred during that process.

Action

Review the trace file for the exception details. Look at the directories and file information to determine why the exception occurred.

BPCUI0421E There is a log collection operation already running. A new one cannot be submitted until the current one completes.

Explanation

Only one log collection operation can run on the server at a time. There is already one running.

Action

BPCUI0422E Cannot start the log collecting job. Unable to locate the required script *path to script*.

Explanation

The script that is required to collect the logs was not found on the local file system.

Action

Verify that the script exists at the specified location.

BPCUI0423E Cannot start the log collecting job. Unable to run the log collection script *path_to_script*.

Explanation

The script that collects the product logs could not be run.

Action

Verify that the script is configured with the correct permissions to allow it to be run from the web server.

BPCUI0424E Storage cannot be provisioned from capacity pool *capacity pool* using service class *service class* for the following reason:

Explanation

An error occurred during the execution of the provisioning plan for the specified service class and capacity pool.

Action

Verify that the capacity pool for the service class still meets the requirements for the requested storage to be provisioned.

BPCUI0425W The task *task name* cannot be scheduled because it is already running.

Explanation

This task cannot be scheduled to run later because it is already running. It cannot be run again.

Action

No action is required.

BPCUI0426E Storage cannot be provisioned by using service class *service class* for the following reason:

Explanation

A provisioning task cannot be created. The requested capacity cannot be found for the selected service class.

Action

Verify that there is free space in storage resources that meet the requirements of the selected service class.

BPCUI0427W The selected group action is complete for all tasks, but warnings were reported.

Explanation

The action to execute, schedule, or delete tasks is complete. However, the action resulted in at least one warning for one or more of the tasks.

Action

The warnings are listed following this message. Refer to the warning messages.

BPCUI0428I The selected group action is complete for all tasks. Some informational messages were returned.

Explanation

The action to execute, schedule, or delete tasks was successful. No warnings or errors were reported. At least one informational message was returned for one or more of the tasks.

Action

No action is required.

BPCUI0429E The validation process cannot contact the server. The server might be down or unreachable due to network problems.

Explanation

The server cannot be added because the validation process cannot contact the server.

Action

Use the ping command to verify that you have a network connection to the server. Try to add the server again.

BPCUI0430I Some tasks were not deleted because they were already run.

Explanation

When you complete the steps of the Provision Storage wizard, provisioning tasks are created. If you return to the Provision Storage wizard without executing, scheduling, or deleting the provisioning tasks, the tasks are deleted. Not all the tasks were deleted, however, because some were already executed.

Action

No action is required.

BPCUI0431E Failed to retrieve the list of managed devices.

Explanation

An unexpected error occurred trying to retrieve the list of managed devices from the database.

Action

Check the connection to the database and retry the operation.

BPCUI0432E Failed to retrieve the performance monitoring granularity from the Device server. Check the connection to the Device server and retry the operation.

Explanation

An unexpected error occurred trying to retrieve the performance monitoring granularity from the Device server.

Action

Check the connection to the Device server and retry the operation.

BPCUI0433E OS type *osType* specified on line *line* of file *file* is not valid.

Explanation

The specified OS type in the file is not valid.

Action

Enter a valid OS type. Valid OS types are "Windows", "Linux", "AIX", "Solaris", or "HP-UX".

BPCUI0434E Data source *data_Source_Key* could not be found.

Explanation

The data source could not be found in the database.

Action

Ensure that the database is running properly. Ensure that the Data server and Device server are up and running. Verify that the local area network is available and a firewall is not preventing network access to product services and agents. Try the action again.

If the problem persists, check the log files for error messages that might help determine the problem. For information about the location of log files and how to start the Data server, Device server, and Db2 database repository, see the IBM Knowledge Center.

If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCUI0435E Required host name or IP address and OS type were not specified on line *line* of file *file*.

Explanation

Deploying a server from a file requires a minimum host name or IP address and OS type.

Action

Ensure the file contains the required host name or IP address and OS type.

BPCUI0436E The alert notification settings cannot be displayed.

Explanation

Information about the alert notification settings for the resource cannot be retrieved from the product database.

Action

Ensure that the product database, Data server, and Device server are up and running. Verify that the local area network is available. Try to view the alert notification settings again.

BPCUI0437E The alert notification settings cannot be saved.

Explanation

Information about the alert notification settings for the resource cannot be saved to the product database.

Action

Check the log files for the Data server and the GUI to determine where the problem might have occurred. The log files are located in the following default locations:

- Data server: (Windows) TPC_installation_directory\data\log, (Linux or AIX) TPC_installation_directory/data/log
- GUI: (Windows) TPC_INSTALL_DIR\web\log, (Linux or AIX) TPC_INSTALL_DIR/web/log

Ensure that the product database, Data server, and Device server are up and running. Verify that the local area network is available. Try to save the alert notification settings again.

BPCUI0438E File *file* does not exist or is empty.

Explanation

The script file that you want to upload must exist in the specified location and contain the commands that you want to run when an alert is detected.

Action

Ensure that the script file exists in the specified location. If it does not exist, create the file or specify a different location. If the file exists but is empty, edit the file to include the script commands that you want to run when an alert is detected.

BPCUI0439E The file *file* could not be uploaded.

Explanation

An error occurred while uploading the script

Action

Check the log files for the GUI to determine where the problem might have occurred. The log files are located in the following default locations:

- GUI: (Windows) TPC_INSTALL_DIR\web\log, (Linux or AIX) TPC_INSTALL_DIR/web/log

BPCUI0440E The text *location* specified on line *line* of file *file* has invalid character(s): *characters*

Explanation

The specified location or custom tag in the file contains invalid characters.

Action

Enter a valid location or custom tag that must contain only letters, numbers, spaces and common characters.

BPCUI0441E The alert definitions cannot be displayed.

Explanation

Information about the alert definitions for the resource cannot be retrieved from the product database.

Action

Ensure that the product database, Data server, and Device server are up and running. Verify that the local area network is available. Try to view the alert definitions again.

BPCUI0442E The alert definitions cannot be saved.

Explanation

Information about the alert definitions for the resource cannot be saved to the product database.

Action

Check the log files for the Data server and the GUI to determine where the problem might have occurred. The log files are located in the following default locations:

- Data server: (Windows) TPC_installation_directory\data\log, (Linux or AIX) TPC_installation_directory/data/log
- GUI: (Windows) TPC_INSTALL_DIR\web\log, (Linux or AIX) TPC_INSTALL_DIR/web/log

Ensure that the product database, Data server, and Device server are up and running. Verify that the local area network is available. Try to save the alert definitions again.

BPCUI0443E Select at least one managed server that is deployed for which alert notification settings need to be displayed.

Explanation

Alert notification settings can be displayed only for managed servers that are deployed.

Action

Select at least one managed server that is deployed and try to view the alert notification settings again.

BPCUI0444E Select at least one managed server that is deployed for which alert definitions need to be displayed.

Explanation

Alert definitions can be displayed only for managed servers that are deployed.

Action

Select at least one managed server that is deployed and try to view the alert definitions again.

BPCUI0445W The discovery job completed with errors. Some available devices were not discovered.

Explanation

The discovery job was able to discover some devices, but encountered problems discovering other available devices.

Action

Check the logs for an explanation of errors. Correct the errors and run the discovery again, or continue configuring the devices that were discovered.

BPCUI0446E Unable to test the connection to the device because the request was not processed by the data collector.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

BPCUI0447E Select at least one managed storage subsystem for which alert notification settings need to be displayed.

Explanation

Alert notification settings can be displayed only for managed storage subsystems.

Action

Select at least one managed storage subsystem and try to view the alert notification settings again.

BPCUI0448E Select at least one managed storage subsystem for which alert definitions need to be displayed.

Explanation

Alert definitions can be displayed only for managed storage subsystems.

Action

Select at least one managed server that is deployed and try to view the alert definitions again.

BPCUI0449E The user does not have the required authority to complete the task or command.

Explanation

The level of authority that is required for the task or command depends on the type of resource that the user is managing. This error can occur in the following situations:

- For IBM SONAS resources, if the user is an rssh restricted account and can issue only a restricted set of commands on the resource.
- For IBM Spectrum Scale, if the user that is used to log on to the cluster node does not have privileges to monitor the GPFS cluster. The user must have root privileges on the cluster node or have privileges to run a set of specified administration commands using the sudo command. For information about monitoring IBM Spectrum Scale without requiring root privileges, go to the IBM Knowledge Center at http://www.ibm.com/support/knowledgecenter/search/tpch_t_configuring_sudo_access?scope=SS5R93. View the appropriate topic for the version of IBM Spectrum Control that you are using.

Action

Ensure that the user has the required permissions to complete the task.

BPCUI0451E One or more applications from provided list: *names* do not exist.

Explanation

An application with the specified name was not found.

Action

Verify that the required application name exists. If it does not, specify a different application.

BPCUI0452E *entity name* is not supporting data collection actions.

Explanation

The specified entity does not support data collection actions.

Action

The specified entity does not support data collection actions.

BPCUI0453E One or more departments from provided list: *names* do not exist.

Explanation

A department with the specified name was not found.

Action

Verify that the required department name exists. If it does not, specify a different department.

BPCUI0455I No performance data is available for the selected resources.

Explanation

Performance data must be collected about a resource before you can view its performance. Use performance monitors to collect performance data about a resource.

Action

To collect performance data about a resource immediately, go to the Storage Systems page or Switches page, right-click the storage system or switch, and select Data Collection > Start Performance Monitor. To schedule performance monitors to run at set times, select Data Collection > Schedule.

BPCUI0456E You cannot complete the action because the service is temporarily unavailable.

Explanation

IBM Marketplace is investigating the issue and service will be resumed as soon as possible.

Action

Wait a few minutes and try again. If you still can't complete the action, go to your Products and services page (<https://myibm.ibm.com/products-services/>) on IBM Marketplace. Click the down-arrow for the Storage Insights offering, click Support, and then choose an option.

BPCUI0457W The applications *listOfApplications* cannot be deleted because they contain subcomponents *subcomponent*, which cannot be moved up a level in the applications hierarchy due to name conflicts with existing applications in that higher level.

Explanation

When you delete an application, the subcomponents that belong to that application are not automatically deleted unless you specify the Remove subcomponents option. They are moved to the next higher level in the application hierarchy. If those subcomponents have the same name as an application in the higher level, they cannot be moved up, and the parent application of those subcomponents cannot be deleted.

Action

Either rename the specified subcomponents and then delete the applications, or specify the Remove subcomponents option when you delete these applications.

BPCUI0458W The departments *listOfDepartments* cannot be deleted because they contain subdepartments or applications *subdepartment*, which cannot be moved up a level in the departments hierarchy due to name conflicts with departments in that higher level.

Explanation

When you delete a department, the subdepartments and applications that belong to that department are not automatically deleted unless you specify the Remove subdepartments and applications option. They are moved to the next higher level in the department hierarchy. If those subdepartments and applications have the same name as a department or an application in the higher level, they cannot be moved up, and the parent department of those subdepartments and applications cannot be deleted.

Action

Either rename the specified subdepartments or applications and then delete the department, or specify the Remove subdepartments and applications option when you delete these departments.

BPCUI0459W The selected subcomponents cannot be removed from the application because they cannot be moved up a level in the application hierarchy due to name conflicts with the existing applications or subcomponents at the higher level.

Explanation

When you remove a subcomponent from an application, the subcomponent is moved up to the same level as the parent application. If the subcomponent has the same name as an existing application or subcomponent at that higher level, it cannot be moved up and the subcomponent is not removed from the application.

Action

Rename the specified subcomponents and try to remove them from the application again.

BPCUI0460W The selected applications or subdepartments cannot be removed from the department because they cannot be moved up a level in the department hierarchy due to name conflicts with the existing applications or subdepartments at the higher level.

Explanation

When you remove an application or subdepartment from a department, the application or subcomponent is moved up to the same level as the parent department. If the application or subdepartment has the same name as an existing application or subdepartment at the higher level, it cannot be moved up. The application or subdepartment is not removed from the department.

Action

Rename the specified applications or subdepartments and try to remove them from the department again.

BPCUI0461W There are no task details to display. The analysis-execution task could not be run.

Explanation

The execution task was created when the Device server was not available. The task is not valid.

Action

Ensure that the Device server is running, and then create and run a new task.

BPCUI0462E Failed to add the device because the data collector is not responding.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

BPCUI0463E The discovery failed because the data collector is not responding.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

BPCUI0464E The connection test failed because the data collector is not responding.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

BPCUI0465E The requested action failed because the data collector is not responding.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

BPCUI0466I The servers were created.

Explanation

Action

The action completed successfully, no further action necessary

BPCUI0467W *successCount* of *totalCount* servers were created.

Explanation

Action

Not all of the servers were created, review the detailed error messages for more information.

BPCUI0468E The creation of the servers failed.

Explanation

Action

None of the servers were created, review the detailed error messages for more information.

BPCUI0469E Schedule job does not exist for *entity name*.

Explanation

Schedule job should be created first in order to be started.

Action

Schedule job should be created first in order to be started.

BPCUI0470E Invalid file *file* size of *size* GB. Maximum allowed file size is *max size* GB.

Explanation

Maximum allowed files size exceeded.

Action

Verify the size of the input file.

BPCUI0471E Failed to set the trace settings from the Alert server.

Explanation

An error occurred when attempting to save the trace settings from the Alert server.

Action

Verify that the Alert server is running.

BPCUI0472E Failed to retrieve the system management information from the Alert server.

Explanation

An error occurred when attempting to retrieve the system management information from the Alert server.

Action

Verify that the Alert server is running.

BPCUI0474E Failed to retrieve the server status of the Alert server.

Explanation

An error occurred when attempting to retrieve the server status of the Alert server.

Action

Verify that the Alert server is running.

BPCUI0475I The volumes have been excluded from the reclamation analysis.

Explanation

The removed volumes will now be in the excluded list and will not be considered in future runs of the reclamation analysis.

Action

The action completed successfully, no further action necessary.

BPCUI0476I The volumes will be included in future analyses to reclaim storage.

Explanation

On completion of the next reclamation analysis the volumes may appear in the table of recommended reclamation volumes and reclamation summary charts

Action

The action completed successfully, no further action necessary.

BPCUI0477E An unexpected error occurred when modifying the optimization characteristics of the volumes.

Explanation

To find the cause of the issue, further investigation is required.

Action

To resolve the issue, try the following actions:

- Check the status of the product servers on the Home > System Management page.
- Verify that the database repository is available.
- Verify that the related database service is active.
- Check for error messages in the log files for the servers.

If you need more information, go to IBM Knowledge Center and check the Administering section. You can access IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93>. If you cannot resolve the issue, contact IBM Support.

BPCUI0478E The scheduled agent upgrade time is in the past.

Explanation

The upgrade was scheduled to occur at a time in the past.

Action

Schedule another date and time to upgrade the agent.

BPCUI0479E The object storage credentials are incorrect. Enter the correct credentials. Alternatively, clear the object credentials check box and do not specify the authentication credentials for object storage now. You can use the Modify Connection action to add the object storage later.

Explanation

The GPFS cluster is configured for object storage, but the specified user credentials are invalid.

Action

Enter the correct object storage credentials and try the operation again.

Alternatively, clear the object credentials check box and do not specify the authentication credentials for object storage now. You can use the Modify Connection action on the Object Storage Systems page to add the object storage later.

BPCUI0480E An object storage request failed on the GPFS cluster.

Explanation

The IBM Spectrum Control server cannot connect to the object storage on the GPFS cluster. This error might occur because the object service is disabled or stopped.

Action

Verify that the object service is configured correctly and is enabled and started. For more information about configuring the object service for IBM Spectrum Scale, go to the IBM Knowledge Center (<http://www.ibm.com/support/knowledgecenter>).

Try the operation again. If the problem persists, contact IBM Software Support.

BPCUI0481W No resources were removed.

Explanation

None of the selected resources were removed, either the resource was already removed or could not be found.

Action

Wait a few minutes, if the resource is still present contact IBM Support.

BPCUI0482E No resources were updated.

Explanation

None of the selected resources were updated because the resource could not be found.

Action

Contact IBM Support.

BPCUI0483E The connection information cannot be updated because it points to another device.

Explanation

The serial number of the device that is managed by this data source doesn't match the serial number of the existing device.

Action

Enter the host name or the IP address of the existing device.

BPCUI0484I The connection information for *device name* was updated.

Explanation

You successfully updated the connection information of the named device.

Action

No action is required.

BPCUI0485E The connection information cannot be updated.

Explanation

The connection information cannot be updated because the serial number of the resource cannot be retrieved. This problem might occur if the resource is unavailable or the connection to the resource was lost.

Action

Try the following actions:

- Verify that the resource is available.
- Ensure that a connection to the resource is active.
- Verify the available local disk space.
- Check the log files for error messages to determine the cause. For information about the location of log files, see the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

BPCUI0486E Cannot query the object service for information about accounts and containers as the specified user does not have admin privileges.

Explanation

To query account and container information from the object service, the user must be assigned the admin role in Keystone, the OpenStack identity service. To monitor all accounts and containers, the user must also be assigned the role that is defined in the `reseller_admin_role` configuration option in the Swift proxy server. The default value for the `reseller_admin_role` option is `ResellerAdmin`.

Action

Check the credentials for the user. In Keystone, the OpenStack identity service, ensure that the user is assigned the required role and has the authority to retrieve object storage account and container information. Try the operation again.

BPCUI0487I The connection information of the selected device was successfully updated. Other devices were detected as being managed by the same data source. Would you like to update the connection information of all of them?

Explanation

Other devices were found in Spectrum Control as being managed by the same data source.

Action

Select "Yes" to update the connection information of all detected devices, or "No" to close the dialog.

BPCUI0488I The connection information of all devices connecting through this data source was updated.

Explanation

You successfully updated the connection information of all devices connecting through this data source.

Action

No action is required.

BPCUI0489W Some of the devices connecting through this data source failed to be updated.

Explanation

One or more devices connecting through this data source was not updated.

Action

See below the reason of failure for each device.

BPCUI0490I The *vCenter* vCenter Server was removed.

Explanation

The removal of the specified vCenter Server succeeded.

Action

No action is required.

BPCUI0491E The *vCenter* vCenter Server was not found in the database.

Explanation

The specified vCenter Server was not found in the database. Maybe it was removed.

Action

Wait a few minutes, then verify that the vCenter Server is not listed in the "vCenters" tab of the "Hypervisors" page.

BPCUI0492E The *selected vCenter Servers* were not found in the database.

Explanation

None of the selected vCenter Servers was found in the database. Maybe they were removed.

Action

Wait a few minutes, then verify that the vCenter Servers are not listed in the "vCenters" tab of the "Hypervisors" page.

BPCUI0493I The *vCenter* vCenter Server and all *number of monitored hypervisors* hypervisors monitored by it were successfully removed.

Explanation

The selected vCenter Server and the hypervisors that it monitors were successfully removed.

Action

No action is required.

BPCUI0494I The *number of vCenters* selected vCenter Servers and all *number of monitored hypervisors* hypervisors monitored by them were successfully removed.

Explanation

The selected vCenter Servers and the hypervisors that they monitor were successfully removed.

Action

No action is required.

BPCUI0495W Only *number of removed vCenters* of *number of selected vCenters* of the selected vCenter Servers and *number of removed monitored hypervisors* of *number of monitored hypervisors* of the hypervisors monitored by them were successfully removed.

Explanation

The selected vCenter Servers and the hypervisors that they monitor were partially removed, but some errors occurred.

Action

Review the list of detailed messages for further information.

BPCUI0496I The following fabrics were detected as being managed by the same data source: *comma separated fabrics list*. This action applies to all fabrics that are managed by the current data source. Would you like to update the connection information of all of them?

Explanation

Other monitored fabrics are being managed by the same data source. When you change the connection information for one fabric, the change will apply to all of the fabrics.

Action

Select Yes to update the connection information of all monitored fabrics, or No to close the window without updating connection information.

BPCUI0497E The following fabrics cannot be monitored through the SMI agent: *comma separated fabrics list*. The data source connection information will not be updated.

Explanation

This message applies to all fabrics that are managed by the SMI agent and occurs when one or more switches in the fabrics cannot be reached through the SMI agent.

Action

To resolve the problem, try the following actions:

- Ensure that all of the switches in the fabrics can be reached by the SMI agent.
- Use a different SMI agent to connect to a fabric. To connect a fabric to a different SMI agent, go to Network > Fabrics, click Add Fabric, and select Other. Specify information about the SMI agent, including host name or IP address, to complete the add action.

BPCUI0498E The fabric cannot cannot be monitored through the SMI agent.

Explanation

At least one switch in this fabric cannot be monitored through the SMI agent.

Action

Ensure that all of the switches in the fabric can be reached by the SMI agent.

BPCUI0499I Other switches were detected as being managed by the same data source. This action applies to all switches that are managed by the current data source. Would you like to update the connection information of all of them?

Explanation

Other monitored switches are being managed by the same data source. When you change the connection information for one switch, the change will apply to all of the switches.

Action

Select Yes to update the connection information of all monitored switches, or No to close the window without updating connection information.

BPCUI0500E One or more switches cannot be monitored through the SMI agent. The data source connection information will not be updated.

Explanation

This message applies to all switches that are managed by the SMI agent and occurs when at least one switch cannot be reached through the SMI agent.

Action

Ensure that all of the switches can be reached by the SMI agent.

BPCUI0501E The information cannot be displayed. Log out of the GUI, log in, and try the action again.

Explanation

An error occurred when the server tried to process a request. This message might occur when a request is not handled correctly by the internal Web server, the Web server is down, or the related data collection job failed.

Action

To resolve the problem, try the following actions:

- Ensure that the Web server (and all required product servers) are running and that you have a network connection to the system on which they are located. To check the status of the servers, go to the Home > System Management page. If the status of any server is not Running, click Component Servers for more details.
- Ensure that the related data collection jobs are running and completing successfully. To check the data collection jobs for a specific resource, go to the resource page (for example, Storage > Block Storage Systems) and check the Probe Status and Performance Monitor status columns.
- Log out of the GUI, log in, and try the action again.
- Restart the browser, log in to the GUI, and try the action again.

If the problem persists, contact IBM support. For information about how to contact IBM support, go to <http://www.ibm.com/support/knowledgecenter/SS5R93> and navigate to Troubleshooting and problem determination > Contacting IBM Software Support.

BPCUI0502E The device is already managed by this data source. The data source connection information will not be updated.

Explanation

The device is already being managed by the data source.

Action

No action is required.

BPCUI0503I The connection information of the selected switches was updated.

Explanation

The selected switches have been updated with new connection information.

Action

No action is required.

BPCUI0504I The detected versions of the resources discovered on the data source *data_Source_Address* are unsupported.

Explanation

This resource is of an unsupported version.

Action

For a list of supported versions of this product, go to the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg21386446>.

BPCUI0505E The resource does not have a connection configured.

Explanation

The data source for the resource might have been removed. You must add a connection to the resource again.

Action

To add the connection to the resource again, go to the resource list page for this resource type and click the Add button.

BPCUI0506E Cannot connect to the Alert server.

Explanation

The Alert server is unavailable. This error might occur if the Alert server is down or the local area network is unavailable.

Action

Verify that the database service and Alert server are up and running. Ensure that you have a network connection to the server on which the Alert server is located. Try the action again.

To check the status of IBM Spectrum Control servers and services, go to Home - System Management. For additional status details, click Component Servers or Database in the left navigation pane.

BPCUI0507E The version of the *tpc_server* IBM Spectrum Control Server is not supported.

Explanation

You can manage only the supported versions of IBM Spectrum Control.

Action

Check the product support site for a list of IBM Spectrum Control Server versions that are supported.

BPCUI0508E Cannot connect to the rollup server *rollup_server* on port *host_port*.

Explanation

The rollup server cannot be contacted on the specified port.

Action

To resolve the issue, try the following actions:

- Ensure that you enter the correct host address and port.
- Verify that the local area network is available and a firewall is not preventing network access to product services.
- Check the status of the rollup server.
- Ensure that the Device server is running properly.
- Ensure that the database is running properly.
- Verify that the database repository is available.
- Verify that the related database service is active.
- Check for error messages in the server log files.

BPCUI0509E Cannot authenticate with the rollup server using the provided credentials.

Explanation

The user name or password that was entered for the rollup server is not correct.

Action

Make sure that the user name and password are correct for the device that is being added. Reenter the user name or password and click Add.

BPCUI0510E You entered an invalid time range. The start date and time must be before the end date and time.

Explanation

The start date and time of the time range that you specify must be earlier than the end date and time.

Action

Enter a valid time range, and try the operation again.

BPCUI0511E The following alert name(s) are not unique: *names*.

Explanation

The names of custom alerts must be unique across all resources.

Action

Specify unique names for your custom alerts and try again.

BPCUI0512E Custom alerts already exist for other resources with the following alert name(s): *names*.

Explanation

The names of custom alerts must be unique across all resources.

Action

Specify unique names for your custom alerts and try again.

BPCUI0513E Unable to connect from rollup server *rollup_server* to the repository database.

Explanation

This error typically indicates that the repository database has been shut down. The rollup server must connect to the repository database in order to add or modify subordinate servers.

Action

Please ensure that specified repository RDBMS is up and running.

BPCUI0514E The specified secondary server *secondary_server* is the primary server.

Explanation

This problem might occur when the host name or IP address of the primary server was entered instead of the secondary server.

Action

Enter the correct host name or IP address for the secondary server that you want to add and try again.

BPCUI0515E The duration of the automated probe run window must be at least *minimum_hours* hours.

Explanation

The automated probe window cannot be less than the value that is specified in the message.

Action

Enter the start time and end time so that the duration of the window is at least the amount of time that is specified in the message.

BPCUI0516W The selected subgroups cannot be removed from the general group because they cannot be moved up a level in the groups hierarchy due to name conflicts with the general groups at the higher level.

Explanation

When you remove a subgroup from its parent general group, the subgroup is moved up to the same level in the hierarchy as the parent group. If the subgroup has the same name as an existing general group at the higher level, the subgroup cannot be moved up. The subgroup is not removed from the general group.

Action

Rename the subgroup and try the action again.

BPCUI0519E Authorization has failed because the private key is not valid for the user name that you have specified.

Explanation

The private key and user name that you have provided do not match what has been defined on the cluster.

Action

Ensure that the private key is valid for the specified user name, and log in again.

BPCUI0520E The IP address *ip_address* for the FlashSystem storage system is not the management IP address.

Explanation

The IP address for the FlashSystem storage system that you added is not the management IP address. If you do not use the management IP address, the storage system might be managed incorrectly.

Action

Add the FlashSystem storage system again using the management IP address.

BPCUI0521E The configuration for the report can't be saved.

Explanation

The save operation wasn't completed.

Action

Contact IBM Software Support.

BPCUI0522E Failed to delete a report configuration.

Explanation

An attempt to delete a report configuration failed.

Action

Verify that the database service is up and running.

BPCUI0523E Alerts cannot be defined for this storage system.

Explanation

This error might occur when a storage system is not fully supported for monitoring and data for generating alerts is not being collected.

Action

To verify if the storage system is supported for monitoring, check the support matrix at <http://www.ibm.com/support/docview.wss?uid=swg27047049>.

BPCUI0524E The changes to the report configuration can't be saved.

Explanation

The configuration for the report can't be updated because it couldn't be retrieved from the database.

Action

A new report must be created and configured.

BPCUI0525E The configuration for the report can't be saved because the report title isn't unique.

Explanation

The title of the report must be unique.

Action

Enter a unique title for the report.

BPCUI0527E The action cannot be completed because of an invalid request.

Explanation

The issue should not be seen in the field.

Action

If the problem persists, contact IBM Software Support.

Related reference

-  [Getting support](#)

BPCUI0528E The action cannot be completed because of an invalid file upload request.

Explanation

The issue should not be seen in the field.

Action

If the problem persists, contact IBM Software Support.

Related reference

-  [Getting support](#)

BPCUI0526I The connection test to data source *data source* was successful. A probe is running.

Explanation

The previous state of the monitored device was either unreachable or unknown.

Action

No action is required.

BPCUI0529I The data source *data_Source_Address* is already being managed as a data source for monitoring. No new resources were detected.

Explanation

Only resources that are newly discovered or are not included in a data collection schedule can be added for monitoring.

Action

Enter the IP address or host for a different data source or resource to continue.

If you want to modify resources that are already monitored, go to the list page for the resource. For example, to modify a storage system, in the navigation pane select Storage Resources > Storage Systems. Then, right-click the resource and select View Properties. In the properties notebook, modify the values for the resource.

BPCUI0530I The data source *data_Source_Address* is already being managed as a data source for monitoring. The following new resources were detected:

Explanation

You cannot configure resources that are already being monitored. Only resources that are newly discovered or are not included in a data collection schedule can be added for monitoring.

Action

No action is required.

BPCUI0531E The action cannot be completed because LDAP registry file failed to upload.

Explanation

The LDAP registry file failed to upload.

Action

No action is required.

BPCUI0532E The action failed because of a missing resource.

Explanation

An error occurred while processing a user request.

Action

Ensure that the database repository is running properly. Ensure that all required servers and services are running. Verify that the local area network is available and a firewall is not preventing network access to product services and agents. Try the action again.

If the problem persists, check the log files for error messages that might help determine the problem. For information about the location of log files, check the IBM Knowledge Center.

If none of these actions help resolve the problem, contact IBM Software Support.

- [Getting support](#)

BPCUI0533E The LDAP configuration test failed.

Explanation

An error occurred while testing the LDAP configuration.

Action

Ensure that the user ID and password you are using is correct.

BPCUI0534E There was an error executing the collect log process. If this problem persists, you can try collecting and uploading the service logs manually. [Learn More](#).

Explanation

There was a problem while executing the collect log process.

Either the process could not be started, or it has failed unexpectedly.

Action

Collect logs manually: [Collecting Service Logs](#).

After the log package has been created, manually upload the service logs.

BPCUI0535E An FTP connection can not be established. If your organization requires the use of a proxy server, consult the following documentation: [Troubleshooting FTP Transfers](#).

Explanation

A proxy configuration file ibmsdduu.config has been created, but the content is not valid.

Action

Please check and fix the configuration file, and try again.

BPCUI0536E The support data collection failed due to an invalid PMR number format.

Explanation

The used PMR number was not in format nnnnn,nnn,nnn.

Action

Please check the PMR number and try again.

BPCUI0537E The support package could not be created because file system permissions prevent the creation of temporary files.

Explanation

The collection of the support information failed because of problems reading/writing to the file system.

Action

Please check the file system and try again.

BPCUI0538E The support data collection completed creating a support package, but the package could not be uploaded to IBM.

Explanation

The upload of the support package via FTP failed. This might be caused by firewalls preventing the Spectrum Control server to access the internet.

Action

Please do a manual upload of the created service package.

To enable the automatic upload of the support packages in the future, you might have to configure Spectrum Control to use a proxy server. Please see the documentation for details.

BPCUI0539E The support data collection failed with an internal error

Explanation

The creation of the support data package failed due to an internal error.

Action

Try again or try using the CLI command to collect the service information. Please see the documentation for details.

BPCUI0540E The support data collection failed due to an invalid email address format.

Explanation

The used email address was not according to the syntax rules of RFC 822.

Action

Please check the email address and try again.

BPCUI0541E The specified SMI agent was not found. Make sure that the protocol, SMI agent host name or IP address, and port are specified correctly and that the SMI agent is properly configured at that location.

Explanation

The SMI agent specified was not found.

BPCUI0542E A connection was not established. Make sure that the protocol, SMI agent host name or IP address, and port are specified correctly.

Explanation

The attempt to establish a connection failed.

Related reference

- [🔗 Resolving communication issues with Brocade Network Advisor](#)

BPCUI0543E The authentication to the SMI agent failed.

Explanation

The credentials that you supplied for the connection are incorrect.

BPCUI0544E There is a pending delete in process for this SMI agent.

Explanation

The specified SMI agent is currently being deleted.

BPCUI0545E The SMI agent service is not available.

Explanation

The service accessed by the SMI agent is not available.

Action

Make sure that the service accessed by the SMI agent is started and operational.

BPCUI0546E The action cannot be completed because the LDAP registry file could not be updated.

Explanation

The ldapregistry.properties file failed to update.

Action

Check the file ldapregistry.properties file for possible conditions that caused the error. For example, the LDAP registry file is locked or is being used by an application. Correct the error condition and perform the action again.

BPCUI0547E Connection failed. The server might be down or unreachable due to network problems.

Explanation

The test to connect to the server failed.

Action

Test the connection again when the network connection to the server is restored.

BPCUI0548E The add SSL certificate action failed.

Explanation

The script that was used to add the SSL certificate to the webServer keystore file failed.

Action

Verify that you have the correct SSL certificate and try to add the SSL certificate again.

BPCUI0549E The add SSL certificate action failed because of a wrong password.

Explanation

A wrong password was used in the script to add the SSL certificate to the webServer keystore file.

Action

Verify that you have the correct password for the webServer keystore file and try to add the SSL certificate again.

BPCUI0550E The specified storage resource is not valid for the REST API service request.

Explanation

The service request does not support the specified storage resource. For example, you cannot specify a virtual server if you use the Consumption REST API.

Action

Enter a storage resource that is valid for the service request.

BPCUI0551E The file cannot be used because it is not a valid SSL certificate. Select a valid certificate file and try again.

Explanation

The file must be a valid SSL certificate to configure LDAP authentication.

Action

Select a valid SSL certificate file and try again.

BPCUI0554E The SSL certificate download process failed.

Explanation

The process for downloading the SSL certificate from the LDAP server failed.

Action

Try downloading the SSL certificate again. If the problem persists, contact your LDAP administrator.

BPCUI0555E The test connection to the LDAP server failed. Verify that your XML file contains the correct syntax and values and that the LDAP server is running.

Explanation

The test connection to the LDAP server failed.

Action

Verify the settings in the configuration file and test your connection again.

BPCUI0556E An unexpected error occurred creating or updating a support ticket.

Explanation

While executing the action, an error occurred when reading the request data.

BPCUI0557E An invalid request was made when creating or updating a support ticket.

Explanation

While executing the action, an error occurred when reading the request data.

BPCUI0558E This tier name is already in use. Enter a different name .

Explanation

Tier names must be unique so that each tier can be identified.

Action

Enter a unique name for each tier.

BPCUI0559E The custom dashboard was removed by another user. Cancel the action and refresh the page manually.

Explanation

Before the page could be refreshed, the custom dashboard was removed by another user.

Action

Cancel the action or close the dialog, and then refresh the page manually.

BPCUI0600W Can't save the scheduling information for the report because the Data server is offline.

Explanation

The report was saved with the configuration changes that were made, but without the scheduling information.

Complete these actions:

1. From the Home menu, click System Management.
2. In the Components section, click Component Servers.
3. Click Start Server next to the Data server.

When the Data server starts, complete these actions:

1. From the Reports menu, click Reports.
2. In the Custom Report section, click the report, and then click Edit.
3. Click Next, configure the schedule, and save your changes.

Action

Wait a few minutes and then complete these actions:

BPCUI0601I The resource does not have a connection configured. To add a connection to the resource, click Add Switch or Add Fabric.

Explanation

The data source for the resource might have been removed. You must add a connection to the resource again.

Action

Use the Add dialog for the resource to add the connection again.

BPCUI0602E The `osAuthentication` script does not start. The script reported the following error: `script_error`.

Explanation

Action

Fix the reason for failure and try the script again.

BPCUI0603E The connection test to data source `data source` was not successful.

Explanation

The connection to the data source (SMI-S provider) was established but the resource was not found. This problem might occur if the resource was removed and is no longer managed by the SMI-S provider.

Action

In your storage environment, assign the resource to be managed by the SMI-S provider. In IBM Spectrum Control, test the connection again.

BPCUI0604E Can't stop data collection for `entity name`.

Explanation

An error was encountered when stopping the data collection.

Action

Wait a few minutes and try again. If you still can't complete the action, go to your Products and services page (<https://myibm.ibm.com/products-services/>) on IBM Marketplace. Click the down-arrow for the Storage Insights offering, click Support, and then choose an option.

Related reference

-  [Getting support](#)

BPCUI0605E Can't restart data collection for `entity name`.

Explanation

An error was encountered when restarting the data collection.

Action

Wait a few minutes and try again. If you still can't complete the action, go to your Products and services page (<https://myibm.ibm.com/products-services/>) on IBM Marketplace. Click the down-arrow for the Storage Insights offering, click Support, and then choose an option.

Related reference

-  [Getting support](#)

BPCUI0606E The action cannot be completed because there was a failure to create or write into the pending configuration file.

Explanation

An unknown error occurred when trying to create or write the .PendingConfiguration file.

Action

Check that files can be created on the filesystem.

BPCUI0607E The action cannot be completed because there was a failure to read the pending LDAP registry file.

Explanation

An unknown error occurred when trying to read from the ldapregistry.pend file.

Action

Check that the ldapregistry.pend file exists and is readable.

BPCUI0608E The action cannot be completed because there was a failure to get the list of LDAP groups.

Explanation

There was a failure to get LDAP groups. Verify the settings in the uploaded LDAP registry file.

Action

Check the settings in the uploaded LDAP registry file.

BPCUI0609E The Local OS authentication configuration test failed.

Explanation

An error occurred while testing the Local OS authentication configuration.

Action

Ensure that the user ID and password are correct, and the user is member of the group selected.

BPCUI0610E Failed to update modified username for IBMId unique ID.

Explanation

An error occurred trying to update a modified IBMId username.

Action

Try the action again. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCUI0611E Failed to update IBMid unique ID for IBMid username.

Explanation

An error occurred trying to update a modified IBMid unique ID.

Action

Try the action again. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

BPCUI0612E The action was not performed due to invalid device credentials for *entity name*.

Explanation

An authentication error occurred trying to execute the selected action for a device. The credentials might need to be updated before the action is retried.

Action

Update the device credentials and test the connection. Try the action again. If the problem persists, contact IBM Software Support.

BPCUI0613E A switch with this host name or IP address is already being monitored.

Explanation

You can add a switch only if it is not already being monitored

Action

Enter a host name or IP address of a switch that is not already being monitored.

BTACD - Database verifier messages for SAN database service

- [BTACD0010I IBM Spectrum Control \(Configuration Service\) initialized successfully.](#)
- [BTACD0011E An error occurred while reading properties from file file name](#)
- [BTACD0012I Properties were successfully read from file file name](#)
- [BTACD0013E Exception occurred while saving the properties file file name.](#)
- [BTACD0014E An error was received while attempting to remove a callback key.](#)
- [BTACD0015E An error was received while attempting to get the database driver driver name.](#)
- [BTACD0016E An error was received while decrypting the database password.](#)
- [BTACD0017E There was an error in setting the WAS Admin password.](#)

BTACD0010I IBM Spectrum Control (Configuration Service) initialized successfully.

Explanation

Configuration Service initialized successfully.

BTACD0011E An error occurred while reading properties from file *file name*

Explanation

There was an error reading from the specified file. This file contains configuration data and is required for the product to initialize.

Action

Verify that the specified file exists and is not corrupt.

- If the file does not exist, restore from a backup copy or reinstall the product.
- If the file exists, verify that it does not have unreadable characters. The file should contain only standard English text characters, integers, and local machine names.

If the problem continues, contact IBM customer support.

Related reference

-  [Getting support](#)

BTACD0012I Properties were successfully read from file *file name*

Explanation

Startup properties were successfully loaded.

BTACD0013E Exception occurred while saving the properties file *file name*.

Explanation

There was an error saving the specified properties file. Updates have not been saved. There might be a problem with the file or you might not have permission to write to the file.

Action

Try to save the properties file again.

If the problem continues, make sure that you have write permission to the file.

BTACD0014E An error was received while attempting to remove a callback key.

Explanation

There was an error removing a callback. Either it has already been deregistered or the key was invalid. This is an internal error that should not affect the product function.

BTACD0015E An error was received while attempting to get the database driver *driver name*.

Explanation

There was an error loading the database driver. Either the driver does not exist or the driver name is incorrect.

Action

Verify that tsnmdbparms.properties lists the driver name as com.ibm.db2.jcc.DB2Driver. Restart the product. If the problem continues, contact IBM customer support.

Related reference

-  [Getting support](#)

BTACD0016E An error was received while decrypting the database password.

Explanation

There was an error decrypting the database password. Either the encrypted password does not exist, it has been corrupted, or the installation has been corrupted.

- If the `tivoli.sanmgmt.jdbc.dbPassword` field in the `tsnmdbparms.properties` file does not contain a 72 character value, then the file is either incorrect or corrupt.
- If the properties file is correct, then the product might not have installed correctly.

Action

Restart the product. If the problem continues, contact IBM customer support.

Related reference

- [Getting support](#)

BTACD0017E There was an error in setting the WAS Admin password.

Explanation

The `ChangeWASAdminPass` script file failed.

BTACE - SAN event services messages

- [BTACE0034E The Tivoli Enterprise Console server location has not been specified.](#)
- [BTACE0035E JMSEException: exception](#)
- [BTACE0037E An error occurred during the process of forwarding an SNMP trap or sending a Tivoli Enterprise Console event.](#)
- [BTACE0039E Unable to save the SnmpAddress entry to the properties file properties file.](#)
- [BTACE0040E Unable to remove the SnmpAddress entry from the properties file properties file.](#)
- [BTACE0041E Unable to save the SAN Domain ID to the properties file properties file.](#)
- [BTACE0042E Unable to read the SNMP and Tivoli Enterprise Console server address entries from the properties file properties file.](#)
- [BTACE0507E Messaging Service is not running and cannot be used to subscribe or publish events.](#)
- [BTACE0508E A proxy to the Messaging Service could not be obtained.](#)
- [BTACE0509E The proxy to the Messaging Service might not be valid. Cannot publish or subscribe to events.](#)
- [BTACE0510E Unable to create topic topic name.](#)
- [BTACE0511E Unable to create a publisher for topic topic name.](#)
- [BTACE0512E Unable to create a subscriber for topic topic name.](#)
- [BTACE0513E Unable to create a message.](#)
- [BTACE0514E Service service name failed to subscribe to topic topic name.](#)
- [BTACE0515E Publish failed for topic topic name.](#)

BTACE0030I IBM Spectrum Control (Event Service) initialized successfully.

Explanation

SAN Event Services has initialized successfully.

BTACE0031I A SAN Event message was received from: publisher name.

Explanation

SAN Event Service has received a message from the publisher indicated.

BTACE0032E Missing SNMP destination address. SNMP trap was not sent.

Explanation

There is no address to forward SNMP traps to. You can specify an SNMP server to forward events, or traps, to. The SNMP server can be configured to perform actions based on the events it receives.

Action

Specify the address of the SNMP server you would like to forward these events to.

BTACE0033E An error occurred when trying to send an event to the Tivoli Enterprise Console server.

Explanation

An exception occurred when trying to send an event to the Tivoli Enterprise Console server.

Action

Verify that the address of the Tivoli Enterprise Console server is valid.

BTACE0034E The Tivoli Enterprise Console server location has not been specified.

Explanation

There is no location set up for sending the Tivoli Enterprise Console event to.

Action

Specify the address of the Tivoli Enterprise Console server you would like to send the event to.

BTACE0035E JMSException: *exception*

Explanation

An exception was received from the messaging service.

Action

Refer to the logged exception and identify the problem. If the problem continues, contact IBM customer support.

BTACE0037E An error occurred during the process of forwarding an SNMP trap or sending a Tivoli Enterprise Console event.

Explanation

SAN Event Service has received an error while attempting to process an SNMP trap or a Tivoli Enterprise Console event.

Action

Refer to the logged exception and identify the problem. If the problem continues, contact IBM customer support.

BTACE0039E Unable to save the SnmpAddress entry to the properties file *properties file*.

Explanation

There was an error saving the SnmpAddress entry to the properties file. Updates have not been saved. There might be a problem with the file or you might not have permission to write to the file.

Action

Try to save the SnmpAddress entry again and make sure that you have write permission to the properties file *properties file*. If the problem continues, contact IBM customer support.

BTACE0040E Unable to remove the SnmpAddress entry from the properties file *properties file*.

Explanation

There was an error removing the SnmpAddress entry from the properties file. Updates have not been saved. There might be a problem with the file or you might not have permission to write to the file.

Action

Try to remove the SnmpAddress entry again and make sure that you have write permission to the properties file *properties file*. If the problem continues, contact IBM customer support.

BTACE0041E Unable to save the SAN Domain ID to the properties file *properties file*.

Explanation

There was an error saving the SAN Domain ID to the properties file. Updates have not been saved. There might be a problem with the file or you might not have permission to write to the file.

Action

Try to save the SAN Domain ID again and make sure that you have write permission to the properties file *properties file*. If the problem continues, contact IBM customer support.

BTACE0042E Unable to read the SNMP and Tivoli Enterprise Console server address entries from the properties file *properties file*.

Explanation

There was an error reading the SNMP and Tivoli Enterprise Console server address entries from the properties file. There might be a problem with the file or you might not have permission to read the file. This error can also occur if the ConfigService is down.

Action

Make sure the ConfigService is up and that you have permission to read the properties file *properties file*. Then restart the service. If the problem continues, contact IBM customer support.

BTACE0507E Messaging Service is not running and cannot be used to subscribe or publish events.

Explanation

The Messaging Service, which is used by all other services to subscribe to and publish events, is not running. Services cannot subscribe to or publish events.

Action

Restart the product. If the problem persists, contact IBM customer support.

BTACE0508E A proxy to the Messaging Service could not be obtained.

Explanation

A proxy to the Messaging Service could not be obtained.

Action

Review the message log to determine why the proxy could not be obtained. If this problem persists, enable ServiceManager tracing to assist in determining why the proxy could not be obtained.

BTACE0509E The proxy to the Messaging Service might not be valid. Cannot publish or subscribe to events.

Explanation

The proxy to the Messaging Service might not be valid. The Messaging Service might not be running.

Action

Restart the product. If the problem persists, contact IBM customer support.

BTACE0510E Unable to create topic *topic name*.

Explanation

makeTopic tries to construct the full class name of the topic by prefixing the superclass name recursively until the root of the class hierarchy is reached. An error occurred in makeTopic which prevented the full topic name to be constructed.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why makeTopic failed.

BTACE0511E Unable to create a publisher for topic *topic name*.

Explanation

An error occurred while creating a publisher for the specified topic.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why the createPublisher method failed.

BTACE0512E Unable to create a subscriber for topic *topic name*.

Explanation

An error occurred while creating a subscriber for the specified topic.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why the createSubscriber method failed.

BTACE0513E Unable to create a message.

Explanation

An error occurred while creating a message.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why the createMessage method failed.

BTACE0514E Service *service name* failed to subscribe to topic *topic name*.

Explanation

An error occurred when the service tried to subscribe to the topic.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why subscribe failed.

BTACE0515E Publish failed for topic *topic name*.

Explanation

An error occurred when the topic was being published.

Action

Enable the messaging middleware trace (san.tesTrcLogger) and view the trace logs to determine why publish failed.

BTACS0001I IBM Spectrum Control command line interface initialized successfully.

Explanation

IBM Spectrum Control command line interface has initialized successfully.

BTACS0002E The -url requires a host:port argument.

Explanation

The -url argument was not entered correctly. It must be in this format: host:port. For example, tiger.wild.com:2210.

Action

Try the command again using the correct syntax for the -url argument.

BTACS0003E Required parameters are not present.

Explanation

The host:port service method [params] required parameters were not entered.

Action

Retry the command with the correct parameters.

BTACS0002I The command line interface is binding to the service.

Explanation

The IBM Spectrum Control command line interface is binding to the service specified on the command line.

BTACS0003I The bind was successful.

Explanation

IBM Spectrum Control command line interface bound to the service specified on the command line.

BTACS0004E An exception occurred while invoking the service: *method name*.

Explanation

An exception was received by the IBM Spectrum Control command line interface while attempting to start the specified service.

Action

Refer to the exception for more information. Contact IBM customer support if the problem continues.

BTACS0015E Caught exception: *value*.

Explanation

An exception was received by the command line interface.

Action

Refer to the exception for more information. Contact IBM customer support if the problem continues.

Related reference

-  [Getting support](#)

BTACS0005E Could not deserialize exception: *value*.

Explanation

An exception was encountered when Service Manager was deserializing an object.

Action

Refer to the exception for more information. Contact IBM customer support.

Related reference

-  [Getting support](#)

BTACS0006E Fault detail: *value*.

Explanation

An error was encountered when Service Manager was deserializing an object.

Action

If the problem persists, shut down and restart IBM Spectrum Control. If this does not correct the error, the problem is probably in network communications.

BTACS0014E An undeclared exception was encountered: *value*.

Explanation

An undeclared exception was encountered by Service Manager.

Action

Refer to the exception for more information. Contact IBM customer support if the problem continues.

BTACS0007E Unrecognized command for service: *service name*.

Explanation

Service Manager encountered an internal problem while managing the specified service.

Action

Shut down and restart the program.

BTACS0005I Deployed service *service name*: class=*value*, scope=*value*, autostart=*value*, static=*value*, order=*value*.

Explanation

Service Manager encountered an internal problem while managing a service.

Action

Shut down and restart the program.

BTACS0006I Undeploying service: *service name*

Explanation

Service Manager is undeploying the specified service.

BTACS0007I Undeployed service: *service name*

Explanation

Service Manager successfully undeployed the specified service.

BTACS0008E Error undeploying service *value* : *value*

Explanation

Service Manager encountered a problem while attempting to undeploy the specified service.

Action

Contact IBM customer support.

BTACS0008I Starting service *service name* (timeout *number* seconds)

Explanation

Service Manager started the specified service.

BTACS0013E Service *service name* did not start, interrupting the startup thread.

Explanation

Service Manager timed out while starting the specified service.

Action

Change the service.timeout setting in the setup.properties file and restart the program.

BTACS0009I The service *service name* was stopped.

Explanation

Service Manager stopped the specified service.

BTACS0010E An error was encountered while stopping service *service name*.

Explanation

Service Manager encountered an error while stopping the specified service.

Action

Contact IBM customer support.

BTACS0010I Stopping service *service name* (timeout *number* seconds).

Explanation

Service Manager is stopping the specified service.

BTACS0017E Service *service name* did not stop, interrupting the startup thread.

Explanation

Service Manager timed out while stopping the specified service.

Action

Change the service.timeout setting in the setup.properties file and restart the program.

BTACS0018E A problem was encountered while getting class definition: *class definition name*.

Explanation

Service Manager encountered a problem while getting interface details from the JVM.

Action

Contact IBM customer support.

Related reference

- [Getting support](#)

BTACS0019E An interface *value* in service *service name* is being ignored.

Explanation

Service Manager is ignoring an interface because it could not get details for it from the JVM.

Action

Contact IBM customer support.

BTACS0011I Interrupting monitor thread and waiting for it to exit.

Explanation

Service Manager is shutting down - stopping the monitor thread.

BTACS0012I Service Manager shutting down.

Explanation

Service Manager is shutting down.

BTACS0013I Monitoring services (monitor interval is *number* seconds) .

Explanation

Service Manager is monitoring services.

BTACS0014I Service *service name* has *value*.

Explanation

Service Manager is monitoring services.

BTACS0015I The Service Manager monitor process is exiting.

Explanation

The Service Manager monitor process is exiting.

BTACS0016I There are no services to autostart.

Explanation

No services are configured for Service Manager to start.

You can configure services to start automatically. For more information, see the Planning and Installation Guide.

BTACS0017I All autostart services have started.

Explanation

All services configured to autostart have been started.

BTACS0018I All services are shutting down.

Explanation

Service Manager is shutting down all services.

BTACS0019I All services have been shut down

Explanation

Service Manager has shut down all services.

BTACS0020I Deleted file *file name*

Explanation

Service Manager deleted the deployed services file.

BTACS0021I Unable to delete file *file name*

Explanation

Service Manager was unable to delete the specified file.

BTACS0022I Starting autostart services.

Explanation

Service Manager is starting all services that were configured to start automatically.

BTACS0023I An error occurred while starting the *service name* service.

Explanation

Service Manager encountered an error while starting the specified service.

Action

Shut down and restart the program. If the problem continues, contact IBM customer support.

BTACS0024I The properties from file *file name* were successfully read.

Explanation

Startup properties were successfully loaded.

BTACS0025E An error occurred while reading properties from file *file name*.

Explanation

An error occurred while reading from the specified file. This file contains configuration data and is required for the product to initialize.

Action

Verify that the specified file exists and is not corrupt.

- If the file does not exist, restore from a backup copy or reinstall the product.
- If the file exists, verify that it does not have unreadable characters. The file should contain only standard English text characters, integers and local machine names.

If the problem continues, contact IBM customer support.

BTACS0026E Login failed: Unknown user name or bad password.

Explanation

The command line was unable to authenticate the specified user with the host operating system.

Action

Verify the user name specified exists in the host operating system and the password is still valid. If this is a Windows machine, confirm that the user that the Fabric service is running under has Act As Part Of The Operating System authority. If running under WebSphere, make sure that WebSphere security is enabled.

BTACS0027E Command failed: Failed to connect.

Explanation

Failed to connect to application.

Action

Failed to make a network connection to the application. Confirm that the application is running.

BTACS0028E Command failed.

Explanation

The command line command failed.

Action

If the problem continues, contact IBM customer support.

Related reference

- [Getting support](#)

BTACS0029E Failed to connect to <hostname>.

Explanation

Service Manager was unable to connect to the remote machine.

Action

If the problem continues, contact IBM customer support.

Related reference

BTACS0031I The server is not registered with the Agent Manager.

Explanation

The server is required to register with the Agent Manager before communicating with any common agents.

BTACS0032I Registering with the Agent Manager at *host name:port*.

Explanation

The server is starting the registration process.

BTACS0033I The server is renewing credentials with the Agent Manager at *host name:port*.

Explanation

The server is renewing credentials with the agent manager because the current credentials will expire soon.

BTACS0034I The server credentials are current. Agent Manager at *host name:port*.

Explanation

The credentials are current.

BTACS0035E The server failed to register with the Agent Manager at *host name:port*.

Explanation

The server failed to register with the Agent Manager.

Action

Check the status of the Agent Manager.

BTACS0036W The server failed to register with the Agent Manager. It will retry in *delay* seconds.

Explanation

The server failed to register with the Agent Manager, but the maximum number of retry attempts has not been reached.

BTACS0037I The server successfully registered with the Agent Manager.

Explanation

The server successfully registered with the Agent Manager.

BTACS0038I The server successfully renewed the credentials with the Agent Manager.

Explanation

The server successfully renewed the credentials with the Agent Manager.

BTACS0039W The server failed to renew the credentials with the Agent Manager.

Explanation

The server failed to renew the credentials with the Agent Manager.

BTACS0040E This command requires additional arguments.

Explanation

More arguments are required for the command line command in order to process the request.

BTACS0041E The command line is not available for service: *service name*.

Explanation

The specified service does not provide a command line interface.

BTACS0042E Invalid command: *CLI command*

Explanation

The specified service does not provide a command line interface.

BTACS0043E Failed to authenticate with host *hostUrl*. Invalid host authentication password.

Explanation

The host authentication password is incorrect.

Action

Reset the host authentication password. If the problem continues, contact IBM customer support.

Related reference

BTACS0045I SERVICE MANAGER COMMANDS

Explanation

Header for the Service Manager command line interface.

BTACS0046I Returns the status of the services.

Explanation

Description of the get status function provided by the Service Manager Command line interface.

BTACS0047I *Service.functionName* performed by user at location. Input parameters: *input parameters*, output parameters: *output parameters*

Explanation

The specified remote procedure call was authorized.

BTACS0048W Unauthorized request by user at location to perform *service.functionName*.

Explanation

The specified remote procedure was not authorized.

BTACS0049W Not licensed to perform *service.functionName* request by user at *location*.

Explanation

The system is not licensed to perform the specified call.

BTACS0050I Waiting for Common Agent services.

Explanation

The agent startup will be performed when the required services have started.

Action

Make sure the Connector service of the Common Agent has started successfully. The service may fail to start if the credentials required for SSL have expired and the Common Agent has not renewed the credentials with the Agent Manager.

BTACS0051I The Common Agent services have started successfully.

Explanation

The required Common Agent services have started. The Fabric agent will proceed with the startup procedure.

BTACS0052W Failed to create the Common Agent service filter. The Fabric agent will start without waiting for the required Common Agent services.

Explanation

The Fabric agent is unable to check if the required Common Agent services have started.

BTACS0053I Agent startup is already in progress.

Explanation

The Fabric agent has already initiated the startup sequence. The current start request will be ignored.

BTACS0054I Invalid Server ID has been provided to update Server Job status.

Explanation

Invalid Server id was provided to update job status. If there are jobs in "running" state, status of those jobs will not be reset to "failed".

BTACS0055I Agent Manager Registration is set to NO. The server will not register with an AgentManager.

Explanation

IBM Spectrum Control is operating in an environment with "AgentManager.Registration" set to NO. The server will not attempt to register with the Agent Manager.

BTACS0056I Agent Manager Registration is set to YES. The server will register with the AgentManager.

Explanation

IBM Spectrum Control is operating in an environment with "AgentManager.Registration" set to YES. The server will attempt to register with the Agent Manager.

BTACS0057W Error in configuration parameter AgentManager.Registration - default value will be used.

Explanation

There was an error in the value of the Configuration parameter "AgentManager.Registration". Allowed values are "yes" and "no".

BTACS0000I Starting Control Process: *value*, Device Server RUN ID=*value*, Job ID=*value*.

Explanation

The specified control process has been started.

Action

None.

BTACS0001I IBM Spectrum Control command line interface initialized successfully.

Explanation

IBM Spectrum Control command line interface has initialized successfully.

BTACS0002I The command line interface is binding to the service.

Explanation

The IBM Spectrum Control command line interface is binding to the service specified on the command line.

BTACS0003I The bind was successful.

Explanation

IBM Spectrum Control command line interface bound to the service specified on the command line.

BTADS0000I Starting Discover Process value , with Device Server RUN ID value , and Job ID value .

Explanation

The specified discovery request has been started.

Action

None.

BTADS0001I Discover Process with Device Server run ID *value* and job ID *value* is complete.

Explanation

The specified discovery request has completed.

Action

None.

BTADS0002I Starting Child Discover Process *value* with Job ID= *value* .

Explanation

The specified child discovery request has started.

Action

None.

BTADS0003I The Child Discover Process with Job ID *value* has completed with Status= *value* and Return Code= *value* .

Explanation

The specified child discovery request has completed.

Action

None.

BTADS0004W The child discovery request with job ID *job_id* completed with status *status_number* and return code *value*.

Explanation

The specified child discovery request completed with one or more warnings.

Action

For more information about the warnings, check the job log for the child discovery request. To find the child discovery request, check the job logs that have the same run ID.

BTADS0005E The child discovery request with job ID *job_id* completed with status *status_number* and return code *value*.

Explanation

The specified child discovery request completed with one or more errors.

Action

For more information about the errors, check the job log for the child discovery request. To find the child discovery request, check the job logs that have the same run ID.

BTADS0010I Invoking outband scanner value on agent value .

Explanation

The specified scan has been invoked.

Action

None.

BTADS0011I Outband scanner value on agent value completed successfully.

Explanation

The specified scan has been completed.

Action

None.

BTADS0012E Outband Scanner value on agent value failed with return code value .

Explanation

The specified scan failed.

Action

None.

BTADS0019E An outband scanner failed to capture the scan data.

Explanation

An error condition prevented the scanner from processing the outband scan data.

Action

If the problem continues, contact IBM customer support.

BTADS0020I Processing value data from agent value .

Explanation

TSANMLegacyParser is running the specified Device Server job to parse XML that represents a fabric.

Action

None.

BTADS0021W Warning encountered while parsing Fabric XML for job: RUN ID= *value* , and Job ID= *value* . *value* .

Explanation

The DESaxParser has encountered a warning while parsing XML that represents a fabric.

Action

None.

BTADS0022E Exception encountered while parsing Fabric XML for job: RUN ID= *value* , and Job ID= *value* . *value* .

Explanation

The DESaxParser has encountered an exception while parsing XML that represents a fabric.

Action

Contact IBM customer technical support.

BTADS0025I Running job to discover SMI-S providers through Service Location Protocol: RUN ID= *value* , Job ID= *value* .

Explanation

SLPObjectParser is running the specified job to discover SMI-S providers through Service Location Protocol.

Action

None.

BTADS0026I Service Location Protocol has found *value* SMI-S providers.

Explanation

SLPObjectParser has found SMI-S providers through Service Location Protocol.

Action

None.

BTADS0027E Error encountered by a Service Location Protocol job: RUN ID= *value* , and Job ID= *value* . *value* .

Explanation

SLPObjectParser has encountered an error while discovering SMI-S providers through Service Location Protocol. One or more SMI-S providers may not have been discovered.

Action

Information for one or more SMI-S providers may need to be manually entered. Contact IBM customer technical support if automatic discovery of SMI-S providers through Service Location Protocol is needed.

BTADS0028W The Device Server Job with RUN ID=: *value* , Job ID= *value* , Discover Request= *value* has been cancelled since it is long running.

Explanation

The specified job has been cancelled.

Action

None.

BTADS0029I Scanner *value* data from agent *value* has not changed since last scan.

Explanation

The specified scan has been invoked.

Action

None.

BTADS0030I Invoking inband Scanner *value* on agent *value* .

Explanation

The specified scan has been invoked.

Action

None.

BTADS0031I Inband Scanner *value* on Agent *value* completed successfully.

Explanation

The specified scan has been completed.

Action

None.

BTADS0032E Inband Scanner *value* failed on agent *value* with Return Code *value* .

Explanation

The specified scan failed.

Action

None.

BTADS0033E Error invoking *value* on host *value* .

Explanation

The specified scan failed.

Action

None.

BTADS0034E Fatal error encountered while persisting the data for job: RUN ID= *value* , and Job ID= *value* . *value* .

Explanation

The DESaxParser has encountered a fatal error while persisting fabric information.

Action

Contact IBM customer technical support.

BTADS0055E Outband Scanner *value* on agent *value* encountered the presence of a McData i10k. These devices do not report correctly via SNMP and can only be used with SMI-S provider.

Explanation

McData i10k devices do not work properly with SNMP agents. They should only be used with SMI-S providers. Remove this SNMP agent.

Action

Remove this device as an Out of band Fabric agent and add it as an SMI-S provider.

BTADS0056E Errors in Topology XML generator.

Explanation

Some of the data generated by the scanner appears to have errors.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

BTADS0059E The outband agent target address *IP address* is not a Cisco device or is invalid.

Explanation

The Cisco scan cannot be run on the outband agent target address. Either the device is not a Cisco device or the IP address is not valid.

Action

Verify that the connection information for the device is valid. Ensure that the network and the device are up and available. Try the action again.

BTADS0060E Outband Scanner *value* is not responding.

Explanation

The specified scan failed has failed due to a timeout.

Action

Please check network connections to the switch and SNMP settings on the switch.

BTADS0062E Encountered SQL error *value* while persisting some data.

Explanation

Some discovered data was not stored in the database due to an SQL error.

Action

Please check the device server trace log for more detail. If the problem continues, contact IBM support.

BTADS0063W The performance data collection for the current device
is not enabled.

Explanation

The performance collection service is disabled. Please check the external provider documentation.

Action

None.

BTADS0064I Starting scan of Storage Subsystems from *value* to *value*
.

Explanation

Scanning the specified range of IP Addresses for Storage Subsystems.

Action

None.

BTADS0065I Outband and inband agents for fabric(s) specified in
probe are *value*

Explanation

Determining outband and inband agents that can be used to probe fabric(s)

Action

None.

BTADS0066I Could not find scanners for agent *value*

Explanation

Unable to find scanners for agent and so will not be able to invoke the scanners for this particular agent during the probe

Action

None.

BTADS0067I Agent value is configured for no SAN calls and so no scanners will be invoked for this particular agent

Explanation

Determining outband and inband agents that can be used to probe fabric(s)

Action

None.

BTADS0068I Could not retrieve connection information for agent value. Will not be able to invoke scanners for this particular agent

Explanation

Unable to invoke scanners for a agent since connection information for the agent could not be obtained

Action

None.

BTADS0069I Added inband scanner job with id value discover request value for agent value.

Explanation

Added a job to invoke scanner for a particular agent to probe a fabric

Action

None.

BTADS0070I Agent value has not discovered any fabrics and will not be used during the probe.

Explanation

This particular agent has not discovered a fabric previously and will not be used during this probe run

Action

None.

BTADS0071I Invoked inband Scanner value on agent value .

Explanation

The specified scan has been invoked successfully.

Action

None.

BTADS0072I Successfully received response from agent for job value with request id value .

Explanation

Response received from agent successfully. Server will process the response.

Action

None.

BTADS0073E Received error response from agent for job value with request id value. Return code is value.

Explanation

Error response received from agent for specified job or there was a error encountered while receiving job. Job will be considered failed.

Action

None.

BTADS0074E IP Scan Discovery was canceled due to a hung socket/thread detected. Partial result of the scan will be persisted.

Explanation

IP Scan Discovery was canceled since a hung thread or socket was detected. Available results will be persisted in the database.

Action

None.

BTADS0075E IP Scan Discovery was canceled due to a hung socket/thread detected.

Explanation

IP Scan Discovery was canceled since a hung thread or socket was detected.

Action

None.

BTADS0076I IP Scan Discovery has started for DS, XIV, and IBM SONAS subsystems .

Explanation

IP Scan Discovery for DS, XIV, and IBM SONAS subsystems has started

Action

BTADS0077I Scanning value out of value IP addresses.

Explanation

Informational message on number of IP being scanned.

Action

None.

BTADS0078I IP Scan Discovery has started for SVC subsystems.

Explanation

IP Scan Discovery for SVC subsystems has started

Action

None.

BTADS0079I IP Scan Discovery for DS and XIV was done.

Explanation

IP Scan Discovery for DS, XIV, and IBM SONAS was done

Action

None.

BTADS0080I IP Scan Discovery for SVC was done

Explanation

IP Scan Discovery for SVC was done.

Action

None.

BTADS0081I Inband Scanner value for agent address value is not required for probing switches and will not be used.

Explanation

The information that can be collected using the specified scanner will be collected by another scanner or agent instead.

Action

None.

BTADS0082W A first run of a switch probe failed. Additional agents will be used.

Explanation

A probe that used a subset of agents to probe switches did not complete. The probe will now use previously unassigned agents. Depending on the types of agents that are available, all or a subset of information will be collected about the switches.

Action

Check the trace log for more detail. Determine whether the agent or agents that failed are currently down for a known reason. If the problem continues, contact IBM Software Support.

BTADS0083I The available agents provide a subset of possible features for the probed switch: *value*

Explanation

Some switches require more than one type of agent (such as a Storage Resource agent, SNMP agent, and SMI agent) to collect all the available information for the switch.

Action

To determine if any additional agent types are required for the switch and fabric functions that you need, go IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93> and view the Reference section. If you have all the required agents deployed for the switch, ensure that are configured and running properly.

BTADS0084I There are no limitations for probing switch *value* based on the mix of agents that are configured.

Explanation

With the current mix of configured agents, there are no known limitations on the information that can be collected from a probe of the specified switch.

Action

No action is required.

BTADS0085W A problem was encountered when agent assignments were being determined for the probe. All available agents will be used to collect information about the switch.

Explanation

Typically, agent assignment is used to reduce the number of agents that are used by a probe. Because an exception was encountered while determining agent assignments, all the available agents will be used.

Action

Check the device server message and trace log for more information. If the problem continues, contact IBM support.

BTADS0086I The following storage systems were discovered *value*

Explanation

This message is for informational purposes only.

Action

No action is required.

BTADS0087I IP Scan Discovery did not find any DS8000, SVC, XIV, and IBM SONAS storage systems in the given IP range.

Explanation

This message is for informational purposes only.

Action

No action is required.

BTADS0088I IP Scan Discovery finished.

Explanation

This message is for informational purposes only.

Action

No action is required.

BTADS0089E The Device server is not registered with agent manager. Scanners cannot be used for agent value. value.

Explanation

The Device server must be registered with the agent manager.

Action

Configure the Device server to register with the agent manager. Check the Device server message and trace log for more information. If the problem continues, contact IBM support.

BTADS0090E There are no agents currently available to probe switch value.

Explanation

There are no agents configured to probe the specified switch or the agents configured are not operational.

Action

Configure the agents to probe switches. If agents are already configured, check if they are operational. Check the trace log for more detail. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTADS0091I Inband Scanner value for agent address value is currently not running and will not be used.

Explanation

The specified scanner is currently not running and will not be used.

Action

Check the status of specified agent and determine the reason that it is not running. Check the device server message and trace log for more detail. Check if an alternate agent can be used for the probe. If the problem continues, contact IBM support.

BTADS0092I Inband Scanner value for agent address value is currently disabled from performing fabric functions and will not be used.

Explanation

The specified scanner must be enabled if you want to perform fabric functions.

Action

Check the reason for disabling the fabric functions for the specified agent. Check if an alternate agent can be used for the probe.

BTADS0093I Inband Scanner value for agent address value is currently not reachable and will not be used.

Explanation

The specified scanner must be reachable to use it for a probe.

Action

Check if the host on which the agent is running is reachable from the server and that the server is reachable from the agent. Check the trace log for more detail. Check if an alternate agent can be used to probe switches. If the problem continues, contact IBM Software Support.

BTADS0094W The probe for switch value has some limitations.

Explanation

There are some limitations for the information collected by a probe of the switch based on the mix of agents that are configured and operational.

Action

Check if there are additional agents that can be configured for the probe. Check the status of the configured agents. Check the device server message and trace log for more detail. If the problem continues, contact IBM support.

BTADS0095W For switch value some information will not be collected.

Explanation

There are some limitations for the information collected by a probe of the fabric based on the mix of agents that are configured and operational.

Action

Check if there are additional agents that can be configured for the probe. Check the status of the configured agents. Check the device server message and trace log for more detail. If the problem continues, contact IBM support.

BTADS0096I The probe limitation can be overcome by configuring an SMI agent to manage fabric value.

Explanation

An SMI agent is required to manage the fabric. Note that there might be more than one type of agent that can manage the fabric.

Action

Configure an SMI agent to manage the specified fabric. For more information about the types of agents that are available to manage a fabric, go IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93> and view the Reference section.

BTADS0097I The probe limitation can be overcome by configuring SNMP agents to manage switches in fabric value.

Explanation

SNMP agents are required to manage the specified fabric. Note that there might be more than one type of agent that can manage the fabric.

Action

Configure an SNMP agent to manage the specified fabric. For more information about the types of agents that are available to manage a fabric, go IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93> and view the Reference section.

BTADS0098I The probe limitation can be overcome by configuring a Storage Resource agent to manage fabric value.

Explanation

A Storage Resource agent is required to manage the specified fabric. Note that there might be more than one type of agent that can manage the fabric.

Action

Configure a Storage Resource agent to manage the specified fabric. For more information about the types of agents that are available to manage a fabric, go IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93> and view the Reference section.

BTADS0099W The following WWN is not recognized as belonging to a known vendor: value.

Explanation

A unique identifier contained in the WWN was not found and associated with a known vendor.

Action

Contact IBM support for more information about associating the identifier in the WWN with a corresponding vendor.

BTADS0100W Invalid relationships between switches and fabrics were identified. If possible, these relationships will be fixed automatically for the following switches: value.

Explanation

Some switches were identified as belonging to more than one fabric. This issue might occur if two fabric data sources report different principal switches for the same fabric. The firmware on the switches might be the root cause of this problem. One of the principal switches is chosen to be displayed as the fabric WWN and the other switch WWN is not shown as a separate fabric.

Action

Ensure that all switches in your fabric are running the same firmware level. If the problem continues, upgrade the switches to the latest firmware level. If the problem still occurs, contact IBM customer support.

BTADS0101W The discover process that has the Device server run ID value and job ID value completed with one or more warnings.

Explanation

The specified discovery process completed with one or more warnings.

Action

See the probe logs for this run ID to view the warning messages.

BTADS0102E The probe with the run ID value completed with errors.

Explanation

Configuration, capacity, and status information couldn't be collected about the resource.

Action

Complete one or more of the following actions:

- Check the probe log for related error messages that might help determine the cause of the problem.
- Verify that the resource that is being monitored is up and available.
- Verify that the local area network is available and that the firewall is not preventing network access to product services and agents. Contact your firewall administrator to ensure that the required ports are open.
- Check the status of the product servers and database repository on the Home > System Management page.
- On Windows, verify that the related database services are active.
- Check for error messages in the log files for the servers.
- Try the probe again. If the problem persists, contact IBM Software Support.

BTADS0104E A timeout occurred while processing the request. Try the request again.

Explanation

The request could not be processed in the time allowed.

Action

Try the request again.

BTADS0105E A response from the data collector was not received within the specified time.

Explanation

The data collector did not respond to the server in the specified time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server. Then try the request again.

BTADS0106E The requested action on agent *agent_name* did not complete because the data collector stopped or is not responding. The request failed with error code *error_code*.

Explanation

The specified scan did not complete.

Action

Verify that the data collector is running and that it can connect to the server. Then try the request again.

BTADS0107W Outband Scanner *outband_scanner_name* on agent *agent_name* failed because of another transaction in progress on the switch.

Explanation

The switch is busy handling another transaction. To avoid this error, wait for the transaction to be done and try to run the probe again.

Action

Check the trace file for more details. Try the operation again.

BTADS0108E Outband Scanner *outband_scanner_name* on agent *agent_name* failed because unexpected data was returned by the switch. Check the trace file for more details.

Explanation

The switch is returning unexpected data. To avoid this error, review recent configuration changes and try to run the probe again.

Action

Check the trace file for more details. Try the operation again.

BTADS0109I Outband Scanner *outband_scanner_name* on agent *agent_name* did not collect zoning data.

Explanation

The switch did not return zoning data. There may be issues with the switch configuration or zoning configuration.

Action

Review recent configuration changes. Try the operation again.

BTADS0110I Outband Scanner *outband_scanner_name* on agent *agent_name* did not pass write capabilities check.

Explanation

The IBM Spectrum Control server could not verify write capabilities either due to an incorrect write community string or an authentication failure. Without correct credentials, zone control functions will not work.

Action

Check and if necessary correct either the write community string or the authentication parameters.

BTADS0111E The probe was unable to collect some details of the switch.

Explanation

A problem was encountered during the probe of the switch. The switch properties might be reported incorrectly until a later probe is completed.

Action

Try the following actions to resolve the problem:

- Check the logs for an indication of the error or exception, and resolve the problem if possible. For information about probe logs, see the Viewing probe logs topic in the IBM Spectrum Control Knowledge Center.
- Try the probe again at a later time. For instructions on how to start a probe, see the Starting probes topic in the IBM Spectrum Control Knowledge Center.
- If the problem continues, contact IBM customer support.

BTAFM4002E Could not get requested information due to an internal error - *errorMessage*

Explanation

An error occurred during the attempt to retrieve information from the database.

Action

Check the health of the database. Then, rerun the discovery and probe process, and then run a data collection task.

BTAFM4100E Mandatory parameter *parameter_Name* is missing.

Explanation

A service has been called without a required parameter.

Action

Check the mandatory parameters and retry the operation.

BTAFM4101E Invalid parameter *parameter_name*.

Explanation

A service has been called with an invalid parameter.

Action

Check the valid parameters and retry the operation.

BTAFM4103E Entity *entity_name* was not found.

Explanation

The database entity that was specified was not found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4104E Attribute *attribute_name* was not found.

Explanation

The database column specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4105E Computer *computer_name* was not found.

Explanation

No computer system was found that corresponds to the key that was passed in as an input parameter. The computer system specified as a parameter can not be found.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4106E Fabric *fabric_name* was not found.

Explanation

The fabric specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4107E Switch *switch_name* was not found.

Explanation

The switch specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4108E Port *port_name* was not found.

Explanation

The port specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4109E Zone set *zoneset_name* was not found.

Explanation

The zone set specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4110E Zone *zone_name* was not found.

Explanation

The zone specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4111E Zone alias *zone_alias_name* was not found.

Explanation

The zone alias specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4112E Zone member *zone_member_name* was not found.

Explanation

The zone member specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4113E Subsystem *subsystem_name* was not found.

Explanation

The subsystem specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4114E Host Bus Adapter *HBA_name* was not found.

Explanation

The Host Bus Adapter specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4115E Node *node_name* was not found.

Explanation

The node specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4116E Link from port *from_port_name* to port *to_port_name* was not found.

Explanation

The link specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4117E Hub *hub_name* was not found.

Explanation

The hub port specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4118E Router *router_name* was not found.

Explanation

The router specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4119E Bridge *bridge_name* was not found.

Explanation

The bridge specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4120E LUN *LUN_name* was not found.

Explanation

The LUN specified as a parameter can not be found in the database.

Action

Rerun the discovery and probe process, and then run a data collection task.

BTAFM4140E Agent *Agent_name* was not found.

Explanation

The agent specified as a parameter can not be found in the database.

Action

Open the agent configuration panel and check on the status of the agents.

BTAFM4141E Scanner *scanner_name* on agent *agent_name* was not found.

Explanation

The scanner specified as a parameter can not be found in the database.

Action

Open the agent configuration panel and check on the status of the agents.

BTAFM4142W Agent *agent_name* was ignored because the switch *switch_name* was probed by agent *agent1_name*.

Explanation

The agent specified was ignored because another, more appropriate one, was used for the same WWN.

Action

No action is required.

BTAFM4150E Indexed properties *property_name* don't match.

Explanation

Indexed input parameters different sizes.

Action

Make sure that all the indexed input parameters are the same size.

BTAFM4180E Agent to gather sensor and event data is not available for the switch *switch_name*.

Explanation

The switch event and sensor data is only available through SNMP agents.

Action

Make sure you have configured the correct IP address for the switch for which you want to obtain sensor and event data.

BTAFM4200E Credentials not found.

Explanation

A problem occurred while accessing the user credentials.

Action

Make sure the database is running and that the IBM Spectrum Control setup completed successfully.

BTAFM4300E The connection to the SMI agent for switch *switch_name* could not be made.

Explanation

The creation of the SMI agent client failed.

Action

Ensure that the SMI agent is running and that the correct user ID and password have been set for this SMI agent in the user interface panels.

BTAFM4301E The invocation of CIM method *method_name* failed on SMI-S provider *SMI-S provider name*. The return code is *return_code*.

Explanation

The CIM method that was invoked on the specified SMI-S provider failed.

Action

Check the health of the SMI-S provider. Check the trace log for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

BTAFM4302E The invocation of CIM method *method_name* failed on SMI-S provider *SMI-S provider name* with the following exception text: *exception_text*.

Explanation

The CIM method that was invoked on the specified SMI-S provider failed.

Action

Check the health of the SMI-S provider. Check the trace log for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

BTAFM4303E Received unexpected values from SMI-S provider *SMI-S provider name* .

Explanation

The SMI-S provider returned values that are unexpected and might indicate that the SMI-S provider is not working correctly.

Action

Using the CIMBrowser, make sure the SMI-S provider has the correct information. If not, fix the problem on the SMI-S provider. Otherwise, check the logs for an indication of an error or exception and contact IBM customer support.

BTAFM4304E SMI agent *SMI agent name* can not contact switch *switch_name*.

Explanation

The SMI agent can not contact the switch that it manages.

Action

Check the SMI agent logs to determine why it cannot contact the switch.

BTA FM4305E The CIM method *method_name* is not supported on the switch *switch_name*.

Explanation

The switch does not support the specified function.

Action

No action is required.

BTA FM4306E Could not create connection to SMI-S provider *SMI-S provider name* . Reason: *reason*.

Explanation

A connection to the SMI-S provider could not be established.

Action

Check the health of the SMI-S provider. Check the trace log for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

BTA FM4307E The username *user_name* or password is wrong on SMI-S provider *SMI-S provider name*.

Explanation

The username or password specified for the SMI-S provider are not valid.

Action

Specify the correct username/password combination for the SMI-S provider.

BTA FM4308I Could not create connection to SMI-S provider *SMI-S provider name* . Reason: *reason*. An alternate SMI-S provider will be used.

Explanation

A connection to the SMI-S provider could not be established. An alternate SMI-S provider has been identified to be used to manage the fabric or switch.

Action

Ensure that the server and the SMI-S provider service are running properly.

Check the dmSvcTrace.log file for an indication of the error or exception, and for the URL of the problematic SMI-S provider. This file is located in installation_directory\IBM\TPC\device\log. Contact IBM customer support.

BTA FM4501E No agent is available to configure the zoning on the fabric with ID *fabric_name*.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. An agent to change the zone configuration was not found.

Action

Check the health of all agents for the fabric. Check that the user id and password are valid.

BTA FM4502E The fabric with ID *fabric_name* is currently locked by another client of IBM Spectrum Control.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. The fabric is currently reserved by another client of IBM Spectrum Control. This fabric lock is used to prevent other clients of this instance of IBM Spectrum Control from attempting concurrent zone configuration changes to the same fabric.

Action

Try the zone configuration again after the other client of IBM Spectrum Control has finished.

BTA FM4503E A token for fabric *fabric_name* has expired for client *client_name*.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. The token specified has expired.

Action

The client must call reserve again to get a new token.

BTA FM4504E The transaction for fabric *fabric_name* has expired.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. The transaction has expired.

Action

Start a new transaction to continue the control operations.

BTA FM4505E Another transaction is in progress for fabric *fabric_name*.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. Another transaction is already in progress.

Action

Wait until the other client finishes before starting a new transaction.

BTA FM4506E Zone set *zoneset_name* already exists.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone set already exists with the specified name.

Action

Retry the operation with a unique zone set name.

BTAFM4507E Zone *zone_name* already exists.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone already exists with the specified name.

Action

Retry the operation with a unique zone name.

BTAFM4508E Zone alias *zone_alias_name* already exists.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone alias already exists with the specified name.

Action

Retry the operation with a unique zone alias name.

BTAFM4509E Zone member *zone_member_name* already exists.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone member already exists with the specified name.

Action

Retry the operation with a unique zone member name.

BTAFM4510E Another job is in progress for fabric *fabric_name*.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric. Another job is already in progress.

Action

Wait until the other job finishes before starting a new transaction.

BTAFM4550E The Device Server encountered an error accessing the database.

Explanation

The Device Server service cannot access data stored in the database.

Action

Check the status of the database. Also, check the logs for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

BTAFM4600E Unable to start the Device Server service.

Explanation

An exception occurred while starting up one or more components.

Action

If this is a new installation, make sure the install procedures have been followed. Also, check the trace log for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

BTAFM5000E Step failed after collecting *Count of collected entities* entities for switch *switch* where entities exist. Continuing with next step.

Explanation

During a probe job one of the collection steps has failed. This entity type is probably not entirely collected. The probe will continue to execute the subsequent collection steps.

Action

Look for prior error messages in this log and review the traceFabric.log file. If the problem persists, contact IBM Support.

Related reference

- [Getting support](#)

BTAFM5001E No set of fabrics or switches was defined for this probe.

Explanation

No set of fabric WWNs or switch WWNs was passed as an input argument to the probe.

Action

If this error occurs during a scheduled probe or a probe that starts immediately, reschedule the probe.

If this error occurs in the message logs for a probe that was run by an event, you can ignore the error if no other problems are observed.

BTAFM5002E The SMI agents *SMIURL* returned an error or can no longer contact the switches.

Explanation

When a fabric uses a data source from an SMI agent, the fabric probe uses the data source to try to rediscover the fabrics and switches. A problem was encountered during this step. The SMI agents either returned an error, or the SMI agents can no longer contact the switches.

Action

Check that the SMI agent service is running. Check the SMI agent logs and UI for problems, for example, problems with contacting the switches. Check for any general problems on the SMI agent system. For example, check the memory available on the system, and check that the disk drive space is sufficient. If you cannot resolve the problem, contact IBM Software Support.

Related reference

-  [Getting support](#)

BTAFM5003E Requests to an SMI agent did not correctly collect a set of switches for fabric *fabric identity*.

Explanation

The probe of an SMI agent did not collect a set of switches for the fabric. This may indicate that the SMI agent was not able to contact the switches during the probe.

Action

Check that the SMI agent service is running. Check the SMI agent logs and UI for problems, for example, problems with contacting the switches. Check for any general problems on the SMI agent system. For example, check the memory available on the system, and check that the disk drive space is sufficient. If you cannot resolve the problem, contact IBM Software Support.

No action is required.

BTAFM0662I Start enumerating associations between virtual fabric and zoning entities at selected data source *Url entity*.

Explanation

Start enumeration collection.

Action

No action is required.

BTAFM0663I Starting collection of switch control processor blades for switch *switch identifier*.

Explanation

A probe job has begun to collect entities from the given switch.

Action

No action is required.

BTAFM0664I *Count of collected entities control processor blades collected for switch switch where entities exist.*

Explanation

A probe job has collected the given number of control processor blades so far.

Action

No action is required.

BTAFM0665I *Collection of switch control processor blades completed. Count of collected entities entities collected in total for switch switch identifier.*

Explanation

A probe job has collected the given number of entities.

Action

No action is required.

BTAFM0666I *Checksums for the active and defined Zone Database could not be updated for fabric entity.*

Explanation

Zone Database Checksums are not available for the fabric, or an error occurred while processing the Checksums. These Checksums are used only as a performance enhancement to quickly determine whether the Zone Database on the fabric has changed. This message is expected in certain scenarios. Since the Checksums cannot be saved, the Zone Database will be collected from the SMI-S provider during the next Probe.

Action

No action is required.

BTAFM0667E *Job id or request id is missing for a SRA job that is been processed.*

Explanation

Server is attempting to process a job for which response was received from SRA. Job id and/or request id is missing and so the response cannot be matched with a server job that is currently running.

Action

No action is required.

BTAFM0668E *Command and/or job timestamp is missing for job id with request id .*

Explanation

Command and/or job timestamp is missing for a SRA job and so the job cannot be processed successfully.

Action

No action is required.

BTAFM0669I job *id* with *request id* was is not found. Device server may have been restarted after job was created.

Explanation

Job was notfound and will not be processed. Device server may have been restarted after the job was created.

Action

No action is required.

BTAFM0670E could not retrieve output file for job *id* with *request id* .

Explanation

Unable to retrieve output file from agent for specified job. Job will be considered failed.

Action

No action is required.

BTAFM0671E Another probe of fabric *The Name+Nameformat of the fabric* is already in progress.

Explanation

Another probe for the same fabrric was already started and is in progress, so the new probe cannot be started.

Action

Start again the new probe only after the previous one is finished.

BTAFM0672E Device server is not registered with agent manager. Will not be able to invoke scanner on host .

Explanation

The device server is unable to register with the agent manager using the credentials provided through the agent manager registration panel.

Action

Verify the credentials specfied through the agent manager registration configuration panel. Also verify the connectivity between hosts running device server and agent manager if they are been hosted on different servers.

BTAFM0673E There are no agents that are currently available to probe fabric .

Explanation

There are no agents configured to probe specified fabric or the agents configured are not operational.

Action

Configure agents to probe fabric. If agents are already configured, check if they are operational.

BTAFM0674W No fabric found for event source that is associated with switch with IP address .

Explanation

No fabric was found for event resource generated by the switch.

Action

No action is required.

BTAFM0675E Unable to start parsing of SRA fabric probe data for SRA job id request id file name .

Explanation

An error was encountered while attempting to start parsing of fabric probe data returned by SRA for specified job id and request id.

Action

Check if there are any connectivity issues with the SRA. Also, check the device server message and trace log for more detail. If the problem continues, contact IBM support.

BTAFM0678I The *Name of the switch* switch was removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BTAFM0679I The *The Name+Nameformat of the fabric* fabric was removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BTAFM0680E The *Name of the switch* switch was not removed because it is not missing.

Explanation

There are Data Sources configured managing this switch. Only switches which are no more managed by any Data Source can be removed.

Action

Remove all Data Sources which are managing this switch.

BTAFM0681E The *The Name+Nameformat of the fabric* fabric was not removed because it is not missing.

Explanation

There are Data Sources configured managing switches of this fabric. The fabric can only be removed after all Data Sources which are managing switches of this fabric are removed.

Action

Remove all Data Sources which are managing switches of this fabric.

BTAFM0682E An error occurred while checking for access to the database to save new zoning information for fabric to the database.

Explanation

The device server is unable to save new zoning information to the database because an error occurred while checking for other currently running jobs that might cause conflicts.

Action

Try the operation again later. If the problem continues, restart the device server.

BTAFM0683E Unable to access the database to save zoning information for fabric . Another job is currently saving new

zoning information to the database for the same fabric.

Explanation

The device server cannot save new zoning information to the database because another job is saving new zoning information to the database for the same fabric. A maximum wait timeout occurred while attempting to access the database to save new zoning information for this fabric.

Action

Try the operation again later. If the problem continues, contact IBM Software Support.

No action is required.

BTA FM0692E A response from the data collector was not received within the specified time.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server. Then try the request again.

BTAFM0693E A response from the data collector was not received.
The request failed with return code *return_code*

Explanation

The specified scan did not complete.

Action

None.

BTAFM0694W Zoning data cannot be collected because there is a transaction in progress on the switch *key*

Explanation

The specified scan did not complete.

Action

None.

BTAFM0695E The switch *key* is returning unexpected data.

Explanation

The specified scan did not complete.

Action

None.

BTAFM0696E Zone set *zoneset_name* is already active.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone set with the specified name is already active.

Action

Try the operation again with a different zone set name.

BTAFM0697E Zone set *zoneset_name* is already inactive.

Explanation

A failure occurred during an attempt to configure zoning on the specified fabric because a zone set with the specified name is already inactive.

Action

Try the operation again with a different zone set name.

BTAFM0698E On the switch *switch_name* VSAN *vsan_name* was not found.

Explanation

The VSAN specified as a parameter can not be found in the switch.

Action

Try the operation again with a different VSAN name.

BTAFM0699E The switch *key* did not return zoning data.

Explanation

The switch did not return zoning data. There may be issues with the switch configuration or zoning configuration.

Action

Review recent configuration changes and try to run the probe again.

BTAFM0700E Duplicate entries for the same switch: *switch*.

Explanation

The list of switches contains duplicate entries. Either a DNS name matches an IP address or there are duplicate DNS names or IP addresses.

Action

Ensure the list of switches contains only one entry per switch.

BTAFM0701E Current active full zone configuration is not synchronized with the zone configuration on the switch *switch_name* for VSAN *vsan_name* .

Explanation

The active zone configuration for the VSAN does not match the configuration on the switch. The zoning action will not be performed.

Action

Activate the zone set using the switch command line or management application. Activating the zone set on a switch synchronizes the active zone configuration for the VSAN with the zone configuration of the switch.

BTAFM0702E You cannot monitor Brocade Access Gateway switches without Network Advisor.

Explanation

You must use Network Advisor to monitor Brocade Access Gateway switches, also known as NPV switches. You cannot use SNMP agents as the data source for Brocade Access Gateway switches, you must use SMI agents that are installed with Network Advisor.

Action

Use Network Advisor to monitor Brocade Access Gateway switches.

BTA FM0703I Waiting for probes of other Access Gateway switches to complete.

Explanation

An Access Gateway switch is a Brocade switch that is operating in Access Gateway mode. Only one Access Gateway switch at a time can be probed by using the same SMI agent.

A probe of an Access Gateway switch was requested, but a probe of another Access Gateway switch is already in progress. The current probe waits until the first probe is completed. If there are no probes of other Access Gateway switches in progress, the current probe proceeds without any wait.

Brocade switches in Access Gateway mode are also known as NPV switches.

Action

No action is required.

BTA FM0704W Distributing zone configuration across all the switches for VSAN *vsan_name* did not succeed on the switch *switch_name* .

Explanation

The active zone configuration for the VSAN does not match the configuration on the switch. The zoning action will not be performed.

Action

Activate the zone set using the switch command line or management application. Activating the zone set on a switch synchronizes the active zone configuration for the VSAN with the zone configuration of the switch.

BTA FM0705W Zone data collection after zone changes were made failed on the switch *switch_name* .

Explanation

Zone changes were successful. Zone data collection to update the latest zone changes failed. The most current zone information will not be reported.

Action

Run a data collection for the failing switch. If the problem persists, contact IBM Software Support.

BTA FM0706E The fabric probe was unable to collect some details of the blades on the switches.

Explanation

A problem was encountered during the probe of the switch blades. The switch blade properties might be reported incorrectly until a later probe is completed.

Action

Try the following actions to resolve the problem:

- Check the logs for an indication of the error or exception, and resolve the problem if possible. For information about probe logs, see the Viewing probe logs topic in the IBM Spectrum Control Knowledge Center.
- Try the probe again at a later time. For instructions on how to start a probe, see the Starting probes topic in the IBM Spectrum Control Knowledge Center.
- If the problem continues, contact IBM customer support.

BTA FM0707I You cannot use IBM Spectrum Control to make zoning changes for provisioning on switch *switch_name*.

Explanation

A check of the ability to perform zone control operations on the switch has failed. Zone control operations through IBM Spectrum Control are not possible on this switch. This affects the Provisioning feature.

Action

You can ignore this message if:

- You do not plan to use the provisioning feature of IBM Spectrum Control.
- You plan to use the provisioning feature of IBM Spectrum Control for volume creation and assignment but not for zoning.

Otherwise, check that the model of the switch supports fibre channel zone control, and check that the switch is configured properly for zone control.

BTAFM0708E The probe was unable to collect some details of the switches.

Explanation

A problem was encountered during the probe. The fabric or switch properties might be reported incorrectly until a later probe is completed.

Action

Try the following actions to resolve the problem:

- Check the logs for an indication of the error or exception, and resolve the problem if possible. For information about probe logs, see the Viewing probe logs topic in the IBM Spectrum Control Knowledge Center.
- Try the probe again at a later time. For instructions on how to start a probe, see the Starting probes topic in the IBM Spectrum Control Knowledge Center.
- If the problem continues, contact IBM customer support.

BTAFM0709I Started to process information for fabric *fabric_name*.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0710I Started to process information for switch *switch_name*.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0711I Started to process information for discovered switches.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0712I Started to process information for a switch blade.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0713I Started to process information for a switch zone set.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0714I Started to process information for switch ports.

Explanation

The information is being parsed and added to the database.

Action

No action is required.

BTAFM0715E Error occurred while processing information for fabric *fabric_name*.

Explanation

The information for the fabric was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0716E Error occurred while processing information for virtual fabric *virtual_fabric_name*.

Explanation

The information for the virtual fabric was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0717E Error occurred while processing information for switch *switch_name*.

Explanation

The information for the fabric and switch was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0718E Error occurred while processing information for discovered switches.

Explanation

The information for the discovered switches was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0719E Error occurred while processing information for logical switches.

Explanation

The information for the logical switch was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0720E Error occurred while processing information for active zone set *active_zone_set_name*.

Explanation

The information for the active zone set was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0721E Error occurred while processing information for inactive zone set *inactive_zone_set_name*.

Explanation

The information for the inactive zone set was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAFM0722E Error occurred while processing information for port *port_name*.

Explanation

The information for the port was not added to the database.

Action

Check the Device server message log and trace log for more details. If the problem continues, contact IBM Support.

BTAQE1107E InbandScanHandler failed to start InbandScanner *scanner name* on managed host *target*.

Explanation

The InbandScanner scans managed hosts for device information and displays that information in the network topology display. The InbandScanner is necessary for providing accurate information about your SAN.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1108E InbandScanHandler failed to get callback information for InbandScanner *scanner name* on managed host *target*.

Explanation

The InbandScanHandler service was unable to receive device information from the scanner. This can cause the network topology displays to show inaccurate SAN data. Other services will be affected as well.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1112E During an outband scan, the scanner *scanner name* was unable to identify the target host *target*.

Explanation

The target host might have an invalid IP address.

Action

Verify the IP address of the target managed host. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1113E Unable to invoke an Outband scan *scanner name* on target *target*.

Explanation

IBM Spectrum Control was unable to start an outband scan for Fabric. There might be problems with the SAN connectivity.

Action

Make sure the SAN is working properly. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE114E OutbandScannerHandler received invalid callback information for Outband scanner *scanner name* on target *target*.

Explanation

The information received from an outband scan appears to be invalid.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1115E The outband scanner *scanner name* did not return the SAN ID on target *target*.

Explanation

The switch vendor may not support FE MIB or certain fields in the FC MGMT MIB.

Action

Check the Tivoli Support Web site to see if the switch is supported by IBM Spectrum Control. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

No action required.

BTAVM0011I The Connection test to data source *Name of the data source* completed successfully.

Explanation

Connectivity to the data source was validated successfully.

Action

No action required.

BTAVM0012I Hypervisor *Name of the Hypervisor* discovered/rediscovered.

Explanation

The hypervisor has been discovered.

Action

No action required.

BTAVM0013I Discovery: Hypervisor *Name of the hypervisor* will not be discovered as it is managed by another data source.

Explanation

The hypervisor is managed by another data source.

Action

No action is required.

BTAVM0014I Discovery: Hypervisor *Name of the hypervisor* will not be discovered as it itself is registered as a data source.

Explanation

The hypervisor is registered directly as a data source.

Action

No action is required.

BTAVM0015I Collection of the physical storage configuration for hypervisor *Name of the hypervisor* has started.

Explanation

The probe collects physical storage configuration details of the hypervisor.

Action

No action is required.

BTAVM0016I Collection of the physical storage configuration for hypervisor *Name of the hypervisor* completed successfully.

Explanation

The probe of the hypervisors physical storage configuration completed successfully.

Action

No action is required.

BTAVM0017I Collection of the logical storage configuration for hypervisor *Name of the hypervisor* has started.

Explanation

The probe collects logical storage configuration details of the hypervisor .

Action

No action is required.

BTAVM0018I Collection of the logical storage configuration for hypervisor *Name of the hypervisor* completed successfully.

Explanation

The probe of the hypervisors logical storage configuration completed successfully.

Action

No action is required.

BTAVM0019I Collection of the virtual machines configuration for hypervisor *Name of the hypervisor* has started.

Explanation

The probe collects virtual machines configuration details of the hypervisor.

Action

No action is required.

BTAVM0020I Collection of the virtual machines configuration for hypervisor *Name of the hypervisor* completed successfully.

Explanation

The probe of the hypervisors virtual machines configuration completed successfully.

Action

No action is required.

BTAVM0021I The probe of *name of the hypervisor* found *number of physical disks* physical disks.

Explanation

The probe collects the number of physical disks found in the hypervisors physical storage configuration.

Action

No action is required.

BTAVM0022I The probe of *name of the hypervisor* found *number of logical volumes* logical volumes.

Explanation

The probe collects the number of logical volumes found in the hypervisors logical storage configuration.

Action

No action is required.

BTAVM0023I The probe of *name of the hypervisor* found *number of virtual machines* virtual machines.

Explanation

The probe collects the number of virtual machines found in the hypervisors virtual machines configuration.

Action

No action is required.

BTAVM0024I The *Name of the hypervisor* hypervisor was removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

BTAVM0025I VMWare Cluster *Name of the Cluster* discovered/rediscovered.

Explanation

The cluster has been discovered.

Action

No action required.

BTAVM1301I The probe of *name of the hypervisor* could collect partial information only for the disk with the device name *Device name of the disk*.

Explanation

The disk attributes number of heads, number of sectors and number of cylinders are not available.

Action

No action is required.

BTAVM1302I LUN correlation is not supported for disk with device name *Device name of the disk*, vendor: *Vendor name*, model: *model name*, for hypervisor *hypervisor name*.

Explanation

LUN correlation is not supported for this disk. LUN definition data for this disk will not be available.

Action

Refer to the IBM Spectrum Control Supported Product List.

BTAVM1503E An internal error occurred: *Text describing the internal error.*

Explanation

An internal operating error occurred. Any exceptions are logged in the traceTPCDeviceServer.log file. This log file resides in the installation subdirectory device/log.

Action

Review the traceTPCDeviceServer.log file. If the problem persists, contact IBM Technical Support.

BTAVM2008E The product *Name of the unsupported product* is not supported.

Explanation

This virtualization product is not supported by IBM Spectrum Control.

Action

Use a supported virtualization product. Refer to the IBM Spectrum Control Supported Product List.

BTAVM2010E The user name or password is invalid for *Address of the host*

Explanation

The user name or password is not valid.

Action

Enter the correct user name and password. Try the action again.

BTAVM2011E The operation *Name of the timed out operation* could not complete within the time limit of *Timeout threshold in milliseconds* milliseconds.

Explanation

For each service method invocation a timeout is defined. The timeout for this operation has been exceeded.

Action

Check the Hypervisor or increase the timeout value.

BTAVM2012E An error occurred while trying to establish secure communication over SSL.

Explanation

The communication to the data source over SSL failed. There may be a configuration error.

Action

Make sure that the SSL certificate of the data source has been imported correctly to the local truststore. If the problem persists, contact IBM Technical Support.

BTAVM2210W Error getting LUN definition data for the disk with the device name *Device name of the disk*, storage subsystem vendor: *Vendor name*, model: *model name*, for hypervisor *hypervisor name*.

Explanation

The LUN definition data will not be available.

Action

Check the configuration of your environment. Check the trace logs. The log files reside in the installation subdirectory device/log. If possible correct any error and rerun the probe of the hypervisor. If the problem persists, contact IBM Technical Support.

BTAVM2211E Probe: Virtualization Manager failed to get the VMWare VI data source for the hypervisor *Name of the hypervisor* from the database.

Explanation

The VMWare VI data source managing the hypervisor may have been deleted.

Action

Add the VMWare VI data source, perform a VMWare VI data source discovery and re-create the probe.

BTAVM2212E Probe: The hypervisor *Name of the hypervisor* is not available on the VMWare VI datasource *Name of the datasource*.

Explanation

The hypervisor may have been deleted or moved to another datasource.

Action

Add the VMWare VI datasource the hypervisor was moved to. Perform a VMWare VI data source discovery and re-create the probe.

BTAVM2213E Data source *Name of the datasource* is disconnected from Virtual Center.

Explanation

A connection test to the data source failed.

Action

Connect data source in Virtual Center and run discovery again.

BTAVM2214E The probe job encountered an NFS file system while probing ESX server {0}. IBM Spectrum Control currently does not support probes of ESX servers with NFS file systems. The probe job for this ESX server has been stopped. Probes of other ESX servers that are included in this probe job will continue.

Explanation

ESX servers with NFS file systems are not supported. Probes of other ESX servers that do not have NFS file systems will continue.

Action

If this is a repeating probe job, remove the ESX servers that have NFS file systems from the probe job to prevent this error from occurring again.

BTAVM2215W Unsupported storage subsystem disk with device name *Device name of the disk*, vendor: *Vendor name*, model: *model name*, for hypervisor *hypervisor name* with hypervisor version less than 3.5.0.

Explanation

Hypervisors with version less than 3.5.0 do not offer the necessary support for getting LUN definition data for this storage subsystem type. LUN definition data for this disk will not be available.

Action

Refer to the IBM Spectrum Control Supported Product List and upgrade the Hypervisors and Virtual Centers to the latest supported level.

BTAVM2216E Unable to get keystore instance.

Explanation

The required keystore type (JKS) is not available.

Action

Make sure the required keystore application is available in the Java environment. If the problem persists, contact IBM Technical Support.

BTAVM2217E Unable to load keystore file.

Explanation

The default keystore file used by IBM Spectrum Control could not be loaded.

Action

Make sure that the keystore password has not been changed. If the problem persists, contact IBM Technical Support.

Related reference

- [Getting support](#)

BTAVM2218E Unable to set certificate entry in keystore file.

Explanation

The certificate entry couldn't be added to the keystore file

Action

Make sure the certificate being added to the keystore is a valid certificate. If the problem persists, contact IBM Technical Support.

Related reference

- [Getting support](#)

BTAVM2219E Unable to open keystore for writing.

Explanation

An exception occurred attempting to open keystore for writing.

Action

Make sure that the keystore file is valid and has the proper permissions. If the problem persists, contact IBM Technical Support.

BTAVM2220E Unable to close keystore file.

Explanation

An exception occurred attempting to close keystore file.

Action

Make sure there are proper permissions on the keystore file and that no other user or process has it locked.

BTAVM2221E Unable to acquire lock on keystore file.

Explanation

The keystore file cannot be locked for write access.

Action

Make sure that no other user or process has the keystore locked.

BTAVM2222E Unable to store certificate in keystore file.

Explanation

The certificate could not be stored in the keystore file.

Action

Make sure that the keystore is valid and that the keystore password has not been changed.

BTAVM2223E Unable to release lock on keystore file.

Explanation

Keystore could not be unlocked.

Action

Make sure that the keystore is accessible and no other user or process has it locked.

BTAVM2224E Unable to decrypt keystore password.

Explanation

An error occurred while trying to decrypt the provided password to the keystore.

Action

The keystore may have become corrupted. Save the keystore to a new location so a new one will be created in the default location, and try again. If the problem persists, contact IBM Technical Support.

Related reference

-  [Getting support](#)

BTAVM2225E Unable to open keystore for reading.

Explanation

The keystore could not be opened for reading.

Action

Make sure that the keystore is not locked and is set with the proper read permissions.

BTAVM2226E Certificate already exists in keystore.

Explanation

Unable to store the certificate in the keystore because a certificate already exists for hostname.

Action

Either choose the option to replace the certificate, or specify a different alias (hostname) for the certificate.

BTAVM2227E *host_address* hypervisor is already being monitored and could not be added.

Explanation

A hypervisor cannot be added if it is already monitored by IBM Spectrum Control.

Action

Verify that the hypervisor has already been added to IBM Spectrum Control. If the hypervisor is not being monitored, try to add it again. If it is being monitored, enter the name of a different hypervisor.

BTAVM2228E Missing host name.

Explanation

The host name of the hypervisor was not provided.

Action

Make sure to provide a hostname for the certificate.

BTAVM2229E Missing certificate.

Explanation

A valid certificate was not provided

Action

Make sure to provide a valid certificate for insertion into the keystore.

BTAVM2230E Cannot create keystore directory.

Explanation

The default keystore directory could not be created.

Action

Make sure file permissions have been set to allow creation of the default keystore directory.

BTAVM2231E Cannot download the certificate from Data Source *Name of the data source*.

Explanation

The SSL certificate cannot be downloaded from the specified data source. The certificate must be downloaded before the data source can be added. A data source can be a VMWare hypervisor or vSphere server.

Action

Verify that the specified Data Source is a VMWare hypervisor or vSphere server. Verify that you have a network connection to the data source. Try to add the data source again.

BTAVM2232E Cannot connect to the *Name of the data source* data source.

Explanation

The host name or IP address that was entered for the data source might not be valid.

Action

Ensure that the network is up and available and that you have a network connection to the data source. Verify the correct host name or IP address. Try to add the data source again.

BTAVM2233E Cannot download the certificate from the port.

Explanation

The port that was entered for the data source might not be valid.

Action

Specify the correct port. The default port number is 443.

BTAVM2234E The *hypervisor name* hypervisor was not removed because IBM Spectrum Control is running other actions on the device.

Explanation

The hypervisor is in use by IBM Spectrum Control and cannot be removed from the database repository at this time. For example, a probe schedule is collecting data about the hypervisor.

Action

Wait for the probe schedule or other action to complete and try to remove the hypervisor again.

BTAVM2235E Unable to obtain the cluster(s) from the datasource *Name of the datasource*.

Explanation

The discovery was not able to obtain the clusters.

Action

Check the configuration of your environment. Check the trace logs. The log files reside in the installation subdirectory device/log. If possible correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM Technical Support.

BTAVM2236W Subsequent steps of probe process may not be able to collect data for the hypervisor *Name of the hypervisor* because the hypervisor is in critical state.

Explanation

The hypervisor is in critical state and the probe process may not be able to do data collection.

Action

Check the VMWare ESX or VirtualCenter for the cause of critical state for the hypervisor. If possible correct the issue and rerun the probe of the hypervisor.

BTAVM2237E Datastore Browser Task failed for hypervisor *Name of the hypervisor*, datastore *Name of the datastore* with error: *Error*

Explanation

The datastore could not be browsed.

Action

The datastore could not be browsed due to the error specified. If possible correct the issue and rerun the probe of the hypervisor.

BTAVM2238E The registration of the vSphere Web Client extension for IBM Spectrum Control has started on *Name of the vCenter server*.

Explanation

The registration process has started.

Action

No action required.

BTAVM2239E The registration of the vSphere Web Client extension for IBM Spectrum Control did not extract the extension package.

Explanation

The configuration process updates the vSphere Web Client extension for IBM Spectrum Control Centre package. The extension package, TPC_VmPlug.zip, could not be updated because the packaged was not extracted.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [Getting support](#)

BTAVM2240E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete while updating the VASA web archive file, vasa.war, with the IBM Spectrum Control server configuration.

Explanation

The configuration process updates the IBM Spectrum Control Web Client extension for VMware package. The update operation could not be completed.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

-  [Getting support](#)

BTAVM2241E The registration of the vSphere Web Client extension for IBM Spectrum Control completed.

Explanation

The registration process has completed.

Action

No action required.

BTAVM2242E Unable to register IBM Spectrum Control as an extension on the vCenter server *Name of the vCenter server*. The validation of input values did not complete.

Explanation

The validation of input values did not complete. One or more of the supplied values may be empty or invalid.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

-  [Getting support](#)

BTAVM2243E Unable to register IBM Spectrum Control as an extension on the vCenter server *Name of the vCenter server*. Could not authenticate with the vCenter server.

Explanation

Could not authenticate with the vCenter server.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [🔗 Getting support](#)

BTAVM2244E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete.

Explanation

The configuration process was unable to register the IBM Spectrum Control Web Client extension for VMware

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [🔗 Getting support](#)

BTAVM2245E Unable to connect to the vCenter Server *Name of the datasource*.

Explanation

The data source configuration process was not able to connect to the vCenter server.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [🔗 Getting support](#)

BTAVM2246E Unable to configure the vCenter Server.

Explanation

The configuration process was unable to remotely register the vSphere Web Client extension for IBM Spectrum Control.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [🔗 Getting support](#)

BTAVM2247E The registration of the vSphere Web Client extension for IBM Spectrum Control did not delete the temporary directory *Name of the directory*.

Explanation

The registration process was unable to delete a temporary directory on the vCenter Server

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

Related reference

- [Getting support](#)

BTAVM2248E The registration of IBM Spectrum Control as a VASA provider did not complete.

Explanation

The configuration process was unable to register IBM Spectrum Control as a VASA provider for VMware.

Action

Check the trace logs. The log files reside in the installation subdirectory log under device. Correct any error and rerun the discovery of the hypervisor(s). If the problem persists, contact IBM customer technical support.

BTAVM2249E Automatic registration of IBM Spectrum Control as a VASA provider is not supported for vCenter Server version 5.0 and earlier.

Explanation

vCenter Server version 5.1 or later is required to automatically register IBM Spectrum Control as a VASA provider.

Action

Register IBM Spectrum Control as a VASA provider manually in the vSphere Web Client.

BTAVM2250E IBM Spectrum Control is already registered as a VASA provider for vCenter Server *server_name*. Register IBM Spectrum Control as a VASA provider manually in the vSphere Web Client to update the credentials.

Explanation

Automatic update of IBM Spectrum Control as a VASA provider is not supported if the provider is already registered for this vCenter Server.

Action

Remove IBM Spectrum Control as a VASA provider and register it again manually to update the user name or password.

BTAVM2251E One or more third-party VASA providers are already registered with the vCenter Server. IBM Spectrum Control VASA provider was not registered. Register IBM Spectrum Control as a VASA provider manually.

Explanation

If one or more third-party VASA providers are already registered with the vCenter Server, you must register IBM Spectrum Control VASA provider manually.

Action

Register IBM Spectrum Control as a VASA provider manually in the vSphere Web Client.

BTAVM2252E The registration of IBM Spectrum Control as a VASA provider has started on *Name of the vCenter server*.

Explanation

The VASA provider registration process has started.

Action

No action required.

BTAVM2253E The registration of IBM Spectrum Control as a VASA provider has completed.

Explanation

The VASA provider registration process has completed.

Action

No action required.

BTAVM2254E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete. The current session is invalid.

Explanation

The current session is invalid.

Action

Log out of the vCenter Server and then log back in.

BTAVM2255E The registration of IBM Spectrum Control as a VASA provider did not complete. The current session is invalid.

Explanation

The current session is invalid.

Action

Log out of the vCenter Server and then log back in.

BTAVM2256W Could not determine the host for VM with ID: *host id* and Name: *Vendor name*. Check if the same mac address is used on other computers.

Explanation

The correlation between the VM and the host cannot be done if the MAC Addresses are not unique.

Action

Change the MAC Address of the VM.

BTAVM2257I Found *number of files* files on *name of datastore* of *name of the hypervisor*.

Explanation

The probe collected details on given number of files from the datastore of the hypervisor.

Action

No action is required.

BTAVM2258I The probe of *name of the hypervisor* found *number of controllers* controllers.

Explanation

The probe collected the number of controllers for the hypervisors.

Action

No action is required.

BTAVM2259I Collecting file system details for hypervisor *Name of the hypervisor*.

Explanation

The probe collects file system details of the hypervisor.

Action

No action is required.

BTAVM2260I Collecting list of files for hypervisor *Name of the hypervisor*.

Explanation

The probe collects list of files on the datastores Yes of the hypervisor.

Action

No action is required.

BTAVM2261I Collecting logical volumes for hypervisor *Name of the hypervisor*.

Explanation

The probe collects logical volumes details of the hypervisor.

Action

No action is required.

BTAVM2262I Collecting disk partition for hypervisor *Name of the hypervisor*.

Explanation

The probe collects disk partitions details of the hypervisor.

Action

No action is required.

BTAVM2263I Files details for *Name of the datastore* being collected by *id of the Hypervisor*.

Explanation

The file details for the given datastore is already in progress as part of another hypervisor's probe, hence will be skipped.

Action

No action is required.

BTAVM2264I Files details for *Name of the datastore* were collected by *id of the Hypervisor* on *timestamp*.

Explanation

The file details for the given datastore were collected on given time as part of another hypervisor's probe, hence will be skipped.

Action

No action is required.

BTAVM2265E Invalid host name or IP address.

Explanation

Host name or IP address is not valid.

Action

Enter a valid host name or IP address

BTAVM2266E The connection information cannot be updated because it points to another device.

Explanation

To change the host name or IP address at least one hypervisor has to be managed by the new host name/IP address.

Action

Enter the correct host name or IP address.

BTAVM2268E The connection information cannot be updated because IBM Spectrum Control cannot determine if the hypervisor is managed by the *Name of the data source* data source.

Explanation

This problem might occur if the hypervisor is unavailable or the connection was lost.

Action

Try the following actions:

- Verify that the hypervisor is available.
- Ensure that a connection to the hypervisor is active.
- Check the log files for error messages to determine the cause. For information about the location of log files, see the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

BTAVM2269E The connection information cannot be updated because a data source with this host name or IP address is already present.

Explanation

You cannot change the host name or IP address of a data source to match an existing one because you cannot move hypervisors from one data source to another data source.

Action

Let the existing event mechanism detect when a hypervisor was moved to another data source.

BTAVM2270E The connection information cannot be updated because it doesn't point to a data source of the same type (vCenter/ESX).

Explanation

Changing the host name or IP address of a data source is allowed only within the same connection type. You cannot change a vCenter Server address to an ESX Server address. Similarly, you cannot change an ESX Server address to a vCenter address.

Action

Enter a host name or IP address that points to a data source of the same type as the one you are trying to update.

BTAVM2271W The hypervisor *Name of the Hypervisor* cannot be discovered because its connection state is "*Connection State*".

Explanation

The vCenter Server discovery process ignores the hypervisors that do not have the connection state of "CONNECTED". The hypervisor might have been disconnected from the vCenter Server intentionally for maintenance purposes. It might have been moved to another vCenter Server, but remains disconnected in the inventory of the old vCenter Server. Or it might have been accidentally disconnected due to a functional problem.

Action

Verify why the hypervisor is not connected to the vCenter Server.

BTAVM2272E The user *User Name* does not have the privilege to browse the datastore *Name of the Datastore*.

Explanation

The hypervisor scan failed because the user does not have the Datastore.Browse privilege that is required to execute the SearchDatastoreSubFolders task. For more details, go to the IBM Knowledge Center and check Administering>Administering resources and data sources>Hypervisors and VMware data sources>Checking permissions to browse data stores. You can access the IBM Knowledge Center for the product at <http://www.ibm.com/support/knowledgecenter/SS5R93>.

Action

Assign the user to a role that has the Datastore.Browse privilege. An appropriate default role is Virtual machine power user.

HWN020001I *Operation Name of the operation processed successfully.*

Explanation

The request has been executed successfully. No error condition has been encountered.

Action

No action is required.

HWN020002E *Mandatory parameter Name of the mandatory parameter which is missing* missing

Explanation

Mandatory parameter {0} missing

Action

Pass the mandatory parameters.

HWN020003E *Invalid parameter Name of the parameter which was* *invalid*

Explanation

Invalid Parameter{0}

Action

Pass a valid parameter.

HWN020101E *The external process terminated unexpected.*

Explanation

The external process for the current job did not complete successful because the process terminated unexpected.

Action

If available check the logfile of the external process to find the cause of the error. Make sure that no external event on the IBM Spectrum Control server terminated or ended the process. Try to rerun the job. If the problem persists, enable high level tracing as explained in the IBM Spectrum Control Installation and Configuration Guide and contact IBM Software Support.

HWN020102W *The external process was canceled per users request.*

Explanation

The external process for the current job did not complete successful because the process was terminated per users request to cancel the job.

Action

No action is required.

HWN020103E The external process exceeded the timeout limit and was canceled.

Explanation

The external process for the current job did not complete within the timeout limit and was terminated.

Action

Check your system environment, including the network connection and server load to determine the root cause of the long running job. If necessary, increase the timeout value for the external process. For information about increasing the timeout value, go to the IBM Knowledge Center at http://www.ibm.com/support/knowledgecenter/search/fqz0_t_setting_timeout_values_for_the_deviceserver?scope=SS5R93. View the appropriate topic for the version of IBM Spectrum Control that you are using.

HWN020104E The external process could not be started.

Explanation

Unable to start the external process for the current job.

Action

If available check the logfile of the external process to find the cause of the error. Try to rerun the job. If the problem persists, enable high level tracing as explained in the IBM Spectrum Control Installation and Configuration Guide and contact IBM Software Support.

HWN020105E The data collector is not responding to the server.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

HWN020106E An external process was cancelled by the data collector.

Explanation

An external process for the current job did not complete because the process was cancelled during the shutdown of the data collector. The data collector was shut down for one of the following reasons:

- The user stopped the data collector.
- The system that the data collector runs on was shut down or restarted.
- The data collector is being upgraded.

Action

Wait until the data collector starts again, then try the task or job again.

HWN021503E The action cannot be completed

Explanation

The error occurred while processing a request from the GUI.

Action

To resolve the issue, try the following actions:

- Verify that the local area network is available and a firewall is not preventing network access to product services and agents.
- Check the status of the product servers and database repository on the Home > System Management page.
- On Windows, verify that the related database services are active.
- Check for error messages in the log files for the servers.

If the problem persists, check the product's log files for error messages that might help determine the problem. For information about the location of log files, check the IBM Knowledge Center at <http://www.ibm.com/support/knowledgecenter/SS5R93/>.

- [🔗 Default locations of log files](#)

HWN021504E Entity *The ID of the entity* was not found.

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

The server or the interface might be out of sync with the co-server. Rerun the discovery process, and then run a data collection task.

HWN021508E Credentials not found

Explanation

There was a problem accessing the user credential on the coserver

Action

Ensure the database is running and that the IBM Spectrum Control setup was completed successfully.

HWN021514E The invocation of CIM method *Name of method* failed on SMI-S provider *Name of SMI-S provider* . The return code is *Return code of method*

Explanation

The extrinsic CIM method that was invoked on the given SMI-S provider failed.

Action

Ensure that the correct input parameters for the CIM method have been used.

HWN021515E The invocation of CIM method *Name of method* failed on SMI-S provider *Name of SMI-S provider* with the following exception text: *Exception text*

Explanation

The extrinsic CIM method that was invoked on the given SMI-S provider failed.

Action

Check the ErrorTrace.log file for further information. If the log file does not exist, enable tracing as follows: (1) Enter the WAS administration console. Click Application Servers, click the server name, and click Diagnostic Trace Service. (2) Select the Enable trace check box, and enable tracing for the MDM groups. (3) Restart the server and run the application again. (4) Check the errorTrace.log file to determine which problems were encountered.

HWN021516E The LSS specified *LSS name* on subsystem *Name of subsystem* is already at the maximum volume number (255). Volume creation can not be done on this LSS, please select a different one.

Explanation

Only 255 volumes can be created on a particular LSS. IBM Spectrum Control believes that this LSS is full because the highest numbered volume on the LSS is 255.

Action

If volume number 255 has been deleted, try rerunning a probe of the subsystem. Otherwise, either choose a different LSS or else delete volume #255 (and any others as necessary depending on the number of new volumes needed)

HWN021517E The connection to SMI-S provider for storage system *VPD of the storage system* could not be made.

Explanation

Creation of the CIM client failed.

Action

Ensure that the SMI-S provider is running and that the correct user ID and password have been set for this SMI-S provider in the IBM Spectrum Control UI.

HWN021520E The attribute *Name of the attribute* was not found.

Explanation

A method was called with wrong attributes.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

Related reference

- [Getting support](#)

HWN021522E Host port *The WWPN of the host port* not assigned to Volume *The PK of the volume*

Explanation

The host port is not assigned to the volume.

Action

Specify a port that is assigned to the volume.

HWN021524E Indexed Properties *Names* don't match

Explanation

Indexed input parameters are not of the same size

Action

Make sure that all the indexed input parameters are of the same size.

HWN021529E An SMI-S provider has reported unexpected values: *IP and port of SMI-S provider.*

Explanation

The values returned by the SMI-S provider might indicate an SMI-S provider malfunction.

Action

If not already enabled, enable tracing for the Device server. To enable tracing for the Device server, go to the IBM Spectrum Control Information Center and search for "Configuring tracing". Restart the Device server, run the application again, and check the Device server log files for more information about this error.

HWN021530E The Volume - Port mapping can not be created. There are existing mappings that prevent this combination. *VolumeCOP: The ID of the volume , Port: The WWPN of the port that should be mapped to the volume*

Explanation

For FASTT it is not possible to merge existing mappings. That means, if you have volume A mapped to port 1, and volume B mapped to port 2, you will neither be able to map port 1 to volume B, nor port 2 to volume A.

Action

Build up mappings beginning with one volume-port mapping, and then add further volumes and ports. For Example, first map volume A and port 1, then volume A and port 2, finally volume B and port1 or port 2. The volume will be mapped to both ports. See also documentation for details.

HWN021531E SMI-S provider *The IP and port of the SMI-S provider* can not reach storage system *The VPD of the storage system*

Explanation

The SMI-S provider can not reach the subsystem that it manages.

Action

Check logs on SMI-S provider side to determine why it can't reach the device.

HWN021535E There is not enough space left in the storage pool *The primary key of the Poolon storage system The VPD of the storage system* to create a volume of *The requested volume size bytes.*

Explanation

The size of the volume to be created is too large for the selected storage pool.

Action

Choose or create a storage pool with enough space or create a smaller volume.

HWN021536E The CIM method *The CIM method that is not supported.* is not supported on the storage system *The VPD of the storage system*

Explanation

The storage system does not support the specified function.

Action

No action is required.

HWN021537E Could not create connection to SMI-S provider *The IP and port for the SMI-S provider.* Reason: *The exception returned by the SMI-S provider.*

Explanation

No connection to the SMI-S provider could be established.

Action

Check the given reason.

HWN021538E The username *The username that was used to connect to the SMI-S provider.* or password is wrong on SMI-S provider *The IP and port for the SMI-S provider.*

Explanation

The username and/or password specified for the SMI-S provider are not valid.

Action

Set correct username/password combination for the SMI-S provider.

HWN021539E The SVC with IP *The IP of the SVC.* which is managed by SMI-S provider *The IP and port for the SMI-S provider.* can not be discovered. The status is *The status of the SVC.* .

Explanation

The SMI-S provider can not reach the SVC. The SVC is not added to the IBM Spectrum Control repository.

Action

There is a SVC which is disconnected and not reachable from the SMI-S provider. Please check the status of this SVC and run discovery again.

HWN021540E The invocation of CIM method *Name of method* failed on SMI-S provider *Name of SMI-S provider* . The return code is *Return code of method*. Details provided by the SMI-S provider : *Description of Returncode*

Explanation

The extrinsic CIM method that was invoked on the given SMI-S provider failed.

Action

Ensure that the correct input parameters for the CIM method have been used.

HWN021600W *Operation Name of the operation. partially processed.*

Explanation

The request has been partially executed. Some operations as part of this request have failed. Please check the detailed error messages.

Action

No action is required.

HWN021601E *The operation(s) Operation_names failed.*

Explanation

Multiple operations failed. None of the requested operations was carried out.

Action

Check the error messages in the system log files for the jobs that failed.

HWN021602E *It is necessary to specify target ports for storage device VPD of the storage subsystem*

Explanation

This storage subsystem requires that target FCPorts are specified during the assignment operation.

Action

Re-run the operation and specify the target ports

HWN021603W *More storage volumes and ports than specified will loose access*

Explanation

The unassignment operation was executed successfully, but more storage volumes and ports have been unassigned than specified because the 'force' option was set to true for this command. All unassigned WWPNS and storage volumes are returned in the return object.

Action

Check that the additionally unassigned volumes/ports do not cause any problems.

HWN021604E *WWPNs and storage volumes to be unassigned not completely specified. Assigned WWPNS: All WWPNS that are assigned to the volumes in the host port collection , missing WWPNS: The WWPNS that are assigned but were not specified in the input parameter in the method unassign . Storage volumes to be unassigned not completely specified. Assigned storage volumes: Lists all storage volumes that are really assigned to the WWPNS. }, missing storage volumes: The storage volumes that are really*

assigned but were not specified in the input parameter in the method unassign

Explanation

Not all ports that belong to a host port collection were specified. In order to unassign a host port collection, all ports have to be specified. Not all storage volumes that are assigned to the WWPNS were specified in the input. In order to unassign the WWPNS, all storage volumes have to be specified.

Action

Specify all ports belonging to the host port collection. Specify all storage volumes that are assigned to the WWPNS. You can alternatively specify the force flag to automatically unassign all WWPNS and volumes that need to be included.

HWN021605I More storage volumes and ports than specified will gain access.

Explanation

The assignment operation was executed successfully, but more storage volumes and ports have been assigned than specified because the 'force' option was set to true for this command. All assigned WWPNS and storage volumes are returned in the return object.

Action

Check that the additionally assigned volumes/ports do not cause any problems.

HWN021606E WWPNS and storage volumes to be assigned not completely specified. Missing WWPNS: *The WWPNS that need to be assigned but were not specified in the input parameter.* . Storage volumes to be assigned not completely specified. Missing storage volumes: *The storage volumes that need to be assigned but were not specified in the input parameter.*

Explanation

Not all ports that belong to a host port collection were specified. In order to assign a host port collection, all ports have to be specified. Not all storage volumes that need to be assigned due to existing assignments to the WWPNS were specified in the input. In order to assign the WWPNS, all storage volumes have to be specified.

Action

Specify all ports belonging to the host port collection. Specify all storage volumes that need to be assigned to the WWPNS. You can alternatively specify the force flag to automatically assign all WWPNS and volumes that need to be included.

HWN021607E The client type *the client type* with description *the client description* is not supported on SMI-S provider *the SMI-S provider IP and port* for storage subsystem *the subsystem ID* of volumes *the volumeIDs of the subsystem* which were passed in

Explanation

The SMI-S provider for the storage device does not support the chosen client type

Action

Specify the client type that is supported by the SMI-S provider. Because the supported client types also depend on the SMI-S provider version, you might need to change or upgrade the SMI-S provider.

HWN021608E The target port *the target port ID* does not belong to storage subsystem *the subsystem ID* of volumes *the volumeIDs* of the *subsystem which were passed in*

Explanation

The target ports specified do not belong to the subsystem of the input volumes

Action

Specify target ports of the same subsystem as the volumes or specify no target ports

HWN021609E There is not enough space left in the storage pool *The primary key of the Pool* on storage system *The VPD of the storage system* to create *The number of volumes to create* volumes of *The total size needed bytes total*.

Explanation

The size of the volumes to be created is too large for the selected storage pool.

Action

Choose or create a storage pool with enough space or create smaller volumes.

HWN021610E The specified size *The size of the volume to create* is not supported on pool *The storage pool ID* Size has to be dividable by *Divisor* returned by *getSupportedSizeRange* and in between *Minimum* returned by *getSupportedSizeRange* and *Maximum* returned by *getSupportedSizeRange*

Explanation

This pool supports sizes within the given range and divisible by the given divisor only.

Action

Use a size which is divisible by the given divisor and within the provided range.

HWN021611E Volume *The volume ID* has mappings, it can not be deleted.

Explanation

A volume can not be deleted as long as it has mappings

Action

Delete all mappings of the volume.

HWN021612E The mapping between volume *The volume ID* and port *The initiator port wwpn* exists already

Explanation

A mapping that exists already can not be created again

Action

None

HWN021613E *The WWPN The WWPN not found can not be found on subsystem The subsystem*

Explanation

The subsystem does not know the WWPN given.

Action

The information in the database repository might be out of sync with the monitored devices in your environment. Rerun data collection jobs against those monitored devices to refresh the information stored in the database repository.

HWN021614E *The WWPNs The WWPNs without mappings have no mappings on storage system The storage system*

Explanation

The WWPNs do not have any mappings on this storage system.

Action

The information in the database repository might be out of sync with the monitored devices in your environment. Rerun data collection jobs against those monitored devices to refresh the information stored in the database repository.

HWN021615E *WWPNs WWPNs that can not share mappings can not share mappings on storage system Storage system}. There are existing mappings that prevent this.*

Explanation

For some devices (e.g. FASTT, HDS) it is not possible to merge existing mappings. That means, if you have volume A mapped to port 1, and volume B mapped to port 2, you will not be able to create any mapping that has both port1 and port2 included.

Action

Create all mappings at once; specify all ports and volumes to be mapped together. OR: Build up mappings beginning with one volume-port mapping, and then add further volumes and ports. For Example, first map volume A and port 1, then volume A and port 2, finally volume B and port1 or port 2. The volume will be mapped to both ports. See also documentation for details.

HWN021616E *Volumes VolumeIDs can not share mappings on storage system Storage system }. There are existing mappings that prevent this.*

Explanation

For some devices (e.g. FASTT, HDS) it is not possible to merge existing mappings. That means, if you have volume A mapped to port 1, and volume B mapped to port 2, you will not be able to create any mapping that has both volume A and volume B included.

Action

Create all mappings at once; specify all ports and volumes to be mapped together. OR: Build up mappings beginning with one volume-port mapping, and then add further volumes and ports. For Example, first map volume A and port 1, then volume A and port 2, finally volume B and port1 or port 2. The volume will be mapped to both ports. See also documentation for details.

HWN021617E The stored data for storage system *The storage system* is not in sync with the environment. Rerun data collection.

Explanation

The data stored for the storage system does not seem to be in sync with the environment

Action

Rerun data collection.

HWN021618E Modifying target ports is not supported by subsystem *the subsystem* .

Explanation

The subsystem does not support modifying target ports of existing mappings.

Action

Remove the mapping and re-create with the new set of target ports.

HWN021619E Modifying the target ports for mapping of initiator port *initiator port WWPN* and volume *volume name* will also modify the target ports of the following mappings: *port - volume list*

Explanation

The initiator port has mappings to more volumes than were specified. The mappings to all volumes will be modified.

Action

Specify all volumes that are impacted.

HWN021620I Modifying the target ports for mapping of initiator port *initiator port WWPN* and volume *volume name* will modify the target ports of more mappings than specified.

Explanation

The initiator port has mappings to more volumes than were specified. The mappings to all volumes will be modified.

Action

Check the job log to see the additionally modified mappings.

HWN021621E It is not supported to modify the target ports of existing mappings and create new mappings in one step. Modify the existing mappings first and then create the new mappings. Existing mappings: *port - volume list*

Explanation

It is not supported to modify the target ports of existing mappings and create new mappings in one step.

Action

Modify the existing mappings first and then create the new mappings.

HWN021622I Started modification of the assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* . Target ports to add: *target ports to add* Target ports to remove: *target ports to remove*

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021623I Finished modification of the assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* . Target ports to add: *target ports added* Target ports to remove: *target ports removed*

Explanation

The task succeeded.

Action

No action required.

HWN021624E The modification of the assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* failed. Target ports to add: *target ports to add* Target ports to remove: *target ports to remove*

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021650E A timeout occurred while connecting to SMI-S provider *SMI-S provider IP and port*.

Explanation

There was a timeout on an attempted connection to an SMI-S provider. The service is unavailable or not responding, or the network may be congested.

Action

Check that:

1. The SMI-S provider is running.
2. The SMI-S provider is able to answer IBM Spectrum Control requests without delay.
3. There is a good network connection between IBM Spectrum Control and the SMI-S provider.

If the SMI-S provider is running correctly and the network connection is fine, increase the timeout and try again.

HWN021651E Job on SMI-S provider *SMI-S provider IP and Port in format IP:Port* failed. Job Status: *Job status* . Error code is *Error code* , error description: *Error description* . Check IBM Spectrum Control and SMI-S provider logs.

Explanation

An asynchronous job on the SMI-S provider failed.

Action

Check IBM Spectrum Control and SMI-S provider logs.

HWN021652E The process has timed out. Check the IBM Spectrum Control log files for more information.

Explanation

The process has taken longer than the specified timeout period. The process might be continuing even though the timeout has occurred.

Action

Check the log file at TPC_installation_directory\device\log\dmSvcTrace.log. If there are no additional error messages, then the process completed successfully in a longer amount of time than expected.

HWN021653E The attribute *Name of the attribute* was not found.

Explanation

A IBM Spectrum Control execution error occurred. Check IBM Spectrum Control logs.

Action

Check IBM Spectrum Control logs.

HWN021654E Pool ID *was not found*.

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021655E Volume ID *The ID of the volume* was not found.

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021656E Port ID *The ID of the port was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021657E Subsystem ID *The ID of the subsystem was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021658E Managed Disk ID *The ID of the MDisk was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021659E SMI-S provider *The ID of the SMI-S provider was not found*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021660E IO Group *The SVC IO Group was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021661E Extent *The storage extent external key was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021662E Physical volume *The physical volume external key was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021670E The client type *the client type* with description *the client description* is not unique on SMI-S provider *the SMI-S provider IP and port* } for storage subsystem *the subsystem ID* of volumes *the volumeIDs of the subsystem which were passed in*

Explanation

This SMI-S provider for the storage device does not have several entries for the chosen client type.

Action

Specify client type and description that are unique for the SMI-S provider. The supported client types also depend on the SMI-S provider version. Maybe you will need to change or upgrade the SMI-S provider.

HWN021671I The storage system *The storage system* was deleted from the database

Explanation

This storage system was deleted from the database.

Action

No action is required.

HWN021672E The *storage system name* storage system was not removed because other monitoring actions are running on the device.

Explanation

The storage system is in use by other monitoring actions and cannot be removed from the database repository at this time. For example, a probe schedule is collecting data about the storage system.

Action

Wait for the probe schedule or other action to complete and try to remove the storage system again.

HWN021673E The probe job on SMI-S provider *SMI-S provider IP and Port in format IP:Port* did not complete within the time limit of *Microseconds* microseconds. The job is *Percent complete* percent complete. Check the SMI-S provider log for job status. Job

information: *JobCOP* . Run the probe job again after the current job has completed.

Explanation

The probe job was started on the SMI-S provider, but did not complete in the specified time limit. The time limit can be set by using the `setdscfg` CLI command to modify the `CIMJobContext.JobRetrievalRetry` and `CIMJobContext.JobRetrievalSleep` parameters in the Db2 table.

- `CIMJobContext.JobRetrievalRetry` defines the maximum number of retries to check a job for completion.
- `CIMJobContext.JobRetrievalSleep` defines the wait time in microseconds between two retries.

Action

Check the SMI-S provider logs for status of the probe job. Use the `setdscfg` CLI command to change the CIM job retrieval parameters if necessary. Run the probe again to get the most recent data from the subsystem.

For more information about CLI commands, see the Command-line interface section of the Knowledge Center.

HWN021674E Job on SMI-S provider *SMI-S provider IP and Port* in format *IP:Port* returned unexpected results. Job information: *JobCOP* Job status: *JobState* , status description: *JobStatus* Check SMI-S provider log. Redo probe if the job completed.

Explanation

The job was started on the SMI-S provider, but returned an unexpected status.

Action

Check the SMI-S provider logs for job information. If the job completed, probe the subsystem again to get the up to date data.

HWN021675I Started creation of volume with size *Size* in pool *Pool* on subsystem *Subsystem*

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021676I Volume creation completed successfully. New volume *VolumeID* created with size *Size* in pool *Pool* on subsystem *Subsystem* .

Explanation

The task succeeded.

Action

No action required.

HWN021677E Volume creation failed. The volume of size *Size* in pool *Pool* on subsystem *Subsystem* could not be created.

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021678I Started assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* .

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021679I Finished assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* .

Explanation

The task succeeded.

Action

No action required.

HWN021680E The assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* failed.

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021681I Started unassignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* .

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021682I Finished unassignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* .

Explanation

The task succeeded.

Action

No action required.

HWN021683E The unassignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *WWPN* failed.

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021684I Started deletion of volume *VolumeID* on subsystem *Subsystem* .

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021685I Volume deletion completed successfully. Volume *VolumeID* on subsystem *Subsystem* was deleted.

Explanation

The task succeeded.

Action

No action required.

HWN021686E Volume deletion failed. Volume *VolumeID* on subsystem *Subsystem* could not be deleted.

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021687I Started modification of Pool *Pool display name* on subsystem *Subsystem display name* .

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021688I Pool modification completed successfully. Pool *Pool display name* on subsystem *Subsystem display name* was modified.

Explanation

The task succeeded.

Action

No action required.

HWN021689E Pool modification failed. Pool *Pool display name* on subsystem *Subsystem display name* could not be modified.

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021690I Started creation of *number volumes* volumes with size *Size* in pool *Pool* on subsystem *Subsystem*

Explanation

The task was started. The log will inform about the further process.

Action

No action required.

HWN021691I Created *number volumes* out of *total number volumes* volumes with size *Size* in pool *Pool* on subsystem *Subsystem*

Explanation

The task succeeded.

Action

No action required.

HWN021692E Volume creation failed. Created *number volumes* out of *total number volumes* volumes with size *Size* in pool *Pool* on subsystem *Subsystem*

Explanation

The task failed.

Action

Check the log for failure reason.

HWN021693W Warning: The task succeeded, but the database update failed. Run probe to update the database.

Explanation

The task succeeded, but the database update failed.

Action

Run probe for the subsystem to update the database.

HWN021700I Enumerating CIM Associator *The CIM association name which is being enumerated. for The name of the DB table which will be populated as result of this query.*

Explanation

The discovery or probe is currently enumerating a CIM associator. Inventory collection enumerates CIM classes in order to collect data for a particular IBM Spectrum Control entity, such as storage subsystem or storage volume.

Action

No action is required.

HWN021701I Enumerating CIM Class *The CIM class name which is being enumerated. for The name of the DB table which will be populated as result of this query.*

Explanation

The discovery or probe is currently enumerating a CIM class. Inventory collection enumerates CIM classes in order to collect data for a particular IBM Spectrum Control entity, such as storage subsystem or storage volume.

Action

No action is required.

HWN021702I Querying SMI-S provider

Explanation

An SMI-S provider query is in process

Action

No action is required.

HWN021703I Task starting on SMI-S provider *Identifier of the SMI-S provider..*

Explanation

The task is starting on the specified SMI-S provider.

Action

No action is required.

HWN021708I Initializing Collection for storage system *storage system identification*.

Explanation

Probe is being initialized.

Action

No Action is required

HWN021709I Collection for storage system *storage system identification* completed.

Explanation

Probe is completed.

Action

No action is required.

HWN021710I Discovering devices for SAN Volume Controller *The VPD of the SAN Volume Controller*.

Explanation

Prior to the discovery or probe, a fiber channel discovery on this SAN Volume Controller is issued.

Action

No action is required.

HWN021711I Discovery devices for SAN Volume Controller *The VPD of the SAN Volume Controller*. failed with error message *The exception which has occurred*.

Explanation

Fiber channel discovery issued prior to discovery or probe on the SAN Volume Controller was failing.

Action

Collection will continue without discovery.

HWN021712I Collecting Nodes for storage system *storage system identification*.

Explanation

The probe is currently traversing and storing CIM information that are related to the Nodes of the storage system.

Action

No action is required.

HWN021713I Collecting fibre channel ports for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to the fibre channel ports of the storage system.

Action

No action is required.

HWN021714I Collecting volumes for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to the volumes of the storage system.

Action

No action is required.

HWN021715I Traversing host to volume assignments for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to host to volume assignment.

Action

No action is required.

HWN021716I Collecting pools and volumes for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to the pools and volumes of the storage system.

Action

No action is required.

HWN021717I Collecting volume settings for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to the volume settings of the storage system.

Action

No action is required.

HWN021718I Collecting client setting data for storage system *storage system identification.*

Explanation

The probe is currently traversing and storing CIM information that are related to the client setting data of the storage system.

Action

No action is required.

HWN021719I Perform collection post process tasks for storage system *storage system identification.*

Explanation

CIM based collection is completed and post collection tasks for the probe are performed.

Action

No action is required.

HWN021720I Flash enclosure is missing drive *flash_drive_identifier.*

Explanation

The drive is missing from its enclosure. Typically, all drives of a flash enclosure are installed.

Action

No action is required. Consider replacing the missing drive. However, the missing drive does not adversely affect the operation of the storage system or the ability to monitor the storage system.

HWN021724W SMI-S provider *SMI-S provider identifier* manages device(s) of type *device_type* which is supported through the native device interface or SNMP only.

Explanation

The specified device type is not supported through the SMI-S provider.

Action

Add the device again using a supported interface such as the CLI, the native API, or SNMP.

HWN021725I IBM Spectrum Control discovered/rediscovered a device with name *Identifier of the device.* on SMI-S provider *Identifier of the SMI-S provider..*

Explanation

The discovery found a device on an SMI-S provider it is examining.

Action

No action is required.

HWN021726I IBM Spectrum Control discovered/rediscovered no device on SMI-S provider *Identifier of the SMI-S provider..*

Explanation

The discovery found no device on an SMI-S provider.

Action

Check if this is correct that there is no device on the SMI-S provider.

HWN021727I IBM Spectrum Control discovery starting on SMI-S provider *Identifier of the SMI-S provider..*

Explanation

The discovery is starting on an SMI-S provider.

Action

No action is required.

HWN021728I IBM Spectrum Control discovery on SMI-S provider *Identifier of the SMI-S provider. is complete.*

Explanation

The discovery is finished on an SMI-S provider.

Action

No action is required.

HWN021729W IBM Spectrum Control discovery of Device type value is not supported.

Explanation

The device type specified is not supported.

Action

No action is required.

HWN021730W IBM Spectrum Control discovery of device value with code level value is not supported on SMI-S provider *Identifier of the SMI-S provider..*

Explanation

The code level specified is not supported.

Action

Upgrade the device to a version supported by the SMI-S provider.

HWN021731I Probing Volumes for Storage System: *value*.

Explanation

The probe is finding the volumes for this storage system.

Action

No action is required.

HWN021732I Number of Volumes Found Currently: *value*. Continuing to Probe Volumes.

Explanation

The Probe is finding the Volumes. This status update is to inform how many volumes have been processed at this point during the probe.

Action

No action is required.

HWN021733I *value* Volumes Found.

Explanation

This status message is to inform you of the total number of volumes found for this storage system or storage pool.

Action

No action is required.

HWN021734I Probing Disks for Storage System: *value*.

Explanation

The probe is finding the disks for this storage system.

Action

No action is required.

HWN021735I Number of Disks Found Currently: *value*. Continuing to Probe Disks.

Explanation

The probe is finding the disks. This status update is to inform how many disks have been processed at this point during the probe.

Action

No action is required.

HWN021736I *value* Disks Found.

Explanation

This status message to inform you of the total number of disks found for this storage system or storage pool.

Action

No action is required.

HWN021737I Probing Virtual Disks for Cluster: *value*

Explanation

The probe is finding the virtual disks for this SAN Volume Controller cluster.

Action

No action is required.

HWN021738I Number of Virtual Disks currently found: *value*. Continuing to probe Virtual Disks.

Explanation

The probe is finding the virtual disks. This status update is to inform of the number of virtual disks that have been processed at this point during the probe.

Action

No action is required.

HWN021739I *value* Virtual Disks found.

Explanation

This is the total number of Virtual disks found on the corresponding SAN Volume Controller cluster.

Action

No action is required.

HWN021740I Probing Views of Host Initiator access to Volumes.

Explanation

The probe is finding the Host Initiator access to Volumes.

Action

Check logs for SQLExceptions logged for ServiceUtils.getConnection().

HWN021741I *value* Views Found.

Explanation

This status message to inform you of the total number of Views for Host Initiator access to Volumes that are found for this storage system.

Action

Check logs for SQLExceptions logged for ServiceUtils.getConnection().

HWN021742E The SMI-S provider *SMI-S provider URL* is not managing storage subsystems.

Explanation

The SMI-S provider is managing switches and no storage subsystems.

Action

Specify the correct SMI-S provider which manages the storage subsystems.

HWN021743E The SMI-S provider *SMI-S provider URL* is not managing switches.

Explanation

The SMI-S provider is managing storage subsystems only and no switches.

Action

Specify the correct SMI-S provider which manages switches.

HWN021744E Cannot connect to a resource because of an SSL certificate error. Troubleshooting information: http://www.ibm.com/support/docview.wss?uid=swg21976237

Explanation

This communication problem might be caused by an error with the SSL certificate on the resource.

Action

To learn about how to troubleshoot the problem, go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>.

Related reference

- [Resolving security certificate errors in IBM Spectrum Control V5.2.9 and later](#)

HWN021745I Cannot connect to a resource because of an SSL certificate error. Troubleshooting information: http://www.ibm.com/support/docview.wss?uid=swg21976237. An alternate resource will be used.

Explanation

This communication problem might be caused by an error with the SSL certificate on the resource.

An alternate resource has been identified and will be used instead for the fabric or switch.

Action

To learn about how to troubleshoot the problem, go to <http://www.ibm.com/support/docview.wss?uid=swg21976237>.

Related reference

- [Resolving security certificate errors in IBM Spectrum Control V5.2.9 and later](#)

HWN021746W SMI-S provider *Identifier of the SMI-S provider.* manages Cisco device types through SNMP only.

Explanation

The device type specified is not supported through the SMI-S provider.

Action

Use the add switch wizard to add and configure switches of the specified device type by using the SNMP interface.

HWN021747E Unable to add the specified switch by using SNMP. The switch is a Brocade switch and can be added only by using an SMI agent.

Explanation

Brocade switches must be added by using an SMI agent rather than by SNMP.

Action

Restart the Add Switch wizard and select Brocade as the vendor, and complete the information for the SMI agent.

HWN021800E Failed to get a database connection.

Explanation

Failed to get a database connection. Null was returned instead.

Action

Check logs for SQLExceptions logged for ServiceUtils.getConnection().

HWN021801E The server failed to get SMI-S provider entity from database.

Explanation

The server failed to get SMI-S provider entity from database. Either cursor on table T_RES_REGISTERED_CIMOM or contained object was null.

Action

No action is required.

HWN021802E Experienced SQL problems while working with database: *The SQL error.*

Explanation

Failed to work with database. Received SQL error instead.

Action

No action is required.

HWN021803W The server did not get userid and or password for SMI-S provider *The Service URL of the SMI-S provider* from database.

Explanation

The server found userid and or password being null in database.

Action

No action is required.

HWN021804E The server failed to access slp attributes for SMI-S provider *The Service URL of the SMI-S provider* from database.

Explanation

The server failed to access slp attributes for this SMI-S provider. Either cursor on table T_RES_SLP_ATTRIBUTES or contained object was null.

Action

No action is required.

HWN021805E CIMOMManager failed to get a database mapper of type *The type of the database mapper*.

Explanation

The CIMOMManager failed to get a database mapper. Unable to persist data to database.

Action

No action is required.

HWN021806E CIMOMManager failed to get a valid mapper result from *The type of the database mapper*.

Explanation

The CIMOMManager failed to get a valid mapper result from a database mapper. Unable to persist data to database.

Action

No action is required.

HWN021807E CIMOMManager failed to get a proxy for calling slp discovery.

Explanation

The CIMOMManager failed to get a proxy for calling slp discovery. Unable to discover SMI-S providers.

Action

Restart DiscoveryService if not running.

HWN021808E The device cannot be contacted through any of the following SMI-S providers *The comma separated list of IP and port for the SMI-S providers..* Possible causes are that the SMI-S providers are not accessible or the device is disconnected from the SMI-S providers.

Explanation

No connection to the SMI-S provider could be established.

Action

Check the given reason.

HWN021809E The host for SMI-S provider *The service URL of the SMI-S providers.* was not resolvable in DNS.

Explanation

The hostname of the SMI-S provider could not be translated to an IP address.

Action

Check the hostname.

HWN021810E The service URL for SMI-S provider *The service URL of the SMI-S providers.* is not valid.

Explanation

The hostname of the SMI-S provider could not be translated to an IP address.

Action

Check the URL fragments.

HWN021811I The operational status for device *The ID of the device.* on SMI-S provider *The service URL of the SMI-S provider.* has this value *The operational status vector.* .

Explanation

The operational status for this device was retrieved from the specific SMI-S provider. The value is a string representation of an vector of integers.

Action

No action is required.

HWN021812E The operational status for device *The ID of the device.* on SMI-S provider *The service URL of the SMI-S provider.* could not

be retrieved because SMI-S provider is in status *The SMI-S provider connection status.* .

Explanation

The operational status for this device was not retrieved from the specific SMI-S provider. The SMI-S provider is in a state which does not allow retrieval of operational status for the device.

Action

Action depends on returned SMI-S provider connection status.

HWN021813E Fabric ID *The ID of the fabric was not found.*

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Rerun the discovery process, and then run a data collection task.

HWN021814E The device *device id* cannot be contacted through the SMI-S provider *SMI-S provider service URL*.

Explanation

The SMI-S provider is in a state which does not allow retrieval of operational status for the device or the device is disconnected from the SMI-S provider.

Action

Check that the device can be reached from the machine that the SMI-S provider is running on.

HWN021899E Switch *The wwn of the switch. has no associated Fabric.*

Explanation

The SMI agent that has reported the switch is not reporting a fabric for the switch. The discovered switch is not persisted, due to this failure.

Action

Try restarting the switch SMI agent. If this does not fix the problem, contact customer support for your switch vendor.

HWN021901E The virtual disk size cannot exceed *maximum size* when creating space efficient virtual disks.

Explanation

When creating space efficient virtual disks, the maximum virtual disk size cannot be higher than the specified value.

Action

Provide a correct size for the virtual disk.

HWN021902E Invalid grain size. Valid values are *valid values*.

Explanation

The specified grain size parameter is invalid.

Action

Pass a valid parameter value.

HWN021903E Authentication to *ip or name of host* failed. Please specify correct authentication information.

Explanation

Cannot authenticate with given authentication information.

Action

Make sure username and password are correct.

HWN021904E Connection to *IP address or name of host* failed with following operating system exception: *exception text* . Please make sure IP address is correct and machine is up and running. If this is a SVC V4 machine, it could be that its RAS interface is not up. If this is a SVC V5, make sure the SMI-S provider is up and running.

Explanation

Connection to the host failed.

Action

Make sure IP address is valid and machine is up.

HWN021905E Connection to *IP address or name of host* failed with following operating system exception: *exception text* .

Explanation

Connection to the host failed.

Action

Contact IBM support.

HWN021906E Failed to get native API entity from database.

Explanation

The NAPIManager failed to get native API entity or related information from database.

Action

Configure Subsystem connection again, run Discovery and Probe again for the failing device. Ensure that everything completes successful.

HWN021907E The IP address *The service URL of the SMI-S providers.* was not resolvable in DNS.

Explanation

The hostname could not be translated to an IP address.

Action

Check the hostname.

HWN021908E Failed to get a proxy for calling NAPI discovery.

Explanation

The NAPIManager failed to get a proxy for calling NAPI discovery. Unable to discover subsystems.

Action

Restart DiscoveryService if not running.

HWN021909E There are no IO Groups available for Virtual Disk creation.

Explanation

A virtual disk creation using system chosen parameters was attempted but there are no valid IO Groups available to choose from.

Action

Probe the San Volume Controller again. Check San Volume Controller configuration and ensure there is at least one IO Group that has nodes. Should the problem persist, contact IBM support.

HWN021910E Managed Disk ID *The ID of the MDisk is not in unmanaged mode and cannot be added to the specified managed-disk group.*

Explanation

The Managed Disk specified in the command is not in unmanaged mode. To be a candidate for a managed-disk group, a managed disk cannot be part of another managed group. It also cannot be either offline or excluded.

Action

Choose a different Managed Disk ID to add to the specified managed-disk group.

HWN021911E Another probe of storage subsystem *The Name+Nameformat of the storage subsystem is already in progress.*

Explanation

Another probe for the same subsystem was already started and is in progress, so the new probe cannot be started.

Action

Probe this subsystem only after the previous probe for it is finished.

HWN021912E Other probes of storage subsystems *The list of Name+Nameformat of the storage subsystems* are already in progress.

Explanation

Other probes for the same subsystems were already started and are in progress, so the new probes cannot be started.

Action

Probe these subsystems only after the previous probes for them are finished.

HWN021913E IBM Spectrum Control Device Server could not write to directory *The directory*.

Explanation

The IBM Spectrum Control Device Server is not able to write to the directory. Possible reasons could be insufficient disk space, missing access privileges, etc.

Action

Check the free disk space and ensure that the access permissions for the directory are set correctly. If the problem still occurs, please contact IBM support.

HWN021914E SSH key file *The SSH key file name* is still in use, so it cannot be deleted.

Explanation

The SSH key is still used by IBM Spectrum Control to manage one or more SVC devices, so it cannot be deleted.

Action

No action is required.

HWN021915E IBM Spectrum Control Device Server could not delete the file *The file*.

Explanation

The IBM Spectrum Control Device Server is not able to delete the file. A possible reason could be missing or wrong access privileges.

Action

Ensure that the access permissions for the file are set correctly. If the problem still occurs, please contact IBM support.

HWN021916E The storage subsystem *subsystem ID* is not configured for file level management.

Explanation

File level management information is not available for the storage subsystem.

Action

Verify the storage subsystem is configured for file level management. If the storage subsystem is configured for file level management, run a storage subsystem probe. Then try the operation again.

HWN021917E An invalid parameter *Name of the parameter which was invalid* was specified. The corresponding file system mount point does not exist.

Explanation

An invalid parameter was specified. The corresponding file system mount point does not exist.

Action

Specify a valid file system mount point and try the operation again.

HWN021919E The cluster ID *The ID of the cluster.* was not found.

Explanation

The cluster ID specified in the command was not found.

Action

Some of the IBM Spectrum Control components might be out of sync. Run a discovery, then run a data collection task, such as a subsystem probe. Try the command again.

HWN021920E The export ID *The ID of the export.* was not found.

Explanation

The export ID specified in the command was not found.

Action

Some of the IBM Spectrum Control components might be out of sync. Run a discovery, then run a data collection task, such as a subsystem probe. Try the command again.

HWN021921E The specified activity or protocol could not be used to change the export *The ID of the export..*

Explanation

A valid activity or protocol is required to change an export.

Action

Specify a valid activity or protocol to change the export.

HWN021922E The file system ID *file_system_ID* was not found.

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Run the discovery process again, and then run a data collection task.

HWN021923E Invalid parameter *Name of the parameter which was invalid.* File system does not exist.

Explanation

The file system system does not exist.

Action

Specify a file system.

HWN021924E The parameter *Name of the parameter which was invalid* is not a valid parameter.

Explanation

The NFS position option is only used by NFS add or NFS change option.

Action

In order to use the NFS position option, you must also specify either the NFS add option or the NFS change option.

HWN021925E The fileset ID *fileset_ID* was not found.

Explanation

No DB row was found that corresponds to the key that was passed in as an input parameter.

Action

IBM Spectrum Control components may be out of sync. Run the discovery process again, and then run a data collection task.

HWN021926E The WAN-cache source ID *WAN_cache_source_id* was not found.

Explanation

The WAN-cache source ID specified in the command was not found.

Action

Some IBM Spectrum Control components may be out of sync. Run a discovery, and then run a data collection task, such as a subsystem probe. Try the command again.

HWN021927E The WAN-cache ID *WAN_cache_source_id* was not found.

Explanation

The WAN-cache ID specified in the command was not found.

Action

Some IBM Spectrum Control components may be out of sync. Run a discovery, and then run a data collection task, such as a subsystem probe. Try the command again.

HWN023000I The Optimization Execution task has started.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023001E The task to optimize the volumes was not completed successfully.

Explanation

The action was not completed because unexpected errors occurred.

Action

Open the logs for the task and complete the following actions:

- Examine the log messages that were generated before the errors occurred.
- Determine the current state of the volumes.

Depending on the error, it might be necessary to access the storage virtualizer. If this is the case, complete the following actions:

- Carry out further investigations to determine the cause of the errors.
- Resolve the issues that caused the errors.

When the issues are resolved, probe the storage virtualizer, and then rerun the task to optimize the volumes. If the issues cannot be resolved, contact IBM Software Support.

HWN023002I The Optimization Execution task has completed.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023003I The Optimization Execution task retrieved *number* recommendations

Explanation

The Optimization Execution request will process the number of recommendations retrieved.

Action

No action is required.

HWN023004I The Optimization Automation request persisted recommendations to be processed.

Explanation

The Optimization request persisted the recommendations to be processed.

Action

No action is required.

HWN023005I The Optimization Execution task updated the status of *number* recommendations.

Explanation

The Optimization Execution task has updated the status of the specified number of recommendations.

Action

No action is required.

HWN023006I The Optimization Automation request begins processing *number* recommendations.

Explanation

The Optimization request is processing the specified number of recommendations.

Action

No action is required.

HWN023007W The recommendation being processed contains a virtual disk that is no longer detected.

Explanation

The recommendation list contains a recommendation request where the virtual disk is no longer detected by IBM Spectrum Control. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer detected by TPC. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023008W The recommendation for virtual disk *vdisk name* contains a source storage pool that is no longer detected.

Explanation

The recommendation list contains a recommendation request where the source storage pool is no longer detected by IBM Spectrum Control. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer detected by TPC. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023009W The recommendation for virtual disk *vdisk name* contains a target storage pool that is no longer detected.

Explanation

The recommendation list contains a recommendation request where the target storage pool is no longer detected by IBM Spectrum Control. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer detected by TPC. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023010I Virtual disk *vdisk name* was successfully migrated from storage pool *source pool name* to storage pool *target pool name*.

Explanation

The Recommendation processed successfully migrated the virtual disk to the target pool.

Action

No action is required.

HWN023011W The recommendation for virtual disk *vdisk name* contains a virtual disk that does not exist in the source storage pool *source pool name* or the target storage pool *target pool name*.

Explanation

The recommendation list contains a recommendation request where the virtual disk does not exist in either the source or target storage pool. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer in a relationship once detected by IBM Spectrum Control. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023012W The recommendation for virtual disk *vdisk name* contains a non-mirrored virtual disk that is now a mirrored virtual disk.

Explanation

The recommendation list contains a recommendation request where a non-mirrored virtual disk is now a mirrored virtual disk. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer in a relationship once detected by IBM Spectrum Control. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023013W The recommendation for virtual disk *vdisk name* contains a mirrored virtual disk that is now a non-mirrored virtual disk.

Explanation

The recommendation list contains a recommendation request where a mirrored virtual disk is now a non-mirrored virtual disk. The recommendation will be ignored.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer in a relationship once detected by IBM Spectrum Control. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023014I The recommendation for virtual disk *vdisk name* requires more space on target pool *target pool name* to be processed.

Explanation

The Recommendation processed requires space to be freed by dependent migrations before the recommendation can be processed. Once the dependent migrations have been completed, the recommendation will be retried with the expectation that the recommendation will succeed since the space required was freed.

Action

No action is required.

HWN023015I Virtual disk *vdisk name* will now be migrated from storage pool *source pool name* to storage pool *target pool name*.

Explanation

The Recommendation processed will now perform the virtual disk migration.

Action

No action is required.

HWN023016I Successfully added virtual disk copy to virtual disk *vdisk name*.

Explanation

The Recommendation processed successfully added a virtual disk copy to the specified virtual disk.

Action

No action is required.

HWN023017I Synchronization for virtual disk *vdisk name* has completed *synchronization percent%* and requires about *seconds to complete* seconds to complete.

Explanation

The synchronization for the virtual disk is not complete and will need to take the specified amount of time to finish. Keep in mind that the time to complete is only an approximation and competing activity within the virtualizer may either hasten or slow the synchronization. Therefore, the time to complete adjusts as the synchronization of the virtual disk progresses.

Action

No action is required.

HWN023018I Synchronization for virtual disk *vdisk name* has completed.

Explanation

The synchronization for the virtual disk has completed.

Action

No action is required.

HWN023019I Successfully removed a virtual disk copy from virtual disk *vdisk name*.

Explanation

The Recommendation processed successfully removed a virtual disk copy of the specified virtual disk.

Action

No action is required.

HWN023020I Successfully changed the synchronization rate of virtual disk *vdisk name* to *syncrate%*.

Explanation

The Recommendation processed successfully changed the synchronization rate to the specified amount.

Action

No action is required.

HWN023021I Successfully changed the primary copy of virtual disk *vdisk name*.

Explanation

The Recommendation processed successfully changed the primary copy of the virtual disk.

Action

No action is required.

HWN023022E There is no space available on target pool *target pool name* to migrate the virtual disk *vdisk name*.

Explanation

The Recommendation for the virtual disk cannot be migrated due to no available space in the target storage pool.

Action

Make more space available in the target storage pool or re-run the analysis so that a new recommendation with sufficient space can be accomplished.

HWN023023E Unable to submit request to add vdisk copy command for virtual disk *vdisk name* due to rc (*rc*).

Explanation

Could not submit the request to add a vdisk copy to the specified virtual disk due to an error with the request submission.

Action

Check subsequent messages for more details and additional log files that may surface communication errors under the device server log directory, otherwise contact IBM support for more assistance.

Related reference

HWN023033E The request failed. Message from failed request: *message*.

Explanation

The request failed due to an error processing the request.

Action

Contact IBM customer technical support if unable to determine the error from the request error message or the log files under the device server log directory.

Related reference

- [Getting support](#)

HWN023034E The Optimization Automation job completed with errors in the recommendations.

Explanation

The Optimization Automation job failed due to errors with the recommendations.

Action

Investigate the reason for the recommendation errors. This can be done by looking at the messages within the job log and taking the appropriate action where needed.

HWN023035W The Optimization Execution task completed with warnings.

Explanation

The Optimization Execution task encountered errors that were ignored during the processing of the recommendations.

Action

Investigate the reason for the recommendation errors. This can be done by looking at the messages within the job log and taking the appropriate action where needed.

HWN023036E The request failed because there were not enough extents in the storage pool.

Explanation

The request failed due to there not being enough space to satisfy the request.

Action

Make more space available in the target storage pool or re-run the analysis so that a new recommendation with sufficient space can be accomplished.

HWN023037E The request failed because the number of copies of this volume would exceed the limit.

Explanation

The request failed due to there being the expected limit of volume copies for the volume. It is possible that the volume has already been migrated to a new target pool.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer detected by TPC. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023038E The request failed because the copy specified does not exist.

Explanation

The request failed due to the copy specified no longer existing. It is possible that the volume has already been migrated to a new target pool.

Action

If the analysis that generated the recommendation was performed sometime in the past, it is possible that an entity that was part of the recommendation is no longer detected by TPC. It would therefore be recommended to resubmit the analysis job to generate a new set of recommendations that would not contain entities that no longer exist.

HWN023039E The following exception occurred during a migration request: *exception*

Explanation

The migration request failed due to an exception The exception is caused by an internal error in the program.

Action

Contact IBM support with all the service log files so that the exception can be investigated further.

Related reference

- [Getting support](#)

HWN023040E The migration request for volume *vdisk name* is already being processed.

Explanation

The migration request failed for the specified volume because it is already being processed. This could be due to a concurrent job request to perform different migrations on the same volume. The first migration request for the volume will be preferred over any subsequent migration request for the same volume.

Action

Check the job logs for competing migration requests and if the wrong migration was performed, perform the analysis again and resubmit the optimization automation.

HWN023041W The request to migrate the mirrored volume *vdisk name* is suspended because the secondary volume is offline.

Explanation

To complete the migration request for the mirrored volume, the status of the secondary volume must change from offline to online. The status of the secondary volume is checked at regular intervals. If the status of the secondary volume changes to online, the migration request is resumed.

Action

If the migration request remains suspended, you can either cancel the execution of the recommendation, or open the Storage System GUI to bring the secondary volume back online.

HWN023042E The secondary copy needed for migration does not exist.

Explanation

The secondary copy is needed for volume migration since it is the means by which migration is achieved. Without the secondary copy, the migration cannot complete.

Action

Look at job logs to determine why the volume that was to be added was removed. If an action was taken that removed the new secondary copy before the copy was synchronized, then this error will occur. It is recommended to retry the recommendation and submit it separately from other recommendations.

HWN023043I The mirrored volume migration for volume *vdisk name* will be ignored.

Explanation

The mirrored volume migration for the specified volume will be ignored because the user specified that it should be ignored.

Action

No action is required.

HWN023044I The mirrored volume migration for volume *vdisk name* will result in the current secondary volume becoming the primary volume.

Explanation

The mirrored volume migration for the specified volume will result in the current secondary volume to become the primary volume and the new secondary volume will be migrated to the target pool. This is because the user specified this action.

Action

No action is required.

HWN023045I The mirrored volume migration for volume *vdisk name* will result in the primary volume being migrated to the target pool.

Explanation

The mirrored volume migration for the specified volume will result in the primary volume to be migrated to the target pool because the user specified this action.

Action

No action is required.

HWN023046I The Migration of the previously abandoned Optimization Automation job has started.

Explanation

If an optimization automation job was in progress prior to a server shutdown, the job will resume if any migrations are pending. This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023047I The Migration of the previously abandoned Optimization Automation job has completed.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023048I The Optimization Automation cancellation job *jobname* has started.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023049E The Optimization Automation cancellation job completed with errors.

Explanation

The cancellation of the Optimization Automation job failed due to an unexpected error.

Action

Contact IBM customer technical support with all related errors.

Related reference

-  [Getting support](#)

HWN023050I The Optimization Automation cancellation job *jobname* has completed.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN023051I The Optimization Automation job *jobname* will be canceled.

Explanation

The request to cancel an optimization job will commence being canceled.

Action

The result of the cancellation can be located in the job log of the job that is being canceled.

HWN023052W The Optimization Automation job is not in progress.

Explanation

The request to cancel an optimization job could not be canceled because it is not being processed.

Action

Check to see if the optimization job that was to be canceled has completed.

HWN023053I The migration of volume *vdisk name* has been canceled.

Explanation

The migration of the volume was canceled by the user. No further investigation is required.

Action

No action is required.

HWN023054W The Optimization Automation job was canceled.

Explanation

The Optimization Automation job was canceled by the user.

Action

Check if the cancellation was valid, and if so, no action is necessary. If not, look at the cancel request to determine who initiated the cancellation..

HWN023055I The volume that was chosen for transformation, *vdisk name*, is a secondary volume in a mirrored volume relationship. The secondary volume will be migrated to the specified target pool or converted as specified.

Explanation

The secondary volume will be converted or moved as specified.

Action

No action is required.

HWN024000I An optimization analysis task was started.

Explanation

This message is for informational purposes only.

Action

None.

HWN024001I The analysis is completed.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024002W Unable to retrieve any policy for Tier value.

Explanation

No policy was found for this tier. The input storage pool might have moved to another tier.

Action

If there have been changes to the storage pool tier since the analysis job was created, create a new analysis job.

HWN024003I Analyzed *number_of_volumes* volumes on tier *tier_number* for storage virtualizer *subsystem_name*.

Explanation

This message is for informational purposes. No further investigation is required.

Action

No action is required.

HWN024006W No target pools in *subsystem value* were selected.

Explanation

Source pools in the specified subsystem were selected, but no target pools in that subsystem were selected. IBM Spectrum Control will only move volumes across pools in the same subsystem.

Action

Select target pools in the specified subsystem and retry.

HWN024011W Destination storage pool *value* in subsystem *value* was not considered. Reason: *value*.

Explanation

This message is for informational purposes.

Action

None.

HWN024012I It is recommended that *number_of_volumes* volumes on tier *source_tier_number* are moved to tier *target_tier_number*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024015I The optimization analysis of the *value* subsystem was started.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024016W Volume *value* is already in the destination storage pool *value*. No recommendations will be generated for the volume.

Explanation

The volume is already in the storage pool that was selected as the destination. No recommendations will be generated for the volume.

Action

Select a destination storage pool that is not the same as the source storage pool.

HWN024018W No destination storage pools in Tier *value* have been specified for subsystem *value*.

Explanation

Optimization Analysis cannot balance storage pools when no destination pools have been specified.

Action

Specify destination storage pools for the balance operation.

HWN024019W The following pools on tier *tier_number* on the *storage_system* storage system cannot be balanced by redistributing or re-tiering volumes: *pool_names*.

Explanation

The pools were not balanced either because volumes could not be re-tiered to balance the pools, or an insufficient number of volumes were re-tiered to reduce the activity level of the pools below the specified threshold.

Action

Complete one or more of the following actions, and then rerun the task to balance the pools:

- Select a wider range of pools on the tiers that you want to balance.
- Select a wider range of target pools on tiers that are higher and that are lower than the tiers that you want to balance.
- Increase the value for the activity limit of the pools that you want to balance.

HWN024020I Started analysis to balance pools on tier *value*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024021W The *pool_name* pool on tier *tier_number* on the *storage_system* storage system cannot be balanced by redistributing the volumes.

Explanation

The pool was not balanced because an insufficient number of volumes could be redistributed across the pools to reduce the activity level of the pool below the specified threshold.

Action

Complete one or more of the following actions, and then rerun the task to balance the pools:

- Select a wider range of pools on the tiers that you want to balance.
- Increase the value for the activity limit of the pools that you want to balance.

Alternatively, run the Analyze Tiering wizard to automatically balance the pools. If the pools cannot be balanced across the tier, the most active volumes are re-tiered to balance the pools.

HWN024027I Storage Pool *pool name* has insufficient available space for volume *volume name* in storage pool *pool name*.

Explanation

The Optimization Balance Analysis determined that the specified volume could not be moved to the specified storage pool due to insufficient space. This does not mean that the specified storage pool is a good candidate in other aspects, just that the storage pool had insufficient space.

Action

If the storage pool activity values can not be reduced sufficiently by the Balance Analysis, consider resolving this issue by either modifying the storage pool or including additional storage pools in the Balance Analysis.

HWN024030W One or more entities specified as input for the analysis could not be found or pools or volumes in some input entities could not be found.

Explanation

The Optimization Analysis task was not able to find all of the input entities specified when the task was created or was not able to find pools or volumes in such entities. The entities may have been deleted or removed.

Action

If all input entities should still exist, check to see if IBM Spectrum Control reports any errors for these entities. If this situation is expected due to intentional environment changes, then no action is necessary.

HWN024031W One or more entities specified as candidate destinations for the analysis could not be found.

Explanation

The Optimization Analysis task was not able to find all of the candidate destination entities specified when the task was created. The entities may have been deleted or removed.

Action

If all candidate destination entities should still exist, check to see if IBM Spectrum Control reports any errors for these entities. If this situation is expected due to intentional environment changes, then no action is necessary.

HWN024032W For one or more mirrored volumes, both the primary and the secondary volume copies were chosen for transformation. You cannot transform both volume copies in the same transform task. Only the primary volume copies are included for transformation. You can transform the secondary volume copies in a separate transformation.

Explanation

If you are transforming both the primary and secondary copies of a mirrored volume, you must include the volume copies in separate transformations.

Action

On the Volumes page, choose the secondary volume copies that were excluded from this transformation and run the transform storage analysis for those volumes.

HWN024033W The volume *volume name* cannot be analyzed because it is not in a capacity pool.

Explanation

When you restrict optimization to target pools in the same capacity pool, the volumes that you select for analysis must belong to a capacity pool.

Action

Add the volume to a capacity pool and run the Analyze Tiering wizard again. Alternatively, choose another option for selecting target pools such as manual selection.

HWN024034W The pool *pool name* cannot be analyzed because the pool is not in a capacity pool.

Explanation

When you restrict optimization to target pools in the same capacity pool, the pools that you select for analysis must belong to a capacity pool.

Action

Add the pool to a capacity pool and run the Analyze Tiering wizard again. Alternatively, choose another option for selecting target pools such as manual selection.

HWN024035W The storage virtualizer *system name* cannot be analyzed because the storage virtualizer is not in a capacity pool.

Explanation

When you restrict optimization to target pools in the same capacity pool, the storage virtualizer that you select for analysis must belong to a capacity pool.

Action

Add the storage virtualizer to a capacity pool and run the Analyze Tiering wizard again. Alternatively, choose another option for selecting target pools such as manual selection.

HWN024036W The operation to transform the volumes on the *subsystem name* storage virtualizer cannot be completed because the destination pools were not available.

Explanation

The destination pools that were selected to transform the volumes could not be detected.

Action

Run the Transform Storage wizard again.

HWN024037E An unexpected error occurred. The operation to transform the volumes on the *subsystem name* storage virtualizer cannot be completed because the destination pools were not identified.

Explanation

The pools that were selected to transform the volumes could not be identified.

Action

If the problem persists, use the Service tool to collect trace data and send it to IBM Software Support.

HWN024043I The capacity pools of the source volumes were selected as the target pools.

Explanation

In the Analyze Tiering wizard, the option to restrict the selection of target pools to target pools in the same capacity pool was selected.

Action

No action is required.

HWN024046I The option that was selected to handle volumes with mirrored volumes is: After optimization, set the copy of the secondary volume in the destination pool as the primary volume. The original secondary volume remains the secondary volume.

Explanation

The option that was selected by the user to include or exclude volumes with mirrored volumes in the analysis.

Action

No action is required.

HWN024047I The number of days for collecting performance data to analyze the volumes is set to *performance_data_collection_period*.

Explanation

Only the performance data that was collected within the specified period is used to analyze the volumes.

Action

No action is required.

HWN024050I Automatic tiering was selected to tier the volumes.

Explanation

The default option, automatic tiering, was selected by the user in the Analyze Tiering wizard.

Action

No action is required.

HWN024051I The tiering analysis is starting.

Explanation

The source volumes that you selected are analyzed to determine whether they require re-tiering.

Action

No action is required.

HWN024052I Tier *tier#* has an I/O density threshold value of *value* per second per GiB.

Explanation

User-defined values for the I/O density thresholds were specified for the storage tiers.

Action

No action is required.

HWN024053I Tier *tier#*, has a file age threshold value of *value* percent of files last accessed within *time_unit*.

Explanation

User-defined threshold values were specified for file usage for the storage tier.

Action

No action is required.

HWN024054I The real capacity for the thin-provisioned volumes is set to *value unit*.

Explanation

The percentage or amount of the current capacity of the volume that is allocated when the volume is converted to a thin-provisioned volume was specified by the user in the Transform Storage wizard.

Action

No action is required.

HWN024055I The auto expand property of the thin-provisioned volumes is set to *yes/no*.

Explanation

Whether the auto expand property was enabled or disabled by the user in the Transform Storage wizard.

Action

No action is required.

HWN024056I The warning level for thin-provisioned volumes is set to *value %*.

Explanation

The warning level threshold that was specified by the user in the Transform Storage wizard for thin-provisioned volumes.

Action

No action is required.

HWN024057I The grain size that was specified for the thin-provisioned volumes is *grain_size* KiB.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024058I The real capacity for the compressed volumes is set to *value unit*.

Explanation

The percentage or amount of the current capacity of the volume that is allocated when the volume is converted to a compressed volume was specified by the user in the Transform Storage wizard.

Action

No action is required.

HWN024059I The auto expand property for the compressed volumes is set to *yes/no*.

Explanation

Whether the auto expand property was enabled or disabled by the user in the Transform Storage wizard.

Action

No action is required.

HWN024060I The warning level for the compressed volumes is set to *value*.

Explanation

The warning level threshold that was specified by the user in the Transform Storage wizard for compressed volumes.

Action

No action is required.

HWN024061I The option that was selected to handle volumes with mirrored volumes is: After optimization, set the secondary volume as the primary volume. The volume in the destination pool is the secondary volume.

Explanation

The option that was selected by the user to include or exclude volumes with mirrored volumes in the analysis.

Action

No action is required.

HWN024062I The option that was selected for mirrored volumes is: Do not optimize volumes with mirrored volumes.

Explanation

The option that was selected by the user to include or exclude volumes with mirrored volumes in the analysis.

Action

No action is required.

HWN024066I Tier *tier#* has an I/O rate threshold value of value I/O per second.

Explanation
