Preface	
Who Should Use This Book	. xvi
How This Book Is Organized	
Typographic Conventions	
Chapter 1. The Command Line Interface	1
Connecting to the Switch	2
Management Module Setup	
Factory-Default vs. MM-Assigned IP Addresses	
Default Gateway	
Configuring Management Module for Switch Access	
Connecting to the Switch via Telnet	
Connecting to the Switch via SSH	
Accessing the Switch	
Setup vs. CLI	
Command Line History and Editing	
Idle Timeout	
Chapter 2. First-Time Configuration	. 11
Using the Setup Utility	
Information Needed for Setup	
Starting Setup When You Log In	
Stopping and Restarting Setup Manually	
Stopping Setup	
Restarting Setup	
Optional Setup for Telnet Support	
Setting Passwords	
Changing the Default Administrator Password.	
Changing the Default User Password	. 10
Ohantan O. Manu Basina	40
Chapter 3. Menu Basics	
The Main Menu	
Menu Summary	
Global Commands	
Command Line History and Editing	
Command Line Interface Shortcuts	
CLI List and Range Inputs	
Command Stacking	
Command Abbreviation	
Tab Completion	. 27

Preface

The IBM N/OSTM 7.4 Menu-Based CLI for the Virtual Fabric 10Gb Switch Module for IBM BladeCenter[®] Command Reference describes how to configure and use the IBM N/OS 7.4 software with your Virtual Fabric 10Gb Switch Module (VFSM) for IBM BladeCenter.

For documentation on installing the switches physically, see the *Installation Guide* for your VFSM. For details about configuration and operation of your VFSM, see the *IBM N/OS 7.4 Application Guide*.

Who Should Use This Book

This book is intended for network installers and system administrators engaged in configuring and maintaining a network. The administrator should be familiar with Ethernet concepts, IP addressing, the IEEE 802.1D Spanning Tree Protocol, and SNMP configuration parameters.

How This Book Is Organized

Chapter 1, "The Command Line Interface," describes how to connect to the switch and access the information and configuration menus.

Chapter 2, "First-Time Configuration," describes how to use the Setup utility for initial switch configuration and how to change the system passwords.

Chapter 3, "Menu Basics," provides an overview of the menu system, including a menu map, global commands, and menu shortcuts.

Chapter 4, "The Information Menu," shows how to view switch configuration parameters.

Chapter 5, "The Statistics Menu," shows how to view switch performance statistics.

Chapter 6, "The Configuration Menu," shows how to configure switch system parameters, ports, VLANs, Spanning Tree Protocol, SNMP, Port Mirroring, IP Routing, Port Trunking, and more.

Chapter 7, "The Operations Menu," shows how to use commands which affect switch performance immediately, but do not alter permanent switch configurations (such as temporarily disabling ports). The menu describes how to activate or deactivate optional software features.

Chapter 8, "The Boot Options Menu," describes the use of the primary and alternate switch images, how to load a new software image, and how to reset the software to factory defaults.

Chapter 9, "The Maintenance Menu," shows how to generate and access a dump of critical switch state information, how to clear it, and how to clear part or all of the forwarding database.

© Copyright IBM Corp. 2012 XVII

Appendix A, "IBM N/OS System Log Messages," shows a listing of syslog messages.

Appendix B, "IBM N/OS SNMP Agent," lists the Management Interface Bases (MIBs) supported in the switch software.

Appendix C, "Getting help and technical assistance," describes how to get help, service, or technical assistance or more information about IBM products.

"Index" includes pointers to the description of the key words used throughout the book.

Typographic Conventions

The following table describes the typographic styles used in this book.

Table 1. Typographic Conventions

Typeface or Symbol	Meaning					
plain fixed-width text	This type is used for names of commands, files, and directories used within the text. For example:					
	View the readme.txt file.					
	It also depicts on-screen computer output and prompts.					
bold fixed-width text	This bold type appears in command examples. It shows text that must be typed in exactly as shown. For example:					
	/info/sys/gen					
bold body text	This bold type indicates objects such as window names, dialog box names, and icons, as well as user interface objects such as buttons, and tabs.					
italicized body text	This italicized type indicates book titles, special terms, or words to be emphasized.					
angle brackets < >	Indicate a variable to enter based on the description inside the brackets. Do not type the brackets when entering the command.					
	Example: If the command syntax is ping <ip address=""></ip>					
	you enter ping 192.32.10.12					
braces { }	Indicate required elements in syntax descriptions where there is more than one option. You must choose only one of the options. Do not type the braces when entering the command.					
	Example: If the command syntax is /cfg/l2/vlan/vmap {add rem} <1-127>					
	you enter: /cfg/l2/vlan/vmap add 1					
	or /cfg/l2/vlan/vmap rem 1					

© Copyright IBM Corp. 2012 Preface **XİX**

Table 1. Typographic Conventions

Typeface or Symbol	Meaning						
brackets []	Indicate optional elements in syntax descriptions. Do not type the brackets when entering the command.						
	Example: If the command syntax is /cfg/sys/dhcp [mgta mgtb] enable						
	you enter /cfg/sys/dhcp mgta enable						
	or /cfg/sys/dhcp mgtb enable						
vertical line	Separates choices for command keywords and arguments. Enter only one of the choices. Do not type the vertical line when entering the command.						
	Example: If the command syntax is /cfg/l3/route/ecmphash [sip dip]						
	you enter: /cfg/l3/route/ecmphash sip						
	or /cfg/l3/route/ecmphash dip						
	or /cfg/l3/route/ecmphash sip dip						

Chapter 1. The Command Line Interface

Your Virtual Fabric 10Gb Switch Module (VFSM) is ready to perform basic switching functions right out of the box. Some of the more advanced features, however, require some administrative configuration before they can be used effectively.

The extensive IBM N/OS switching software included in your switch provides a variety of options for accessing and configuring the switch:

- A built-in, text-based command line interface and menu system for access via a Telnet session or serial-port connection
- SNMP support for access through network management software such as IBM Director or HP OpenView
- IBM N/OS Browser-Based Interface (BBI)

The command line interface is the most direct method for collecting switch information and performing switch configuration. Using a basic terminal, you are presented with a hierarchy of menus that enable you to view information and statistics about the switch, and to perform any necessary configuration.

This chapter explains how to access the Command Line Interface (CLI) for the switch.

© Copyright IBM Corp. 2012

Connecting to the Switch

You can access the command line interface in any one of the following ways:

- · Using a Telnet connection via the management module
- Using a Telnet connection over the network
- Using a SSH connection via the management module
- Using a serial connection via the serial port on the VFSM

Management Module Setup

The BladeCenter VFSM is an integral subsystem within the overall BladeCenter system. The BladeCenter chassis includes a management module as the central element for overall chassis management and control.

You can use the management module to configure and manage the VFSM. The VFSM communicates with the management module(s) through its internal port 15 (MGT1) and port 16 (MGT2), which you can access through the 100 Mbps Ethernet port on each management module. The factory default settings permit management and control access to the switch module through *only* the management module or the built-in serial port. You can use the external Ethernet ports (EXTx) on the switch module for management and control of the switch, by selecting this mode as an option through the management module configuration utility program (see the applicable *BladeCenter Installation and User's Guide* publications for more information).

Note: Support for each management module is provided by a separate management port (MGT1 and MGT2). One port is active, and the other is used as a backup.

Factory-Default vs. MM-Assigned IP Addresses

Each VFSM must be assigned its own Internet Protocol address, which is used for communication with an SNMP network manager or other Transmission Control Protocol/Internet Protocol (TCP/IP) applications (for example, BootP or TFTP). The factory-default IP address is 10.90.90.8x, where x corresponds to the number of the bay into which the VFSM is installed. For additional information, see the *Installation Guide*). The management module assigns an IP address of 192.168.70.1xx, where xx corresponds to the number of the bay into which each VFSM is installed, as shown in the following table:

Table 2	VESMIE	addraccac	hacad on	cwitch	modulo	hav	numbers
Table 2.	VESIVI IF	oddresses,	baseu on	SWILCIT-	-moaule	Day	numbers

Bay number	Factory-default IP address	IP address assigned by MM
Bay 7	10.90.90.80	192.168.70.133
Bay 8	10.90.90.82	192.168.70.134
Bay 9	10.90.90.81	192.168.70.135
Bay 10	10.90.90.83	192.168.70.136

Note: Before you install the VFSM in Bay 8 or Bay 10, confirm that your blade I/O Expansion adapter supports communication to these I/O bays.

Default Gateway

The default Gateway IP address determines where packets with a destination address outside the current subnet are sent. Usually, the default Gateway is a router or host acting as an IP gateway to handle connections to other subnets of other TCP/IP networks. If you want to access the VFSM from outside your local network, use the management module to assign a default Gateway address to the VFSM. Choose I/O Module Tasks > Configuration from the navigation pane on the left, and enter the default Gateway IP address (for example, 192.168.70.125). Click Save.

Configuring Management Module for Switch Access

Complete the following initial configuration steps:

- 1. Connect the Ethernet port of the management module to a 10/100 Mbps network (with access to a management station) or directly to a management station.
- 2. Access and log on to the management module, as described in the BladeCenter Management Module User's Guide. The management module provides the appropriate IP addresses for network access (see the applicable BladeCenter Installation and User's Guide publications for more information).
- Select Configuration on the I/O Module Tasks menu on the left side of the BladeCenter Management Module window. See Figure 1.

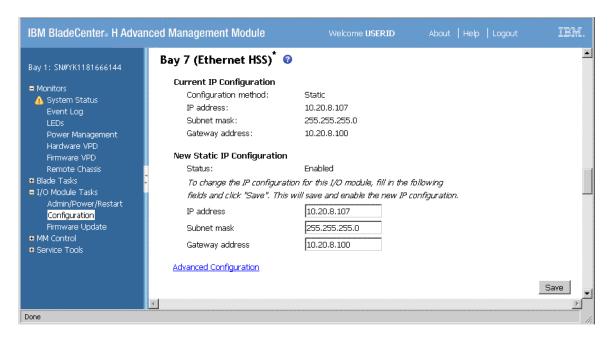

Figure 1. Switch Management on the BladeCenter Management Module

- 4. You can use the default IP addresses provided by the management module, or you can assign a new IP address to the switch module through the management module. You can assign this IP address through one of the following methods:
 - Manually through the BladeCenter management module
 - Automatically through the IBM Director Configuration Wizard

Note: If you change the IP address of the VFSM, make sure that the switch module and the management module both reside on the same subnet.

- 5. Enable the following features in the management module:
 - External Ports (I/O Module Tasks > Admin/Power/Restart > Advanced Setup)
 - External management over all ports (Configuration > Advanced Configuration)

This setting is required if you want to access the management network through the external data ports (EXTx) on the VFSM.

The default value is Disabled for both features. If these features are not already enabled, change the value to Enabled, then Save.

Note: In Advanced Configuration > Advanced Setup, enable "Preserve new IP configuration on all switch resets" to retain the switch's IP interface when you restore factory defaults. This setting preserves the management port's IP address in the management module's memory so you maintain connectivity to the management module after a reset.

You can now start a telnet session, Browser-Based Interface (Web) session, a Secure Shell session, or a secure HTTPS session to the VFSM.

Connecting to the Switch via Telnet

Configuring the Switch for Telnet Access

Use the management module to access the VFSM through Telnet. Choose I/O Module Tasks > Configuration from the navigation pane on the left. Select a bay number and click Advanced Configuration > Start Telnet/Web Session > Start Telnet Session. A Telnet window opens a connection to the Switch Module (requires Java 1.4 Plug-in).

Once that you have configured the VFSM with an IP address and gateway, you can access the switch from any workstation connected to the management network. Telnet access provides the same options for user and administrator access as those available through the management module, minus certain Telnet and management commands.

To establish a Telnet connection with the switch, run the Telnet program on your workstation and issue the Telnet command, followed by the switch IP address:

telnet <switch IP address>

The command line interface recognizes both CR and LF as end-of-line markers. Consequently, Telnet clients using CR+LF end-of-line markers will produce double line breaks, impairing interaction with the command line interface. In such instances, adjust your Telnet client to use either CR or LF.

Using Telnet to Access the Switch

Once the IP parameters on the VFSM are configured, you can access the CLI using a Telnet connection. From the management module, you can establish a Telnet connection with the switch.

You will then be prompted to enter a password as explained on page 6.

Connecting to the Switch via SSH

Although a remote network administrator can manage the configuration of a VFSM via Telnet, this method does not provide a secure connection. The SSH (Secure Shell) protocol enables you to securely log into another device over a network to execute commands remotely. As a secure alternative to using Telnet to manage switch configuration, SSH ensures that all data sent over the network is encrypted and secure.

The switch can do only one session of key/cipher generation at a time. Thus, a SSH/SCP client will not be able to login if the switch is doing key generation at that time. Similarly, the system will fail to do the key generation if a SSH/SCP client is logging in at that time.

The supported SSH encryption and authentication methods are listed below.

- Server Host Authentication: Client RSA-authenticates the switch in the beginning of every connection.
- Key Exchange: RSA
- Encryption: 3DES-CBC, DES
- User Authentication: Local password authentication, RADIUS, TACACS+

The following SSH clients have been tested:

- OpenSSH 5.1p1 Debian-3ubuntu1
- SecureCRT 5.0 (Van Dyke Technologies, Inc.)
- Putty beta 0.60

Note: The IBM N/OS implementation of SSH supports both versions 1.5 and 2.0 and supports SSH client version 1.5 - 2.x.

Using SSH to Access the Switch

Once the IP parameters are configured and the SSH service is enabled on the VFSM (it is disabled by default), you can access the command line interface using an SSH connection.

To establish an SSH connection with the switch, run the SSH program on your workstation by issuing the SSH command, followed by the switch IP address:

```
>> # ssh <switch IP address>
```

If SecurID authentication is required, use the following command:

```
>> # ssh -1 ace <switch IP address>
```

You will then be prompted to enter your user name and password.

Accessing the Switch

To enable better switch management and user accountability, three levels or *classes* of user access have been implemented on the VFSM. Levels of access to CLI, Web management functions, and screens increase as needed to perform various switch management tasks. Conceptually, access classes are defined as follows:

- User interaction with the switch is completely passive—nothing can be changed on the VFSM. Users may display information that has no security or privacy implications, such as switch statistics and current operational state information.
- Operators can only effect temporary changes on the VFSM. These changes will be lost when the switch is rebooted/reset. Operators have access to the switch management features used for daily switch operations. Because any changes an operator makes are undone by a reset of the switch, operators cannot severely impact switch operation.
- Administrators are the only ones that may make permanent changes to the switch configuration—changes that are persistent across a reboot/reset of the switch. Administrators can access switch functions to configure and troubleshoot problems on the VFSM. Because administrators can also make temporary (operator-level) changes as well, they must be aware of the interactions between temporary and permanent changes.

Access to switch functions is controlled through the use of unique surnames and passwords. Once you are connected to the switch via local Telnet, remote Telnet, or SSH, you are prompted to enter a password. The default user names/password for each access level are listed in the following table.

Note: It is recommended that you change default switch passwords after initial configuration and as regularly as required under your network security policies. For more information, see "Setting Passwords" on page 14.

Table 3.	User A	Access	Level	s
----------	--------	--------	-------	---

User Account	Description and Tasks Performed	Password
User	The User has no direct responsibility for switch management. He or she can view all switch status information and statistics, but cannot make any configuration changes to the switch.	user
Operator	The Operator manages all functions of the switch. The Operator can reset ports, except the management ports.	oper
Administrator	The superuser Administrator has complete access to all menus, information, and configuration commands on the VFSM, including the ability to change both the user and administrator passwords.	admin

Note: With the exception of the "admin" user, access to each user level can be disabled by setting the password to an empty value.

Setup vs. CLI

Once the administrator password is verified, you are given complete access to the switch. If the switch is still set to its factory default configuration, the system will ask whether you wish to run Setup, a utility designed to help you through the first-time configuration process. If the switch has already been configured, the Main Menu of the CLI is displayed instead.

The following table shows the Main Menu with administrator privileges.

```
[Main Menu]
     info
             - Information Menu
     stats - Statistics Menu
     cfg - Configuration Menu
     oper - Operations Command Menu
     boot
            - Boot Options Menu
           - Maintenance Menu
     maint
            - Show pending config changes [global command]
     diff
     apply - Apply pending config changes [global command]
     save - Save updated config to FLASH [global command]
     revert - Revert pending or applied changes [global command]
             - Exit [global command, always available]
```

Note: If you are accessing a user account, some menu options are not available.

Command Line History and Editing

For a description of global commands, shortcuts, and command line editing functions, see "Menu Basics" on page 19."

Idle Timeout

By default, the switch will disconnect your Telnet session after 10 minutes of inactivity. This function is controlled by the idle timeout parameter, which can be set from 1 to 60 minutes. For information on changing this parameter, see "System Configuration Menu" on page 219.

Chapter 2. First-Time Configuration

To help with the initial process of configuring your switch, the IBM N/OS software includes a Setup utility. The Setup utility prompts you step-by-step to enter all the necessary information for basic configuration of the switch. This chapter describes how to use the Setup utility and how to change system passwords. Before you run Setup, you must first connect to the switch (see "Connecting to the Switch" on page 2").

© Copyright IBM Corp. 2012

Using the Setup Utility

Whenever you log in as the system administrator under the factory default configuration, you are asked whether you wish to run the Setup utility. Setup can also be activated manually from the command line interface any time after login.

Information Needed for Setup

Setup requests the following information:

- · Basic system information
 - Date & time
 - Whether to use Spanning Tree Group or not
- · Optional configuration for each port
 - Speed, duplex, flow control, and negotiation mode (as appropriate)
 - Whether to use VLAN tagging or not (as appropriate)
- · Optional configuration for each VLAN
 - Name of VLAN
 - Which ports are included in the VLAN
 - Optional configuration of IP parameters
 - IP address, subnet mask, and VLAN for each IP interface
 - IP addresses for default gateway
 - Destination, subnet mask, and gateway IP address for each IP static route
 - Whether IP forwarding is enabled or not
 - Whether the RIP supply is enabled or not

Starting Setup When You Log In

The Setup prompt appears automatically whenever you login as the system administrator under the factory default settings.

1. Connect to the switch.

After connecting, the login prompt will appear as shown.

Enter Password:

2. Enter admin as the default administrator password.

If the factory default configuration is detected, the system prompts:

IBM Networking OS Virtual Fabric 10Gb Switch Module 18:44:05 Wed Jan 3, 2010

The switch is booted with factory default configuration. To ease the configuration of the switch, a "Set Up" facility which will prompt you with those configuration items that are essential to the operation of the switch is provided.

Would you like to run "Set Up" to configure the switch? [y/n]: Note: If the default admin login is unsuccessful, or if the administrator Main Menu appears instead, the system configuration has probably been changed from the factory default settings. If you are certain that you need to return the switch to its factory default settings, see "Selecting a Configuration Block" on page 499.

3. Enter y to begin the initial configuration of the switch, or n to bypass the Setup facility.

Stopping and Restarting Setup Manually

Follow these instructions to manually stop and restart setup.

Stopping Setup

To abort the Setup utility, press < Ctrl-C> during any Setup question. When you abort Setup, the system will prompt:

Would you like to run from top again? [y/n]

Enter n to abort Setup, or y to restart the Setup program at the beginning.

Restarting Setup

You can restart the Setup utility manually at any time by entering the following command at the administrator prompt:

/cfq/setup

After initial configuration is complete, it is recommended that you change the default passwords as shown in "Setting Passwords" on page 14.

Optional Setup for Telnet Support

Follow these instructions if you want to change telnet access.

Note: This step is optional. Perform this procedure only if you are planning on connecting to the VFSM through a remote Telnet connection.

1. Telnet is enabled by default. To change the setting, use the following command:

>> # /cfq/sys/access/tnet

2. Apply and save the configuration(s).

>> System# apply

>> System# save

Setting Passwords

It is recommended that you change the user and administrator passwords after initial configuration and as regularly as required under your network security policies.

To change the administrator password, you must login using the administrator password.

Note: If you forget your administrator password, call your technical support representative for help using the password fix-up mode.

Changing the Default Administrator Password

The administrator has complete access to all menus, information, and configuration commands, including the ability to change both the user and administrator passwords.

The default password for the administrator account is admin. To change the default password, follow this procedure:

- 1. Connect to the switch and log in using the admin password.
- From the Main Menu, use the following command to access the Configuration Menu:

```
Main# /cfg
```

The Configuration Menu is displayed.

```
[Configuration Menu]
    sys
           - System-wide Parameter Menu
    port - Port Menu
    qos - QOS Menu
    acl
            - Access Control List Menu
    pmirr
            - Port Mirroring Menu
    12
            - Layer 2 Menu
            - Layer 3 Menu
    13
            - RMON Menu
    rmon
    virt
            - Virtualization Menu
    setup - Step by step configuration set up
            - Dump current configuration to script file
    ptcfg - Backup current configuration to FTP/TFTP server
            - Restore current configuration from FTP/TFTP server
    gtcfg
            - Display current configuration
```

From the Configuration Menu, use the following command to select the System Menu:

```
>> Configuration# sys
```

The System Menu is displayed.

```
[System Menu]
    errdis - Errdisable Menu
    syslog - Syslog Menu
    sshd
             - SSH Server Menu
    radius - RADIUS Authentication Menu
    tacacs+ - TACACS+ Authentication Menu
            - LDAP Authentication Menu
    ldap
             - NTP Server Menu
    ntp
             - System SNMP Menu
    ssnmp
    access - System Access Menu
            - Custom DST Menu
    dst
    sflow
             - sFlow Menu
    date
            - Set system date
    time
            - Set system time
    timezone - Set system timezone
    dlight - Set system daylight savings
            - Set timeout for idle CLI sessions
    linkscan - Set linkscan mode
    notice - Set login notice
            - Set login banner
    bannr
    hprompt - Enable/disable display hostname (sysName) in CLI prompt
            - Enable/disable use of DHCP on EXTM interface
    reminder - Enable/disable Reminders
    rstctrl - Enable/disable System reset on panic
    pktlog - Enable/disable CPU packet logging capability
    srvled - Enable/disable Service Required LED
             - Display current system-wide parameters
```

4. From the System Menu, use the following command to select the System Access Menu:

```
>> System# access
```

The System Access Menu is displayed.

```
[System Access Menu]
    mgmt - Management Network Definition Menu
            - User Access Control Menu (passwords)
    user
    https
            - HTTPS Web Access Menu
    snmp
             - Set SNMP access control
    tnport - Set Telnet server port number
            - Set the TFTP Port for the system
    tport
    wport
            - Set HTTP (Web) server port number
             - Enable/disable HTTP (Web) access
    http
            - Enable/disable Telnet access
    tsbbi
             - Enable/disable Telnet/SSH configuration from BBI
    userbbi - Enable/disable user configuration from BBI
             - Display current system access configuration
```

5. Select the administrator password.

```
System Access# user/admpw
```

6. Enter the current administrator password at the prompt:

Changing ADMINISTRATOR password; validation required...
Enter current administrator password:

Note: If you forget your administrator password, call your technical support representative for help using the password fix-up mode.

7. Enter the new administrator password at the prompt:

Enter new administrator password:

8. Enter the new administrator password, again, at the prompt:

Re-enter new administrator password:

9. Apply and save your change by entering the following commands:

System# apply System# save

Changing the Default User Password

The user login has limited control of the switch. Through a user account, you can view switch information and statistics, but you can't make configuration changes.

The default password for the user account is user. This password can be changed from the user account. The administrator can change all passwords, as shown in the following procedure.

- 1. Connect to the switch and log in using the admin password.
- From the Main Menu, use the following command to access the Configuration Menu:

Main# cfq

From the Configuration Menu, use the following command to select the System Menu:

>> Configuration# sys

4. From the System Menu, use the following command to select the System Access Menu:

>> System# access

Select the user password.

System# user/usrpw

6. Enter the current administrator password at the prompt. Only the administrator can change the user password. Entering the administrator password confirms your authority.

Changing USER password; validation required... Enter current administrator password:

7. Enter the new user password at the prompt:

Enter new user password:

8. Enter the new user password, again, at the prompt:

Re-enter new user password:

9. Apply and save your changes:

System# apply System# save

Chapter 3. Menu Basics

The IBM N/OS Command Line Interface (CLI) is used for viewing switch information and statistics. In addition, the administrator can use the CLI for performing all levels of switch configuration.

To make the CLI easy to use, the various commands have been logically grouped into a series of menus and sub-menus. Each menu displays a list of commands and/or sub-menus that are available, along with a summary of what each command will do. Below each menu is a prompt where you can enter any command appropriate to the current menu.

This chapter describes the Main Menu commands, and provides a list of commands and shortcuts that are commonly available from all the menus within the CLI.

© Copyright IBM Corp. 2012

The Main Menu

The Main Menu appears after a successful connection and login. The following table shows the Main Menu for the administrator login. Some features are not available under the user login.

```
[Main Menu]
     info
             - Information Menu
     stats
            - Statistics Menu
     cfg
            - Configuration Menu
           - Operations Command Menu
     oper
            - Boot Options Menu
     boot
     maint - Maintenance Menu
            - Show pending config changes [global command]
     apply - Apply pending config changes [global command]
     save - Save updated config to FLASH [global command]
     revert - Revert pending or applied changes [global command]
           - Exit [global command, always available]
```

Menu Summary

The following menus are available from the Main Menu:

Information Menu

Provides sub-menus for displaying information about the current status of the switch: from basic system settings to VLANs, and more.

Statistics Menu

Provides sub-menus for displaying switch performance statistics. Included are port, IF, IP, ICMP, TCP, UDP, SNMP, routing, ARP, DNS, and VRRP statistics.

· Configuration Menu

This menu is available only from an administrator login. It includes sub-menus for configuring every aspect of the switch. Changes to configuration are not active until explicitly applied. Changes can be saved to non-volatile memory.

Operations Menu

Operations-level commands are used for making immediate and temporary changes to switch configuration. This menu is used for bringing ports temporarily in and out of service, enabling or disabling FDB learning on a port, or sending NTP requests. It is also used for activating or deactivating optional software packages.

Boot Options Menu

This menu is used for upgrading switch software, selecting configuration blocks, and for resetting the switch when necessary.

Maintenance Menu

This menu is used for debugging purposes, enabling you to generate a dump of the critical state information in the switch, and to clear entries in the forwarding database and the ARP and routing tables.

© Copyright IBM Corp. 2012 Chapter 3: Menu Basics 21

Global Commands

Some basic commands are recognized throughout the menu hierarchy. These commands are useful for obtaining online help, navigating through menus, and for applying and saving configuration changes.

For help on a specific command, type help. You will see the following screen:

```
Global Commands: [can be issued from any menu]
                list
                                                     print
help
                lines
                                  verbose
pwd
                                                     exit
              config
revert
history
chpass_p
                                 diff
quit
                                                    apply
                                 ping
save
                                                    traceroute
                                pushd
chpass_s
                                                   popd
clock
telnet
who
                 dir
mτz
The following are used to navigate the menu structure:
   . Print current menu
   .. Move up one menu level
   / Top menu if first, or command separator
    ! Execute command from history
```

Table 4. Description of Global Commands

Command	Action		
? command or help	Provides more information about a specific command on the current menu. When used without the <i>command</i> parameter, a summary of the global commands is displayed.		
. or print	Display the current menu.		
list	Lists the commands available at the current level. You may follow the list command with a text string, and list all of the available commands that match the string.		
or up	Go up one level in the menu structure.		
/	If placed at the beginning of a command, go to the Main Menu. Otherwise, this is used to separate multiple commands placed on the same line.		
lines [<0-300>]	Sets the number of lines per screen displayed in the CLI for the current session. A value of 0 disables paging. By default, it is set to the corresponding /cfg/sys/linevty or /cfg/sys/linecons value effective at login (see page 219 for details). When used without a value, the current setting is displayed.		
diff	Show any pending configuration changes.		
apply	Apply pending configuration changes.		
save	Write configuration changes to non-volatile flash memory.		
revert	Remove pending configuration changes between "apply" commands. Use this command to remove any configuration changes made since last apply.		

Table 4. Description of Global Commands (continued)

Command	Action			
revert apply	Remove pending or applied configuration changes between "save" commands. Use this command to remove any configuration changes made since last save.			
exit or quit	Exit from the command line interface and log out.			
config	Displays the switch configuration dump.			
ping	Use this command to verify station-to-station connectivity across the network. The format is as follows:			
	ping <host name=""> <ip address=""> [-n <tries (0-4294967295)="">] [-w <msec (0-4294967295)="" delay="">] [-1 <length (0="" 2080)="" 32-65500="">] [-s <ip source="">] [-v <tos (0-255)="">] [-f] [-t]</tos></ip></length></msec></tries></ip></host>			
	Where:			
	 - n: Sets the number of attempts (optional). 			
	 w: Sets the number of milliseconds between attempts (optional). 			
	 1: Sets the ping request payload size (optional). s: Sets the IP source address for the IP packet (optional). 			
	 - v: Sets the Type Of Service bits in the IP header. 			
	 - f: Sets the don't fragment bit in the IP header (only for IPv4 addresses). 			
	t: Pings continuously (same as -n 0).			
	The DNS parameters must be configured if specifying hostnames (see "Domain Name System Configuration Menu" on page 400).			
traceroute	Use this command to identify the route used for station-to-station connectivity across the network. The format is as follows:			
	traceroute <hostname> <ip address=""> [<max-hops (1-32)=""> [<msec-delay (1-4294967295)="">]]</msec-delay></max-hops></ip></hostname>			
	Where <i>hostname/IP address</i> is the hostname or IP address of the target station, <i>max-hops</i> (optional) is the maximum distance to trace (1-32 devices), and <i>msec-delay</i> (optional) is the number of milliseconds to wait for the response.			
	As with ping, the DNS parameters must be configured if specifying hostnames.			
pwd	Display the command path used to reach the current menu.			
	ı			

© Copyright IBM Corp. 2012 Chapter 3: Menu Basics 23

Table 4. Description of Global Commands (continued)

Command	Action					
verbose n	Sets the level of information displayed on the screen:					
	0 = Quiet: Nothing appears except errors—not even prompts.					
	1 = Normal: Prompts and requested output are shown, but no menus.					
	2 = Verbose: Everything is shown.					
	When used without a value, the current setting is displayed.					
telnet	This command is used to telnet out of the switch. The format is as follows:					
	telnet <hostname> <ip address=""> [<port>]</port></ip></hostname>					
	Where <i>IP address</i> is the hostname or IP address of the device.					
history	This command displays the most recent commands.					
pushd	Save the current menu path, so you can jump back to it using popd.					
popd	Go to the menu path and position previously saved by using pushd.					
who	Displays a list of users that are logged on to the switch.					
chpass_p	Configures the password for the primary TACACS+ server.					
chpass_s	Configures the password for the secondary TACACS+ server.					
clock	Displays the configured date and time for the switch.					
mv file1 file2	Move (rename) a file					
dir	Lists image and configuration files. The format is as follows:					
	dir [images configs]					

Command Line History and Editing

Using the command line interface, you can retrieve and modify previously entered commands with just a few keystrokes. The following options are available globally at the command line:

Table 5. Command Line History and Editing Options

Option	Description
history	Display a numbered list of the last 64 previously entered commands.
!!	Repeat the last entered command.
! n	Repeat the n^{th} command shown on the history list.
<ctrl-p></ctrl-p>	(Also the up arrow key.) Recall the <i>previous</i> command from the history list. This can be used multiple times to work backward through the last 64 commands. The recalled command can be entered as is, or edited using the options below.
<ctrl-n></ctrl-n>	(Also the down arrow key.) Recall the <i>next</i> command from the history list. This can be used multiple times to work forward through the last 64 commands. The recalled command can be entered as is, or edited using the options below.
<ctrl-a></ctrl-a>	Move the cursor to the beginning of command line.
<ctrl-e></ctrl-e>	Move cursor to the <i>end</i> of the command line.
<ctrl-b></ctrl-b>	(Also the left arrow key.) Move the cursor <i>back</i> one position to the left.
<ctrl-f></ctrl-f>	(Also the right arrow key.) Move the cursor <i>forward</i> one position to the right.
<backspace></backspace>	(Also the Delete key.) Erase one character to the left of the cursor position.
<ctrl-d></ctrl-d>	Delete one character at the cursor position.
<ctrl-k></ctrl-k>	Kill (erase) all characters from the cursor position to the end of the command line.
<ctrl-l></ctrl-l>	Redraw the screen.
<ctrl-u></ctrl-u>	Clear the entire line.
Other keys	Insert new characters at the cursor position.

© Copyright IBM Corp. 2012 Chapter 3: Menu Basics 25

Command Line Interface Shortcuts

The following shortcuts allow you to enter commands quickly and easily.

CLI List and Range Inputs

For CLI commands that allow an individual item to be selected from within a numeric range, lists and ranges of items can now be specified. For example, the /info/vlan command permits the following options:

The numbers in a range must be separated by a dash: <start of range>-<end of range>

Multiple ranges or list items are permitted using a comma: <range or item 1>, <range or item 2>

Do not use spaces within list and range specifications.

Ranges can also be used to apply the same command option to multiple items. For example, to enable multiple ports with one command:

```
# /cfg/port 1-4/ena (Enable ports 1 though 4)
```

Note: Port ranges accept only port numbers, not aliases such as INT1 or EXT1.

Command Stacking

As a shortcut, you can type multiple commands on a single line, separated by forward slashes (/). You can connect as many commands as required to access the menu option that you want. For example, the keyboard shortcut to access the Spanning Tree Port Configuration Menu from the Main# prompt is as follows:

```
Main# cfg/l2/stg 1/port
```

Command Abbreviation

Most commands can be abbreviated by entering the first characters which distinguish the command from the others in the same menu or sub-menu. For example, the command shown above could also be entered as follows:

```
Main# c/l2/stg 1/po
```

Tab Completion

By entering the first letter of a command at any menu prompt and hitting <Tab>, the CLI will display all commands or options in that menu that begin with that letter. Entering additional letters will further refine the list of commands or options displayed. If only one command fits the input text when <Tab> is pressed, that command will be supplied on the command line, waiting to be entered. If the <Tab> key is pressed without any input on the command line, the currently active menu will be displayed.

© Copyright IBM Corp. 2012 Chapter 3: Menu Basics 27

Chapter 4. The Information Menu

You can view configuration information for the switch in both the user and administrator command modes. This chapter discusses how to use the command line interface to display switch information.

/info

Information Menu

```
[Information Menu]
    sys
            - System Information Menu
    stack
            - Stacking Menu
         - Layer 2 Information Menu
- Layer 3 Information Menu
    12
            - OoS Menu
    qos
    acl
            - Show ACL information
    rmon - Show RMON information
    link - Show link status
    port
            - Show port information
    transcvr - Show Port Transceiver status
    virt
             - Show Virtualization information
             - CEE Information Menu
    cee
    fcoe
             - Fiber Channel Over Ethernet Information Menu
             - Dump all information
    dump
```

The information provided by each menu option is briefly described in Table 6, with pointers to detailed information.

Table 6. Information Menu Options (/info)

Command Syntax and Usage sys Displays the System Information Menu. For details, see page 31. stack Displays the Stacking Information Menu. For details, see page 45. **Note:** This option only appears if you have stacking turned on. 12 Displays the Layer 2 Information Menu. For details, see page 47. 13 Displays the Layer 3 Information Menu. For details, see page 69. qos Displays the Quality of Service (QoS) Information Menu. For details, see page 103. acl Displays the current configuration profile for each Access Control List (ACL) and ACL Group. For details, see page 106.

© Copyright IBM Corp. 2012

Table 6. Information Menu Options (/info)

Command Syntax and Usage

rmon

Displays the Remote Monitoring (RMON) Information Menu. For details, see page 107.

link

Displays configuration information about each port, including:

- Port alias and number
- Port speed
- Duplex mode (half, full, or auto)
- Flow control for transmit and receive (no, yes, or both)
- Link status (up, down, or disabled)

For details, see page 111.

port

Displays port status information, including:

- Port alias and number
- Whether the port uses VLAN Tagging or not
- Port VLAN ID (PVID)
- Port name
- VLAN membership
- Fast Fowarding status
- FDB Learning status
- Flooding status

For details, see page 113.

transcvr

Displays the status of the port transceiver module on each external port. For details, see page 114.

virt

Displays the Virtualization information menu. For details, see page 115.

cee

Displays the Converged Enhanced Ethernet (CEE) information menu. For details, see page 119.

fcoe

Displays the Fiber Channel over Ethernet (FCoE) information menu. For details, see page 129.

dump

Dumps all switch information available from the Information Menu (10K or more, depending on your configuration).

If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump commands.

System Information Menu

```
[System Menu]
errdis - Errdisable Menu
snmpv3 - SNMPv3 Information Menu
chassis - Show BladeCenter Chassis related information
general - Show general system information
log - Show last 100 syslog messages
user - Show current user status
dump - Dump all system information
```

The information provided by each menu option is briefly described in Table 7, with pointers to where detailed information can be found.

Table 7. System Menu Options (/info/sys)

Command Syntax and Usage

errdis

Displays Error Disable and Recovery Information menu. To view the menu options, see page 32.

snmpv3

Displays SNMPv3 Information Menu. To view the menu options, see page 33.

chassis

Displays information about the BladeCenter chassis. For details, see page 42.

general

Displays system information, including:

- System date and time
- Switch model name and number
- Switch name and location
- Time of last boot
- MAC address of the switch management processor
- IP address of management interface
- Hardware version and part number
- Software image file and version number
- Configuration name
- Log-in banner, if one is configured

For details, see page 43.

log

Displays most recent syslog messages. For details, see page 44.

user

Displays configured user names and their status. For details, see page 44.

dump

Dumps all switch information available from the Information Menu (10K or more, depending on your configuration).

© Copyright IBM Corp. 2012 Chapter 4: The Information Menu **31**

Error Disable and Recovery Information

```
[ErrDisable Information Menu]
recovery - Show ErrDisable recovery information
timers - Show ErrDisable timer information
dump - Show all of the above
```

This menu allows you to display information about the Error Disable and Recovery feature for interface ports.

Table 8. Error Disable Information Options

Command Syntax and Usage recovery Displays a list ports with their Error Recovery status. timers Displays a list of active recovery timers, if applicable. dump Displays all Error Disable and Recovery information.

/info/sys/snmpv3

SNMPv3 System Information Menu

SNMP version 3 (SNMPv3) is an extensible SNMP Framework that supplements the SNMPv2 Framework by supporting the following:

- a new SNMP message format
- security for messages
- access control
- remote configuration of SNMP parameters

For more details on the SNMPv3 architecture please refer to RFC2271 to RFC2276.

```
[SNMPv3 Information Menu]
            - Show usmUser table information
            - Show vacmViewTreeFamily table information
    access - Show vacmAccess table information
    group - Show vacmSecurityToGroup table information
    comm - Show community table information
    taddr - Show targetAddr table information
    tparam - Show targetParams table information
    notify - Show notify table information
             - Show all SNMPv3 information
```

Table 9. SNMPv3 information Menu Options (/info/sys/snmpv3)

Command Syntax and Usage

usm

Displays User Security Model (USM) table information. To view the table, see page 35.

view

Displays information about view, sub-trees, mask and type of view. To view a sample, see page 35.

access

Displays View-based Access Control information. To view a sample, see page 37.

group

Displays information about the group that includes, the security model, user name, and group name. To view a sample, see page 38.

comm

Displays information about the community table information. To view a sample, see page 38.

taddr

Displays the Target Address table information. To view a sample, see page 39.

tparam

Displays the Target parameters table information. To view a sample, see page 40.

Table 9. SNMPv3 information Menu Options (/info/sys/snmpv3)

Command Syntax and Usage

notify

Displays the Notify table information. To view a sample, see page 40.

dump

Displays all the SNMPv3 information. To view a sample, see page 41.

/info/sys/snmpv3/usm

SNMPv3 USM User Table Information

The User-based Security Model (USM) in SNMPv3 provides security services such as authentication and privacy of messages. This security model makes use of a defined set of user identities displayed in the USM user table. The USM user table contains the following information:

- the user name
- a security name in the form of a string whose format is independent of the Security Model
- an authentication protocol, which is an indication that the messages sent on behalf of the user can be authenticated
- the privacy protocol

usmUser Table: User Name	Protocol
adminmd5 adminsha vlv2only	HMAC_MD5, DES PRIVACY HMAC_SHA, DES PRIVACY NO AUTH, NO PRIVACY

Table 10. USM User Table Information Parameters (/info/sys/usm)

Field	Description
User Name	This is a string that represents the name of the user that you can use to access the switch.
Protocol	This indicates whether messages sent on behalf of this user are protected from disclosure using a privacy protocol. IBM N/OS supports DES algorithm for privacy. The software also supports two authentication algorithms: MD5 and HMAC-SHA.

/info/sys/snmpv3/view

SNMPv3 View Table Information

The user can control and restrict the access allowed to a group to only a subset of the management information in the management domain that the group can access within each context by specifying the group's rights in terms of a particular MIB view for security reasons.

View Name	Subtree	Mask	Туре	
iso	1.3		included	
v1v2only	1.3		included	
v1v2only	1.3.6.1.6.3.15		excluded	
v1v2only	1.3.6.1.6.3.16		excluded	
v1v2only	1.3.6.1.6.3.18		excluded	
l				

Table 11. SNMPv3 View Table Information Parameters (/info/sys/snmpv3/view)

Field	Description
View Name	Displays the name of the view.
Subtree	Displays the MIB subtree as an OID string. A view subtree is the set of all MIB object instances which have a common Object Identifier prefix to their names.
Mask	Displays the bit mask.
Туре	Displays whether a family of view subtrees is included or excluded from the MIB view.

/info/sys/snmpv3/access

SNMPv3 Access Table Information

The access control subsystem provides authorization services.

The vacmAccessTable maps a group name, security information, a context, and a message type, which could be the read or write type of operation or notification into a MIB view.

The View-based Access Control Model defines a set of services that an application can use for checking access rights of a group. This group's access rights are determined by a read-view, a write-view and a notify-view. The read-view represents the set of object instances authorized for the group while reading the objects. The write-view represents the set of object instances authorized for the group when writing objects. The notify-view represents the set of object instances authorized for the group when sending a notification.

Group Name	Prefix	Model	Level	Match	ReadV	WriteV	NotifyV
v1v2grp admingrp		snmpv1 usm	noAuthNoPriv authPriv	exact exact			v1v2only iso

Table 12. SNMPv3 Access Table Information (/info/sys/snmpv3/access)

Field	Description
Group Name	Displays the name of group.
Prefix	Displays the prefix that is configured to match the values.
Model	Displays the security model used, for example, SNMPv1, or SNMPv2 or USM.
Level	Displays the minimum level of security required to gain rights of access. For example, noAuthNoPriv, authNoPriv, or authPriv.
Match	Displays the match for the contextName. The options are: exact and prefix.
ReadV	Displays the MIB view to which this entry authorizes the read access.
WriteV	Displays the MIB view to which this entry authorizes the write access.
NotifyV	Displays the Notify view to which this entry authorizes the notify access.

© Copyright IBM Corp. 2012 Chapter 4: The Information Menu 37

/info/sys/snmpv3/group

SNMPv3 Group Table Information

A group is a combination of security model and security name that defines the access rights assigned to all the security names belonging to that group. The group is identified by a group name.

Sec Model	User Name	Group Name
snmpv1	v1v2only	v1v2grp
usm	adminmd5	admingrp
usm	adminsha	admingrp
		· -

Table 13. SNMPv3 Group Table Information Parameters (/info/sys/snmpv3/group)

Field	Description
Sec Model	Displays the security model used, which is any one of: USM, SNMPv1, SNMPv2, and SNMPv3.
User Name	Displays the name for the group.
Group Name	Displays the access name of the group.

/info/sys/snmpv3/comm

SNMPv3 Community Table Information

This command displays the community table information stored in the SNMP engine.

Index	Name	User Name	Tag
trap1	public	v1v2only	vlv2trap

Table 14. SNMPv3 Community Table Parameters (/info/sys/snmpv3/comm)

Field	Description
Index	Displays the unique index value of a row in this table
Name	Displays the community string, which represents the configuration.
User Name	Displays the User Security Model (USM) user name.
Tag	Displays the community tag. This tag specifies a set of transport endpoints from which a command responder application accepts management requests and to which a command responder application sends an SNMP trap.

/info/sys/snmpv3/taddr

SNMPv3 Target Address Table Information

This command displays the SNMPv3 target address table information, which is stored in the SNMP engine.

1	Name	Transport Addr	Port	Taglist	Params
-					
t	rap1	47.81.25.66	162	v1v2trap	v1v2param

Table 15. SNMPv3 Target Address Table Information Parameters (/info/sys/snmpv3/taddr)

Field	Description
Name	Displays the locally arbitrary, but unique identifier associated with this snmpTargetAddrEntry.
Transport Addr	Displays the transport addresses.
Port	Displays the SNMP UDP port number.
Taglist	This column contains a list of tag values which are used to select target addresses for a particular SNMP message.
Params	The value of this object identifies an entry in the snmpTargetParamsTable. The identified entry contains SNMP parameters to be used when generating messages to be sent to this transport address.

© Copyright IBM Corp. 2012 Chapter 4: The Information Menu **39**

/info/sys/snmpv3/tparam

SNMPv3 Target Parameters Table Information

Name	MP Model	User Name	Sec Model	Sec Level
v1v2param	snmpv2c	v1v2only	snmpv1	noAuthNoPriv

This command displays the SNMPv3 target parameters table information.

Table 16. SNMPv3 Target Parameters Table Information (/info/sys/snmpv3/tparam)

Field	Description
Name	Displays the locally arbitrary, but unique identifier associated with this snmpTargeParamsEntry.
MP Model	Displays the Message Processing Model used when generating SNMP messages using this entry.
User Name	Displays the securityName, which identifies the entry on whose behalf SNMP messages will be generated using this entry.
Sec Model	Displays the security model used when generating SNMP messages using this entry. The system may choose to return an inconsistentValue error if an attempt is made to set this variable to a value for a security model which the system does not support.
Sec Level	Displays the level of security used when generating SNMP messages using this entry.

/info/sys/snmpv3/notify

SNMPv3 Notify Table Information

Name	Tag	l
		ı
v1v2trap	vlv2trap	l

This command displays the SNMPv3 notify table information.

Table 17. SNMPv3 Notify Table Information (/info/sys/snmpv3/notify)

Field	Description
Name	The locally arbitrary, but unique identifier associated with this snmpNotifyEntry.
Tag	This represents a single tag value that is used to select entries in the snmpTargetAddrTable. Any entry in the snmpTargetAddrTable that contains a tag value equal to the value of this entry, is selected. If this entry contains a value of zero length, no entries are selected.

/info/sys/snmpv3/dump

```

Chassis information includes details about the chassis type and position, and management module settings.

/info/sys/general

General System Information

```
System Information at 16:50:45 Wed Nov 16, 2011
Time zone: America/US/Pacific
Daylight Savings Time Status: Disabled
IBM Networking OS Virtual Fabric 10Gb Switch Module for IBM BladeCenter
Switch has been up 5 days, 2 hours, 16 minutes and 42 seconds.
Last boot: 0:00:47 Wed Jan 3, 2010 (reset from console)
Software Version 6.9.0 (FLASH image1), factory default configuration.
PCBA Part Number: BAC-00042-00
Hardware Part Number: 46C7193
FAB Number: BN-RZZ000
Serial Number:
                 PROTO2C04E
Manufacturing Date: 43/08
Hardware Revision: 0
Board Revision:
PLD Firmware Version: 4.0
Temperature Sensor 1 (Warning): 42.0 C (Warn at 88.0 C/Recover at 78.0 C)
Temperature Sensor 2 (Shutdown): 42.5 C (Shutdown at 98.0 C/Recover at 88.0 C)
Temperature Sensor 3 (Exhaust): 37.5 C
Temperature Sensor 4 (Inlet): 32.5 C
Switch is in I/O Module Bay 9
```

Note: The display of temperature will come up only if the temperature of any of the sensors exceeds the temperature threshold. There will be a warning from the software if any of the sensors exceeds this temperature threshold. The switch will shut down if the power supply overheats.

System information includes:

- System date and time
- Switch model
- Switch name and location
- Time of last boot
- MAC address of the switch management processor
- Software image file and version number, and configuration name.
- IP address of the management interface
- Hardware version and part number
- Log-in banner, if one is configured

Each syslog message has a criticality level associated with it, included in text form as a prefix to the log message. One of eight different prefixes is used, depending on the condition for which the administrator is being notified.

- EMERG: indicates the system is unusable
- · ALERT: Indicates action should be taken immediately
- CRIT: Indicates critical conditions
- ERR: indicates error conditions or errored operations
- WARNING: indicates warning conditions
- NOTICE: indicates a normal but significant condition
- INFO: indicates an information message
- DEBUG: indicates a debug-level message

/info/sys/user

User Status Information

```
Usernames:

            - Show switch firmware information
    path - Show inter switch packet path map
    pushstat - Show config/image push status information
    dump - Dump all stacking information
```

Note: The Stacking Information menu only appears if you have stacking turned on.

Table 18 lists the Stacking information menu options.

Table 18. Stacking Information Menu Options (/info/stack)

Command Syntax and Usage

switch

Displays information about each switch in the stack, including:

- Configured Switch Number (csnum)
- Attached Switch Number (asnum)
- MAC address
- Stacking state

link

Displays link information for each switch in the stack, listed by assigned switch number.

name

Displays the name of the stack.

backup

Displays the unit number of the backup switch.

Displays the firmware version number for the selected switch.

path

Displays the Stacking packet path map that shows how the stack switches are connected.

pushstat

Displays the status of the most recent firmware and configuration file push from the master to member switches.

dump

Displays all stacking information.

Stacking Switch Information

```
Stack name: MyStack
Local switch is the master.
Local switch:
 csnum - 1
MAC - 00:25:03:1c:96:00
Switch Type - 9
 Switch Mode (cfg) - Master
 Priority - 225
Stack MAC - 00:25:03:1c:96:1f
Master switch:
             - 1
- 00:25:03:1c:96:00
  MAC
Configured Switches:
          MAC
                     asnum

            - Show VLAN information
    pvlan - Show protocol VLAN information
    prvlan - Show private-vlan information
            - Dump all layer 2 information
```

The information provided by each menu option is briefly described in Table 19, with pointers to where detailed information can be found.

Table 19. Layer 2 Information Menu Options (/info/l2)

Command Syntax and Usage

fdb

Displays the Forwarding Database Information Menu. For details, see page 50.

lacp

Displays the Link Aggregation Control Protocol Menu. For details, see page 52.

failovr

Displays the Layer 2 Failover Information menu. For details, see page 53.

Displays the Hot Links Information menu. For details, see page 54.

еср

Displays the Edge Control Protocol (ECP) Information menu. For details, see page 55.

lldp

Displays the LLDP Information menu. For details, see page 55.

udld

Displays the Unidirectional Link Detection (UDLD) Information menu. For details, see page 58.

oam

Displays the Operation, Administration, and Maintenance (OAM) Information menu. For details, see page 59.

Table 19. Layer 2 Information Menu Options (/info/l2) (continued)

Command Syntax and Usage

8021x

Displays the 802.1X Information Menu. For details, see page 60.

stq

Displays Spanning Tree information, including the status (on or off), Spanning Tree mode (STP/PVST+, RSTP, PVRST, or MSTP), and VLAN membership.

In addition to seeing if STG is enabled or disabled, you can view the following STG bridge information:

- Priority
- Hello interval
- Maximum age value
- Forwarding delay
- Aging time

You can also see the following port-specific STG information:

- Port alias and priority
- Cost
- State
- Port Fast Forwarding state

For details, see page 62.

cist

Displays Common Internal Spanning Tree (CIST) information, including the MSTP digest and VLAN membership.

CIST bridge information includes:

- Priority
- Hello interval
- Maximum age value
- Forwarding delay
- Root bridge information (priority, MAC address, path cost, root port)

CIST port information includes:

- Port number and priority
- Cost
- State

For details, see page 66.

trunk

When trunk groups are configured, you can view the state of each port in the various trunk groups. For details, see page 68.

Table 19. Layer 2 Information Menu Options (/info/l2) (continued)

Command Syntax and Usage

vlan

Displays VLAN configuration information, including:

- VLAN Number
- VLAN Name
- Status
- Port membership of the VLAN
- VLAN management status

For details, see page 68.

pvlan

Displays Protocol VLAN information.

prvlan

Displays Private VLAN information.

dump

Dumps all switch information available from the Layer 2 menu (10K or more, depending on your configuration).

If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump commands.

FDB Information Menu

```
[Forwarding Database Menu]

mcast - FDB multicast menu

find - Show a single FDB entry by MAC address

port - Show FDB entries on a single port

trunk - Show FDB entries on a single trunk

vlan - Show FDB entries on a single VLAN

state - Show FDB entries by state

static - Show FDB static unicast entries

dump - Show all non-multicast FDB entries
```

The forwarding database (FDB) contains information that maps the media access control (MAC) address of each known device to the switch port where the device address was learned. The FDB also shows which other ports have seen frames destined for a particular MAC address.

Note: The master forwarding database supports up to 32K MAC address entries on the MP per switch.

Table 20. FDB Information Menu Options (/info/l2/fdb)

Command Syntax and Usage

mcast

Displays the FDB Multicast Menu. For details, see page 51.

```
find <MAC address> [<VLAN>]
```

Displays a single database entry by its MAC address. You are prompted to enter the MAC address of the device. Enter the MAC address using the format, xx:xx:xx:xx:xx. For example, 08:00:20:12:34:56

You can also enter the MAC address using the format, xxxxxxxxxxxx. For example, 080020123456

port port number or alias>

Displays all FDB entries for a particular port.

trunk <trunk number>

Displays all FDB entries for a particular trunk.

vlan <*VLAN number*>

Displays all FDB entries on a single VLAN.

state unknown|forward|trunk

Displays all FDB entries of a particular state.

static

Displays all static unicast entries in the FDB.

dump

Displays all non-multicast entries in the Forwarding Database. For more information, see page 51.

/info/l2/fdb/mcast

FDB Multicast Menu

```
[Multicast Menu]
find - Show a single FDB multicast entry by MAC address
port - Show FDB multicast entries on a single port
vlan - Show FDB multicast entries on a single VLAN
dump - Show all FDB multicast entries
```

The following table shows the forwarding database multicast options.

Table 21. FDB Multicast Menu Options (/info/l2/fdb/mcast)

Command Syntax and Usage find <MAC address> [<VLAN>] Displays a single FDB multicast entry by its MAC address. You are prompted to enter the MAC address of the device. Enter the MAC address using the format, xx:xx:xx:xx:xx:xx. For example, 08:00:20:12:34:56 You can also enter the MAC address using the format, xxxxxxxxxxxx. For example, 080020123456 port port port number or alias> Displays all FDB multicast entries for a particular port. vlan <VLAN number (1-4094)> Displays all FDB multicast entries on a single VLAN. dump Displays all multicast entries in the Forwarding Database.

/info/l2/fdb/dump

Show All FDB Information

When an address that is in the forwarding (FWD) state, this means that it has been learned by the switch. When in the trunking (TRK) state, the port field represents the trunk group number. If the state for the port is listed as unknown (UNK), the MAC address has not yet been learned by the switch, but has only been seen as a destination address.

When an address is in the unknown state, no outbound port is indicated, although ports which reference the address as a destination will be listed under "Reference ports.

To clear the entire FDB, see "Forwarding Database Maintenance Menu" on page 508.

/info/12/lacp

Link Aggregation Control Protocol Information Menu

```
[LACP Menu]

aggr - Show LACP aggregator information

port - Show LACP port information

dump - Show all LACP ports information
```

Use these commands to display Link Aggregation Protocol (LACP) status information about each port on the switch.

Table 22. LACP Information Options (/info/l2/lacp)

```
Command Syntax and Usage

aggr <aggregator ID>
   Displays detailed information about the LACP aggregator.

port
   Displays LACP information about the selected port.

dump
   Displays a summary of LACP information. For details, see page 52.
```

/info/l2/lacp/dump

Show All LACP Information

port	mode	adminkey	operkey	selected	prio	aggr	trunk	status	minlinks
INT1	active	1	1	yes	32768	17	19	up	1
INT2	active	2	2	yes	32768	17	19	up	1
INT3	off	3	3	no	32768				1
INT4	off	4	4	no	32768				1

LACP dump includes the following information for each external port in the VFSM:

LA	CP dump includ	des the following information for each external port in the VFSM:
•	port	Displays the port number or alias.
•	mode	Displays the port's LACP mode (active, passive, or off).
•	adminkey	Displays the value of the port's adminkey.
•	operkey	Shows the value of the port's operational key.
•	selected	Indicates whether the port has been selected to be part of a Link Aggregation Group.
•	prio	Shows the value of the port priority.
•	aggr	Displays the aggregator associated with each port.
•	trunk	This value represents the LACP trunk group number.
•	status	Displays the status of LACP on the port (up or down).
•	minlinks	Displays the minimum number of active links this trunk group needs.

/info/l2/failovr

Layer 2 Failover Information Menu

```
[Failover Info Menu]
    trigger - Show Trigger information
```

Table 23 describes the Layer 2 Failover information options.

Table 23. Failover Information Options (/info/l2/failovr)

```
Command Syntax and Usage
trigger <trigger number>
   Displays detailed information about the selected Layer 2 Failover trigger.
```

/info/l2/failovr/trigger <trigger number>

Show Layer 2 Failover Information

```
Trigger 1 Auto Monitor: Enabled
Trigger 1 limit: 0
Monitor State: Up
Member Status
trunk 1
EXT2 Operational EXT3 Operational
Control State: Auto Disabled
Member Status
_____
          _____
INT1 Operational
INT2
        Operational
INT3
        Operational
INT4
        Operational
```

A monitor port's Failover status is Operational only if all the following conditions hold true:

- Port link is up.
- If Spanning-Tree is enabled, the port is in the Forwarding state.
- If the port is a member of an LACP trunk group, the port is aggregated.

If any of these conditions are not true, the monitor port is considered to be failed.

A control port is considered to be operational if the monitor trigger state is Up. Even if a port's link status is Down, Spanning-Tree status is Blocking, and the LACP status is Not Aggregated, from a teaming perspective the port status is Operational, since the trigger is Up.

A control port's status is displayed as Failed only if the monitor trigger state is Down.

Hot Links Information Menu

```
[Hot Links Info Menu]
trigger - Show Trigger information
```

Table 24. Hot Links Information Options (/info/l2/hotlink)

Command Syntax and Usage

trigger

Displays status and configuration information for each Hot Links trigger. To view a sample display, see page 54.

/info/l2/hotlink/trigger

Hotlinks Trigger Information

```

The following table describes the IEEE 802.1X parameters.

Table 31. 802.1X Parameter Descriptions (/info/l2/8021x)

Parameter	Description		
Port	Displays each port's alias.		
Auth Mode	Displays the Access Control authorization mode for the port. The Authorization mode can be one of the following:		
	force-unauthautoforce-auth		
Auth Status	Displays the current authorization status of the port, either authorized or unauthorized.		

Table 31. 802.1X Parameter Descriptions (/info/l2/8021x) (continued)

Parameter	Description				
Authenticator PAE State	Displays the Authenticator Port Access Entity State. The PAE state can be one of the following:				
	• initialize				
	• disconnected				
	• connecting				
	• authenticating				
	• authenticated				
	• aborting				
	• held				
	• forceAuth				
Backend Auth State	Displays the Backend Authorization State. The Backend Authorization state can be one of the following:				
	• initialize				
	• request				
	• response				
	• success				
	• fail				
	• timeout				
	• idle

```

Note: The sample screens that appear in this document might differ slightly from the screens displayed by your system. Screen content varies based on the type of BladeCenter unit that you are using and the firmware versions and options that are installed.

The switch software uses the IEEE 802.1D Spanning Tree Protocol (STP). If IEEE 802.1w Rapid Spanning Tree Protocol (RSTP), the IEEE 802.1s Multiple Spanning Tree Protocol (MSTP), or Per VLAN Rapid Spanning Tree Protocol (PVRST) are turned on, see "RSTP/MSTP Information" on page 64.

When STP is used, in addition to seeing if STG is enabled or disabled, you can view the STG bridge information shown in the following table.

Table 32. Spanning Tree Parameter Descriptions

Parameter	Description
Current Root	The Current Root shows information about the root bridge for the Spanning Tree. Information includes the priority (in hexadecimal notation) and MAC address of the root.
Priority (bridge)	The bridge priority parameter controls which bridge on the network will become the STG root bridge.
Hello	The hello time parameter specifies, in seconds, how often the root bridge transmits a configuration bridge protocol data unit (BPDU). Any bridge that is not the root bridge uses the root bridge hello value.
MaxAge	The maximum age parameter specifies, in seconds, the maximum time the bridge waits without receiving a configuration bridge protocol data unit before it reconfigure the STG network.
FwdDel	The Forward Delay parameter specifies, in seconds, the amount of time that a bridge port has to wait before it changes from listening to learning and from learning state to forwarding state.
Aging	The aging time parameter specifies, in seconds, the amount of time the bridge waits without receiving a packet from a station before removing the station from the Forwarding Database.
Priority (port)	The port priority parameter helps determine which bridge port becomes the designated port. In a network topology that has multiple bridge ports connected to a single segment, the port with the lowest port priority becomes the designated port for the segment.
Cost	The port path cost parameter is used to help determine the designated port for a segment. Generally speaking, the faster the port, the lower the path cost. A setting of 0 indicates that the cost will be set to the appropriate default after the link speed has been auto negotiated.
FastFwd	The FastFwd shows whether the port is in Fast Forwarding mode or not, which permits the port that participates in Spanning Tree to bypass the Listening and Learning states and enter directly into the Forwarding state.
State	The state field shows the current state of the port. The state field can be BLOCKING, LISTENING, LEARNING, FORWARDING, or DISABLED.
Designated Bridge	The Designated Bridge shows information about the bridge connected to each port, if applicable. Information includes the priority (in hexadecimal notation) and MAC address of the Designated Bridge.
Designated Port	The identifier of the port on the Designated Bridge to which this port is connected.

* = STP turned off for this port.
```

Note: The sample screens that appear in this document might differ slightly from the screens displayed by your system. Screen content varies based on the type of BladeCenter unit that you are using and the firmware versions and options that are installed.

The switch software can be set to use the IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) or the IEEE 802.1s Multiple Spanning Tree Protocol (MSTP). If RSTP/MSTP is turned on (see page 302), you can view RSTP/MSTP bridge information for the Spanning Tree Group and port-specific RSTP information.

The following table describes the STP parameters in RSTP or MSTP mode.

Table 33. RSTP/MSTP Parameter Descriptions

Parameter	Description
Current Root	The Current Root shows information about the root bridge for the Spanning Tree. Information includes the priority (in hexadecimal notation) and MAC address of the root.
Priority (bridge)	The bridge priority parameter controls which bridge on the network will become the STP root bridge.

Table 33. RSTP/MSTP Parameter Descriptions (continued)

Parameter	Description
Hello	The hello time parameter specifies, in seconds, how often the root bridge transmits a configuration bridge protocol data unit (BPDU). Any bridge that is not the root bridge uses the root bridge hello value.
MaxAge	The maximum age parameter specifies, in seconds, the maximum time the bridge waits without receiving a configuration bridge protocol data unit before it reconfigures the STP network.
FwdDel	The Forward Delay parameter specifies, in seconds, the amount of time that a bridge port has to wait before it changes from listening to learning and from learning state to forwarding state.
Aging	The aging time parameter specifies, in seconds, the amount of time the bridge waits without receiving a packet from a station before removing the station from the Forwarding Database.
Prio (port)	The port priority parameter helps determine which bridge port becomes the designated port. In a network topology that has multiple bridge ports connected to a single segment, the port with the lowest port priority becomes the designated port for the segment.
Cost	The port path cost parameter is used to help determine the designated port for a segment. Generally speaking, the faster the port, the lower the path cost. A setting of 0 indicates that the cost will be set to the appropriate default after the link speed has been auto negotiated.
State	The State field shows the current state of the port. The State field in RSTP or MSTP mode can be one of the following: Discarding (DISC), Learning (LRN), Forwarding (FWD), or Disabled (DSB).
Role	The Role field shows the current role of this port in the Spanning Tree. The port role can be one of the following: Designated (DESG), Root (ROOT), Alternate (ALTN), Backup (BKUP), Disabled (DSB), Master (MAST).
Designated Bridge	The Designated Bridge shows information about the bridge connected to each port, if applicable. Information includes the priority (in hexadecimal notation) and MAC address of the Designated Bridge.
Designated Port	The port ID of the port on the Designated Bridge to which this port is connected.
Туре	Type of link connected to the port, and whether the port is an edge port. Link type values are AUTO, P2P, or SHARED.

* = STP turned off for this port.
```

Note: The sample screens that appear in this document might differ slightly from the screens displayed by your system. Screen content varies based on the type of BladeCenter unit that you are using and the firmware versions and options that are installed.

In addition to seeing if Common Internal Spanning Tree (CIST) is enabled or disabled, you can view CIST bridge and port-specific information. The following table describes the CIST parameters.

Table 34. CIST Parameter Descriptions

Parameter	Description
CIST Root	The CIST Root shows information about the root bridge for the Common Internal Spanning Tree (CIST). Values on this row of information refer to the CIST root.
CIST Regional Root	The CIST Regional Root shows information about the root bridge for this MSTP region. Values on this row of information refer to the regional root.

Table 34. CIST Parameter Descriptions (continued)

Parameter	Description
Priority (bridge)	The bridge priority parameter controls which bridge on the network will become the STP root bridge.
Hello	The hello time parameter specifies, in seconds, how often the root bridge transmits a configuration bridge protocol data unit (BPDU). Any bridge that is not the root bridge uses the root bridge hello value.
MaxAge	The maximum age parameter specifies, in seconds, the maximum time the bridge waits without receiving a configuration bridge protocol data unit before it reconfigure the STP network.
FwdDel	The forward delay parameter specifies, in seconds, the amount of time that a bridge port has to wait before it changes from learning state to forwarding state.
Hops	The maximum number of bridge hops a packet can traverse before it is dropped. The default value is 20.
Priority (port)	The port priority parameter helps determine which bridge port becomes the designated port. In a network topology that has multiple bridge ports connected to a single segment, the port with the lowest port priority becomes the designated port for the segment.
Cost	The port path cost parameter is used to help determine the designated port for a segment. Generally speaking, the faster the port, the lower the path cost. A setting of 0 indicates that the cost will be set to the appropriate default after the link speed has been auto negotiated.
State	The state field shows the current state of the port. The state field can be either Discarding (DISC), Learning (LRN), or Forwarding (FWD).
Role	The Role field shows the current role of this port in the Spanning Tree. The port role can be one of the following: Designated (DESG), Root (ROOT), Alternate (ALTN), Backup (BKUP), Disabled (DSB), Master (MAST), or Unknown (UNK).
Designated Bridge	The Designated Bridge shows information about the bridge connected to each port, if applicable. Information includes the priority (in hexadecimal notation) and MAC address of the Designated Bridge.
Designated Port	The port ID of the port on the Designated Bridge to which this port is connected.
Туре	Type of link connected to the port, and whether the port is an edge port. Link type values are AUTO, P2P, or SHARED.

© Copyright IBM Corp. 2012 Chapter 4: The Information Menu **67**

Trunk Group Information

```
Trunk group 1: Enabled
Protocol - Static
Port state:
EXT1: STG 1 forwarding
EXT2: STG 1 forwarding
```

When trunk groups are configured, you can view the state of each port in the various trunk groups.

Note: If Spanning Tree Protocol on any port in the trunk group is set to forwarding, the remaining ports in the trunk group will also be set to forwarding.

/info/12/vlan

VLAN Information

VLAN	Name	Status	MGT	Ports
1	Default VLAN	ena	dis	INT1-INT14 EXT1-EXT8 EXT11
100	VLAN 100	ena	dis	EXT9 EXT10
200	VLAN 200	ena	dis	EXT9 EXT10
4095	Mgmt VLAN	ena	ena	INT1-INT14 MGT1 MGT2

Note: The sample screens that appear in this document might differ slightly from the screens displayed by your system. Screen content varies based on the type of BladeCenter unit that you are using and the firmware versions and options that are installed.

This information display includes all configured VLANs and all member ports that have an active link state. Port membership is represented in slot/port format.

VLAN information includes:

- VLAN Number
- VLAN Name
- Status
- · Management status of the VLAN
- · Port membership of the VLAN
- Protocol-based VLAN information, if applicable
- · Private VLAN configuration, if applicable

    dump - Dump all layer 3 information
```

The information provided by each menu option is briefly described in Table 35, with pointers to detailed information.

Table 35. Layer 3 Information Options (/info/l3)

Command Syntax and Usage

route

Displays the IP Routing Menu. Using the options of this menu, the system displays the following for each configured or learned route:

- Route destination IP address, subnet mask, and gateway address
- Type of route
- Tag indicating origin of route
- Metric for RIP tagged routes, specifying the number of hops to the destination (1-15 hops, or 16 for infinite hops)
- The IP interface that the route uses

For details, see page 72.

arp

Displays the Address Resolution Protocol (ARP) Information Menu. For details, see page 75.

Displays BGP Information Menu. To view menu options, see page 77.

ospf

Displays OSPF routing Information Menu. For details, see page 79.

Table 35. Layer 3 Information Options (/info/l3)

Command Syntax and Usage

ospf3

Displays OSPFv3 routing Information Menu. For details, see page 83.

rip

Displays Routing Information Protocol Menu. For details, see page 88.

route6

Displays the IPv6 Routing information menu. To view menu options, see page 89.

nbrcache

Displays the IPv6 Neighbor Discovery cache information menu. To view menu options, see page 90.

ndprefix

Displays the IPv6 Neighbor Discovery Prefix information menu. To view menu options, see page 91.

ecmp

Displays information about ECMP static routes. For details, see page 91.

hash *<Source IP address> <destination IP address> <number of ECMP paths>*Displays information about ECMP hashing results. For details, see page 91.

ip

Displays IP Information. For details, see page 99.

IP information, includes:

- IP interface information: Interface number, IP address, subnet mask, VLAN number, and operational status.
- Default gateway information: Metric for selecting which configured gateway to use, gateway number, IP address, and health status
- IP forwarding settings, network filter settings, route map settings

igmp

Displays IGMP Information Menu. For details, see page 92.

mld

Displays MLD Information Menu. For details, see page 94.

vrrp

Displays VRRP Information. For details, see page 97.

if

Displays interface information. For details, see page 98.

ip6pmtu [<destination IPv6 address>]

Displays IPv6 Path MTU information. For details, see page 98.

Table 35. Layer 3 Information Options (/info/l3)

Command Syntax and Usage

ip

Displays IP Information. For details, see page 99.

IP information, includes:

- IP interface information: Interface number, IP address, subnet mask, VLAN number, and operational status.
- Default gateway information: Metric for selecting which configured gateway to use, gateway number, IP address, and health status
- IP forwarding settings, network filter settings, route map settings

ikev2

Displays IKEv2 Information menu. For details, see page 100.

ipsec

Displays IPsec Information menu. For details, see page 102.

Dumps all switch information available from the Layer 3 menu (10K or more, depending on your configuration).

If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump commands.

IP Routing Information Menu

```
[IP Routing Menu]
    find - Show a single route by destination IP address
            - Show routes to a single gateway
           - Show routes of a single type
           - Show routes of a single tag
    tag
    if
           - Show routes on a single interface
            - Show best routes
    ecmphash - Show the ECMP hash value
            - Show all routes
```

Using the commands listed in the following table, you can display all or a portion of the IP routes currently held in the switch.

Table 36. Route Information Menu Options (/info/l3/route) **Command Syntax and Usage** find <IP address (such as 192.4.17.101)> Displays a single route by destination IP address. gw <default gateway address (such as 192.4.17.44)> Displays routes to a single gateway. type indirect|direct|local|broadcast|martian|multicast Displays routes of a single type. For a description of IP routing types, see Table 37 on page 73. tag fixed|static|addr|rip|ospf|bgp|broadcast|martian| multicast Displays routes of a single tag. For a description of IP routing types, see Table 38 on page 74. if <interface number> Displays routes on a single interface. best Displays the best routes. For more information, see page 73. ecmphash Displays the current ECMP hashing mechanism. dump Displays all routes configured in the switch. For more information, see page 73.

The following table describes the Type parameters.

Table 37. IP Routing Type Parameters

Parameter	Description
indirect	The next hop to the host or subnet destination will be forwarded through a router at the Gateway address.
direct	Packets will be delivered to a destination host or subnet attached to the switch.
local	Indicates a route to one of the switch's IP interfaces.
broadcast	Indicates a broadcast route.
martian	The destination belongs to a host or subnet which is filtered out. Packets to this destination are discarded.
multicast	Indicates a multicast route.

The following table describes the $\ensuremath{\mathtt{Tag}}$ parameters.

Table 38. IP Routing Tag Parameters

Parameter	Description			
fixed	The address belongs to a host or subnet attached to the switch.			
static	The address is a static route which has been configured on the VFSM.			
addr	The address belongs to one of the switch's IP interfaces.			
rip	The address was learned by the Routing Information Protocol (RIP).			
ospf	The address was learned by Open Shortest Path First (OSPF).			
bgp	The address was learned via Border Gateway Protocol (BGP)			
broadcast	Indicates a broadcast address.			
martian	The address belongs to a filtered group.			
multicast	Indicates a multicast address.			

ARP Information Menu

```
[Address Resolution Protocol Menu]
    find - Show a single ARP entry by IP address
            - Show ARP entries on a single port
     port
          - Show ARP entries on a single VLAN
     vlan
     addr - Show ARP address list
     dump - Show all ARP entries
```

The ARP information includes IP address and MAC address of each entry, address status flags (see Table 39), VLAN and port for the address, and port referencing information.

Table 39. ARP Information Menu Options (/info/l3/arp)

Command Syntax and Usage

find <IP address (such as, 192.4.17.101>

Displays a single ARP entry by IP address.

port port alias or number>

Displays the ARP entries on a single port.

vlan <*VLAN number*>

Displays the ARP entries on a single VLAN.

addr

Displays the ARP address list: IP address, IP mask, MAC address, and VLAN

dump

Displays all ARP entries. including:

- IP address and MAC address of each entry
- Address status flag (see below)
- The VLAN and port to which the address belongs
- The ports which have referenced the address (empty if no port has routed traffic to the IP address shown)

For more information, see page 76.

/info/l3/arp/dump

Show All ARP Entry Information

```
Total number of arp entries : 3

IP address Flags MAC address VLAN Age Port

10.90.90.81 P 00:25:03:1f:fa:00 4095

172.25.1.1 fc:cf:62:10:b2:00 1 1 EXT11

172.25.38.38 P 00:25:03:1f:fa:00 1
```

The Port field shows the target port of the ARP entry.

The Flag field is interpreted as follows:

Table 40. ARP Dump Flag Parameters

Flag	Description
Р	Permanent entry created for switch IP interface.
R	Indirect route entry.
U	Unresolved ARP entry. The MAC address has not been learned.

/info/l3/arp/addr

ARP Address List Information

IP address	IP mask	MAC address	VLAN Pass-Up

```

Table 42. OSPF Information Menu Options (/info/l3/ospf)

Command Syntax and Usage

general

Displays general OSPF information. See page 80 for a sample output.

aindex < area index (0-2)>

Displays area information for a particular area index. If no parameter is supplied, it displays area information for all the areas.

if <interface number>

Displays interface information for a particular interface. If no parameter is supplied, it displays information for all the interfaces. See page 80 for a sample output.

loopif <interface number>

Displays loopback information for a particular interface. If no parameter is supplied, it displays loopback information for all the interfaces. See page 81 for a sample output.

virtual

Displays information about all the configured virtual links.

nbr < nbr router-id (A.B.C.D) >

Displays the status of a neighbor with a particular router ID. If no router ID is supplied, it displays the information about all the current neighbors.

dbase

Displays OSPF database menu. To view menu options, see page 81.

sumaddr < area index (0-2)>

Displays the list of summary ranges belonging to non-NSSA areas.

nsumadd < area index (0-2)>

Displays the list of summary ranges belonging to NSSA areas.

            - Network-Summary LS Database info
     summ
     all
             - All
```

Table 43. OSPF Database Information Menu Options (/info/l3/ospf/dbase)

Command Syntax and Usage

```
advrtr < router-id (A.B.C.D)>
```

Takes advertising router as a parameter. Displays all the Link State Advertisements (LSAs) in the LS database that have the advertising router with the specified router ID, for example: 20.1.1.1.

asbrsum < adv-rtr(A.B.C.D) > | < link state id(A.B.C.D > | < self >

Displays ASBR summary LSAs. The usage of this command is as follows:

- asbrsum adv-rtr 20.1.1.1
 - Displays ASBR summary LSAs having the advertising router 20.1.1.1.
- asbrsum link-state-id 10.1.1.1
 - Displays ASBR summary LSAs having the link state ID 10.1.1.1.
- asbrsum self
 - Displays the self advertised ASBR summary LSAs.
- asbrsum with no parameters displays all the ASBR summary LSAs.

Table 43. OSPF Database Information Menu Options (/info/l3/ospf/dbase)

Command Syntax and Usage

dbsumm

Displays the following information about the LS database in a table format:

- Number of LSAs of each type in each area.
- Total number of LSAs for each area.
- Total number of LSAs for each LSA type for all areas combined.
- Total number of LSAs for all LSA types for all areas combined.

No parameters are required.

```
ext < adv-rtr(A.B.C.D) > | < link state id(A.B.C.D > | < self > |
```

Displays the AS-external (type 5) LSAs with detailed information of each field of the LSAs. The usage of this command is the same as the usage of the command asbrsum.

```
nw <adv-rtr (A.B.C.D)> | link_state_id (A.B.C.D> | <self>
```

Displays the network (type 2) LSAs with detailed information of each field of the LSA.network LS database. The usage of this command is the same as the usage of the command asbrsum.

```
nssa <adv-rtr (A.B.C.D)> | link state id (A.B.C.D> | <self>
```

Displays the NSSA (type 7) LSAs with detailed information of each field of the LSAs. The usage of this command is the same as the usage of the command asbrsum.

```
rtr <adv-rtr (A.B.C.D)> | link state id (A.B.C.D> | <self>
```

Displays the router (type 1) LSAs with detailed information of each field of the LSAs. The usage of this command is the same as the usage of the command asbrsum.

self

Displays all the self-advertised LSAs. No parameters are required.

```
summ < adv-rtr (A.B.C.D) > | < link state id (A.B.C.D > | < self > |
```

Displays the network summary (type 3) LSAs with detailed information of each field of the LSAs. The usage of this command is the same as the usage of the command asbrsum.

all

Displays all the LSAs.

```

Table 44. OSPFv3 Information Menu Options (/info/l3/ospf3)

Command Syntax and Usage aindex < area index (0-2)> Displays the area information menu for a particular area index. To view menu options, see page 85. dbase Displays the OSPFv3 database menu. To view menu options, see page 87. areas Displays the OSPFv3 Area Table.

Table 44. OSPFv3 Information Menu Options (/info/l3/ospf3)

Command Syntax and Usage

if <interface number>

Displays interface information for a particular interface. If no parameter is supplied, it displays information for all the interfaces. To view a sample display, see page 86.

virtual

Displays information about all the configured virtual links.

nbr < nbr router-id (A.B.C.D) >

Displays the status of a neighbor with a particular router ID. If no router ID is supplied, it displays the information about all the current neighbors.

host

Displays OSPFv3 host configuration information.

reglist <nbr router-id (A.B.C.D)>

Displays the OSPFv3 request list. If no router ID is supplied, it displays the information about all the current neighbors.

retlist <nbr router-id (A.B.C.D)>

Displays the OSPFv3 retransmission list. If no router ID is supplied, it displays the information about all the current neighbors.

sumaddr

Displays the OSPFv3 external summary-address configuration information.

redist

Displays OSPFv3 redistribution information to be applied to routes learned from the route table.

ranges

Displays the OSPFv3 list of all area address ranges information.

routes

Displays OSPFv3 routing table. To view a sample display, see page 88.

borderrt

Displays OSPFv3 routes to an ABR or ASBR.

dump

Displays all OSPFv3 information. To view a sample display, see page 86.

```

Table 48 describes the IPv6 Routing information options.

Table 48. IPv6 Routing Information Menu Options (/info/l3/route6)

Command Syntax and Usage

find <IP address (such as 3001:0:0:0:0:0:0:abcd:12)>

Displays a single route by destination IP address.

gw <default gateway address (such as 3001:0:0:0:0:0:abcd:14)>

Displays routes to a single gateway.

type connected|static|ospf

Displays routes of a single type. For a description of IP routing types, see Table 37 on page 73.

if <interface number>

Displays routes on a single interface.

summ

Displays a summary of IPv6 routing information, including inactive routes.

dump

Displays all IPv6 routing information. For more information, see page 90.

/info/13/route6/dump

IPv6 Routing Table Information

Note that the first number inside the brackets represents the metric and the second number represents the preference for the route.

/info/l3/nbrcache

IPv6 Neighbor Discovery Cache Information Menu

```
[IP6 Neighbor Discovery Protocol Menu]
find - Show a single NBR Cache entry by IP address
port - Show NBR Cache entries on a single port
vlan - Show NBR Cache entries on a single VLAN
dump - Show all NBR Cache entries
```

Table 49 describes IPv6 Neighbor Discovery cache information menu options.

Table 49. IPv6 Neighbor Discovery Cache Information Options (/info/l3/nbrcache)

Command Syntax and Usage find <IPv6 address> Shows a single Neighbor Discovery cache entry by IP address. port <port alias or number> Shows the Neighbor Discovery cache entries on a single port. vlan <VLAN number> Shows the Neighbor Discovery cache entries on a single VLAN. dump Shows all Neighbor Discovery cache entries. For more information, see page 91.

/info/13/nbrcache/dump

IPv6 Neighbor Discovery Cache Information

IPv6 Address	Age	Link-layer Addr	State	IF	VLAN	Port
2001:2:3:4::1	10	00:50:bf:b7:76:b0	Reachable	2	1	EXT1
fe80::250:bfff:feb7:76b0	0	00:50:bf:b7:76:b0	Stale	2	1	EXT2

/info/l3/ndprefix

IPv6 Neighbor Discovery Prefix Information

```
Codes: A - Address , P - Prefix-Advertisement
      D - Default , N - Not Advertised
     [L] - On-link Flag is set
     [A] - Autonomous Flag is set
```

Neighbor Discovery prefix information includes information about all configured prefixes.

/info/l3/ecmp

ECMP Static Routes Information

Destination	Mask	Gateway	If	GW Status
10.10.1.1	255.255.255.255	10.100.1.1	1	up
		10.200.2.2	1	down
10.20.2.2	255.255.255.255	10.233.3.3	1	up
10.20.2.2	255.255.255.255	10.234.4.4	1	up
10.20.2.2	255.255.255.255	10.235.5.5	1	up
	k ping interval:			

ECMP route information shows the status of each ECMP route configured on the switch.

/info/13/hash

ECMP Hashing Result

```
Enter SIP address: 10.10.10.10
Enter DIP address (0 for SIP only): 157.0.0.10
Enter number of ECMP paths: 32
Source 10.10.10.10 will go through route number 9
```

ECMP hashing information shows the status of ECMP hashing on each switch.

IGMP Multicast Group Information Menu

```
[IGMP Multicast Menu]

mrouter - Show IGMP Snooping Multicast Router Port information

find - Show a single group by IP group address

vlan - Show groups on a single vlan

port - Show groups on a single port

trunk - Show groups on a single trunk

detail - Show detail of a single group by IP group address

dump - Show all groups

ipmcgrp - Show all ipmc groups
```

Table 50 describes the commands used to display information about IGMP groups learned by the switch.

Table 50. IGMP Multicast Group Information Menu Options (/info/l3/igmp)

```
Command Syntax and Usage
mrouter
   Displays IGMP Multicast Router menu. To view menu options, see page 93.
find <IP address>
    Displays a single IGMP multicast group by its IP address.
vlan <VLAN number>
    Displays all IGMP multicast groups on a single VLAN.
port  port number or alias>
    Displays all IGMP multicast groups on a single port.
trunk <trunk number>
    Displays all IGMP multicast groups on a single trunk group.
detail < IP address>
    Displays details about IGMP multicast groups, including source and timer
   information.
dump
   Displays information for all multicast groups. For details, see page 93
ipmcgrp <VLAN number>
    Displays all ipmc groups on a single VLAN.
```

/info/13/iqmp/mrouter

IGMP Multicast Router Port Information Menu

```
[IGMP Multicast Router Menu]
    vlan - Show all multicast router ports on a single vlan
             - Show all learned multicast router ports
```

Table 51 describes the commands used to display information about multicast routers (Mrouters) learned through IGMP Snooping.

Table 51. IGMP Mrouter Information Menu Options (/info/igmp/mrouter)

Command Syntax and Usage

vlan <*VLAN number*>

Displays the multicast router ports configured or learned on the selected VLAN.

dump

Displays information for all multicast groups learned by the switch.

/info/13/iqmp/mrouter/dump

IGMP Multicast Router Dump Information

Total entries: 1	Total numbe	r of dynami	c mrouters	: 1

dump

Displays information for MLD Mrouter ports. See page 96 for sample output.

/info/l3/mld/mrouter/dump

MLD Mrouter Dump Information

Source: fe80:0:0:0:200:bff:fe88:2748

Port/Vlan: XGE2/4 Interface: 3 QRV: 2 QQIC:125

Maximum Response Delay: 1000 Version: MLDv2 Expires:1:03

Table 54 describes the MLD Mrouter dump information displayed in the output.

Table 54. MLD Mrouter Dump Information (/info/l3/mld/mrouter/dump)

Statistic	Description
Source	Displays the link-local address of the reporter.
Port/Vlan	Displays the port/vlan on which the general query is received.
Interface	Displays the interface number on which the general query is received.
QRV	Displays the Querier's robustness variable value.
QQIC	Displays the Querier's query interval code.
Maximum Response Delay	Displays the configured maximum query response time.
Version	Displays the MLD version configured on the interface.
Expires	Displays the interval after which the multicast router decides that there are no more listeners for a multicast address or a particular source on a link.

/info/l3/vrrp

VRRP Information

Virtual Router Redundancy Protocol (VRRP) support on the VFSM provides redundancy between routers in a LAN. This is accomplished by configuring the same virtual router IP address and ID number on each participating VRRP-capable routing device. One of the virtual routers is then elected as the master, based on a number of priority criteria, and assumes control of the shared virtual router IP address. If the master fails, one of the backup virtual routers will assume routing authority and take control of the virtual router IP address.

```
VRRP information:
 1: vrid 2, 205.178.18.210, if 1, renter, prio 100, master
 2: vrid 1, 205.178.18.202, if 1, renter, prio 100, backup
 3: vrid 3, 205.178.18.204, if 1, renter, prio 100, master
```

When virtual routers are configured, you can view the status of each virtual router using this command. VRRP information includes:

- Virtual router number
- Virtual router ID and IP address
- Interface number
- Ownership status
 - owner identifies the preferred master virtual router. A virtual router is the owner when the IP address of the virtual router and its IP interface are the same.
 - renter identifies virtual routers which are not owned by this device.
- Priority value. During the election process, the virtual router with the highest priority becomes master.
- Activity status
 - master identifies the elected master virtual router.
 - backup identifies that the virtual router is in backup mode.
 - init identifies that the virtual router is waiting for a startup event. For example, once it receives a startup event, it transitions to master if its priority is 255, (the IP address owner), or transitions to backup if it is not the IP address owner.

Interface Information

For each interface, the following information is displayed:

- · IPv4 interface address and subnet mask
- IPv6 address and prefix
- VLAN assignment
- Status (up, DOWN, disabled)

/info/l3/ip6pmtu [<destination IPv6 address>]

IPv6 Path MTU Information

```
Path MTU Discovery info:

Max Cache Entry Number: 10

Current Cache Entry Number: 2

Cache Timeout Interval: 10 minutes

Destination Address Since PMTU

5000:1::3 00:02:26 1400

FE80::203:A0FF:FED6:141D 00:06:55 1280
```

Path MTU Discovery information provides information about entries in the Path MTU cache. The PMTU field indicates the maximum packet size in octets that can successfully traverse the path from the switch to the destination node. It is equal to the minimum link MTU of all the links in the path to the destination node.

IP Information

```
IP information:
  AS number 0

```

IP information includes:

- IP interface information: Interface number, IP address, subnet mask, broadcast address, VLAN number, and operational status.
- · Loopback interface information, if applicable
- Default gateway information: Metric for selecting which configured gateway to use, gateway number, IP address, and health status
- BootP relay settings
- IP forwarding settings, including the forwarding status of directed broadcasts, and the status of ICMP re-directs
- · Network filter settings, if applicable
- Route map settings, if applicable

/info/l3/ikev2

IKEv2 Information

```
[IKEv2 Information Menu]
info - Show IKEv2 information
cacert - Show CA certificate information
hcert - Show host certificate information
```

Table 55 describes the commands used to display information about IKEv2.

Table 55. IKEv2 Information Menu Options (/info/l3/ikev2)

Command Syntax and Usage

info

Displays all IKEv2 information. See page 101 for sample output.

cacert

Displays CA certificate information.

hcert

Displays host certificate information.

/info/l3/ikev2/info

IKEv2 Information Dump

IKEv2 retransmit time: 20 IKEv2 cookie notification: disable IKEv2 authentication method: Pre-shared key IKEv2 proposal: Cipher: 3des Authentication: sha1 dh-2 DH Group: ibm123 Local preshare key: IKEv2 choose IPv6 address as ID type No SAD entries.

IKEv2 information includes:

- IKEv2 retransmit time, in seconds.
- Whether IKEv2 cookie notification is enabled.
- The IKEv2 proposal in force. This includes the encryption algorithm (cipher), the authentication algorithm type, and the Diffie-Hellman (DH) group, which determines the strength of the key used in the key exchange process. Higher DH group numbers are more secure but require additional time to compute the key.
- The local preshare key.
- Whether IKEv2 is using IPv4 or IPv6 addresses as the ID type.
- Security Association Database (SAD) entries, if applicable.

IPsec Information Menu

```
[IPsec Information Menu]

sa - Show all sa information

spd - Show all spd information

dpolicy - Show dynamic policy information

mpolicy - Show manual policy information

txform - Show ipsec transform information

selector - Show ipsec traffic selector information
```

Table 56 describes the commands used to display information about IPsec.

Table 56. IPsec Information Menu Options (/info/l3/ipsec)

Sa Displays all security association information. spd Displays all security policy information. dpolicy <1-10> Displays dynamic policy information. mpolicy <1-10> Displays manual policy information. See page 103 for sample output. txform <1-10> Displays IPsec transform information. selector <1-10> Displays IPsec traffic selector information.

/info/l3/ipsec/mpolicy

IPsec Manual Policy Information

```
IPsec manual policy 1 -----
IP Address:
                                      2002:0:0:0:0:0:0:151
Associated transform ID:
                                      1
Associated traffic selector ID: 1
IN-ESP SPI: 9900
IN-ESP encryption KEY: 3456789abcdef012
IN-ESP authentication KEY: 23456789abcdef0123456789abcdef0123456789
OUT-ESP SPI: 7700

OUT-ESP encryption KEY: 6789abcdef012345

OUT-ESP authentication KEY: 56789abcdef0123456789abcdef0123456789abc
Applied on interface:
interface 1
```

IPsec manual policy information includes:

- The IP address of the remote peer
- The transform set ID associated with this policy
- Traffic selector ID associated with this policy
- ESP inbound SPI
- ESP inbound encryption key
- ESP inbound authentication key
- ESP outbound SPI
- ESP outbound encryption key
- ESP outbound authentication key
- The interface to which this manual policy has been applied

```

The following table describes the RMON History Information parameters.

Table 63. RMON History Parameter Descriptions

Parameter	Description
Index	Displays the index number that identifies each history instance.
IFOID	Displays the MIB Object Identifier.
Interval	Displays the time interval for each sampling bucket.
Rbnum	Displays the number of requested buckets, which is the number of data slots into which data is to be saved.
Gbnum	Displays the number of granted buckets that may hold sampled data.
Owner	Displays the owner of the history instance.

RMON Alarm Information

```
RMON Alarm group configuration:

    Index
    Interval

Index rEvtIdx fEvtIdx
                                  OID
 1 0 0 1.3.6.1.2.1.2.2.1.10.1
Index
                      Owner
```

The following table describes the RMON Alarm Information parameters.

Table 64. RMON Alarm Parameter Descriptions

Parameter	Description
Index	Displays the index number that identifies each alarm instance.
Interval	Displays the time interval over which data is sampled and compared with the rising and falling thresholds.
Sample	Displays the method of sampling the selected variable and calculating the value to be compared against the thresholds, as follows: • abs—absolute value, the value of the selected variable is compared directly with the thresholds at the end of the sampling interval. • delta—delta value, the value of the selected variable at the last sample is subtracted from the current value, and the difference compared with the thresholds.
Туре	Displays the type of alarm, as follows: • falling—alarm is triggered when a falling threshold is crossed. • rising—alarm is triggered when a rising threshold is crossed. • either—alarm is triggered when either a rising or falling threshold is crossed.
rLimit	Displays the rising threshold for the sampled statistic.
fLimit	Displays the falling threshold for the sampled statistic.
Last value	Displays the last sampled value.
rEvtldx	Displays the rising alarm event index that is triggered when a rising threshold is crossed.
fEvtldx	Displays the falling alarm event index that is triggered when a falling threshold is crossed.
OID	Displays the MIB Object Identifier for each alarm index.
Owner	Displays the owner of the alarm instance.

RMON Event Information

```
RMON Event group configuration:

Index Type Last Sent Description

1 both OD: OH: 1M:20S Event_1
2 none OD: OH: OM: OS Event_2
3 log OD: OH: OM: OS Event_3
4 trap OD: OH: OM: OS Event_4
5 both OD: OH: OM: OS Log and trap event for Link Down
10 both OD: OH: OM: OS Log and trap event for Link Up
11 both OD: OH: OM: OS Send log and trap for icmpInMsg
15 both OD: OH: OM: OS Send log and trap for icmpInEchos

Index Owner

1 dan
```

The following table describes the RMON Event Information parameters.

Table 65. RMON Event Parameter Descriptions

Parameter	Description
Index	Displays the index number that identifies each event instance.
Туре	Displays the type of notification provided for this event, as follows: none, log, trap, both.
Last sent	Displays the time that passed since the last switch reboot, when the most recent event was triggered. This value is cleared when the switch reboots.
Description	Displays a text description of the event.
Owner	Displays the owner of the event instance.

This command displays link status information about each port on the VFSM, including:

- Ethernet port alias, number, and configuration
- Link status (up, down, or disabled)
- Bridge Module (KR) port alias, port number, and configuration (if applicable)
- · Bridge Module alias and speed setting

/info/port

Note: The sample screens that appear in this document might differ slightly from the screens displayed by your system. Screen content varies based on the type of BladeCenter unit that you are using and the firmware versions and options that are installed.

Port information includes:

- Port alias and number
- Whether the port uses VLAN tagging or not (y or n)
- Type of port (Internal, External, or Management)
- Whether the port is configured for Port Fast Fowarding (Fast)
- Whether the port has Remote Monitoring (RMON) enabled
- Whether the port has FDB learning enabled (Lrn)
- Whether the port has Port Flooding enabled (Fld)
- Port VLAN ID (PVID)
- Port name
- VLAN membership

Port Transceiver Status

26	_	EXT10	NO	Devi	ce						

This command displays information about the transceiver module on each port, as follows:

- Port number and media type
- · TXEna: Transmission status
- RXsig: Receive Signal indicator
- TXuW: Transmit power, in micro-watts
- · RXuW: Receive power, in micro-watts
- · TXflt: Transmission fault indicator
- Vendor name
- Serial number

The optical power levels shown for transmit and receive functions for the transceiver must fall within the expected range defined in the IEEE 802-3-2008 specification for each transceiver type. For convenience, the expected range values are summarized in the following table.

Table 66. Expected Transceiver Optical Power Levels

Transceiver Type	Tx Minimum	Tx Maximum	Rx Minimum	Rx Maximum
SFP SX	112μW	1000μW	20μW	1000μW
SFP LX	70.8μW	501μW	12.6μW	501μW
SFP+ SR	186μW	794μW	102μW	794μW
SFP+ LR	151μW	891μW	27.5μW	891μW

Note: Power level values in the IEEE specification are shown in dBm, but have been converted to μW in this table to match the unit of measure shown in the /info/transcvr output.

Virtualization Information

```
[Virtualization Menu]

	es: 8 are ESX Service Consc are ESX/ESXi VMKerne			rface

VM information includes the following for each Virtual Machine (VM):

- IP address
- MAC address
- Index number assigned to the VM
- Internal port on which the VM was detected
- VM group that contains the VM, if applicable

/info/virt/vm/vmware

VMware Information

```
[VMware-specific Information Menu]
hosts - Show the names of all VMware Hosts in Data Center
showhost - Show networking information for the specified VMware Host
showvm - Show networking information for the specified VMware VM
vms - Show the names of all VMware VMs in the Data Center
```

Use these commands to display information about Virtual Machines (VMs) and VMware hosts in the data center. These commands require the presence of a configured Virtual Center.

Table 69. VMware Information Options (/info/virt/vm/vmware)

hosts Displays a list of VMware hosts. For details, see page 117. showhost <host UUID> | <host IP address> | <host host name> Displays detailed information about a specific VMware host. showvm <VM UUID> | <VM IP address> | <VM name> Displays detailed information about a specific Virtual Machine (VM).

/info/virt/vm/vmware/hosts

VMware Host Information

Name(s), IP Address
127.12.41.30
127.12.46.10
127.12.44.50
127.12.46.20
127.12.46.30
127.12.46.40

VM host information includes the following:

- UUID associated with the VMware host.
- Name or IP address of the VMware host.

/info/virt/vnic

Virtual Network Interface Card Information

```
[vNIC Information Menu]

DMAC 01:10:18:01:00:02, Ethertype 0x8914, action permit.
Ethertype 0x8914, action deny.
Ethertype 0x8906, action deny.
SMAC 0e:fc:00:00:00:00, SMAC mask ff:ff:ff:00:00:00, action deny.
```

FIP Snooping port information includes the following:

- · Fiber Channel Forwarding (FCF) mode
- Number of FCF links connected to the port
- · List of FIP Snooping ACLs assigned to the port

/info/dump

Information Dump

Use the dump command to dump all switch information available from the Information Menu (10K or more, depending on your configuration). This data is useful for tuning and debugging switch performance.

If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump commands.

Chapter 5. The Statistics Menu

You can view switch performance statistics in both the user and administrator command modes. This chapter discusses how to use the command line interface to display switch statistics.

/stats

Statistics Menu

```
[Statistics Menu]

port - Port Stats Menu

trunk - Trunk Group Stats Menu

12 - Layer 2 Stats Menu

13 - Layer 3 Stats Menu

mp - MP-specific Stats Menu

acl - ACL Stats Menu

fcoe - FCOE Stats Menu

snmp - Show SNMP stats

ntp - Show NTP stats

clrmp - Clear all MP related stats

clrports - Clear stats for all ports

dump - Dump all stats
```

The information provided by each menu option is briefly described in Table 82, with pointers to detailed information.

Table 82. Statistics Menu Options (/stats)

Command Syntax and Usage

Displays the Port Statistics Menu for the specified port. Use this command to display traffic statistics on a port-by-port basis. Traffic statistics are included in SNMP Management Information Base (MIB) objects. To view menu options, see page 133.

trunk <trunk group number>

Displays the Trunk Statistics Menu for the specified port. To view menu options, see page 156.

12

Displays the Layer 2 Statistics Menu. To view menu options, see page 156.

13

Displays the Layer 3 Stats Menu. To view menu options, see page 162.

mp

Displays the Management Processor Statistics Menu. Use this command to view information on how switch management processes and resources are currently being allocated. To view menu options, see page 196.

acl

Displays ACL Statistics menu. To view menu options, see page 208.

© Copyright IBM Corp. 2012

Table 82. Statistics Menu Options (/stats)

Command Syntax and Usage

fcoe [clear]

Displays Fiber Channel over Ethernet (FCoE) Statistics. To view details, see page 210.

You can use the clear option to delete all FCoE statistics.

snmp

Displays SNMP statistics. See page 210 for sample output.

ntp [clear]

Displays Network Time Protocol (NTP) Statistics. See page 214 for a sample output and a description of NTP Statistics.

You can use the clear option to delete all NTP statistics.

clrmp

Clears all management processor statistics.

clrports

Clears statistics counters for all ports.

dump

Dumps all switch statistics. Use this command to gather data for tuning and debugging switch performance. If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump command. For details, see page 214.

/stats/port port alias or number>

Port Statistics Menu

This menu displays traffic statistics on a port-by-port basis. Traffic statistics include SNMP Management Information Base (MIB) objects.

```
[Port Statistics Menu]
    8021x - Show 802.1x stats
    bootp - Show BOOTP relay stats
    brate - Show interface bitrate [Kbps] usage (continuos)
    brg - Show bridging ("dot1") stats
   brg-rate - Show bridging ("dot1") stats/second
    ether - Show Ethernet ("dot3") stats
    eth-rate - Show Ethernet ("dot3") stats/second
            - Show interface ("if") stats
    if-rate - Show interface ("if") stats/second
    ip - Show Internet Protocol ("IP") stats
    ip-rate - Show Internet Protocol ("IP") stats/second
    link
           - Show link stats
    maint - Show port maintenance stats
    rmon - Show RMON stats
    dump
            - Show all port stats
    clear - Clear all port stats
```

Table 83. Port Statistics Menu Options (/stats/port)

Command Syntax and Usage

8021x

Displays IEEE 802.1x authenticator statistics for the port. See page 136 for sample output.

bootp

Displays BOOTP Relay statistics for the port. See page 138 for sample output.

brate

Displays continuous interface bitrate usage in Kb per second.

brq

Displays bridging ("dot1") statistics for the port. See page 139 for sample output.

brg-rate

Displays bridging ("dot1") statistics per second for the port. See page 140 for sample output.

ether

Displays Ethernet ("dot3") statistics for the port. See page 140 for sample output.

eth-rate

Displays Ethernet ("dot3") statistics per second for the port. See page 140 for sample output.

Table 83. Port Statistics Menu Options (/stats/port) (continued)

Command Syntax and Usage

if

Displays interface statistics for the port. See page 147 for sample output.

if-rate

Displays interface statistics per second for the port. See page 150 for sample output.

ip

Displays IP statistics for the port. See page 151 for sample output.

ip-rate

Displays IP statistics per second for the port. See page 153 for sample output.

link

Displays link statistics for the port. See page 153 for sample output.

maint

Displays detailed maintenance statistics for the port.

rmon

Displays Remote Monitoring (RMON) statistics for the port. See page 154 for sample output.

dump

This command dumps all statistics for the selected port.

clear

This command clears all the statistics on the selected port.

/stats/port <port alias or number>/8021x

802.1x Authenticator Statistics

This menu option enables you to display the 802.1x authenticator statistics of the selected port.

```
Authenticator Statistics:

eapolFramesRx = 925
eapolFramesTx = 3201
eapolStartFramesRx = 2
eapolLogoffFramesRx = 0
eapolRespIdFramesRx = 463
eapolRespFramesRx = 460
eapolReqIdFramesTx = 1820
eapolReqFramesTx = 1381
invalidEapolFramesRx = 0
eapLengthErrorFramesRx = 0
lastEapolFrameVersion = 1
lastEapolFrameSource = 00:01:02:45:ac:51
```

Table 84. 802.1x Authenticator Statistics of a Port (/stats/port/8021x)

Statistics	Description
eapolFramesRx	Total number of EAPOL frames received
eapolFramesTx	Total number of EAPOL frames transmitted
eapolStartFramesRx	Total number of EAPOL Start frames received
eapolLogoffFramesRx	Total number of EAPOL Logoff frames received
eapolRespldFramesRx	Total number of EAPOL Response Identity frames received
eapolRespFramesRx	Total number of Response frames received
eapolReqIdFramesTx	Total number of Request Identity frames transmitted
eapolReqFramesTx	Total number of Request frames transmitted
invalidEapolFramesRx	Total number of invalid EAPOL frames received
eapLengthErrorFramesRx	Total number of EAP length error frames received
lastEapolFrameVersion	The protocol version number carried in the most recently received EAPOL frame.
lastEapolFrameSource	The source MAC address carried in the most recently received EAPOL frame.

/stats/port <port alias or number>/8021x

802.1x Authenticator Diagnostics

This menu option enables you to display the 802.1x authenticator diagnostics of the selected port.

 backendAuthFails
                                     = 458
```

Table 85. 802.1x Authenticator Diagnostics of a Port (/stats/port/8021x)

Statistics	Description
authEntersConnecting	Total number of times that the state machine transitions to the CONNECTING state from any other state.
authEapLogoffsWhile Connecting	Total number of times that the state machine transitions from CONNECTING to DISCONNECTED as a result of receiving an EAPOL-Logoff message.
authEnters Authenticating	Total number of times that the state machine transitions from CONNECTING to AUTHENTICATING, as a result of an EAP-Response/Identity message being received from the Supplicant.
authSuccessesWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to AUTHENTICATED, as a result of the Backend Authentication state machine indicating successful authentication of the Supplicant.
authTimeoutsWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of the Backend Authentication state machine indicating authentication timeout.
authFailWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to HELD, as a result of the Backend Authentication state machine indicating authentication failure.

Table 85. 802.1x Authenticator Diagnostics of a Port (/stats/port/8021x) (continued)

Statistics	Description
authReauthsWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of a re-authentication request
authEapStartsWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Start message being received from the Supplicant.
authEapLogoffWhile Authenticating	Total number of times that the state machine transitions from AUTHENTICATING to ABORTING, as a result of an EAPOL-Logoff message being received from the Supplicant.
authReauthsWhile Authenticated	Total number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of a re-authentication request.
authEapStartsWhile Authenticated	Total number of times that the state machine transitions from AUTHENTICATED to CONNECTING, as a result of an EAPOL-Start message being received from the Supplicant.
authEapLogoffWhile Authenticated	Total number of times that the state machine transitions from AUTHENTICATED to DISCONNECTED, as a result of an EAPOL-Logoff message being received from the Supplicant.
backendResponses	Total number of times that the state machine sends an initial Access-Request packet to the Authentication server. Indicates that the Authenticator attempted communication with the Authentication Server.
backendAccess Challenges	Total number of times that the state machine receives an initial Access-Challenge packet from the Authentication server. Indicates that the Authentication Server has communication with the Authenticator.
backendOtherRequests ToSupplicant	Total number of times that the state machine sends an EAP-Request packet (other than an Identity, Notification, Failure, or Success message) to the Supplicant. Indicates that the Authenticator chose an EAP-method.
backendNonNak ResponsesFrom Supplicant	Total number of times that the state machine receives a response from the Supplicant to an initial EAP-Request, and the response is something other than EAP-NAK. Indicates that the Supplicant can respond to the Authenticator.s chosen EAP-method.

Table 85. 802.1x Authenticator Diagnostics of a Port (/stats/port/8021x) (continued)

Statistics	Description
backendAuthSuccesses	Total number of times that the state machine receives an Accept message from the Authentication Server. Indicates that the Supplicant has successfully authenticated to the Authentication Server.
backendAuthFails	Total number of times that the state machine receives a Reject message from the Authentication Server. Indicates that the Supplicant has not authenticated to the Authentication Server.
	not authenticated to the Authentication Server.

/stats/port <port alias or number>/bootp

BOOTP Relay Statistics

This menu option enables you to display the bootstrap protocol relay statistics of the selected port

BOOTP Relay statistics for port EXT11:	
Requests received from client:	0
Requests relayed to server:	0
Requests relayed with option 82:	0
Requests dropped due to	
- relay not allowed:	0
- no server or unreachable server:	0
packet or processing errors:	0
Replies received from server:	0
Replies relayed to client:	0
Replies dropped due to	
- packet or processing errors:	0

/stats/port <port alias or number>/brg

Bridging Statistics

This menu option enables you to display the bridging statistics of the selected port.

```
Bridging statistics for port INT1:

dot1PortInFrames: 63242584

dot1PortOutFrames: 63277826

dot1PortInDiscards: 0

dot1TpLearnedEntryDiscards: 0

dot1StpPortForwardTransitions: 0
```

Table 86. Bridging Statistics of a Port (/stats/port/brg)

Statistics	Description
dot1PortInFrames	The number of frames that have been received by this port from its segment. A frame received on the interface corresponding to this port is only counted by this object if and only if it is for a protocol being processed by the local bridging function, including bridge management frames.
dot1PortOutFrames	The number of frames that have been transmitted by this port to its segment. Note that a frame transmitted on the interface corresponding to this port is only counted by this object if and only if it is for a protocol being processed by the local bridging function, including bridge management frames.
dot1PortInDiscards	Count of valid frames received which were discarded (that is, filtered) by the Forwarding Process.
dot1TpLearnedEntry Discards	The total number of Forwarding Database entries, which have been or would have been learnt, but have been discarded due to a lack of space to store them in the Forwarding Database. If this counter is increasing, it indicates that the Forwarding Database is regularly becoming full (a condition which has unpleasant performance effects on the subnetwork). If this counter has a significant value but is not presently increasing, it indicates that the problem has been occurring but is not persistent.
dot1StpPortForward Transitions	The number of times this port has transitioned from the Learning state to the Forwarding state.

/stats/port <port alias or number>/brg-rate

Bridging Per Second Statistics

This menu option enables you to display the bridging statistics per second of the selected port.

```
Bridging statistics for port INT1A:
dot1PortInFrames: 0
dot1PortOutFrames: 0
dot1PortInDiscards: 0
dot1TpLearnedEntryDiscards: 0
dot1StpPortForwardTransitions: 0
```

Table 87. Bridging Statistics of a Port (/stats/port/brg)

Statistics	Description
dot1PortInFrames	The number of frames that have been received by this port from its segment. A frame received on the interface corresponding to this port is only counted by this object if and only if it is for a protocol being processed by the local bridging function, including bridge management frames.
dot1PortOutFrames	The number of frames that have been transmitted by this port to its segment. Note that a frame transmitted on the interface corresponding to this port is only counted by this object if and only if it is for a protocol being processed by the local bridging function, including bridge management frames.
dot1PortInDiscards	Count of valid frames received which were discarded (that is, filtered) by the Forwarding Process.
dot1TpLearnedEntry Discards	The total number of Forwarding Database entries, which have been or would have been learnt, but have been discarded due to a lack of space to store them in the Forwarding Database. If this counter is increasing, it indicates that the Forwarding Database is regularly becoming full (a condition which has unpleasant performance effects on the subnetwork). If this counter has a significant value but is not presently increasing, it indicates that the problem has been occurring but is not persistent.
dot1StpPortForward Transitions	The number of times this port has transitioned from the Learning state to the Forwarding state.

/stats/port <port alias or number>/ether

Ethernet Statistics

This menu option enables you to display the ethernet statistics of the selected port.

```
Ethernet statistics for port INT1A:
dot3StatsAlignmentErrors: 0
dot3StatsFCSErrors: 0
dot3StatsSingleCollisionFrames: 0
dot3StatsMultipleCollisionFrames: 0
dot3StatsMultipleCollisions: 0
dot3StatsLateCollisions: 0
dot3StatsLateCollisions: 0
dot3StatsExcessiveCollisions: NA
dot3StatsInternalMacTransmitErrors: NA
dot3StatsFrameTooLongs: 0
dot3StatsInternalMacReceiveErrors: 0
```

Table 88. Ethernet Statistics of a Port (/stats/port/ether)

Statistics	Description
dot3StatsAlignment Errors	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the Frame Check Sequence (FCS) check.
	The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the Logical Link Control (LLC) (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsFCS Errors	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the Frame Check Sequence (FCS) check.
	The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsSingle CollisionFrames	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision.
	A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrame Object.

Table 88. Ethernet Statistics of a Port (/stats/port/ether)

Statistics	Description
dot3StatsMultiple CollisionFrames	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision.
	A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object.
dot3StatsLate Collisions	The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet.
	Five hundred and twelve bit-times corresponds to 51.2 microseconds on a 10 Mbit/s system. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics.
dot3StatsExcessiv e Collisions	A count of frames for which transmission on a particular interface fails due to excessive collisions.
dot3StatsInternal MacTransmitErrors	A count of frames for which transmission on a particular interface fails due to an internal MAC sub layer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object.
	The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted.

Table 88. Ethernet Statistics of a Port (/stats/port/ether)

Statistics	Description
dot3StatsFrameTo o Longs	A count of frames received on a particular interface that exceed the maximum permitted frame size.
J J	The count represented by an instance of this object is incremented when the <code>frameTooLong</code> status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsInternal MacReceiveErrors	A count of frames for which reception on a particular interface fails due to an internal MAC sub layer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameTooLongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object.
	The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of received errors on a particular interface that are not otherwise counted.

/stats/port <port alias or number>/eth-rate

Ethernet Statistics Per Second

This menu option enables you to display the ethernet statistics per second of the selected port.

```
Ethernet statistics for port INT1A:
                                            0
dot3StatsAlignmentErrors:
dot3StatsFCSErrors:
                                            0
dot3StatsSingleCollisionFrames:
dot3StatsMultipleCollisionFrames:
dot3StatsLateCollisions:
                                            0
dot3StatsExcessiveCollisions:
                                            0
dot3StatsInternalMacTransmitErrors:
                                           NA
dot3StatsFrameTooLongs:
dot3StatsInternalMacReceiveErrors:
                                            0
```

Table 89. Ethernet Statistics of a Port (/stats/port/ether)

Statistics	Description
dot3StatsAlignmentErrors	A count of frames received on a particular interface that are not an integral number of octets in length and do not pass the Frame Check Sequence (FCS) check.
	The count represented by an instance of this object is incremented when the alignmentError status is returned by the MAC service to the Logical Link Control (LLC) (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsFCSErrors	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the Frame Check Sequence (FCS) check.
	The count represented by an instance of this object is incremented when the frameCheckError status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.

Table 89. Ethernet Statistics of a Port (/stats/port/ether) (continued)

Statistics	Description
dot3StatsSingleCollision Frames	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision.
	A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsMultipleCollisionFrame object.
dot3StatsMultipleCollision Frames	A count of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision.
	A frame that is counted by an instance of this object is also counted by the corresponding instance of either the ifOutUcastPkts, ifOutMulticastPkts, or ifOutBroadcastPkts, and is not counted by the corresponding instance of the dot3StatsSingleCollisionFrames object.
dot3StatsLateCollisions	The number of times that a collision is detected on a particular interface later than 512 bit-times into the transmission of a packet.
	Five hundred and twelve bit-times corresponds to 51.2 microseconds on a 10 Mbit/s system. A (late) collision included in a count represented by an instance of this object is also considered as a (generic) collision for purposes of other collision-related statistics.
dot3StatsExcessive Collisions	A count of frames for which transmission on a particular interface fails due to excessive collisions.
dot3StatsInternalMac TransmitErrors	A count of frames for which transmission on a particular interface fails due to an internal MAC sub layer transmit error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsLateCollisions object, the dot3StatsExcessiveCollisions object, or the dot3StatsCarrierSenseErrors object.
	The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of transmission errors on a particular interface that are not otherwise counted.

Table 89. Ethernet Statistics of a Port (/stats/port/ether) (continued)

Statistics	Description
dot3StatsFrameTooLongs	A count of frames received on a particular interface that exceed the maximum permitted frame size.
	The count represented by an instance of this object is incremented when the frameTooLong status is returned by the MAC service to the LLC (or other MAC user). Received frames for which multiple error conditions obtained are, according to the conventions of IEEE 802.3 Layer Management, counted exclusively according to the error status presented to the LLC.
dot3StatsInternalMac ReceiveErrors	A count of frames for which reception on a particular interface fails due to an internal MAC sub layer receive error. A frame is only counted by an instance of this object if it is not counted by the corresponding instance of either the dot3StatsFrameToolongs object, the dot3StatsAlignmentErrors object, or the dot3StatsFCSErrors object.
	The precise meaning of the count represented by an instance of this object is implementation-specific. In particular, an instance of this object may represent a count of received errors on a particular interface that are not otherwise counted.

/stats/port <port alias or number>/if

Interface Statistics

This menu option enables you to display the interface statistics of the selected port.

Interface statistics i	for port EXT1:		
=	ifHCIn Counters	ifHCOut Counters	
Octets:	51697080313	51721056808	
UcastPkts:	65356399	65385714	
BroadcastPkts:	0	6516	
MulticastPkts:	0	0	
FlowCtrlPkts:	0	0	
Discards:	0	0	
Errors:	0	21187	
Ingress Discard reason	ns:	Egress Discard reasons:	
VLAN Discards:	0	HOL-blocking Discards:	0
Filter Discards:	0	MMU Discards:	0
Policy Discards:	0	Cell Error Discards:	0

IBP/CBP Discards:	0	Other Discards:	0
Empty Egress Portmap: * Check for "HOL-block		ssociated egress ports	

Table 90. Interface Statistics of a Port (/stats/port/if)

Statistics	Description
ifInOctets	The total number of octets received on the interface, including framing characters.
ifInUcastPkts	The number of packets, delivered by this sub-layer to a higher sub- layer, which were not addressed to a multicast or broadcast address at this sub-layer.
ifInBroadcastPkts	The number of packets, delivered by this sub-layer to a higher sub- layer, which were addressed to a broadcast address at this sub-layer.
ifInMulticastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
ifInFlowControlPkts	The total number of flow control pause packets received on the interface.
ifInDiscards	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being delivered to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.

Table 90. Interface Statistics of a Port (/stats/port/if)

Statistics	Description
ifInErrors	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being delivered to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol.
ifOutOctets	The total number of octets transmitted out of the interface, including framing characters.
ifOutUcastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
ifOutBroadcastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts.
ifOutMulticastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts.
ifOutFlowControlPkts	The total number of flow control pause packets transmitted out of the interface.
ifOutDiscards	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
ifOutErrors	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.
VLAN Discards	Discarded because the packet was tagged with a VLAN to which this port is not a member.
Filter Discards	Dropped by the Content Aware Engine (user-configured filter).

Table 90. Interface Statistics of a Port (/stats/port/if)

Statistics	Description
Policy Discards	Dropped due to policy setting, such as a user-configured static entry.
Non-Forwarding State	Discarded because the ingress port is not in the forwarding state.
IBP/CBP Discards	Discarded because of Ingress Back Pressure (flow control), or because the Common Buffer Pool is full (for example, insufficient packet buffering).
HOL-blocking Discards	Discarded because of the Head Of Line (HOL) blocking mechanism. Low-priority packets are placed in a separate queue and can be discarded while applications or the TCP protocol determine whether a retransmission is necessary. HOL blocking forces transmission to stop until the overloaded egress port buffer can receive data again.
MMU Discards	Discarded because of the Memory Management Unit.
Cell Error Discards	
MMU Aging Discards	
Other Discards	Discarded packets not included in any category.

/stats/port <port alias or number>/if-rate

Interface Statistics Per Second

This menu option enables you to display the interface statistics per second of the selected port.

Interface statistic	s for port INT1A:	
	ifHCIn Counters	ifHCOut Counters
Octets:	0	0
UcastPkts:	0	0
BroadcastPkts:	0	0
MulticastPkts:	0	0
FlowCtrlPkts:	0	0
Discards:	0	0
Errors:	0	0

Table 91. Interface Statistics of a Port (/stats/port/if-rate)

Statistics	Description
ifInOctets	The total number of octets received on the interface, including framing characters.
ifInUcastPkts	The number of packets, delivered by this sub-layer to a higher sub- layer, which were not addressed to a multicast or broadcast address at this sub-layer.
ifInBroadcastPkts	The number of packets, delivered by this sub-layer to a higher sub- layer, which were addressed to a broadcast address at this sub-layer.
ifInMulticastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
ifInFlowControlPkts	The total number of flow control pause packets received on the interface.
ifInDiscards	The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being delivered to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
ifInErrors	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being delivered to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol.
ifOutOctets	The total number of octets transmitted out of the interface, including framing characters.

Table 91. Interface Statistics of a Port (/stats/port/if-rate) (continued)

Statistics	Description
ifOutUcastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
ifOutBroadcastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts.
ifOutMulticastPkts	The total number of packets that higher-level protocols requested to be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts.
ifOutFlowControlPkts	The total number of flow control pause packets transmitted out of the interface.
ifOutDiscards	The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
ifOutErrors	For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.

/stats/port <port alias or number>/ip

Interface Protocol Statistics

This menu option enables you to display the interface statistics of the selected port.

GEA IP statistics	for port INT1:	
ipInReceives :	0	
ipInHeaderError:	0	
ipInDiscards :	0	

Table 92. Interface Protocol Statistics of a Port (/stats/port/ip)

Statistics	Description
ipInReceives	The total number of input datagrams received from interfaces, including those received in error.
ipInHeaderErrors	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity (the switch).
ipInDiscards	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.

/stats/port <port alias or number>/ip-rate

Interface Protocol Per Second Statistics

This menu option enables you to display the interface statistics per second of the selected port.

```
GEA IP statistics for port INTIA:
ipInReceives : 0
ipInHeaderError: 0
ipInDiscards : 0
```

Table 93. Interface Protocol Statistics of a Port (/stats/port/ip)

Statistics	Description
ipInReceives	The total number of input datagrams received from interfaces, including those received in error.
ipInHeaderErrors	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity (the switch).
ipInDiscards	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.

/stats/port <port alias or number>/link

Link Statistics

This menu enables you to display the link statistics of the selected port.

```
Link statistics for port INT1:
linkStateChange: 1
```

Table 94. Link Statistics of a Port (/stats/port/link)

Statistics	Description
linkStateChange	The total number of link state changes.

/stats/port /port alias or number>/rmon

RMON Statistics

This menu enables you to display the Remote Monitoring (RMON) statistics of the selected port.

```
RMON statistics for port EXT2:
etherStatsDropEvents:
                                 NA
etherStatsOctets:
etherStatsPkts:
                                 0
etherStatsBroadcastPkts:
                                 0
etherStatsMulticastPkts:
etherStatsCRCAlignErrors:
                                 0

etherStatsOversizePkts:
                                NA
etherStatsFragments:
etherStatsJabbers:
etherStatsCollisions:
etherStatsPkts64Octets:
etherStatsPkts65to1270ctets:
etherStatsPkts128to255Octets:
etherStatsPkts256to5110ctets:
                                  0
etherStatsPkts512to1023Octets:
etherStatsPkts1024to1518Octets:
```

Table 95. RMON Statistics of a Port (/stats/port/rmon)

Statistics	Description
etherStatsDropEvents	The total number of packets received that were dropped because of system resource constraints.
etherStatsOctets	The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets).
etherStatsPkts	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.
etherStatsBroadcastPkts	The total number of good packets received that were directed to the broadcast address.
etherStatsMulticastPkts	The total number of good packets received that were directed to a multicast address.
etherStatsCRCAlignErrors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
etherStatsUndersizePkts	The total number of packets received that were less than 64 octets long (excluding framing bits but including FCS octets) and were otherwise well formed.

Table 95. RMON Statistics of a Port (/stats/port/rmon)

Statistics	Description
etherStatsOversizePkts	The total number of packets received that were longer than 1518 octets (excluding framing bits but including FCS octets) and were otherwise well formed.
etherStatsFragments	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
etherStatsJabbers	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Jabber is defined as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.
etherStatsCollisions	The best estimate of the total number of collisions on this Ethernet segment.
etherStatsPkts64Octets	The total number of packets (including bad packets) received that were less than or equal to 64 octets in length (excluding framing bits but including FCS octets).
etherStatsPkts65to127 Octets	The total number of packets (including bad packets) received that were greater than 64 octets in length (excluding framing bits but including FCS octets).
etherStatsPkts128to255 Octets	The total number of packets (including bad packets) received that were greater than 127 octets in length (excluding framing bits but including FCS octets).
etherStatsPkts256to511 Octets	The total number of packets (including bad packets) received that were greater than 255 octets in length (excluding framing bits but including FCS octets).
etherStatsPkts512to1023 Octets	The total number of packets (including bad packets) received that were greater than 511 octets in length (excluding framing bits but including FCS octets).
etherStatsPkts1024to1518 Octets	The total number of packets (including bad packets) received that were greater than 1023 octets in length (excluding framing bits but including FCS octets).

/stats/trunk <trunk group number>

Trunk Statistics Menu

This menu allows you to display traffic statistics for the selected trunk group.

```
[Trunk Group Statistics Menu]

if - Show interface ("if") stats

clear - Clear all trunk group stats
```

Table 96. Trunk Statistics Menu Options (/stats/trunk)

Command Syntax and Usage

if

Displays interface statistics for the trunk group.

clear

This command clears all the statistics on the selected trunk group.

/stats/12

Layer 2 Statistics Menu

```
[Layer 2 Statistics Menu]

fdb - Show FDB stats
lacp - Show LACP stats
hotlink - Show Hot Links stats
lldp - Show LLDP port stats
oam - Show OAM stats
```

The Layer 2 statistics provided by each menu option are briefly described in Table 97, with pointers to detailed information.

Table 97. Layer 2 Statistics Menu Options (/stats/l2)

Command Syntax and Usage

```
fdb [clear]
```

Displays FDB statistics. See page 157 for sample output.

Use the clear option to delete all FDB statistics.

```
lacp [<port alias or number>|clear]
```

Displays Link Aggregation Control Protocol (LACP) statistics for a specified port, or for all ports if no port is specified. See page 158 for sample output.

Use the clear option to delete all LACP statistics.

hotlink

Displays Hotlinks statistics. See page 159 for sample output.

Table 97. Layer 2 Statistics Menu Options (/stats/l2)

Command Syntax and Usage

lldp [<port alias or number>|clear]

Displays LLDP port statistics for a specified port or for all ports if no port is specified. See page 160 for sample output.

Use the clear option to delete all LLDP statistics.

oam

Displays the OAM Statistics menu. See page 160 for sample output.

/stats/12/fdb [clear]

FDB Statistics

FDB statistics:			
current:	83	hiwat:	855

This menu option enables you to display statistics regarding the use of the forwarding database, including the number of new entries, finds, and unsuccessful searches.

FDB statistics are described in the following table:

Table 98. Forwarding Database Statistics (/stats/fdb)

Statistic	Description
current	Current number of entries in the Forwarding Database.
	Highest number of entries recorded at any given time in the Forwarding Database.

Use the clear option to delete all FDB statistics.

/stats/12/lacp [<port alias or number>|clear]

LACP Statistics

```
LACP statistics for port INT1:

Valid LACPDUs received: - 870

Valid Marker PDUs received: - 0

Valid Marker Rsp PDUs received: - 0

Unknown version/TLV type: - 0

Illegal subtype received: - 0

LACPDUs transmitted: - 6031

Marker PDUs transmitted: - 0

Marker Rsp PDUs transmitted: - 0
```

Link Aggregation Control Protocol (LACP) statistics are described in the following table:

Table 99. LACP Statistics (/stats/l2/lacp)

Statistic	Description
Valid LACPDUs received	Total number of valid LACP data units received.
Valid Marker PDUs received	Total number of valid LACP marker data units received.
Valid Marker Rsp PDUs received	Total number of valid LACP marker response data units received.
Unknown version/TLV type	Total number of LACP data units with an unknown version or type, length, and value (TLV) received.
Illegal subtype received	Total number of LACP data units with an illegal subtype received.
LACPDUs transmitted	Total number of LACP data units transmitted.
Marker PDUs transmitted	Total number of LACP marker data units transmitted.
Marker Rsp PDUs transmitted	Total number of LACP marker response data units transmitted.

Use the clear option to delete all LACP statistics.

/stats/12/hotlink

Hotlinks Statistics

```
Hot Links Trigger Stats:

Trigger 1 statistics:

Trigger Name: Trigger 1

Master active: 0

Backup active: 0

FDB update: 0 failed: 0
```

The following table describes the Hotlinks statistics:

Table 100. Hotlinks Statistics (/stats/l2/hotlink)

Statistic	Description
Master active	Total number of times the Master interface transitioned to the Active state.
Backup active	Total number of times the Backup interface transitioned to the Active state.
FDB update	Total number of FDB update requests sent.
failed	Total number of FDB update requests that failed.

/stats/12/11dp <port alias or number>|clear

LLDP Port Statistics

```
LLDP Port INT1 Statistics

Frames Transmitted : 0

Frames Received : 0

Frames Received in Errors : 0

Frames Discarded : 0

TLVs Unrecognized : 0

Neighbors Aged Out : 0
```

The following table describes the LLDP port statistics:

Table 101. LLDP Port Statistics (/stats/l2/lldp)

Statistic	Description
Frames Transmitted	Total number of LLDP frames transmitted.
Frames Received	Total number of LLDP frames received.
Frames Received in Errors	Total number of LLDP frames that had errors.
Frames Discarded	Total number of LLDP frames discarded.
TLVs Unrecognized	Total number of unrecognized TLV (Type, Length, and Value) fields received.
Neighbors Aged Out	Total number of neighbor devices that have had their LLDP information aged out.

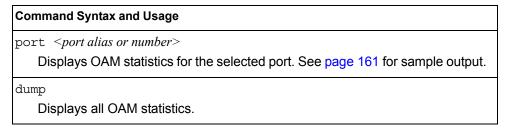

/stats/12/oam

OAM Statistics

```
[OAM statistics Menu]
port - Show OAM port statistics
dump - Show all OAM statistics
```

The following table describes the OAM statistics commands:

Table 102. OAM Statistics Menu Options (/stats/l2/oam)

/stats/12/oam/port <port alias or number>

OAM Statistics

OAM statistics include the following:

- Total number of OAM Protocol Data Units (OAMPDU) transmitted and received.
- Total number of unsupported OAM Protocol Data Units (OAMPDU) transmitted and received.
- Local faults detected
- · Remote faults detected

Layer 3 Statistics Menu

```
[Layer 3 Statistics Menu]

    ospf3clr - Clear all OSPFv3 stats
    dhcp - DHCP statistic Menu
    dump
          - Dump layer 3 stats
```

The Layer 3 statistics provided by each menu option are briefly described in Table 103, with pointers to detailed information.

Table 103. Layer 3 Statistics Menu Options (/stats/l3)

```
Command Syntax and Usage

geal3

Displays the Gigabit Ethernet Aggregators (GEA) statistics menu. GEA statistics are used by service and support personnel. See page 165 for sample output.

ip

Displays IP statistics. See page 166 for sample output.

ip6

Displays IPv6 statistics. See page 169 for sample output.

route [clear]

Displays IPv4 route statistics. See page 173 for sample output.

Use the clear option to delete all route statistics.
```

Table 103. Layer 3 Statistics Menu Options (/stats/l3) (continued)

Command Syntax and Usage

route6 [clear]

Displays IPv6 route statistics. See page 174 for sample output.

Use the clear option to delete all route statistics.

pmtu6

Displays IPv6 Path MTU statistics. See page 174 for sample output.

arp

Displays Address Resolution Protocol (ARP) statistics. See page 175 for sample output.

dns [clear]

Displays Domain Name System (DNS) statistics. See page 175 for sample output.

Use the clear option to delete all DNS statistics.

icmp [clear]

Displays ICMP statistics. See page 176 for sample output.

Use the clear option to delete all ICMP statistics.

tcp [clear]

Displays TCP statistics. See page 178 for sample output.

Use the clear option to delete all TCP statistics.

udp [clear]

Displays UDP statistics. See page 179 for sample output.

Use the clear option to delete all UDP statistics.

igmp

Displays IGMP statistics. See page 180 for sample output.

mld

Displays the MLD statistics menu. See page 181 for menu options.

ospf

Displays OSPF statistics. See page 184 for sample output.

ospf3

Displays OSPFv3 statistics. See page 189 for sample output.

vrrp

When virtual routers are configured, you can display the protocol statistics for VRRP. See page 194 for sample output.

rip

Displays Routing Information Protocol (RIP) statistics. See page 195 for sample output.

Table 103. Layer 3 Statistics Menu Options (/stats/l3) (continued)

Command Syntax and Usage

igmpgrps

Displays the total number of IGMP groups that are registered on the switch.

ipmcgrps

Displays the total number of current IP multicast groups that are registered on the switch.

clrigmp

Clears IGMP statistics.

ipclear

Clears IPv4 statistics. Use this command with caution as it will delete all the IPv4 statistics.

ip6clear

Clears IPv6 statistics. Use this command with caution as it will delete all the IPv6 statistics.

clrvrrp

Clears VRRP statistics.

ripclear

Clears Routing Information Protocol (RIP) statistics.

ospfclr

Clears Open Shortest Path First (OSPF) statistics.

ospf3clr

Clears OSPFv3 statistics.

dhcp

Dumps all Layer 3 statistics. Use this command to gather data for tuning and debugging switch performance. If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump command.

dump

Dumps all Layer 3 statistics. Use this command to gather data for tuning and debugging switch performance. If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump command.

/stats/13/geal3

Gigabit Ethernet Aggregators (GEA) Statistics

```
[GEA Layer 3 Statistics Menu]
13bucket - Show GEA L3 bucket for an IP address
dump - Dump GEA layer 3 stats counter
```

The following table describes the GEA statistics. These are used by technical and support personnel.

Table 104. Layer 3 GEA Statistics Menu Options (/stats/l3/geal3)

Command Syntax and Usage

13bucket <IP address>

Displays the GEA L3 bucket for the specified IP address.

dump

Displays the GEA layer 3 statistics counter.

IPv4 Statistics

IP statistics:				
ipInReceives:	3115873	ipInHdrErrors:	1	
ipInAddrErrors:	35447	ipForwDatagrams:	0	
ipInUnknownProtos:	500504	ipInDiscards:	0	
ipInDelivers:	2334166	ipOutRequests:	1010542	
ipOutDiscards:	4	ipOutNoRoutes:	4	
ipReasmReqds:	0	ipReasmOKs:	0	
ipReasmFails:	0	ipFragOKs:	0	
ipFragFails:	0	ipFragCreates:	0	
ipRoutingDiscards:	0	ipDefaultTTL:	255	
ipReasmTimeout:	5			

Table 105. IPv4 Statistics (stats/l3/ip)

Statistics	Description
ipInReceives	The total number of input datagrams received from interfaces, including those received in error.
ipInHdrErrors	The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so forth.
ipInAddrErrors	The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity (the switch). This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
ipForwDatagrams	The number of input datagrams for which this entity (the switch) was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets, which were Source-Routed via this entity (the switch), and the Source- Route option processing was successful.
ipInUnknownProtos	The number of locally addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.

Table 105. IPv4 Statistics (stats/l3/ip) (continued)

Statistics	Description
ipInDiscards	The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
ipInDelivers	The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).
ipOutRequests	The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.
ipOutDiscards	The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.
ipOutNoRoutes	The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in <code>ipForwDatagrams</code> , which meet this <i>no-route</i> criterion. Note that this includes any datagrams which a host cannot route because all of its default gateways are down.
ipReasmReqds	The number of IP fragments received which needed to be reassembled at this entity (the switch).
ipReasmOKs	The number of IP datagrams successfully re- assembled.
ipReasmFails	The number of failures detected by the IP re- assembly algorithm (for whatever reason: timed out, errors, and so forth). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
ipFragOKs	The number of IP datagrams that have been successfully fragmented at this entity (the switch).
ipFragFails	The number of IP datagrams that have been discarded because they needed to be fragmented at this entity (the switch) but could not be, for example, because their <code>Don't Fragment flag was set</code> .
ipFragCreates	The number of IP datagram fragments that have been generated as a result of fragmentation at this entity (the switch).

Table 105. IPv4 Statistics (stats/l3/ip) (continued)

Statistics	Description
ipRoutingDiscards	The number of routing entries, which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free-up buffer space for other routing entries.
ipDefaultTTL	The default value inserted into the Time-To-Live (TTL) field of the IP header of datagrams originated at this entity (the switch), whenever a TTL value is not supplied by the transport layer protocol.
ipReasmTimeout	The maximum number of seconds, which received fragments are held while they are awaiting reassembly at this entity (the switch).

The following table describes the IPv6 statistics.

Table 106. IPv6 Statistics (stats/l3/ip6)

Statistics	Description
Rcvd	Number of datagrams received from interfaces, including those received in error.
HdrErrors	Number of datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so forth.
TooBigErrors	The number of input datagrams that could not be forwarded because their size exceeded the link MTU of outgoing interface.
AddrErrors	Number of datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity (the switch). This count includes invalid addresses. For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

Table 106. IPv6 Statistics (stats/l3/ip6) (continued)

Statistics	Description
FwdDgrams	Number of input datagrams for which this entity (the switch) was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets, which were Source-Routed via this entity (the switch), and the Source-Route option processing was successful.
UnknownProtos	Number of locally addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.
Discards	Number of IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.
Delivers	Number of datagrams successfully delivered to IP user-protocols (including ICMP).
OutRequests	Number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission.
OutDiscards	Number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space).
OutNoRoutes	Number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this includes any datagrams which a host cannot route because all of its default gateways are down.
ReasmReqds	Number of IP fragments received which needed to be reassembled at this entity (the switch).
ReasmOKs	Number of IP datagrams successfully re- assembled.
ReasmFails	Number of failures detected by the IP re- assembly algorithm (for whatever reason: timed out, errors, and so forth). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
FragOKs	Number of IP datagrams that have been successfully fragmented at this entity (the switch).
FragFails	Number of IP datagrams that have been discarded because they needed to be fragmented at this entity (the switch) but could not be, for example, because their <code>Don't Fragment</code> flag was set.
FragCreates	Number of IP datagram fragments that have been generated as a result of fragmentation at this entity (the switch).

Table 106. IPv6 Statistics (stats/l3/ip6) (continued)

Statistics	Description
RcvdMCastPkt	The number of multicast packets received by the interface.
SentMcastPkts	The number of multicast packets transmitted by the interface.
TruncatedPkts	The number of input datagrams discarded because datagram frame didn't carry enough data.
RcvdRedirects	The number of Redirect messages received by the interface.
SentRedirects	The number of Redirect messages sent.

The following table describes the IPv6 ICMP statistics.

Table 107. ICMP Statistics (stats/l3/ip6)

Statistics	Description		
	Received		
ICMPPkts	Number of ICMP messages which the entity (the switch) received.		
ICMPErrPkt	Number of ICMP messages which the entity (the switch) received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so forth).		
DestUnreach	Number of ICMP Destination Unreachable messages received.		
TimeExcds	Number of ICMP Time Exceeded messages received.		
ParmProbs	Number of ICMP Parameter Problem messages received.		
PktTooBigMsg	The number of ICMP Packet Too Big messages received by the interface.		
ICMPEchoReq	Number of ICMP Echo (request) messages received.		
ICMPEchoReps	Number of ICMP Echo Reply messages received.		
RouterSols	Number of Router Solicitation messages received by the switch.		
RouterAdv	Number of Router Advertisements received by the switch.		
NeighSols	Number of Neighbor Solicitations received by the switch.		
NeighAdv	Number of Neighbor Advertisements received by the switch.		
Redirects	Number of ICMP Redirect messages received.		
AdminProhib	The number of ICMP destination unreachable/communication administratively prohibited messages received by the interface.		
ICMPBadCode	The number of ICMP Parameter Problem messages received by the interface.		

Table 107. ICMP Statistics (stats/l3/ip6) (continued)

Statistics	Description	
Sent		
ICMPMsgs	Number of ICMP messages which this entity (the switch) attempted to send.	
ICMPErrMsgs	Number of ICMP messages which this entity (the switch) did not send due to problems discovered within ICMP such as a lack of buffer. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of errors that contribute to this counter's value.	
DstUnReach	Number of ICMP Destination Unreachable messages sent.	
TimeExcds	Number of ICMP Time Exceeded messages sent.	
ParmProbs	Number of ICMP Parameter Problem messages sent.	
PktTooBigs	The number of ICMP Packet Too Big messages sent by the interface.	
EchoReq	Number of ICMP Echo (request) messages sent.	
EchoReply	Number of ICMP Echo Reply messages sent.	
RouterSols	Number of Router Solicitation messages sent by the switch.	
RouterAdv	Number of Router Advertisements sent by the switch.	
NeighSols	Number of Neighbor Solicitations sent by the switch.	
NeighAdv	Number of Neighbor Advertisements sent by the switch.	
RedirectMsgs	Number of ICMP Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects.	
AdminProhibMsgs	Number of ICMP destination unreachable/communication administratively prohibited messages sent.	

The following table describes the UDP statistics.

Table 108. UDP Statistics (stats/l3/ip6)

Statistics	Description		
	Received		
UDPDgrams	Number of UDP datagrams received by the switch.		
UDPNoPorts	Number of received UDP datagrams for which there was no application at the destination port.		
UDPErrPkts	Number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.		
Sent			
UDPDgrams	Number of UDP datagrams sent from this entity (the switch).

Table 114. ICMP Statistics (/stats/l3/icmp)

Statistics	Description		
icmplnMsgs	The total number of ICMP messages which the entity (the switch) received. Note that this counter includes all those counted by icmpInErrors.		
icmpInErrors	The number of ICMP messages which the entity (the switch) received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so forth).		
icmpInDestUnreachs	The number of ICMP Destination Unreachable messages received.		
icmpInTimeExcds	The number of ICMP Time Exceeded messages received.		
icmpInParmProbs	The number of ICMP Parameter Problem messages received.		
icmpInSrcQuenchs	The number of ICMP Source Quench (buffer almost full, stop sending data) messages received.		
icmpInRedirects	The number of ICMP Redirect messages received.		
icmpInEchos	The number of ICMP Echo (request) messages received.		
icmpInEchoReps	The number of ICMP Echo Reply messages received.		
icmpInTimestamps	The number of ICMP Timestamp (request) messages received.		
icmpInTimestampReps	The number of ICMP Timestamp Reply messages received.		

Table 114. ICMP Statistics (/stats/l3/icmp) (continued)

Statistics	Description		
icmplnAddrMasks	The number of ICMP Address Mask Request messages received.		
icmpInAddrMaskReps	The number of ICMP Address Mask Reply messages received.		
icmpOutMsgs	The total number of ICMP messages which this entity (the switch) attempted to send. Note that this counter includes all those counted by icmpOutErrors.		
icmpOutErrors	The number of ICMP messages which this entity (the switch) did not send due to problems discovered within ICMP such as a lack of buffer. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of errors that contribute to this counter's value.		
icmpOutDestUnreachs	The number of ICMP Destination Unreachable messages sent.		
icmpOutTimeExcds	The number of ICMP Time Exceeded messages sent.		
icmpOutParmProbs	The number of ICMP Parameter Problem messages sent.		
icmpOutSrcQuenchs	The number of ICMP Source Quench (buffer almost full, stop sending data) messages sent.		
icmpOutRedirects	The number of ICMP Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects.		
icmpOutEchos	The number of ICMP Echo (request) messages sent.		
icmpOutEchoReps	The number of ICMP Echo Reply messages sent.		
icmpOutTimestamps	The number of ICMP Timestamp (request) messages sent.		
icmpOutTimestampReps	The number of ICMP Timestamp Reply messages sent.		
icmpOutAddrMasks	The number of ICMP Address Mask Request messages sent.		
icmpOutAddrMaskReps	The number of ICMP Address Mask Reply messages sent.		

Use the ${\tt clear}$ option to delete all ICMP statistics.

Table 115. TCP Statistics (/stats/l3/tcp)

Statistics	Description
tcpRtoAlgorithm	The algorithm used to determine the timeout value used for retransmitting unacknowledged octets.
tcpRtoMin	The minimum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type has the semantics of the LBOUND quantity described in RFC 793.
tcpRtoMax	The maximum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type has the semantics of the UBOUND quantity described in RFC 793.
tcpMaxConn	The limit on the total number of TCP connections the entity (the switch) can support. In entities where the maximum number of connections is dynamic, this object should contain the value -1.
tcpActiveOpens	The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.
tcpPassiveOpens	The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.
tcpAttemptFails	The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.
tcpEstabResets	The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.

Table 115. TCP Statistics (/stats/l3/tcp)

Statistics	Description
tcpInSegs	The total number of segments received, including those received in error. This count includes segments received on currently established connections.
tcpOutSegs	The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
tcpRetransSegs	The total number of segments retransmitted - that is, the number of TCP segments transmitted containing one or more previously transmitted octets.
tcpInErrs	The total number of segments received in error (for example, bad TCP checksums).
tcpCurBuff	The total number of outstanding memory allocations from heap by TCP protocol stack.
tcpCurConn	The total number of outstanding TCP sessions that are currently opened.
tcpOutRsts	The number of TCP segments sent containing the RST flag.

Use the ${\tt clear}$ option to delete all TCP statistics.

The following table describes the fields in the MLD global statistics output.

Table 119. MLD Global Statistics (/stats/l3/mld/global)

Statistic	Description	
Bad Length	Number of messages received with length errors.	
Bad Checksum	Number of messages received with an invalid IP checksum.	
Bad Receive If	Number of messages received on an interface not enabled for MLD.	
Receive non-local	Number of messages received from non-local senders.	
Invalid packets	Number of rejected packets.	
General Query (v1/v2)	Number of general query packets.	
MAS Query(v1/v2)	Number of multicast address specific query packets.	
MASSQ Query (v2)	Number of multicast address and source specific query packets.	
Listener Report(v1)	Number of packets sent by a multicast listener in response to MLDv1 query.	
Listener Done(v1/v2)	Number of packets sent by a host when it wants to stop receiving multicast traffic.	
Listener Report(v2)	Number of packets sent by a multicast listener in response to MLDv2 query.	
MLDv2 INC mode CSRs	Number of current state records with include filter mode.	
MLDv2 EXC mode CSRs	Number of current state records with exclude filter mode.	
MLDv2 TO_INC FMCRs	Number of filter mode change records for which the filter mode has changed to include mode.	
MLDv2 TO_EXC FMCRs	Number of filter mode change records for which the filter mode has changed to exclude mode.	
MLDv2 ALLOW SLCRs	Number of source list change records for which the specified sources from where the data is to be received has changed.	
MLDv2 BLOCK SLCRs	Number of source list change records for which the specified sources from where the data is to be received is to be blocked.

Table 121. OSPF General Statistics (stats/l3/ospf/general)

Statistics	Description		
Rx/Tx Stats:			
Rx Pkts	The sum total of all OSPF packets received on all OSPF areas and interfaces.		
Tx Pkts	The sum total of all OSPF packets transmitted on all OSPF areas and interfaces.		
Rx Hello	The sum total of all Hello packets received on all OSPF areas and interfaces.		
Tx Hello	The sum total of all Hello packets transmitted on all OSPF areas and interfaces.		
Rx Database	The sum total of all Database Description packets received on all OSPF areas and interfaces.		

Table 121. OSPF General Statistics (stats/l3/ospf/general) (continued)

Statistics	Description	
Tx Database	The sum total of all Database Description packets transmitted on all OSPF areas and interfaces.	
Rx Is Requests	The sum total of all Link State Request packets received on all OSPF areas and interfaces.	
Tx Is Requests	The sum total of all Link State Request packets transmitted on all OSPF areas and interfaces.	
Rx Is Acks	The sum total of all Link State Acknowledgement packets received on all OSPF areas and interfaces.	
Tx Is Acks	The sum total of all Link State Acknowledgement packets transmitted on all OSPF areas and interfaces.	
Rx Is Updates	The sum total of all Link State Update packets received on all OSPF areas and interfaces.	
Tx Is Updates	The sum total of all Link State Update packets transmitted on all OSPF areas and interfaces.	
Nbr Change Stats:		
hello	The sum total of all Hello packets received from neighbors on all OSPF areas and interfaces.	
Start	The sum total number of neighbors in this state (that is, an indication that Hello packets should now be sent to the neighbor at intervals of HelloInterval seconds.) across all OSPF areas and interfaces.	
n2way	The sum total number of bidirectional communication establishment between this router and other neighboring routers.	
adjoint ok	The sum total number of decisions to be made (again) as to whether an adjacency should be established/maintained with the neighbor across all OSPF areas and interfaces.	
negotiation done	The sum total number of neighbors in this state wherein the Master/slave relationship has been negotiated, and sequence numbers have been exchanged, across all OSPF areas and interfaces.	
exchange done	The sum total number of neighbors in this state (that is, in an adjacency's final state) having transmitted a full sequence of Database Description packets, across all OSPF areas and interfaces.	
bad requests	The sum total number of Link State Requests which have been received for a link state advertisement not contained in the database across all interfaces and OSPF areas.	

Table 121. OSPF General Statistics (stats/l3/ospf/general) (continued)

Statistics	Description
bad sequence	The sum total number of Database Description packets which have been received that either:
	a. Has an unexpected DD sequence number
	b. Unexpectedly has the init bit set
	c. Has an options field differing from the last Options field received in a Database Description packet.
	Any of these conditions indicate that some error has occurred during adjacency establishment for all OSPF areas and interfaces.
loading done	The sum total number of link state updates received for all out-of-date portions of the database across all OSPF areas and interfaces.
n1way	The sum total number of Hello packets received from neighbors, in which this router is not mentioned across all OSPF interfaces and areas.
rst_ad	The sum total number of times the Neighbor adjacency has been reset across all OPSF areas and interfaces.
down	The total number of Neighboring routers down (that is, in the initial state of a neighbor conversation.) across all OSPF areas and interfaces.

Table 121. OSPF General Statistics (stats/l3/ospf/general) (continued)

Statistics	Description		
Intf Change Stats:			
up	The sum total number of interfaces up in all OSPF areas.		
down	The sum total number of interfaces down in all OSPF areas.		
loop	The sum total of interfaces no longer connected to the attached network across all OSPF areas and interfaces.		
unloop	The sum total number of interfaces, connected to the attached network in all OSPF areas.		
wait timer	The sum total number of times the Wait Timer has been fired, indicating the end of the waiting period that is required before electing a (Backup) Designated Router across all OSPF areas and interfaces.		
backup	The sum total number of Backup Designated Routers on the attached network for all OSPF areas and interfaces.		
nbr change	The sum total number of changes in the set of bidirectional neighbors associated with any interface across all OSPF areas.		
Timers Kickoff:			
hello	The sum total number of times the Hello timer has been fired (which triggers the send of a Hello packet) across all OPSF areas and interfaces.		
retransmit	The sum total number of times the Retransmit timer has been fired across all OPSF areas and interfaces.		
Isa lock	The sum total number of times the Link State Advertisement (LSA) lock timer has been fired across all OSPF areas and interfaces.		
Isa ack	The sum total number of times the LSA Ack timer has been fired across all OSPF areas and interfaces.		
dbage	The total number of times the data base age (Dbage) has been fired.		
summary	The total number of times the Summary timer has been fired.		
ase export	The total number of times the Autonomous System Export (ASE) timer has been fired.

The OSPFv3 General Statistics contain the sum total of all OSPF packets received on all OSPFv3 areas and interfaces.

Table 123. OSPFv3 General Statistics (stats/l3/ospf3/general)

Statistics	Description		
Rx/Tx Stats:			
Rx Pkts	The sum total of all OSPFv3 packets received on all OSPFv3 interfaces.		
Tx Pkts	The sum total of all OSPFv3 packets transmitted on all OSPFv3 interfaces.		
Discarded Pkts	The sum total of all OSPFv3 packets discarded.		
Rx hello	The sum total of all Hello packets received on all OSPFv3 interfaces.		
Tx hello	The sum total of all Hello packets transmitted on all OSPFv3 interfaces.		
Discarded hello	The sum total of all Hello packets discarded, including packets for which no associated interface has been found.		

Table 123. OSPFv3 General Statistics (stats/l3/ospf3/general) (continued)

Statistics	Description		
Rx database	The sum total of all Database Description packets received on all OSPFv3 interfaces.		
Tx database	The sum total of all Database Description packets transmitted on all OSPFv3 interfaces.		
Discarded database	The sum total of all Database Description packets discarded.		
Rx Is requests	The sum total of all Link State Request packets received on all OSPFv3 interfaces.		
Tx Is requests	The sum total of all Link State Request packets transmitted on all OSPFv3 interfaces.		
Discarded Is requests	The sum total of all Link State Request packets discarded.		
Rx Is acks	The sum total of all Link State Acknowledgement packets received on all OSPFv3 interfaces.		
Tx Is acks	The sum total of all Link State Acknowledgement packets transmitted on all OSPFv3 interfaces.		
Discarded Is acks	The sum total of all Link State Acknowledgement packets discarded.		
Rx Is updates	The sum total of all Link State Update packets received on all OSPFv3 interfaces.		
Tx Is updates	The sum total of all Link State Update packets transmitted on all OSPFv3 interfaces.		
Discarded Is updates	The sum total of all Link State Update packets discarded.		
Nbr Change Stats:	,		
down	The total number of Neighboring routers down (that is, in the initial state of a neighbor conversation.) across all OSPFv3 interfaces.		
attempt	The total number of transitions into attempt state of neighboring routers across all OSPFv3 interfaces.		
init	The total number of transitions into init state of neighboring routers across all OSPFv3 interfaces.		
n2way	The total number of bidirectional communication establishment between this router and other neighboring routers.		
exstart	The total number of transitions into exstart state of neighboring routers across all OSPFv3 interfaces		

Table 123. OSPFv3 General Statistics (stats/l3/ospf3/general) (continued)

Statistics	Description		
exchange done	The total number of neighbors in this state (that is, in an adjacency's final state) having transmitted a full sequence of Database Description packets, across all OSPFv3 interfaces.		
loading done	The total number of link state updates received for all out-of-date portions of the database across all OSPFv3 interfaces.		
full	The total number of transitions into full state of neighboring routers across all OSPFv3 interfaces.		
all events	The total number of state transitions of neighboring routers across all OSPFv3 interfaces.		
Intf Change Stats:			
down	The total number of transitions into down state of all OSPFv3 interfaces.		
loop	The total number of transitions into loopback state of all OSPFv3 interfaces.		
waiting	The total number of transitions into waiting state of all OSPFv3 interfaces.		
ptop	The total number of transitions into point-to-point state of all OSPFv3 interfaces.		
dr	The total number of transitions into Designated Router other state of all OSPFv3 interfaces.		
backup	The total number of transitions into backup state of all OSPFv3 interfaces.		
all events	The total number of changes associated with any OSPFv3 interface, including changes into internal states.		
Timers Kickoff:			
hello	The total number of times the Hello timer has been fired (which triggers the send of a Hello packet) across all OSPFv3 interfaces.		
wait	The total number of times the wait timer has been fired (which causes an interface to exit waiting state), across all OPSFv3 interfaces.		
poll	The total number of times the timer whose firing causes hellos to be sent to inactive NBMA and Demand Circuit neighbors has been fired, across all OPSFv3 interfaces.		
nbr probe	The total number of times the neighbor probe timer has been fired, across all OPSFv3 interfaces.		

Table 123. OSPFv3 General Statistics (stats/l3/ospf3/general) (continued)

Statistics	Description		
Number of LSAs:			
originated	The number of LSAs originated by this router.		
rcvd newer originations	The number of LSAs received that have been determined to be newer originations.		

VRRP Statistics

Virtual Router Redundancy Protocol (VRRP) support on the Virtual Fabric 10Gb Switch Module (VFSM) provides redundancy between routers in a LAN. This is accomplished by configuring the same virtual router IP address and ID number on each participating VRRP-capable routing device. One of the virtual routers is then elected as the master, based on a number of priority criteria, and assumes control of the shared virtual router IP address. If the master fails, one of the backup virtual routers will assume routing authority and take control of the virtual router IP address.

When virtual routers are configured, you can display the protocol statistics for VRRP:

VRRP statistics: vrrpInAdvers: vrrpOutAdvers: vrrpBadVersion:	0 0 0	vrrpBadAdvers: vrrpOutGratuitousARPs: vrrpBadVrid:	0 0 0	
vrrpBadAddress:	0	vrrpBadData:	0	
vrrpBadPassword:	0	vrrpBadInterval:	0	

Table 124. VRRP Statistics (/stats/l3/vrrp)

Statistics	Description		
vrrpInAdvers	The total number of valid VRRP advertisements that have been received.		
vrrpBadAdvers	The total number of VRRP advertisements received that were dropped.		
vrrpOutAdvers	The total number of VRRP advertisements that have been sent.		
vrrpOut GratuitousARPs	The total number of VRRP gratuitous ARPs that have been sent.		
vrrpBadVersion	The total number of VRRP advertisements received that had a bad version number.		
vrrpBadVrid	The total number of VRRP advertisements received that had a bad virtual router ID.		
vrrpBadAddress	The total number of VRRP advertisements received that had a bad address.		
vrrpBadData	The total number of VRRP advertisements received that had bad data.		
vrrpBadPassword	The total number of VRRP advertisements received that had a bad password.		
vrrpBadInterval	The total number of VRRP advertisements received that had a bad interval.

Table 127. MP Packet Statistics (/stats/mp/pkt/counters)

Statistics	Description			
Packets received by CPU				
Total packets	Total number of packets received			
BPDUs	Total number of spanning-tree Bridge Protocol Data Units received.			
Cisco packets	Total number of UniDirectional Link Detection (UDLD) packets and Cisco Discovery Protocol (CDP) packets received.			
ARP packets	Total number of Address Resolution Protocol packets received.			
IPv4 packets	Total number of IPv4 packets received.			
IPv6 packets	Total number of IPv6 packets received.			
LLDP PDUs	Total number of Link Layer Discovery Protocol data units received.			
Other	Total number of other packets received.			
Packet Buffer Statistics				
allocs	Total number of packet allocations from the packet buffer pool by the TCP/IP protocol stack.			
frees	Total number of times the packet buffers are freed (released) to the packet buffer pool by the TCP/IP protocol stack.			
failures	Total number of packet allocation failures from the packet buffer pool by the TCP/IP protocol stack.			
small packet buffers				
current	Total number of packet allocations with size less than 128 bytes from the packet buffer pool by the TCP/IP protocol stack.			
max	Maximum number of small packet allocations supported			
threshold	Threshold value for small packet allocations, beyond which only high-priority small packets are allowed.			
hi-watermark	The highest number of packet allocation with size less than 128 bytes from the packet buffer pool by the TCP/IP protocol stack.			
hi-water time	Time stamp that indicates when the hi-watermark was reached.

    ipv6 - Display only IPv6 packets logged
    rip
            - Display only RIP packets logged
    ospf
            - Display only OSPF packets logged
            - Display only BGP packets logged
    bab
          - Display only LLDP PDUs logged
    lldp
          - Display only logged packets with specified vlan
    vlan
    port - Display only logged packets with specified port
            - Display only logged packets with specified mac address
    ip-addr - Display only logged packets with specified ip address
    other - Display logs of all packets not explicitly selectable
            - Display raw packet buffer in addition to headers
```

The behavior of the options in this menu is dependent upon the menu from which you arrived at the MP Packet-log Parse Types menu.

- If you arrived at this menu from /stats/mp/pkt/parse/rx, only received packets that have been parsed that fit the selected option are displayed.
- If you arrived at this menu from /stats/mp/pkt/parse/tx, only sent packets that have been parsed that fit the selected option are displayed.

Table 129 describes the parsing options.

Table 129. Packet Log Parsing Options

Occurred Occurred Unions					
Command Syntax and Usage					
arp					
Displays only ARP packets logged					
rarp					
Displays only Reverse-ARP packets					
bpdu					
Displays only BPDUs logged					
Cisco					
Displays only Cisco packets (BPDU/CDP/UDLD) logged					
lacp					
Displays only LACP PDUs logged					
fcoe					
Displays only FCoE FIP PDUs logged					
ipv4					
Displays only IPv4 packets logged					
igmp					
Displays only IGMP packets logged					
pim Dianleye only DIM neckets legged					
Displays only PIM packets logged					
icmp					
Displays only ICMP packets logged					
tcp					
Displays only TCP packets logged					
ftp					
Displays only FTP packets logged					
http					
Displays only HTTP packets logged					
Ssh Displays only SSH poskets logged					
Displays only SSH packets logged					
tacacs					
Displays only TACACS packets logged					
telnet					
Displays only TELNET packets logged					

Table 129. Packet Log Parsing Options (continued)
Command Syntax and Usage
tcpother Displays only TCP other-port packets logged.
udp Displays only UDP packets logged.
dhcp Displays only DHCP packets logged.
ntp Displays only NTP packets logged.
radius Displays only RADIUS packets logged.
snmp Displays only SNMP packets logged.
tftp Displays only TFTP packets logged.
udpother Displays only UDP other-port packets logged.
ipv6 Displays only IPv6 packets logged.
rip Displays only RIP packets logged.
ospf Displays only OSPF packets logged.
bgp Displays only BGP packets logged.
11dp Displays only LLDP PDUs logged.
vlan < VLAN_number > Displays only logged packets with the specified VLAN.
port <pre>port <pre>port_number></pre> <pre>Displays only logged packets with the specified port.</pre></pre>
mac <mac_address> Displays only logged packets with the specified MAC address.</mac_address>
ip-addr <ipv4_address></ipv4_address>

Displays only logged packets with the specified IPv4 address.

Table 129. Packet Log Parsing Options (continued)

Command Syntax and Usage		
other Displays logs of all packets not explicitly selectable.		
raw Displays raw packet buffer in addition to headers.

ACL statistics are described in the following table.

Table 133. ACL Statistics Menu Options (/stats/acl)

```
Command Syntax and Usage

acl <ACL number>
Displays the Access Control List Statistics for a specific ACL. For details, see page 209.

acl6 <ACL number>
Displays the IPv6 Access Control List Statistics for a specific ACL.
```

Table 133. ACL Statistics Menu Options (/stats/acl)

dump

Displays all ACL statistics.

vmap < VMAP number>

Displays the VLAN Map statistics for a specific VMAP. For details, see

clracl

Clears all ACL statistics.

clracl6

Clears all IPv6 ACL statistics.

clrvmap

Clears all VMAP statistics.

/stats/acl/acl [<ACL number>]

ACL Statistics List

This option displays statistics for the selected ACL if an ACL number is specified, or for all ACLs if the option is omitted.

Hits for ACL 1:	26057515	
Hits for ACL 2:	26057497	

/stats/acl/vmap [<VMAP number>|all]

VLAN Map Statistics

This option displays statistics for the selected VLAN Map, or for all VMAPs.

Hits for VMAP 1:	57515	
Hits for VMAP 2:	74970	

/stats/fcoe [clear]

Fiber Channel over Ethernet Statistics

FCOE statistics:			
FCFAdded:	5	FCFRemoved:	1
FCOEAdded:	81	FCOERemoved:	24

Fiber Channel over Ethernet (FCoE) statistics are described in the following table:

Table 134. FCoE Statistics (/stats/fcoe)

Statistic	Description
FCFAdded	Total number of FCoE Forwarders (FCF) added.
FCFRemoved	Total number of FCoE Forwarders (FCF) removed.
FCOEAdded	Total number of FCoE connections added.
FCOERemoved	Total number of FCoE connections removed.

The total can accumulate over several FCoE sessions, until the statistics are cleared.

/stats/snmp [clear]

SNMP Statistics

Note: You can reset the SNMP counter to zero by using clear command, as follows:

snmpSilentDrops:	0	snmpProxyDrops:	0	

Table 135. SNMP Statistics (/stats/snmp)

Statistics	Description
snmpInPkts	The total number of Messages delivered to the SNMP entity from the transport service.
snmpInBadVersions	The total number of SNMP Messages, which were delivered to the SNMP protocol entity and were for an unsupported SNMP version.
snmpInBadC'tyNames	The total number of SNMP Messages delivered to the SNMP entity which used an SNMP community name not known to the said entity (the switch).
snmpInBadC'tyUses	The total number of SNMP Messages delivered to the SNMP protocol entity which represented an SNMP operation which was not allowed by the SNMP community named in the Message.
snmpInASNParseErrs	The total number of ASN.1 or BER errors encountered by the SNMP protocol entity when decoding SNMP Messages received.
	Note: OSI's method of specifying abstract objects is called ASN.1 (Abstract Syntax Notation One, defined in X.208), and one set of rules for representing such objects as strings of ones and zeros is called the BER (Basic Encoding Rules, defined in X.209). ASN.1 is a flexible notation that allows one to define a variety of data types, from simple types such as integers and bit strings to structured types such as sets and sequences. BER describes how to represent or encode values of each ASN.1 type as a string of eight-bit octets.
snmpEnableAuthTraps	An object to enable or disable the authentication traps generated by this entity (the switch).
snmpOutPkts	The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.
snmpInBadTypes	The total number of SNMP Messages which failed ASN parsing.
snmpInTooBigs	The total number of SNMP Protocol Data Units (PDUs) which were delivered to the SNMP protocol entity and for which the value of the error-status field is too big.
snmpInNoSuchNames	The total number of SNMP Protocol Data Units (PDUs) which were delivered to the SNMP protocol entity and for which the value of the error-status field is noSuchName.
snmpInBadValues	The total number of SNMP Protocol Data Units (PDUs) which were delivered to the SNMP protocol entity and for which the value of the error-status field is badValue.

© Copyright IBM Corp. 2012 Chapter 5: The Statistics Menu **211**

Table 135. SNMP Statistics (/stats/snmp) (continued)

Statistics	Description
snmpInReadOnlys	The total number of valid SNMP Protocol Data Units (PDUs), which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'read-Only'. It should be noted that it is a protocol error to generate an SNMP PDU, which contains the value 'read-Only' in the error-status field. As such, this object is provided as a means of detecting incorrect implementations of the SNMP.
snmpInGenErrs	The total number of SNMP Protocol Data Units (PDUs), which were delivered to the SNMP protocol entity and for which the value of the error-status field is genErr.
snmpInTotalReqVars	The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as a result of receiving valid SNMP Get-Request and Get-Next Protocol Data Units (PDUs).
snmpInTotalSetVars	The total number of MIB objects, which have been altered successfully by the SNMP protocol entity as a result of receiving valid SNMP Set-Request Protocol Data Units (PDUs).
snmpInGetRequests	The total number of SNMP Get-Request Protocol Data Units (PDUs), which have been accepted and processed by the SNMP protocol entity.
snmpInGetNexts	The total number of SNMP Get-Next Protocol Data Units (PDUs), which have been accepted and processed by the SNMP protocol entity.
snmpInSetRequests	The total number of SNMP Set-Request Protocol Data Units (PDUs), which have been accepted and processed by the SNMP protocol entity.
snmpInGetResponses	The total number of SNMP Get-Response Protocol Data Units (PDUs), which have been accepted and processed by the SNMP protocol entity.
snmpInTraps	The total number of SNMP Trap Protocol Data Units (PDUs), which have been accepted and processed by the SNMP protocol entity.
snmpOutTooBigs	The total number of SNMP Protocol Data Units (PDUs), which were generated by the SNMP protocol entity and for which the value of the error-status field is too big.
snmpOutNoSuchNames	The total number of SNMP Protocol Data Units (PDUs), which were generated by the SNMP protocol entity and for which the value of the error-status is noSuchName.

Table 135. SNMP Statistics (/stats/snmp) (continued)

Statistics	Description	
snmpOutBadValues	The total number of SNMP Protocol Data Units (PDUs), which were generated by the SNMP protocol entity and for which the value of the error-status field is badValue.	
snmpOutReadOnlys	Not in use.	
snmpOutGenErrs	The total number of SNMP Protocol Data Units (PDUs), which were generated by the SNMP protocol entity and for which the value of the error-status field is genErr.	
snmpOutGetRequests	The total number of SNMP Get-Request Protocol Data Units (PDUs), which have been generated by the SNMP protocol entity.	
snmpOutGetNexts	The total number of SNMP Get-Next Protocol Data Units (PDUs), which have been generated by the SNMP protocol entity.	
snmpOutSetRequests	The total number of SNMP Set-Request Protocol Data Units (PDUs), which have been generated by the SNMP protocol entity.	
snmpOutGetResponses	The total number of SNMP Get-Response Protocol Data Units (PDUs), which have been generated by the SNMP protocol entity.	
snmpOutTraps	The total number of SNMP Trap Protocol Data Units (PDUs), which have been generated by the SNMP protocol entity.	
snmpSilentDrops	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMPv2 entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request.	
snmpProxyDrops	The total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the message to a proxy target failed in a manner such that no Response-PDU could be returned.

NTP Statistics

IBM N/OS uses NTP (Network Timing Protocol) version 3 to synchronize the switch's internal clock with an atomic time calibrated NTP server. With NTP enabled, the switch can accurately update its internal clock to be consistent with other devices on the network and generates accurate syslogs.

```
NTP statistics:

Primary Server:

Requests Sent:
17
Responses Received:
17
Updates:
1
Secondary Server:
Requests Sent:
0
Responses Received:
0
Updates:
0
```

Table 136. NTP Statistics Parameters (/stats/ntp)

Field	Description
Primary Server	Requests Sent: The total number of NTP requests the switch sent to the primary NTP server to synchronize time.
	 Responses Received: The total number of NTP responses received from the primary NTP server.
	 Updates: The total number of times the switch updated its time based on the NTP responses received from the primary NTP server.
Secondary Server	Requests Sent: The total number of NTP requests the switch sent to the secondary NTP server to synchronize time.
	 Responses Received: The total number of NTP responses received from the secondary NTP server.
	 Updates: The total number of times the switch updated its time based on the NTP responses received from the secondary NTP server.

Note: Use the following command to delete all NTP statistics: /stats/ntp clear

/stats/dump

Statistics Dump

Use the dump command to dump all switch statistics available from the Statistics Menu (40K or more, depending on your configuration). This data can be used to tune or debug switch performance.

If you want to capture dump data to a file, set your communication software on your workstation to capture session data prior to issuing the dump commands.

Chapter 644. The Configuration Menu

This chapter discusses how to use the Command Line Interface (CLI) for making, viewing, and saving switch configuration changes. Many of the commands, although not new, display more or different information than in the previous version. Important differences are called out in the text.

/cfq

Configuration Menu

```
[Configuration Menu]
    sys - System-wide Parameter Menu
             - Port Menu
    port
    stack - Stacking Menu

    rmon
    virt
             - Virtualization Menu
    setup
            - Step by step configuration set up
    dump
             - Dump current configuration to script file
    ptcfg
            - Backup current configuration to FTP/TFTP server
    qtcfq - Restore current configuration from FTP/TFTP server
             - Display current configuration
```

Each configuration option is briefly described in Table 137, with pointers to detailed menu commands.

Table 137. Configuration Menu Options (/cfg)

Command Syntax and Usage

sys

Displays the System Configuration Menu. To view menu options, see page 219.

port port alias or number>

Displays the Port Configuration Menu. To view menu options, see page 256.

stack

Displays the Stacking Configuration Menu. This menu is visible only if stacking is enabled from the /boot menu, and the switch is reset. To view menu options, see page 265.

Note: This option only appears if you have stacking turned on.

qos

Displays the Quality of Service Configuration Menu. To view menu options, see page 267.

© Copyright IBM Corp. 2012 215

Table 137. Configuration Menu Options (/cfg) (continued)

acl

Displays the ACL Configuration Menu. To view menu options, see page 270.

pmirr

Displays the Mirroring Configuration Menu. To view menu options, see page 288.

12

Displays the Layer 2 Configuration Menu. To view menu options, see page 290.

13

Displays the Layer 3 Configuration Menu. To view menu options, see page 335.

cee

Displays the Converged Ethernet Configuration Menu. To view menu options, see page 438.

fcoe

Displays the Fiber Channel over Ethernet Configuration Menu. To view menu options, see page 445.

rmon

Displays the Remote Monitoring (RMON) Configuration Menu. To view menu options, see page 448.

virt

Displays the Virtualization Configuration Menu. To view menu options, see page 453.

dump

Dumps current configuration to a script file. For details, see page 470.

ptcfg <FTP/TFTP server host name or IP address> <filename on host> Backs up current configuration to FTP/TFTP server. For details, see page 470.

gtcfg <host name or IP address of FTP/TFTP server> <filename on host> Restores current configuration from FTP/TFTP server. For details, see page 471.

cur

Displays current configuration parameters.

Viewing, Applying, and Saving Changes

As you use the configuration menus to set switch parameters, the changes you make do not take effect immediately. All changes are considered "pending" until you explicitly apply them. Also, any changes are lost the next time the switch boots unless the changes are explicitly saved.

Note: Some operations can override the settings in the Configuration menu. Therefore, settings you view in the Configuration menu (for example, port status) might differ from run-time information that you view in the Information menu or on the management module. The Information menu displays current run-time information of switch parameters.

While configuration changes are in the pending state, you can do the following:

- View the pending changes
- Apply the pending changes
- Save the changes to flash memory

Viewing Pending Changes

You can view all pending configuration changes by entering diff at the menu

Note: The diff command is a global command. Therefore, you can enter diff at any prompt in the CLI.

Applying Pending Changes

To make your configuration changes active, you must apply them. To apply configuration changes, enter apply at any prompt in the CLI.

apply

Note: The apply command is a global command. Therefore, you can enter apply at any prompt in the administrative interface.

Saving the Configuration

In addition to applying the configuration changes, you can save them to flash memory on the Virtual Fabric 10Gb Switch Module (VFSM).

Note: If you do not save the changes, they will be lost the next time the system is rebooted.

To save the new configuration, enter the following command at any CLI prompt:

save

When you save configuration changes, the changes are saved to the *active* configuration block. The configuration being replaced by the save is first copied to the *backup* configuration block. If you do not want the previous configuration block copied to the backup configuration block, enter the following instead:

save n

You can decide which configuration you want to run the next time you reset the switch. Your options include:

- The active configuration block
- The backup configuration block
- · Factory default configuration

You can view all pending configuration changes that have been applied but not saved to flash memory using the diff flash command. It is a global command that can be executed from any menu.

For instructions on selecting the configuration to run at the next system reset, see "Selecting a Configuration Block" on page 499.

System Configuration Menu

```
[System Menu]
    linevty - Lines Telnet SSH Menu
    linecons - Lines Console Menu
    errdis - ErrDisable Menu
    syslog - Syslog Menu
            - SSH Server Menu
    sshd
    radius - RADIUS Authentication Menu
    tacacs+ - TACACS+ Authentication Menu
    ldap - LDAP Authentication Menu
    ntp
            - NTP Server Menu
            - System SNMP Menu
    ssnmp
    access - System Access Menu
    dst
            - Custom DST Menu
    sflow - sFlow Menu
            - Set system date
    date
    time - Set system time
    timezone - Set system timezone (daylight savings)
    dlight - Set system daylight savings
    idle - Set timeout for idle CLI sessions
    linkscan - Set linkscan mode
    notice - Set login notice
             - Set login banner
    hprompt - Enable/disable display hostname (sysName) in CLI prompt
    reminder - Enable/disable Reminders
    rstctrl - Enable/disable System reset on panic
    pktlog - Enable/disable CPU packet logging capability
            - Display current system-wide parameters
```

This menu provides configuration of switch management parameters such as user and administrator privilege mode passwords, Web-based management settings, and management access lists.

Table 138. System Configuration Menu Options (/cfg/sys)

Command Syntax and Usage

linevty

Configures the number of lines per screen displayed in the CLI by default for Telnet and SSH sessions.

linecons

Configures the number of lines per screen displayed in the CLI by default for console sessions.

Displays the Error Disable Recovery menu. To view menu options, see page 222.

syslog

Displays the Syslog Menu. To view menu options, see page 223.

Displays the SSH Server Menu. To view menu options, see page 225.

Table 138. System Configuration Menu Options (/cfg/sys) (continued)

radius

Displays the RADIUS Authentication Menu. To view menu options, see page 226.

tacacs+

Displays the TACACS+ Authentication Menu. To view menu options, see page 228.

ldap

Displays the LDAP Authentication Menu. To view menu options, see page 231.

ntp

Displays the NTP Server menu, which allows you to synchronize the switch clock with a Network Time Protocol server. To view menu options, see page 232.

ssnmp

Displays the System SNMP Menu. To view menu options, see page 233.

access

Displays the System Access Menu. To view menu options, see page 246.

dst

Displays the Custom Daylight Savings Time menu. To view menu options, see page 253.

sflow

Displays the sFlow menu. To view menu options, see page 254.

date

Prompts the user for the system date. The date retains its value when the switch is reset.

time

Configures the system time using a 24-hour clock format. The time retains its value when the switch is reset.

timezone

Configures the time zone where the switch resides. You are prompted to select your location (continent, country, region) by the timezone wizard. Once a region is selected, the switch updates the time to reflect local changes to Daylight Saving Time, etc.

dlight enable disable

Disables or enables daylight saving time in the system clock. When enabled, the switch will add an extra hour to the system clock so that it is consistent with the local clock.

The default value is disabled.

Table 138. System Configuration Menu Options (/cfg/sys) (continued)

idle <idle timeout in minutes>

Sets the idle timeout for CLI sessions, from 1 to 60 minutes. The default is 10 minutes.

linkscan {fast|normal|slow}

Configures the link scan interval used to poll the status of ports.

notice <maximum 1024 character multi-line login notice> <'.' to end>

Displays login notice immediately before the "Enter password:" prompt. This notice can contain up to 1024 characters and new lines.

bannr <string, maximum 80 characters>

Configures a login banner of up to 80 characters. When a user or administrator logs into the switch, the login banner is displayed. It is also displayed as part of the output from the /info/sys command.

hprompt disable enable

Enables or disables displaying of the host name (system administrator's name) in the Command Line Interface (CLI).

reminder disable enable

Enables or disables reminder messages in the CLI. The default value is enabled.

rstctrl disable enable

Enables or disables the reset control flag. When enabled, the switch continues to function after a crash of the main processor, using the last known Layer 2/3 information.

The default value is enabled.

pktlog disable enable

Enables or disables logging of packets that come to the CPU. The default setting is enabled.

cur

Displays the current system parameters.

/cfq/sys/linevty

Lines Per Screen in Telnet/SSH Configuration

```
[Lines Telnet SSH Menu]
length - Set lines-per-page 0-300, zero for infinite
```

Use this command to configure / cfg/sys/linecons

Lines Per Screen in Console Configuration

```
[Lines Console Menu]
length - Set lines-per-page 0-300, zero for infinite
```

User this command to configure

/cfg/sys/errdis

Error Disable Configuration

```
[System ErrDisable Menu]

timeout - Set ErrDisable timeout (sec)

ena - Enable ErrDisable recovery

dis - Disable ErrDisable recovery

cur - Display current ErrDisable configuration
```

The Error Disable and Recovery feature allows the switch to automatically disable a port if an error condition is detected on the port. The port remains in the error-disabled state until it is re-enabled manually, or re-enabled automatically by the switch after a timeout period has elapsed. The error-disabled state of a port does not persist across a system reboot.

Table 139. Error Disable Configuration Options

Command Syntax and Usage

```
timeout <30 - 86400>
```

Configures the error-recovery timeout, in seconds. After the timer expires, the switch attempts to re-enable the port. The default value is 300.

Note: When you change the timeout value, all current error-recovery timers are reset.

ena

Globally enables automatic error-recovery for error-disabled ports. The default setting is ${\tt disabled}$.

Note: Each port must have error-recovery enabled to participate in automatic error recovery ($/cfg/port \ x/errdis/ena$).

dis

Globally disables error-recovery for error-disabled ports.

cur

Displays the current system Error Disable and Recovery configuration.

/cfq/sys/sysloq

System Host Log Configuration Menu

```
[Syslog Menu]
     host
               - Set IP address of first syslog host
     host2 - Set IP address of second syslog host
     sever - Set the severity of first syslog host
     sever2 - Set the severity of second syslog host
facil - Set facility of first syslog host
     facil2 - Set facility of second syslog host
     console - Enable/disable console output of syslog messages
     consev - Severity Level of console output of syslog messages
log - Enable/disable syslogging of features
     buffer - Buffer Menu
           - Display current syslog settings
```

Table 140. Host Log Menu Options (/cfg/sys/syslog)

Command Syntax and Usage

host < new syslog host IP address>

Sets the IP address of the first syslog host.

host2 < new syslog host IP address>

Sets the IP address of the second syslog host.

sever <syslog host local severity (0-7)>

This option sets the severity level of the first syslog host displayed. The default is 7, which means log all severity levels.

sever2 < syslog host local severity (0-7)>

This option sets the severity level of the second syslog host displayed. The default is 7, which means, log all severity levels.

facil <*syslog host local facility (0-7)*>

This option sets the facility level of the first syslog host displayed. The default is

facil2 <*syslog host local facility (0-7)*>

This option sets the facility level of the second syslog host displayed. The default is 0.

console disable enable

Enables or disables delivering syslog messages to the console. When necessary, disabling console ensures the switch is not affected by syslog messages. It is enabled by default.

consev <0-7>

Sets the severity of console output of syslog messages.

Table 140. Host Log Menu Options (/cfg/sys/syslog) (continued)

log <feature|all> <enable|disable>

Displays a list of features for which syslog messages can be generated. You can choose to enable or disable specific features (such as vlans, stg, or ssh), or to enable or disable syslog on all available features.

buffer

Displays the Buffer menu. To view menu options, see page 224.

cur

Displays the current syslog settings.

/cfg/sys/syslog/buffer

Syslog Buffer Menu

```
[Buffer Menu] severity - Severity level of syslog messages write to flash
```

The following commands enable you to store messages of a particular severity.

Table 141. System Host Log Buffer Options

Command Syntax and Usage

severity <syslog buffer severity (0-7)>

Sets the severity level of the syslog messages saved to flash memory. The default is 7, which means log all severity levels.

/cfg/sys/sshd

SSH Server Configuration Menu

```
[SSHD Menu]
            - Set SCP-only admin password
    scpadm
    hkeygen - Generate the RSA host key
    sshport - Set SSH server port number
            - Enable the SCP apply and save
    ena
            - Disable the SCP apply and save
           - Turn SSH server ON
    on
    off
            - Turn SSH server OFF
            - Display current SSH server configuration
```

For the VFSM, this menu enables Secure Shell access from any SSH client. SSH scripts can be viewed by using the /cfg/dump command (see page 470).

Table 142. SSH Configuration Menu Options (/cfg/sys/sshd)

Command Syntax and Usage scpadm Set the administration password for SCP access. hkeygen Generate the RSA host key. sshport <TCP port number> Sets the SSH server port number. ena Enables the SCP apply and save. dis Disables the SCP apply and save. on Enables the SSH server. off Disables the SSH server. cur Displays the current SSH server configuration.

RADIUS Server Configuration Menu

```
[RADIUS Server Menu]
   prisrv - Set primary RADIUS server address
   secsrv - Set secondary RADIUS server address
   secret - Set RADIUS secret
   secret2 - Set secondary RADIUS server secret
   port - Set RADIUS port
   retries - Set RADIUS server retries
   timeout - Set RADIUS server timeout
   sloopif - Set RADIUS source loopback interface
   bckdoor - Enable/disable RADIUS backdoor for telnet/ssh/http/https
   secbd - Enable/disable RADIUS secure backdoor for telnet/ssh/https
         - Turn RADIUS authentication ON
   off
          - Turn RADIUS authentication OFF
          - Display current RADIUS configuration
   cur
```

Table 143. RADIUS Server Configuration Menu Options (/cfg/sys/radius)

```
Command Syntax and Usage
prisrv <IP address>
    Sets the primary RADIUS server address.
secsrv <IP address>
    Sets the secondary RADIUS server address.
secret <1-32 character secret>
    This is the shared secret between the switch and the RADIUS server(s).
secret2 <1-32 character secret>
    This is the secondary shared secret between the switch and the RADIUS
   server(s).
port < RADIUS port>
    Enter the number of the UDP port to be configured, between 1500 - 3000. The
   default is 1645.
retries <RADIUS server retries (1-3)>
    Sets the number of failed authentication requests before switching to a
   different RADIUS server. The default is 3 requests.
timeout <RADIUS server timeout seconds (1-10)>
    Sets the amount of time, in seconds, before a RADIUS server authentication
    attempt is considered to have failed. The default is 3 seconds.
sloopif < 1-5 >
```

Sets the RADIUS source loopback interface.

Table 143. RADIUS Server Configuration Menu Options (/cfg/sys/radius) (continued)

bckdoor disable enable

Enables or disables the RADIUS backdoor for Telnet/SSH/HTTP/HTTPS. The default value is disabled.

To obtain the RADIUS backdoor password for your switch, contact your Service and Support line.

secbd enable disable

Enables or disables the RADIUS back door using secure password for telnet/SSH/HTTP/HTTPS. This command does not apply when backdoor (telnet) is enabled.

on

Enables the RADIUS server.

off

Disables the RADIUS server.

cur

Displays the current RADIUS server parameters.

TACACS+ Server Configuration Menu

TACACS (Terminal Access Controller Access Control system) is an authentication protocol that allows a remote access server to forward a user's logon password to an authentication server to determine whether access can be allowed to a given system. TACACS is not an encryption protocol, and therefore less secure than TACACS+ and Remote Authentication Dial-In User Service (RADIUS) protocols. Both TACACS and TACACS+ are described in RFC 1492.

TACACS+ protocol is more reliable than RADIUS, as TACACS+ uses the Transmission Control Protocol (TCP) whereas RADIUS uses the User Datagram Protocol (UDP). Also, RADIUS combines authentication and authorization in a user profile, whereas TACACS+ separates the two operations.

TACACS+ offers the following advantages over RADIUS as the authentication device:

- TACACS+ is TCP-based, so it facilitates connection-oriented traffic.
- It supports full-packet encryption, as opposed to password-only in authentication requests.

It supports de-coupled authentication, authorization, and accounting.

```
[TACACS+ Server Menu]
    prisrv - Set primary TACACS+ server hostname IP address
    secsrv - Set secondary TACACS+ server hostname IP address
    chpass p - Set new password for primary server
    chpass_s - Set new password for secondary server
    secret - Set secret for primary TACACS+ server
    secret2 - Set secret for secondary TACACS+ server
    port - Set TACACS+ port number
    retries - Set number of TACACS+ server retries
    attempts - Set number of TACACS+ login attempts
    timeout - Set timeout value of TACACS+ server retries
    sloopif - Set TACACS+ source loopback interface
    usermap - Set user privilege mappings
    bckdoor - Enable/disable TACACS+ backdoor for telnet/ssh/http/https
    secbd - Enable/disable TACACS+ secure backdoor
    cmap
             - Enable/disable TACACS+ new privilege level mapping
    passch - Enable/disable TACACS+ password change
    cauth - Enable/disable TACACS+ command authorization
clog - Enable/disable TACACS+ command logging
           - Enable/disable TACACS+ directed request
    dreg
    acct
            - Enable/disable TACACS+ accounting
            - Enable TACACS+ authentication
    off
            - Disable TACACS+ authentication
    cur - Display current TACACS+ settings
```

Table 144. TACACS+ Server Menu Options (/cfg/sys/tacacs)

```
Command Syntax and Usage

prisrv <IP address>
   Defines the primary TACACS+ server address.

secsrv <IP address>
   Defines the secondary TACACS+ server address.
```

Table 144. TACACS+ Server Menu Options (/cfg/sys/tacacs) (continued)

chpass p

Configures the password for the primary TACACS+ server. The CLI will prompt you for input.

chpass s

Configures the password for the secondary TACACS+ server. The CLI will prompt you for input.

secret <1-32 character secret>

This is the shared secret between the switch and the TACACS+ server(s).

secret2 <1-32 character secret>

This is the secondary shared secret between the switch and the TACACS+ server(s).

port < TACACS port>

Enter the number of the TCP port to be configured, between 1 - 65000. The default is 49.

retries <TACACS server retries, 1-3>

Sets the number of failed authentication requests before switching to a different TACACS+ server. The default is 3 requests.

attempts < 1-10 >

Sets the number of failed login attempts before disconnecting the user. The default is 2 attempts.

timeout <TACACS server timeout seconds, 4-15>

Sets the amount of time, in seconds, before a TACACS+ server authentication attempt is considered to have failed. The default is 5 seconds.

sloopif < 1-5 >

Sets the TACACS+ source loopback interface.

usermap <0-15> user|oper|admin|none

Maps a TACACS+ authorization level to a switch user level. Enter a TACACS+ authorization level (0-15), followed by the corresponding switch user level.

bckdoor enable disable

Enables or disables the TACACS+ back door for Telnet, SSH/SCP, or HTTP/HTTPS.

Enabling this feature allows you to bypass the TACACS+ servers. It is recommended that you use Secure Backdoor to ensure the switch is secured, because Secure Backdoor disallows access through the back door when the TACACS+ servers are responding.

The default setting is disabled.

To obtain the TACACS+ backdoor password for your GbESM, contact your IBM Service and Support line.

Table 144. TACACS+ Server Menu Options (/cfg/sys/tacacs) (continued)

secbd enable disable

Enables or disables TACACS+ secure back door access through Telnet, SSH/SCP, or HTTP/HTTPS only when the TACACS+ servers are not responding.

This feature is recommended to permit access to the switch when the TACACS+ servers become unresponsive. If no back door is enabled, the only way to gain access when TACACS+ servers are unresponsive is to use the back door via the console port.

The default setting is disabled.

cmap enable disable

Enables or disables TACACS+ privilege-level mapping.

The default value is disabled.

passch enable disable

Enables or disables TACACS+ password change.

The default setting is disabled.

cauth enable disable

Enables or disables TACACS+ command authorization.

clog enable disable

Enables or disables TACACS+ command logging.

dreq enable disable

Enables or disables TACACS+ directed request, which uses a specified TACACS+ server for authentication, authorization, accounting. When enabled, When directed-request is enabled, each user must add a configured TACACS+ server hostname to the username (for example, username@hostname) during login.

This command allows the following options:

- Restricted: Only the username is sent to the specified TACACS+ server.
- No-truncate: The entire login string is sent to the TACACS+ server.

acct enable disable

Enables or disables TACACS+ accounting.

on

Enables the TACACS+ server. This is the default setting.

off

Disables the TACACS+ server.

cur

Displays current TACACS+ configuration parameters.

LDAP Server Configuration Menu

LDAP (Lightweight Directory Access Protocol) is an authentication protocol that allows a remote access server to forward a user's logon password to an authentication server to determine whether access can be allowed to a given system.

```
[LDAP Server Menu]
    prisrv - Set IP address of primary LDAP server
    secsrv - Set IP address of secondary LDAP server
    port - Set LDAP port number
   retries - Set number of LDAP server retries
   timeout - Set timeout value of LDAP server retries
    domain - Set domain name
    bckdoor - Enable/disable LDAP backdoor for telnet/ssh/http/https
            - Enable LDAP authentication
    off
            - Disable LDAP authentication
         - Display current LDAP settings
    cur
```

Table 145. LDAP Server Menu Options (/cfg/sys/ldap)

Command Syntax and Usage

prisrv <IP address>

Defines the primary LDAP server address.

secsrv < IP address>

Defines the secondary LDAP server address.

port <LDAP port>

Enter the number of the TCP port to be configured, between 1 - 65000. The default is 389.

retries <LDAP server retries. 1-3>

Sets the number of failed authentication requests before switching to a different LDAP server. The default is 3 requests.

timeout <LDAP server timeout seconds, 4-15>

Sets the amount of time, in seconds, before a LDAP server authentication attempt is considered to have failed. The default is 5 seconds.

domain < domain name (1-128 characters) > | none

Sets the domain name for the LDAP server. Enter the full path for your organization. For example:

ou=people, dc=mydomain, dc=com

bckdoor disable enable

Enables or disables the LDAP back door for Telnet, SSH/SCP, or HTTP/HTTPS. The default setting is disabled.

To obtain the LDAP back door password for your GbESM, contact your Service and Support line.

on

Enables the LDAP server.

Table 145. LDAP Server Menu Options (/cfg/sys/ldap) (continued)

off

Disables the LDAP server. This is the default setting.

cur

Displays current LDAP configuration parameters.

/cfg/sys/ntp

NTP Client Configuration Menu

```
[NTP Server Menu]

prisrv - Set primary NTP server address

secsrv - Set secondary NTP server address

intrval - Set NTP server resync interval

sloopif - Set NTP source loopback interface

on - Turn NTP service ON

off - Turn NTP service OFF

cur - Display current NTP configuration
```

This menu enables you to synchronize the switch clock to a Network Time Protocol (NTP) server. By default, this option is disabled.

Table 146. NTP Configuration Menu Options (/cfg/sys/ntp)

Command Syntax and Usage

prisrv <IP address>

Prompts for the IP addresses of the primary NTP server to which you want to synchronize the switch clock.

secsrv < IP address>

Prompts for the IP addresses of the secondary NTP server to which you want to synchronize the switch clock.

intrval <5-44640>

Specifies the time interval, in minutes, to re-synchronize the switch clock with the NTP server.

sloopif < 1-5 >

Sets the NTP source loopback interface.

on

Enables the NTP synchronization service.

off

Disables the NTP synchronization service.

cur

Displays the current NTP service settings.

System SNMP Configuration Menu

```
[System SNMP Menu]
    snmpv3 - SNMPv3 Menu
    name - Set SNMP "sysName"
locn - Set SNMP "sysLocation"
    cont - Set SNMP "sysContact"
    rcomm - Set SNMP read community string
    wcomm - Set SNMP write community string
    trsrc - Set SNMP trap source interface for SNMPv1
    trloopif - Set SNMP trap source loopback interface
    thostadd - Add a new trap host
    thostrem - Remove an existing trap host
    timeout - Set timeout for the SNMP state machine
             - Enable/disable SNMP "sysAuthenTrap"
           - Enable/disable SNMP link up/down trap
    linkt
    cur - Display current SNMP configuration
```

IBM N/OS supports SNMP-based network management. In SNMP model of network management, a management station (client/manager) accesses a set of variables known as MIBs (Management Information Base) provided by the managed device (agent). If you are running an SNMP network management station on your network, you can manage the switch using the following standard SNMP MIBs:

- MIB II (RFC 1213)
- Ethernet MIB (RFC 1643)
- Bridge MIB (RFC 1493)

An SNMP agent is a software process on the managed device that listens on UDP port 161 for SNMP messages. Each SNMP message sent to the agent contains a list of management objects to retrieve or to modify.

SNMP parameters that can be modified include:

- System name
- System location
- System contact
- Use of the SNMP system authentication trap function
- Read community string
- Write community string
- Trap community strings

Table 147. System SNMP Menu Options (/cfg/sys/ssnmp)

Command Syntax and Usage snmpv3 Displays SNMPv3 menu. To view menu options, see page 235. name < 1-64 characters> Configures the name for the system. locn < 1-64 characters> Configures the name of the system location.

Table 147. System SNMP Menu Options (/cfg/sys/ssnmp) (continued)

cont <1-64 characters>

Configures the name of the system contact.

rcomm <1-32 characters>

Configures the SNMP read community string. The read community string controls SNMP "get" access to the switch. The default read community string is *public*.

wcomm <1-32 characters>

Configures the SNMP write community string. The write community string controls SNMP "set" and "get" access to the switch. The default write community string is *private*.

trsrc <interface number>

Configures the source interface for SNMP traps. The default value is interface 1.

To send traps through the management ports, specify interface 128.

trloopif <1-5>

Configures the loopback interface for SNMP traps.

thostadd <trap host IP address> <trap host community string>

Adds a trap host server.

thostrem <trap host IP address>

Removes the trap host server.

timeout < 1-30 >

Set the timeout value for the SNMP state machine, in minutes.

auth disable enable

Enables or disables the use of the system authentication trap facility. The default setting is <code>disabled</code>.

linkt <port> {disable|enable}

Enables or disables the sending of SNMP link up and link down traps. The default setting is <code>enabled</code>.

cur

Displays the current SNMP configuration.

/cfq/sys/ssnmp/snmpv3

SNMPv3 Configuration Menu

SNMP version 3 (SNMPv3) is an extensible SNMP Framework that supplements the SNMPv2 Framework by supporting the following:

- a new SNMP message format
- security for messages
- access control
- remote configuration of SNMP parameters

For more details on the SNMPv3 architecture please refer to RFC3411 to RFC3418.

```
[SNMPv3 Menu]
   usm - usmUser Table menu
    view
            - vacmViewTreeFamily Table menu
    access - vacmAccess Table menu
    group - vacmSecurityToGroup Table menu
            - community Table menu
    taddr - targetAddr Table menu
    tparam - targetParams Table menu
    notify - notify Table menu
            - Enable/disable V1/V2 access
            - Display current SNMPv3 configuration
```

Table 148. SNMPv3 Configuration Menu Options (/cfg/sys/ssnmp/snmpv3)

Command Syntax and Usage

```
usm < usmUser number (1-16)>
```

Defines a user security model (USM) entry for an authorized user. You can also configure this entry through SNMP. To view menu options, see page 237.

view <vacmViewTreeFamily number (1-128)>

Allows you to create different MIB views. To view menu options, see page 238.

```
access <vacmAccess number (1-32)>
```

Configures the access rights. The View-based Access Control Model defines a set of services that an application can use for checking access rights of the user. You need access control when you have to process retrieval or modification request from an SNMP entity. To view menu options, see page 239.

```
group <vacmSecurityToGroup number (1-16)>
```

Maps the user name to the access group names and their access rights needed to access SNMP management objects. A group defines the access rights assigned to all names that belong to a particular group. To view menu options, see page 241.

```
comm < snmpCommunity number (1-16)>
```

The community table contains objects for mapping community strings and version-independent SNMP message parameters. To view menu options, see page 242.

Table 148. SNMPv3 Configuration Menu Options (/cfg/sys/ssnmp/snmpv3) (continued)

taddr <snmpTargetAddr number (1-16)>

Allows you to configure destination information, consisting of a transport domain and a transport address. This is also termed as transport endpoint. The SNMP MIB provides a mechanism for performing source address validation on incoming requests, and for selecting community strings based on target addresses for outgoing notifications. To view menu options, see page 243.

tparam < target parameters index (1-16)>

Allows you to configure SNMP parameters, consisting of message processing model, security model, security level, and security name information. There may be multiple transport endpoints associated with a particular set of SNMP parameters, or a particular transport endpoint may be associated with several sets of SNMP parameters. To view menu options, see page 244.

notify <notify index (1-16)>

A notification application typically monitors a system for particular events or conditions, and generates Notification-Class messages based on these events or conditions. To view menu options, see page 245.

v1v2 disable|enable

Allows you to enable or disable the access to SNMP version 1 and version 2. The default setting is enabled.

cur

Displays the current SNMPv3 configuration.

/cfq/sys/ssnmp/snmpv3/usm

User Security Model Configuration Menu

You can make use of a defined set of user identities using this Security Model. An SNMP engine must have the knowledge of applicable attributes of a user.

This menu helps you create a user security model entry for an authorized user. You need to provide a security name to create the USM entry.

```
[SNMPv3 usmUser 1 Menu]
   name - Set USM user name
    auth
            - Set authentication protocol
    authpw - Set authentication password
    priv
            - Set privacy protocol
    privpw - Set privacy password
    del
            - Delete usmUser entry
           - Display current usmUser configuration
```

Table 149. User Security Model Configuration Menu Options (/cfg/sys/ssnmp/snmpv3/usm)

Command Syntax and Usage

name <1-32 characters>

Defines a string that represents the name of the user. This is the login name that you need in order to access the switch.

```
auth {md5|sha|none}
```

Configures the authentication protocol between HMAC-MD5-96 or HMAC-SHA-96. The default algorithm is none.

authpw

Allows you to create or change your password for authentication. If you selected an authentication algorithm using the above command, you need to provide a password, otherwise you will get an error message during validation.

priv des | none

Configures the type of privacy protocol on your switch. The privacy protocol protects messages from disclosure. The options are des (CBC-DES Symmetric Encryption Protocol) or none. If you specify des as the privacy protocol, then make sure that you have selected one of the authentication protocols (MD5 or HMAC-SHA-96). If you select none as the authentication protocol, you will get an error message.

privpw

Defines the privacy password.

del

Deletes the selected USM user entries.

cur

Displays the selected USM user entries.

/cfq/sys/ssnmp/snmpv3/view

SNMPv3 View Configuration Menu

```
[SNMPv3 vacmViewTreeFamily 1 Menu]

name - Set view name

tree - Set MIB subtree(OID) which defines a family of view subtrees

mask - Set view mask

type - Set view type

del - Delete vacmViewTreeFamily entry

cur - Display current vacmViewTreeFamily configuration
```

Note that the first five default vacmViewTreeFamily entries cannot be removed, and their names cannot be changed.

Table 150. SNMPv3 View Menu Options (/cfg/sys/ssnmp/snmpv3/view)

Command Syntax and Usage

name <1-32 characters>

Defines the name for a family of view subtrees.

tree <object identifier, such as 1.3.6.1.2.1.1.1.0 (1-64 characters)>

Defines the MIB tree which, when combined with the corresponding mask, defines a family of view subtrees.

mask < bitmask, 1-32 characters > | none

Configures the bit mask, which in combination with the corresponding tree, defines a family of view subtrees.

type included excluded

This command indicates whether the corresponding instances of vacmViewTreeFamilySubtree and vacmViewTreeFamilyMask define a family of view subtrees, which is included in or excluded from the MIB view.

del

Deletes the vacmViewTreeFamily group entry.

cur

Displays the current vacmViewTreeFamily configuration.

/cfq/sys/ssnmp/snmpv3/access

View-Based Access Control Model Configuration Menu

The view-based Access Control Model defines a set of services that an application can use for checking access rights of the user. Access control is needed when the user has to process SNMP retrieval or modification request from an SNMP entity.

```
[SNMPv3 vacmAccess 1 Menu]
   name - Set group name
    prefix - Set content prefix
    model - Set security model
            - Set minimum level of security
    level
          - Set prefix only or exact match
    match
    rview - Set read view index
          - Set write view index
    wview
    nview - Set notify view index
    del
           - Delete vacmAccess entry
    cur - Display current vacmAccess configuration
```

Table 151. View-based Access Control Model Menu Options (/cfg/sys/ssnmp/snmpv3/access)

Command Syntax and Usage

name <1-32 characters>

Defines the name of the group.

prefix <1-32 characters>

Defines the name of the context. An SNMP context is a collection of management information that an SNMP entity can access. An SNMP entity has access to many contexts. For more information on naming the management information, see RFC2571, the SNMP Architecture document. The view-based Access Control Model defines a table that lists the locally available contexts by contextName.

model usm|snmpv1|snmpv2

Allows you to select the security model to be used.

level noAuthNoPriv|authNoPriv|authPriv

Defines the minimum level of security required to gain access rights. The level noAuthNoPriv means that the SNMP message will be sent without authentication and without using a privacy protocol. The level authNoPriv means that the SNMP message will be sent with authentication but without using a privacy protocol. The authPriv means that the SNMP message will be sent both with authentication and using a privacy protocol.

match exact prefix

If the value is set to exact, then all the rows whose contextName exactly matches the prefix are selected. If the value is set to prefix then the all the rows where the starting octets of the contextName exactly match the prefix are selected.

Table 151. View-based Access Control Model Menu Options (/cfg/sys/ssnmp/snmpv3/access) (continued)

rview <1-32 characters>

Defines a read view name that allows you read access to a particular MIB view. If the value is empty or if there is no active MIB view having this value then no access is granted.

wview <1-32 characters>

Defines a write view name that allows you write access to the MIB view. If the value is empty or if there is no active MIB view having this value then no access is granted.

nview <1-32 characters>

Defines a long notify view name that allows you notify access to the MIB view.

del

Deletes the View-based Access Control entry.

cur

Displays the View-based Access Control configuration.

/cfg/sys/ssnmp/snmpv3/group

SNMPv3 Group Configuration Menu

```
[SNMPv3 vacmSecurityToGroup 1 Menu]
   model - Set security model
    uname - Set USM user name
    gname - Set group gname
    del
           - Delete vacmSecurityToGroup entry
           - Display current vacmSecurityToGroup configuration
```

Table 152. SNMPv3 Group Menu Options (/cfg/sys/ssnmp/snmpv3/group)

Command Syntax and Usage

model usm|snmpv1|snmpv2

Defines the security model.

uname <1-32 characters>

Sets the user name as defined in /cfg/sys/ssnmp/snmpv3/usm/name on page 237.

gname <1-32 characters>

The name for the access group as defined in

/cfg/sys/ssnmp/snmpv3/access/name on page 239.

del

Deletes the vacmSecurityToGroup entry.

cur

Displays the current vacmSecurityToGroup configuration.

/cfg/sys/ssnmp/snmpv3/comm

SNMPv3 Community Table Configuration Menu

This command is used for configuring the community table entry. The configured entry is stored in the community table list in the SNMP engine. This table is used to configure community strings in the Local Configuration Datastore (LCD) of SNMP engine.

```
[SNMPv3 snmpCommunityTable 1 Menu]
index - Set community index
name - Set community string
uname - Set USM user name
tag - Set community tag
del - Delete communityTable entry
cur - Display current communityTable configuration
```

Table 153. SNMPv3 Community Table Configuration Menu Options (/cfg/sys/ssnmp/snmpv3/comm)

Command Syntax and Usage

index <1-32 characters>

Configures the unique index value of a row in this table.

name <1-32 characters>

Defines the user name as defined in the /cfg/sys/ssnmp/snmpv3/usm/name command.

uname <1-32 characters>

Defines a readable text string that represents the corresponding value of an SNMP community name in a security model.

tag < 1-255 characters>

Configures a tag that specifies a set of transport endpoints to which a command responder application sends an SNMP trap.

del

Deletes the community table entry.

cur

Displays the community table configuration.

/cfq/sys/ssnmp/snmpv3/taddr

SNMPv3 Target Address Table Configuration Menu

This command is used to configure the target transport entry. The configured entry is stored in the target address table list in the SNMP engine. This table of transport addresses is used in the generation of SNMP messages.

```
[SNMPv3 snmpTargetAddrTable 1 Menu]
    name - Set target address name
    addr - Set target transport address IP
port - Set target transport address por
              - Set target transport address port
    taglist - Set tag list
             - Set targetParams name
     pname
             - Delete targetAddrTable entry
    del
             - Display current targetAddrTable configuration
```

Table 154. Target Address Table Menu Options (/cfg/sys/ssnmp/snmpv3/taddr)

Command Syntax and Usage

name <1-32 characters>

Defines the locally arbitrary, but unique identifier, target address name associated with this entry.

addr <transport IP address>

Configures a transport IPv4/IPv6 address that can be used in the generation of SNMP traps.

IPv6 addresses are not displayed in the configuration, but they do receive traps.

port <transport address port>

Configures a transport address port that can be used in the generation of SNMP traps.

taglist <1-255 characters>

Allows you to configure a list of tags that are used to select target addresses for a particular operation.

pname <1-32 characters>

Defines the name as defined in the /cfg/sys/ssnmp/snmpv3/tparam/name command on page 244.

del

Deletes the Target Address Table entry.

cur

Displays the current Target Address Table configuration.

/cfq/sys/ssnmp/snmpv3/tparam

SNMPv3 Target Parameters Table Configuration Menu

You can configure the target parameters entry and store it in the target parameters table in the SNMP engine. This table contains parameters that are used to generate a message. The parameters include the message processing model (for example: SNMPv3, SNMPv2c, SNMPv1), the security model (for example: USM), the security name, and the security level (noAuthnoPriv, authNoPriv, or authPriv).

```
[SNMPv3 snmpTargetParamsTable 1 Menu]

name - Set target params name

mpmodel - Set message processing model

model - Set security model

uname - Set USM user name

level - Set minimum level of security

del - Delete targetParamsTable entry

cur - Display current targetParamsTable configuration
```

Table 155. Target Parameters Table Configuration Menu Options (/cfg/sys/ssnmp/snmpv3/tparam)

Command Syntax and Usage

name <1-32 characters>

Defines the locally arbitrary, but unique identifier that is associated with this entry.

```
mpmodel snmpv1|snmpv2c|snmpv3
```

Configures the message processing model that is used to generate SNMP messages.

```
model usm|snmpv1|snmpv2
```

Allows you to select the security model to be used when generating the SNMP messages.

```
uname <1-32 characters>
```

Defines the name that identifies the user in the USM table (page 237) on whose behalf the SNMP messages are generated using this entry.

```
level noAuthNoPriv|authNoPriv|authPriv
```

Allows you to select the level of security to be used when generating the SNMP messages using this entry. The level noAuthNoPriv means that the SNMP message will be sent without authentication and without using a privacy protocol. The level authNoPriv means that the SNMP message will be sent with authentication but without using a privacy protocol. The authPriv means that the SNMP message will be sent both with authentication and using a privacy protocol.

del

Deletes the targetParamsTable entry.

cur

Displays the current targetParamsTable configuration.

/cfq/sys/ssnmp/snmpv3/notify

SNMPv3 Notify Table Configuration Menu

SNMPv3 uses Notification Originator to send out traps. A notification typically monitors a system for particular events or conditions, and generates Notification-Class messages based on these events or conditions.

```
[SNMPv3 snmpNotifyTable 1 Menu]
   name - Set notify name
    tag
            - Set notify tag
            - Delete notifyTable entry
         - Display current notifyTable configuration
```

Table 156. Notify Table Menu Options (/cfg/sys/ssnmp/snmpv3/notify)

Command Syntax and Usage

name <1-32 characters>

Defines a locally arbitrary but unique identifier associated with this SNMP notify entry.

tag <1-255 characters>

Allows you to configure a tag that contains a tag value which is used to select entries in the Target Address Table. Any entry in the snmpTargetAddrTable, that matches the value of this tag is selected.

del

Deletes the notify table entry.

cur

Displays the current notify table configuration.

System Access Configuration Menu

```
[System Access Menu]

mgmt - Management Network Definition Menu
user - User Access Control Menu (passwords)
https - HTTPS Web Access Menu
snmp - Set SNMP access control
tnport - Set Telnet server port number
tport - Set the TFTP Port for the system
wport - Set HTTP (Web) server port number
http - Enable/disable HTTP (Web) access
tnet - Enable/disable Telnet access
tsbbi - Enable/disable Telnet/SSH configuration from BBI
userbbi - Enable/disable user configuration from BBI
cur - Display current system access configuration
```

Table 157. System Access Menu Options (/cfg/sys/access)

Command Syntax and Usage

mgmt

Displays the Management Configuration Menu. To view menu options, see page 247.

user

Displays the User Access Control Menu. To view menu options, see page 248.

https

Displays the HTTPS Menu. To view menu options, see page 251.

```
snmp {disable|read-only|read-write}
```

Disables or provides read-only/write-read SNMP access.

```
tnport <TCP port number>
```

Sets an optional telnet server port number for cases where the server listens for telnet sessions on a non-standard port.

```
tport <TFTP port number (1-65535)>
```

Sets the TFTP port for the switch. The default is port 69.

```
wport <TCP port number (1-65535)>
```

Sets the switch port used for serving switch Web content. The default is HTTP port 80. If Global Server Load Balancing is to be used, set this to a different port (such as 8080).

http disable|enable

Enables or disables HTTP (Web) access to the Browser-Based Interface. It is disabled by default.

```
tnet enable disable
```

Enables or disables Telnet access. This command is disabled by default.

Table 157. System Access Menu Options (/cfg/sys/access) (continued)

tsbbi enable|disable

Enables or disables Telnet/SSH configuration access through the Browser-Based Interface (BBI).

userbbi enable disable

Enables or disables user configuration access through the Browser-Based Interface (BBI).

cur

Displays the current system access parameters.

/cfq/sys/access/mqmt

Management Networks Configuration Menu

```
[Management Networks Menu]
   add - Add mgmt network definition
    rem
            - Remove mgmt network definition
            - Display current mgmt network definitions
    cur
    clear - Clear current mgmt network definitions
```

This menu is used to define IP address ranges which are allowed to access the switch for management purposes.

Table 158. Management Network Options

Command Syntax and Usage

add <mgmt network IPv4 or IPv6 address> <mgmt network mask or prefix length>

Adds a defined network through which switch access is allowed through Telnet. SNMP, RIP, or the IBM N/OS browser-based interface. A range of IP addresses is produced when used with a network mask address. Specify an IP address and mask address in dotted-decimal notation.

Note: If you configure the management network without including the switch interfaces, the configuration causes the Firewall Load Balancing health checks to fail and creates a "Network Down" state on the network.

You can add up to 10 management networks.

rem <mgmt network IPv4 or IPv6 address> <mgmt network mask or prefix length> Removes a defined network, which consists of a management network address and a management network mask address.

cur

Displays the current configuration.

clear

Removes all defined management networks.

/cfg/sys/access/user

User Access Control Configuration Menu

```
[User Access Control Menu]

uid - User ID Menu
eject - Eject user
usrpw - Set user password (user)
opw - Set operator password (oper)
admpw - Set administrator password (admin)
strongpw - Strong password menu
cur - Display current user status
```

Note: Passwords can be a maximum of 128 characters.

Table 159. User Access Control Menu Options (/cfg/sys/access/user)

Command Syntax and Usage

```
uid < user ID (1-10)>
```

Displays the User ID Menu. To view menu options, see page 249.

```
eject user|oper|admin|<user name>
```

Ejects the specified user from the VFSM.

```
usrpw <1-128 characters>
```

Sets the user (user) password. The user has no direct responsibility for switch management. The user view switch status information and statistics, but cannot make any configuration changes.

This command will prompt for required information: current admin password, new password (up to 128 characters) and confirmation of the new password.

Note: To disable the user account, set the password to null (no password).

```
opw <1-128 characters>
```

Sets the operator (oper) password. The operator manages all functions of the switch. The operator can view all switch information and statistics and can reset ports.

This command will prompt for required information: current admin password, new password (up to 128 characters) and confirmation of the new password.

Note: To disable the operator account, set the password to null (no password). The default setting is disabled (no password).

```
admpw <1-128 characters>
```

Sets the administrator (admin) password. The administrator has complete access to all menus, information, and configuration commands on the VFSM, including the ability to change both the user and administrator passwords.

This command will prompt for required information: current admin password, new password (up to 128 characters) and confirmation of the new password.

Access includes "oper" functions.

Note: You cannot disable the administrator password.

Table 159. User Access Control Menu Options (/cfg/sys/access/user) (continued)

strongpw

Displays the Strong User Password Menu. To view menu options, see page 250.

Displays the current user status.

/cfq/sys/access/user/uid <1-10>

System User ID Configuration Menu

```
[User ID 1 Menu]
            - Set class of service
            - Set user name
    pswd - Set user password
            - Enable user ID
    ena
            - Disable user ID
            - Delete user ID
            - Display current user configuration
```

Table 160. User ID Configuration Menu Options (/cfg/sys/access/user/uid)

Command Syntax and Usage

cos <user|oper|admin>

Sets the Class-of-Service to define the user's authority level. IBM N/OS defines these levels as: User, Operator, and Administrator, with User being the most restricted level.

name <1-8 characters>

Sets the user name (maximum of eight characters).

pswd <1-128 characters>

Sets the user password.

ena

Enables the user ID.

dis

Disables the user ID.

del

Deletes the user ID.

cur

Displays the current user ID configuration.

/cfg/sys/access/user/strongpw

Strong Password Configuration Menu

```
[Strong Pwd Menu]
ena - Enable usage of strong passwords
dis - Disable usage of strong passwords
expiry - Set password validity
warning - Set warning days before pswd expiry
faillog - Set number of failed logins for security notification
cur - Display current strong password configuration
```

Table 161. Strong Password Menu Options (/cfg/sys/access/user/strongpw)

Command Syntax and Usage

ena

Enables Strong Password requirement.

dis

Disables Strong Password requirement.

expiry <1-365>

Configures the number of days allowed before the password must be changed. The default value is 60 days.

warning < 1-365 >

Configures the number of days before password expiration, that a warning is issued to users. The default value is 15 days.

faillog <1-255>

Configures the number of failed login attempts allowed before a security notification is logged. The default value is 3 login attempts.

cur

Displays the current Strong Password configuration.

/cfq/sys/access/https

HTTPS Access Configuration

```
[https Menu]
   access - Enable/Disable HTTPS Web access
    port - HTTPS WebServer port number
   generate - Generate self-signed HTTPS server certificate
    certSave - save HTTPS certificate
    gtca - Import ca root certificate via TFTP
    gthkey - Import host private key via TFTP
    gthcert - Import host certificate via TFTP
    cur - Display current SSL Web Access configuration
```

Table 162. HTTPS Access Configuration Menu Options (/cfg/sys/access/https)

Command Syntax and Usage

access ena dis

Enables or disables BBI access (Web access) using HTTPS. The default value is enabled.

port <TCP port number>

Defines the HTTPS Web server port number. The default port is 443.

generate

Allows you to generate a certificate to connect to the SSL to be used during the key exchange. A default certificate is created when HTTPS is enabled for the first time. You can create a new certificate defining the information you want to be used in the various fields. For example:

- Country Name (2 letter code) []: CA
- State or Province Name (full name) []: Ontario
- Locality Name (for example, city) []: Ottawa
- Organization Name (for example, company) []: IBM
- Organizational Unit Name (for example, section) []: Datacenter
- Common Name (for example, user's name) []: Mr Smith
- Email (for example, email address) []: info@ibm.com

You will be asked to confirm if you want to generate the certificate. It will take approximately 30 seconds to generate the certificate. The switch will then restart the SSL agent.

certSave

Allows the client, or the Web browser, to accept the certificate and save the certificate to Flash to be used when the switch is rebooted.

gtca <hostname or server-IP-addr> <server-filename>

Enables you to import a certificate authority root certificate using TFTP.

gthkey <hostname or server-IP-addr> <server-filename>

Enables you to import a host private key using TFTP.

Table 162. HTTPS Access Configuration Menu Options (/cfg/sys/access/https) (continued)

gthcert <hostname or server-IP-addr> <server-filename>

Enables you to import a host certificate using TFTP.

cur

Displays the current SSL Web Access configuration.

/cfq/sys/dst

Custom Daylight Saving Time Configuration Menu

```
[Custom DST Menu]
    dststart - Set the DST start day
    dstend - Set the DST stop day
            - Enable custom DST
           - Disable custom DST
    dis
            - Display custom DST configuration
    cur
```

Use this menu to configure custom Daylight Saving Time. The DST will be defined by two rules: the start rule and the end rule. The rules specify the date and time when the DST starts and finishes. These dates are represented as specific calendar dates or as relative offsets in a month (for example, 'the second Sunday of September').

Relative offset example:

2070901 = Second Sunday of September, at 1:00 a.m.

Calendar date example:

0070901 = September 7, at 1:00 a.m.

Table 163. Custom DST Configuration Menu Options (/cfg/sys/dst)

Command Syntax and Usage

```
dststart {<WDDMMhh>}
```

Configures the start date for custom DST, as follows:

WDMMhh

W = week (0-5, where 0 means use the calender date)D = day of the week (01-07, where 01 is Monday)

MM = month (1-12)

hh = hour (0-23)

Note: Week 5 is always considered to be the last week of the month.

```
dstend {<\WDDMMhh>}
```

Configures the end date for custom DST, as follows:

W = week (0-5, where 0 means use the calender date)

D = day of the week (01-07, where 01 is Monday)

MM = month (1-12)

hh = hour (0-23)

Note: Week 5 is always considered to be the last week of the month.

ena

Enables the Custom Daylight Saving Time settings.

dis

Disables the Custom Daylight Saving Time settings.

cur

Displays the current Custom DST configuration.

sFlow Configuration Menu

```
[sFlow Menu]
  ena   - Enable sFlow
  dis   - Disable sFlow
  saddress - Set the sFlow Analyzer IP address
  sport   - Set the sFlow Analyzer port
  port   - sFlow port Menu
  cur   - Display sFlow configuration
```

IBM N/OS supports sFlow version 5. sFlow is a sampling method used for monitoring high speed switched networks. Use this menu to configure the sFlow agent on the switch.

Table 164. sFlow Configuration Menu Options (/cfg/sys/sflow)

Command Syntax and Usage
ena
Enables the sFlow agent.
dis
Disables the sFlow agent.
saddress <ip address=""></ip>
Defines the sFlow server address.
sport <1-65535>
Configures the UDP port for the sFlow server. The default value is 6343.
port <pre>port alias or number></pre>
Configures the sFlow interface port.
cur
Displays the current sFlow configuration.

/cfg/sys/sflow/port port alias or number>

sFlow Port Configuration Menu

```
[sFlow Port Menu]
    polling - Set the sFlow polling interval
    sampling - Set the sFlow sampling rate
          - Display sFlow port configuration
```

Use this menu to configure the sFlow port on the switch.

Table 165. sFlow Port Configuration Menu Options (/cfg/sys/sflow/port)

Command Syntax and Usage

polling <5-60>|0

Configures the sFlow polling interval, in seconds. The default value is 0 (disabled).

sampling <256-65536>|0|

Configures the sFlow sampling rate, in packets per sample. The default value is 0 (disabled).

cur

Displays the current sFlow port configuration.

/cfg/port port alias or number>

Port Configuration Menu

```
[Port INT1 Menu]
    errdis - ErrDisable Menu
    gig
            - Gig Phy Menu
          - UDLD Menu
    udld
           - OAM Menu
    oam
    aclqos - Acl/Qos Configuration Menu
    stp - STP Menu
    8021ppri - Set default 802.1p priority
    pvid - Set default port VLAN id
    name
            - Set port name
    bpdugrd - Enable/disable BPDU Guard
    dscpmrk - Enable/disable DSCP remarking for port
            - Enable/disable RMON for port
           - Enable/Disable FDB Learning for port
    learn
            - Enable/disable VLAN tagging for port
    tagpvid - Enable/disable tagging on pvid
    tagipvid - Enable/disable adding PVID as outer tag on ingress packets
    evbprof - Set EVB Port Profile
    fastfwd - Enable/disable Port Fast Forwarding mode
    floodblk - Enable/disable Port flood blocking
    brate - Set BroadCast Threshold
            - Set MultiCast Threshold
    drate
            - Set Dest. Lookup Fail Threshold
            - Set port as DHCP Snooping trusted or untrusted port
    trust
    dhrate - Set DHCP packets rate limit for port
    ena
           - Enable port
    dis - Disable port
    cur - Display current port configuration
```

Use the Port Configuration menu to configure settings for internal ports (INTx) and external ports (EXTx).

Table 166. Port Configuration Menu Options (/cfg/port)

Command Syntax and Usage

errdis

Displays the Error Disable and Recovery menu. To view menu options, see page 259.

gig

If a port is configured to support Gigabit Ethernet, this option displays the Gigabit Ethernet Physical Link Menu. To view menu options, see page 260.

udld

Displays the Unidirectional Link Detection (UDLD) Menu. To view menu options, see page 261.

oam

Displays the OAM Discovery Configuration Menu. To view menu options, see page 262.

aclqos

Displays the ACL/QoS Configuration Menu. To view menu options, see page 263.

Table 166. Port Configuration Menu Options (/cfg/port) (continued)

stp

Displays the Spanning Tree Port menu. To view menu options, see page 264.

8021ppri <0-7>

Configures the port's 802.1p priority level.

pvid <VLAN number>

Sets the default VLAN number which will be used to forward frames which are not VLAN tagged. The default number is 1 for non-management ports.

name < 1-64 characters > | none

Sets a name for the port. The assigned port name appears next to the port number on some information and statistics screens. The default setting is none.

bpdugrd e|d

Enables or disables BPDU guard, to avoid spanning-tree loops on ports with Port Fast Forwarding enabled.

dscpmark

Enables or disables DSCP re-marking on a port.

rmon e d

Enables or disables Remote Monitoring for the port. RMON must be enabled for any RMON configurations to function.

learn disable enable

Enables or disables FDB learning on the port.

taq disable enable

Disables or enables VLAN tagging for this port. The default setting is disabled for external ports (EXTx) and enabled for internal server ports (INTx).

tagpvid disable enable

Disables or enables VLAN tag persistence. When disabled, the VLAN tag is removed from packets whose VLAN tag matches the port PVID. The default setting is disabled for external (EXTx) ports and internal server ports (INTx), and enabled for MGT ports.

tagipvid disable enable

Enables or disables tagging the ingress frames with the port's VLAN ID. When enabled, the PVID tag is inserted into untagged and 802.1Q single-tagged ingress frames as outer VLAN ID. The default setting is disabled.

evbprof <0-16>

Adds the specified Edge Virtual Bridge (EVB) profile to the port.

Table 166. Port Configuration Menu Options (/cfg/port) (continued)

fastfwd disable enable

Disables or enables Port Fast Forwarding, which permits a port that participates in Spanning Tree to bypass the Listening and Learning states and enter directly into the Forwarding state. While in the Forwarding state, the port listens to the BPDUs to learn if there is a loop and, if dictated by normal STG behavior (following priorities, etc.), the port transitions into the Blocking state. This feature permits the VFSM to interoperate well within Rapid Spanning Tree networks.

floodblk disable enable

Enables or disables port Flood Blocking. When enabled, unicast and multicast packets with unknown destination MAC addresses are blocked from the port.

brate <0-262143> | dis

Limits the number of broadcast packets per second to the specified value. If disabled (dis), the port forwards all broadcast packets.

mrate <0-262143>|dis

Limits the number of multicast packets per second to the specified value. If disabled (dis), the port forwards all multicast packets.

drate <0-262143>|dis

Limits the number of unknown unicast packets per second to the specified value. If disabled (dis), the port forwards all unknown unicast packets.

trust disable enable

Disables or enables the port as DHCP Snooping trusted.

dhrate <1-2048>|dis

Limits the number of DHCP packets per second for the port to the specified value. If disabled (dis), the port forwards all unknown DHCP packets.

ena

Enables the port.

dis

Disables the port. (To temporarily disable a port without changing its configuration attributes, refer to "Temporarily Disabling a Port" on page 259.)

cur

Displays current port parameters.

Temporarily Disabling a Port

To temporarily disable a port without changing its stored configuration attributes, enter the following command at any prompt:

```
Main# /oper/port /port alias or number>/dis
```

Because this configuration sets a temporary state for the port, you do not need to use apply or save. The port state will revert to its original configuration when the VFSM is reset. See the "Operations Menu" on page 473 for other operations-level commands.

/cfg/port <

Port Error Disable and Recovery Configuration

```
[Port 2 ErrDisable Menu]
    ena - Enable ErrDisable recovery
    dis
            - Disable ErrDisable recovery
            - Display current ErrDisable configuration
```

The Error Disable and Recovery feature allows the switch to automatically disable a port if an error condition is detected on the port. The port remains in the error-disabled state until it is re-enabled manually, or re-enabled automatically by the switch after a timeout period has elapsed. The error-disabled state of a port does not persist across a system reboot.

Table 167. Port Error Disable Configuration Options

Command Syntax and Usage

ena

Enables automatic error-recovery for the port. The default setting is enabled.

Note: Error-recovery must be enabled globally before port-level commands become active (/cfg/sys/errdis/ena).

dis

Enables automatic error-recovery for the port.

cur

Displays current port Error Disable parameters.

/cfg/port <port alias or number>/gig

Port Link Configuration Menu

```
[Gigabit Link Menu]

speed - Set link speed

mode - Set full or half duplex mode

fctl - Set flow control

auto - Set autonegotiation

cl73 - Enable/disable Clause 73 auto-negotiation mode

cur - Display current gig link configuration
```

Link menu options are described in the following table.

Table 168. Port Link Configuration Menu Options (/cfg/port/gig)

Command Syntax and Usage

```
speed 10|100|1000|10000|any
```

Note: External 1/10Gb port speed becomes fixed when a transceiver is plugged into the port.

Sets the link speed. Some options are not valid on all ports. Choices include:

- 10 Mbps
- 100 Mbps
- 1000 Mbps
- 10000 Mps
- any (auto negotiate port speed)

```
mode full|half|any
```

Sets the operating mode. Some options are not valid on all ports. The choices include:

- Full-duplex
- Half-duplex
- "Any," for auto negotiation (default)

```
fctl rx|tx|both|none
```

Sets the flow control. The choices include:

- Receive flow control
- Transmit flow control
- Both receive and transmit flow control
- No flow control

Note: For external ports (EXTx) the default setting is no flow control, and for internal ports (INTx) the default setting is both receive and transmit.

```
auto on off
```

Turns auto-negotiation on or off.

```
c173 e|d
```

Enables or disables 802.3 Clause 73 for high-speed backplane autonegotiation. The default setting is enabled.

Note: This command applies only to internal ports (INTx).

cur

Displays current port parameters.

/cfg/port <port alias or number>/udld

UniDirectional Link Detection Configuration Menu

[UDLD Menu] mode - Set UDLD mode - Enable UDLD ena dis - Disable UDLD - Display current port UDLD configuration

UDLD menu options are described in the following table.

Table 169. Port UDLD Configuration Menu Options (/cfg/port/udld)

Command Syntax and Usage

mode normal aggressive

Configures the UDLD mode for the selected port, as follows:

- **Normal**: Detect unidirectional links that have mis-connected interfaces. The port is status changes to errdisabled if UDLD determines that the port is mis-connected.
- **Aggressive**: In addition to the normal mode, the aggressive mode disables the port if the neighbor stops sending UDLD probes for 7 seconds.

ena

Enables UDLD on the port.

dis

Disables UDLD on the port.

cur

Displays current port UDLD parameters.

/cfg/port <port alias or number> / oam

Port OAM Configuration Menu

[OAM Menu]
ena - Enable OAM Discovery process
dis - Disable OAM Discovery process
mode - Set OAM mode
cur - Display current port OAM configuration

Operation, Administration, and Maintenance (OAM) protocol allows the switch to detect faults on the physical port links. OAM is described in the IEEE 802.3ah standard. OAM menu options are described in the following table.

Table 170. Port OAM Configuration Menu Options (/cfg/port/oam)

Command Syntax and Usage

ena

Enables OAM discovery on the port.

dis

Disables OAM discovery on the port.

mode active passive

Configures the OAM discovery mode, as follows:

- Active: This port link initiates OAM discovery.
- Passive: This port allows its peer link to initiate OAM discovery.

If OAM determines the port is in an anomalous condition, the port is disabled.

cur

Displays current port OAM parameters.

/cfg/port port alias or number>/aclqos

Port ACL Configuration Menu

[Port INT2 ACL Menu] add - Add ACL or ACL group to this port - Remove ACL or ACL group from this port - Display current ACLs for this port

Note: If FCoE is enabled, IPv6 ACLs are not supported. You cannot assign IPv6 ACLs to a port.

Table 171. Port ACL Menu Options (/cfg/port/aclqos)

Command Syntax and Usage

add acl|acl6|grp < ACL or ACL group number>

Adds the specified ACL or ACL group to the port. You can add multiple ACL groups to a port.

rem acl|acl6|grp <ACL or ACL group number>

Removes the specified ACL or ACL group from the port.

cur

Displays current ACL QoS parameters.

/cfg/port port alias or number > /stp

Port Spanning Tree Configuration Menu

```
[Port INT1 STP Menu]

edge - Enable/disable edge port

link - Set port link type

guard - Set Port Guard Type Menu

cur - Display current port stp configuration
```

Table 172. Port STP Menu Options (/cfg/port/stp)

Command Syntax and Usage

```
edge e d
```

Enables or disables this port as an edge port. An edge port is not connected to a bridge, and can begin forwarding traffic as soon as the link is up. Configure server ports as edge ports (enabled).

Note: After you configure the port as an edge port, you must disable the port (/oper/port x/dis) and then re-enable the port (/oper/port x/ena) for the change to take effect.

link auto|p2p|shared

Defines the type of link connected to the port, as follows:

- auto: Configures the port to detect the link type, and automatically match its settings.
- p2p: Configures the port for Point-To-Point protocol.
- shared: Configures the port to connect to a shared medium (usually a hub).

The default link type is auto.

guard

Displays the Spanning Tree Guard menu for the port. To view menu options, see page 265.

cur

Displays current STP parameters for the port.

/cfq/port /cfq/port /cfq/port /stp/quard

Port Spanning Tree Guard Configuration

```
[Guard Menu]
    default - Set guard type to default
            - Set guard type
    type
            - Display current quard type
```

Table 173. Port STP Guard Options

Command Syntax and Usage

default

Sets the Spanning Tree guard parameters to their default values.

```
type loop|root|none
```

Defines the Spanning Tree guard type, as follows:

- loop: STP loop guard prevents the port from forwarding traffic if no BPDUs are received. The port is placed into a loop-inconsistent blocking state until a BPDU is received.
- root: STP root guard enforces the position of the root bridge. If the bridge receives a superior BPDU, the port is placed into a root-inconsistent state
- none: Disables STP loop guard and root guard.

cur

Displays current Spanning Tree guard parameters for the port.

/cfg/stack

Stacking Configuration Menu

```
[Stacking Menu]
   swnum - Switch Number Menu
    name
            - Set stack name
    backup - Set backup switch number
            - Display current stacking configuration
```

A stack is a group of switches that work together as a unified system. The network views a stack of switches as a single entity, identified by a single network IP address. Each unit can have a management interface IP configured. Configuration is allowed only from the master IP. On members, only information regarding their

own management interface IP is visible. The Stacking Configuration menu is used to configure a stack, and to define the Master and Backup interface that represents the stack on the network.

The Stacking Configuration menu is available only after Stacking is enabled and the switch is reset. For more information, see "Stacking Boot Menu" on page 491.

Table 174. Stacking Menu Options (/cfg/stack)

Command Syntax and Usage

swnum <switch number (1-8)>

Displays the Stacking Switch menu. To view menu options, see page 266.

name <1-63 characters>

Defines a name for the stack.

backup <1-8>|0

Defines the backup switch in the stack, based on its configured switch number (csnum).

cur

Displays the current stacking parameters.

/cfg/stack/swnum <1-8>

Stacking Switch Menu

```
[Switch 1 Menu]

uuid - Set Switch Chassis UUID

bay - Set Switch Bay Number

bind - Bind UUID/Bay to switch in stack

del - Delete switch

cur - Display current Switch configuration
```

Table 175. Stacking Switch Menu Options (/cfg/stack/swnum)

Command Syntax and Usage

```
uuid <UUID>
```

Binds the selected switch to the stack, based on the UUID of the chassis in which the switch resides. You also must enter the bay number to specify a switch within the chassis. Following is an example UUID:

uuid 49407441b1a511d7b95df58f4b6f99fe

bay < 1-10 >

Binds the selected switch to the stack, based on its bay number in the chassis. You also must enter the UUID to specify the chassis in which the switch resides.

bind $\langle asnum(1-8) \rangle$

Binds the selected switch to the stack, based on its attached switch number (asnum).

Table 175. Stacking Switch Menu Options (/cfg/stack/swnum) (continued)

del

Deletes the selected switch from the stack.

cur

Displays the current stacking switch parameters.

/cfq/qos

Quality of Service Configuration Menu

```
[QOS Menu]
             - 802.1p Menu
    8021p
    dscp
             - Dscp Menu
             - Display current QOS configuration
    cur
```

Use the Quality of Service (QoS) menus to configure the 802.1p priority value and DiffServ Code Point (DSCP) value of incoming packets. This allows you to differentiate between various types of traffic, and provide different priority levels.

Table 176. Quality of Service Menu Options (/cfg/qos)

Command Syntax and Usage

8021p

Displays 802.1p configuration menu. To view menu options, see page 268.

dscp

Displays DSCP configuration menu. To view menu options, see page 269.

cur

Displays QoS configuration parameters.

802.1p Configuration Menu

```
[802.1p Menu]

priq - Set priority to COS queue mapping
qweight - Set weight to a COS queue
numcos - Set number of COS queue
cur - Display current 802.1p configuration
```

This feature provides the capability to filter IP packets based on the 802.1p bits in the packet's VLAN header. The 802.1p bits specify the priority that you should give to the packets while forwarding them. The packets with a higher (non-zero) priority bits are given forwarding preference over packets with numerically lower priority bits value.

Table 177. 802.1p Menu Options (/cfg/gos/8021p)

Command Syntax and Usage

```
priq <priority (0-7)> <COSq number>
```

Maps the 802.1p priority to the Class of Service queue (COSq) priority. Enter the 802.1p priority value (0-7), followed by the COSq that handles the matching traffic. The valid range of the COSq number is set using the numcos command.

Note: Priority value 7 is reserved for Stacking.

```
qweight <COSq number> <weight (0-15)>
```

Configures the weight of the selected COSq. Enter the COSq number, followed by the scheduling weight (0-15). The valid range of the COSq number is set using the numcos command.

Note: The scheduling weight is automatically rounded up to the nearest of the following values: 2, 4, 8, 16

```
numcos 2 8
```

Sets the number of Class of Service queues (COSq) for switch ports. Depending on the numcos setting, the valid COSq range for the priq and qweight commands is as follows:

- If numcos is 2 (the default), the COSq range is 0-1.
- If numcos is 8, the COSq range is 0-7.

You must apply, save, and reset the switch to activate the new configuration.

Note: In Stacking mode, the number of COS queues available is 1 or 7, because one COS queue is reserved for Stacking.

cur

Displays the current 802.1p parameters.

/cfg/qos/dscp

DSCP Configuration Menu

```
[dscp Menu]
    dscp
             - Remark DSCP value to a new DSCP value
             - Remark DSCP value to a 802.1p priority
    prio
            - Globally turn DSCP remarking ON
    off
            - Globally turn DSCP remarking OFF
            - Display current DSCP remarking configuration
    cur
```

Use this menu map the DiffServ Code Point (DSCP) value of incoming packets to a new value, or to an 802.1p priority value.

Table 178. DSCP Menu Options (/cfg/qos/dscp)

Command Syntax and Usage

```
dscp <DSCP (0-63)> <new DSCP (0-63)>
```

Maps the initial DiffServ Code Point (DSCP) value to a new value. Enter the DSCP value (0-63) of incoming packets, followed by the new value.

```
prio <DSCP (0-63)> <priority (0-7)>
```

Maps the DiffServ Code point value to an 802.1p priority value. Enter the DSCP value, followed by the corresponding 802.1p value.

on

Turns on DSCP re-marking globally.

off

Turns off DSCP re-marking globally.

cur

Displays the current DSCP parameters.

Access Control List Configuration Menu

```
[ACL Menu]

acl - Access Control List Item Config Menu

acl6 - IPv6 Access Control List Item Config Menu

group - Access Control List Group Config Menu

vmap - Vlan Map Config Menu

cur - Display current ACL configuration
```

Use this menu to create Access Control Lists (ACLs) and ACL groups. ACLs define matching criteria used for IP filtering and Quality of Service functions.

For information about assigning ACLs to ports, see "Port ACL Configuration Menu" on page 263.

Table 179. ACL Menu Options (/cfg/acl)

Command Syntax and Usage

acl <1-256>

Displays Access Control List configuration menu. To view menu options, see page 271.

acl6 <1-128>

Displays Access Control List configuration menu. To view menu options, see page 281.

group <1-256>

Displays ACL group configuration menu. To view menu options, see page 286.

vmap <1-128>

Displays ACL VLAN Map configuration menu. To view menu options, see page 287.

cur

Displays the current ACL parameters.

/cfq/acl/acl <ACL number>

ACL Configuration Menu

```
[ACL 1 Menu]
            - Mirror Options Menu
    mirror
    ethernet - Ethernet Header Options Menu
    ipv4 - IP Header Options Menu
    tcpudp - TCP/UDP Header Options Menu
    meter - ACL Metering Configuration Menu
    re-mark - ACL Re-mark Configuration Menu
    pktfmt - Set to filter specific packet format types
    egrport - Set to filter for packets egressing this port
    action - Set filter action
    stats - Enable/disable statistics for this acl
            - Reset filtering parameters
    reset
            - Display current filter configuration
```

These menus allow you to define filtering criteria for each Access Control List (ACL).

Table 180. ACL Menu Options (/cfg/acl/acl x)

```
Command Syntax and Usage
mirror
   Displays the ACL Port Mirror menu. To view menu options, see page 272.
ethernet
   Displays the ACL Ethernet Header menu. To view menu options, see
   page 273.
ipv4
   Displays the ACL IP Header menu. To view menu options, see page 274.
tcpudp
   Displays the ACL TCP/UDP Header menu. To view menu options, see
   page 275.
meter
   Displays the ACL Metering menu. To view menu options, see page 276.
re-mark
   Displays the ACL Re-Mark menu. To view menu options, see page 277.
pktfmt <packet format>
   Displays the ACL Packet Format menu. To view menu options, see page 280.
egrport <port alias or number>
   Configures the ACL to function on egress packets.
action permit|deny|setprio <0-7>
   Configures a filter action for packets that match the ACL definitions. You can
   choose to permit (pass) or deny (drop) packets, or set the 802.1p priority level
   (0-7).
stats e d
   Enables or disables the statistics collection for the Access Control List.
```

Table 180. ACL Menu Options (/cfg/acl/acl x) (continued)

Command Syntax and Usage

reset

Resets the ACL parameters to their default values.

cur

Displays the current ACL parameters.

/cfg/acl/acl <ACL number>/mirror

ACL Mirroring Configuration

cur

```
[Mirror Options Menu]

dest - Set mirror destination

port - Set port as mirror target

del - Clear mirror settings

cur - Display current mirror configuration
```

This menu allows you to define port mirroring for an ACL. Packets that match the ACL are mirrored to the destination interface.

Table 181. ACL Port Mirroring Options

dest port | none Configures the interface type of the destination. port <port alias or number> Configures the destination to which packets that match this ACL are mirrored. del Removes this ACL from port mirroring.

Displays the current port mirroring parameters for the ACL.

/cfq/acl/acl <ACL number>/ethernet

Ethernet Filtering Configuration Menu

```
- Set to filter on source MAC
smac
dmac
        - Set to filter on destination MAC
        - Set to filter on VLAN ID
vlan
       - Set to filter on ethernet type
        - Set to filter on priority
pri
      - Reset all fields
reset
        - Display current parameters
```

This menu allows you to define Ethernet matching criteria for an ACL.

Table 182. Ethernet Filtering Menu Options (/cfg/acl/acl x/ethernet)

Command Syntax and Usage smac <MAC address (such as 00:60:cf:40:56:00)> <mask (FF:FF:FF:FF:FF:FF)> Defines the source MAC address for this ACL. dmac <MAC address (such as 00:60:cf:40:56:00)> <mask (FF:FF:FF:FF:FF)> Defines the destination MAC address for this ACL. vlan <VLAN number> <VLAN mask (0xfff)> Defines a VLAN number and mask for this ACL. etype [ARP|IP|IPv6|MPLS|RARP|any|none|<other (0x600-0xFFFF)>] Defines the Ethernet type for this ACL. pri <0-7> Defines the Ethernet priority value for the ACL. reset Resets Ethernet parameters for the ACL to their default values. Displays the current Ethernet parameters for the ACL.

/cfg/acl/acl <ACL number>/ipv4

IPv4 Filtering Configuration Menu

```
[Filtering IPv4 Menu]

sip - Set to filter on source IP address

dip - Set to filter on destination IP address

proto - Set to filter on prototype

tos - Set to filter on TOS

reset - Reset all fields

cur - Display current parameters
```

This menu allows you to define IP version 4 matching criteria for an ACL.

Table 183. IPv4 Filtering Menu Options (/cfg/acl/acl x/ipv4)

Command Syntax and Usage

```
sip <IP address> <mask (such as 255.255.255.0)>
```

Defines a source IP address for the ACL. If defined, traffic with this source IP address will match this ACL. Specify an IP address in dotted decimal notation.

```
dip <IP address> <mask (such as 255.255.255.0)>
```

Defines a destination IP address for the ACL. If defined, traffic with this destination IP address will match this ACL.

```
proto <0-255>
```

Defines an IP protocol for the ACL. If defined, traffic from the specified protocol matches this filter. Specify the protocol number. Listed below are some of the well-known protocols.

E
۱

1	icmp
2	igmp
6	tcp
17	udp
89	ospf
112	vrrp

tos < 0-255 >

Defines a Type of Service (ToS) value for the ACL. For more information on ToS, refer to RFC 1340 and 1349.

reset

Resets the IPv4 parameters for the ACL to their default values.

cur

Displays the current IPv4 parameters.

/cfq/acl/acl <ACL number>/tcpudp

TCP/UDP Filtering Configuration Menu

```
[Filtering TCP/UDP Menu]
    sport - Set to filter on TCP/UDP source port
            - Set to filter on TCP/UDP destination port
    dport
          - Set to filter TCP/UDP flags
    reset - Reset all fields
            - Display current parameters
    cur
```

This menu allows you to define TCP/UDP matching criteria for an ACL.

Table 184. TCP/UDP Filtering Menu Options (/cfg/acl/acl x/tcpudp)

Command Syntax and Usage

sport <source port (1-65535)> <mask (0xFFFF)>

Defines a source port for the ACL. If defined, traffic with the specified TCP or UDP source port will match this ACL. Specify the port number. Listed below are

some of the well-known ports:		
Number	Name	
20 21 22 23 25 37 42 43 53 69 70	ftp-data ftp ssh telnet smtp time name whois domain tftp gopher	
79 80	finger http	
00	пцр	

dport < destination port (1-65535)> < mask (0xFFFF)>

Defines a destination port for the ACL. If defined, traffic with the specified TCP or UDP destination port will match this ACL. Specify the port number, just as with sport above.

```
flags \langle value(0x0-0x3f) \rangle \langle mask(0x0-0x3f) \rangle
```

Defines a TCP/UDP flag for the ACL.

reset

Resets the TCP/UDP parameters for the ACL to their default values.

cur

Displays the current TCP/UDP Filtering parameters.

/cfq/acl/acl <ACL number>/meter

ACL Metering Configuration Menu

```
[Metering Menu]

cir - Set committed rate in kilobits per second

mbsize - Set maximum burst size in kilobits

enable - Enable/disable port metering

dpass - Set to Drop or Pass out of profile traffic

reset - Reset meter parameters

log - Enable syslog/traps when rate exceeded

cur - Display current settings
```

This menu defines the metering profile for the selected ACL.

Table 185. ACL Metering Menu Options (/cfg/acl/acl x/meter)

Command Syntax and Usage

cir <64-10000000>

Configures the committed rate, in Kilobits per second. The committed rate must be a multiple of 64.

mbsize <32-4096>

Configures the maximum burst size, in Kilobits. Enter one of the following values for mbsize: 32, 64, 128, 256, 512, 1024, 2048, 4096

enable e|d

Enables or disables metering on the ACL.

dpass drop pass

Configures the ACL meter to either drop or pass out-of-profile traffic.

reset

Resets ACL metering parameters to their default values.

log e|d

Enables or disables syslog notification messages for packets that do not conform to the ACL profile.

cur

Displays current ACL metering parameters.

/cfq/acl/acl <ACL number>/re-mark

Re-Mark Configuration Menu

[Re-mark Menu] inprof - In Profile Menu outprof - Out Profile Menu - Set Update User Priority Menu reset - Reset re-mark settings - Display current settings cur

You can choose to re-mark IP header data for the selected ACL. You can configure different re-mark values, based on whether packets fall within the ACL metering profile, or out of the ACL metering profile.

Table 186. ACL Re-Mark Menu Options (/cfg/acl/acl x/re-mark)

Command Syntax and Usage

inprof

Displays the Re-Mark In-Profile menu. To view menu options, see page 278.

outprof

Displays the Re-Mark Out-of-Profile menu. To view menu options, see page 279.

up1p

Displays the Re-Mark Update User Priority menu. To view menu options, see page 279.

reset

Reset ACL re-mark parameters to their default values.

cur

Displays current re-mark parameters.

/cfg/acl/acl <ACL number>/re-mark/inprof

Re-Marking In-Profile Configuration Menu

```
[Re-marking - In Profile Menu]

uplp - Set Update User Priority Menu

updscp - Set the update DSCP

reset - Reset update DSCP settings

cur - Display current settings
```

Table 187. ACL Re-Mark In-Profile Menu (/cfg/acl/acl x/re-mark/inprof)

Command Syntax and Usage

up1p

Displays the Re-Mark Update User Priority menu. To view menu options, see page 279.

updscp <0-63>

Re-marks the DiffServ Code Point (DSCP) of in-profile packets to the selected value.

reset

Resets the re-mark parameters for in-profile packets to their default values.

cur

Displays current re-mark in-profile parameters.

/cfq/acl/acl <ACL number>/re-mark/up1p

Update User Priority Configuration

```
[Update User Priority Menu]
   value - Set the update user priority
    utosp - Enable/Disable use of TOS precedence
    reset - Reset in profile uplp settings
            - Display current settings
```

Table 188. ACL Re-Mark Update User Priority Options

Command Syntax and Usage

value <*0-7*>

Re-marks the 802.1p value. The value is the priority bits information in the packet structure.

utosp enable|disable

Enables or disables mapping of TOS (Type of Service) priority to 802.1p priority for in-profile packets. When enabled, the TOS value is used to set the 802.1p value.

reset

Resets UP1P settings to their default values.

cur

Displays current re-mark User Priority parameters for in-profile packets.

/cfq/acl/acl <ACL number>/re-mark/outprof

Re-Marking Out-of-Profile Configuration Menu

```
[Re-marking - Out Of Profile Menu]
   updscp - Set the update DSCP
    reset - reset update DSCP setting
            - Display current settings
```

Table 189. ACL Re-Mark Out-of-Profile Menu (/cfg/acl/acl x/re-mark/outprof)

Command Syntax and Usage

updscp <0-63>

Re-marks the DiffServ Code Point (DSCP) for out-of-profile packets to the selected value. The switch sets the DSCP value on out-of-profile packets.

Resets the update DSCP parameters for out-of-profile packets to their default values.

cur

Displays current re-mark parameters for out-of-profile packets.

/cfg/acl/acl <ACL number>/pktfmt

Packet Format Filtering Configuration Menu

```
[Filtering Packet Format Menu]
ethfmt - Set to filter on ethernet format
tagfmt - Set to filter on ethernet tagging format
ipfmt - Set to filter on IP format
reset - Reset all fields
cur - Display current parameters
```

This menu allows you to define Packet Format matching criteria for an ACL.

Table 190. ACL Packet Format Filtering Menu Options (/cfg/acl/acl x/pktfmt)

```
ethfmt {none|eth2|SNAP|LLC}
Defines the Ethernet format for the ACL.

tagfmt {disabled|any|none|tagged}
Defines the tagging format for the ACL.

ipfmt {none|v4|v6}
Defines the IP format for the ACL.

reset
Resets Packet Format parameters for the ACL to their default values.

cur
Displays the current Packet Format parameters for the ACL.
```

/cfq/acl/acl6 <ACL number>

ACL IPv6 Configuration

```
[ACL6 2 Menu]
              - IPv6 Header Options Menu
    ipv6
    ipv6 - IPv6 Header Options Menutcpudp - TCP/UDP Header Options Menu
    re-mark - ACL Re-mark Configuration Menu
    egrport - Set to filter for packets egressing this port
    action - Set filter action
    stats - Enable/disable statistics
    reset - Reset filtering parameters
             - Display current filter configuration
```

Note: These menus allow you to define filtering criteria for each IPv6 Access Control List (ACL). If FCoE is enabled, IPv6 ACLs are not supported. You cannot assign IPv6 ACLs to a port.

Table 191. IPv6 ACL Options

Command Syntax and Usage

Displays the ACL IP Header menu. To view menu options, see page 282.

tcpudp

Displays the ACL TCP/UDP Header menu. To view menu options, see page 283.

re-mark

Displays the ACL Re-Mark menu. To view menu options, see page 284.

egrport <port alias or number>

Configures the ACL to function on egress packets.

action permit|deny|setprio <0-7>

Configures a filter action for packets that match the ACL definitions. You can choose to permit (pass) or deny (drop) packets, or set the 802.1p priority level (0-7).

stats e d

Enables or disables the statistics collection for the Access Control List.

reset

Resets the ACL parameters to their default values.

cur

Displays the current ACL parameters.

/cfg/acl/acl6 <ACL number>/ipv6

IP version 6 Filtering Configuration

```
[Filtering IPv6 Menu]

sip - Set to filter on source IPv6 address
dip - Set to filter on destination IPv6 address
nexthd - Set to filter on IPv6 next header
flabel - Set to filter on IPv6 flow label
tclass - Set to filter on IPv6 traffic class
reset - Reset all fields
cur - Display current parameters
```

This menu allows you to define IPv6 matching criteria for an ACL.

Table 192. IP version 6 Filtering Options

Command Syntax and Usage

sip <IPv6 address> <prefix length>

Defines a source IPv6 address for the ACL. If defined, traffic with this source IP address will match this ACL.

dip <IPv6 address> <prefix length>

Defines a destination IPv6 address for the ACL. If defined, traffic with this destination IP address will match this ACL.

nexthd <0-255>

Defines the next header value for the ACL. If defined, traffic with this next header value will match this ACL.

flabel <0-1048575>

Defines the flow label for the ACL. If defined, traffic with this flow label will match this ACL.

tclass <0-255>

Defines the traffic class for the ACL. If defined, traffic with this traffic class will match this ACL.

reset

Resets the IPv6 parameters for the ACL to their default values.

cur

Displays the current IPv6 parameters.

/cfq/acl/acl6 <ACL number>/tcpudp

IPv6 TCP/UDP Filtering Configuration

```
[Filtering TCP/UDP Menu]
    sport - Set to filter on TCP/UDP source port
             - Set to filter on TCP/UDP destination port
    dport
            - Set to filter TCP/UDP flags
            - Reset all fields
    reset
            - Display current parameters
    cur
```

This menu allows you to define TCP/UDP matching criteria for an ACL.

Table 193. IPv6 ACL TCP/UDP Filtering Options

Command Syntax and Usage

sport <source port (1-65535)> <mask (0xFFFF)>

Defines a source port for the ACL. If defined, traffic with the specified TCP or UDP source port will match this ACL. Specify the port number. Listed here are some of the well-known ports:

Number Name 20 ftp-data 21 ftp 22 ssh 23 telnet 25 smtp 37 time 42 name 43 whois 53 domain 69 tftp 70 gopher 79 finger 80 http

dport < destination port (1-65535) > < mask (0xFFFF) >

Defines a destination port for the ACL. If defined, traffic with the specified TCP or UDP destination port will match this ACL. Specify the port number, just as with sport above.

```
flags \langle value(0x0-0x3f) \rangle \langle mask(0x0-0x3f) \rangle
```

Defines a TCP/UDP flag for the ACL.

reset

Resets the TCP/UDP parameters for the ACL to their default values.

cur

Displays the current TCP/UDP Filtering parameters.

/cfq/acl/acl6 <ACL number>/re-mark

IPv6 Re-Mark Configuration

```
[Re-mark Menu]
inprof - In Profile Menu
reset - Reset re-mark settings
cur - Display current settings
```

You can choose to re-mark IP header data for the selected ACL. You can configure different re-mark values, based on whether packets fall within the ACL metering profile, or out of the ACL metering profile.

Table 194. IPv6 ACL Re-Mark Options

Command Syntax and Usage

inprof

Displays the Re-Mark In-Profile menu. To view menu options, see page 284.

reset

Reset ACL re-mark parameters to their default values.

cur

Displays current re-mark parameters.

/cfg/acl/acl6 <ACL number>/re-mark/inprof

IPv6 Re-Marking In-Profile Configuration

```
[Re-marking - In Profile Menu]

uplp - Set Update User Priority Menu

updscp - Set the update DSCP

reset - Reset update DSCP settings

cur - Display current settings
```

Table 195. IPv6 ACL Re-Mark In-Profile Options

Command Syntax and Usage

up1p

Displays the Re-Mark Update User Priority menu. To view menu options, see page 285.

updscp <0-63>

Re-marks the DiffServ Code Point (DSCP) of in-profile packets to the selected value.

reset

Resets the update DSCP parameters to their default values.

cur

Displays current re-mark parameters for in-profile packets.

/cfg/acl/acl6 <ACL number>/re-mark/inprof/up1p

Update User Priority Configuration

[Update User Priority Menu]

value - Set the update user priority

utosp - Enable/Disable use of TOS precedence reset - Reset in profile uplp settings

- Display current settings

Table 196. ACL Re-Mark Update User Priority Options

Command Syntax and Usage

value <0-7>

Re-marks the 802.1p value. The value is the priority bits information in the packet structure.

utosp enable|disable

Enables or disables mapping of TOS (Type of Service) priority to 802.1p priority for in-profile packets. When enabled, the TOS value is used to set the 802.1p value.

reset

Resets UP1P settings to their default values.

cur

Displays current re-mark User Priority parameters for in-profile packets.

/cfg/acl/group <ACL group number>

ACL Group Configuration Menu

```
[ACL Group 1 Menu]

add - Add ACL to group

rem - Remove ACL from group

add6 - Add IPv6 ACL to ACL group

rem6 - Remove IPv6 ACL from ACL group

cur - Display current ACL items in ACL group
```

This menu allows you to compile one or more ACLs into an ACL group. Once you create an ACL group, you can assign the ACL group to one or more ports.

Table 197. ACL Group Menu Options (/cfg/acl/group x)

```
Command Syntax and Usage

add acl <1-256>
Adds the selected ACL to the ACL group.

rem acl <1-256>
Removes the selected ACL from the ACL group.

add6 <1-128>
Adds the selected IPv6 ACL to the ACL group.

rem6 <1-128>
Removes the selected IPv6 ACL from the ACL group.

cur
Displays the current ACL group parameters.
```

/cfq/acl/vmap < 1-128>

VMAP Configuration

```
[VMAP 1 Menu]
    mirror - Mirror Options Menu
    ethernet - Ethernet Header Options Menu
    ipv4 - IP Header Options Menu
    tcpudp - TCP/UDP Header Options Menu
meter - ACL Metering Configuration Menu
    re-mark - ACL Re-mark Configuration Menu
    pktfmt - Set to filter specific packet format types
    egrport - Set to filter for packets egressing this port
    action - Set filter action
    stats - Enable/disable statistics
             - Reset filtering parameters
    reset
          - Display current filter configuration
```

A VLAN Map is an Access Control List (ACL) that can be assigned to a VLAN or a VM group instead of a port. In a virtualized environment where Virtual Machines move between physical servers, VLAN Maps allow you to create traffic filtering and metering policies associated with a VM's VLAN.

For more information about VLAN Map configuration commands, see "Access Control List Configuration Menu" on page 270.

For more information about assigning VLAN Maps to a VLAN, see "VLAN Configuration Menu" on page 330.

For more information about assigning VLAN Maps to a VM group, see "VM Group" Configuration" on page 461.

Port Mirroring Configuration

```
[Port Mirroring Menu]
monport - Monitoring Port based PM Menu
mirror - Enable/Disable Mirroring
cur - Display All Mirrored and Monitoring Ports
```

Port mirroring is disabled by default. For more information about port mirroring on the VFSM, see "Appendix A: Troubleshooting" in the *IBM N/OS Application Guide*.

Note: Traffic on VLAN 4095 is not mirrored to the external ports.

The Port Mirroring Menu is used to configure, enable, and disable the monitor port. When enabled, network packets being sent and/or received on a target port are duplicated and sent to a monitor port. By attaching a network analyzer to the monitor port, you can collect detailed information about your network performance and usage.

Table 198. Port Mirroring Menu Options (/cfg/pmirr)

Command Syntax and Usage

monport port alias or number>

Displays port-mirroring menu. To view menu options, see page 289.

mirror disable enable

Enables or disables port mirroring

cur

Displays current settings of the mirrored and monitoring ports.

/cfg/pmirr/monport port alias or number>

Port-Mirroring Configuration Menu

```
[Port EXT1 Menu]
    add - Add "Mirrored" port
            - Rem "Mirrored" port
    rem
    delete - Delete this "Monitor" port
            - Display current Port-based Port Mirroring configuration
```

Table 199. Port Mirroring Monitor Port Menu Options (/cfg/pmirr/monport)

Command Syntax and Usage

add <mirrored port (port to mirror from)> <direction (in, out, or both)>

Adds the port to be mirrored. This command also allows you to enter the direction of the traffic. It is necessary to specify the direction because:

If the source port of the frame matches the mirrored port and the mirrored direction is ingress or both (ingress and egress), the frame is sent to the monitoring port.

If the destination port of the frame matches the mirrored port and the mirrored direction is egress or both, the frame is sent to the monitoring port.

rem <mirrored port (port to mirror from)>

Removes the mirrored port.

Deletes this monitor port.

cur

Displays the current settings of the monitoring port.

Layer 2 Configuration Menu

```
[Layer 2 Menu]

           - ECP
    lldp - LLDP Menu
    trunk - Trunk Group Menu
    thash - Trunk Hash Menu
    lacp
            - Link Aggregation Control Protocol Menu
    failovr - Failover Menu
    hotlink - Hot Links Menu
    vlan - VLAN Menu
    vlanstg - Enable/disable VLAN auto assign STG
    pvstcomp - Enable/disable PVST+ compatibility mode
    loopgrd - Enable/disable Spanning Tree Loop Guard
    macnotif - Enable/disable MAC address notification
    upfast - Enable/disable Uplink Fast
    update - UplinkFast station update rate
    cur - Display current layer 2 parameters
```

Table 200. Layer 2 Configuration Menu (/cfg/l2)

Command Syntax and Usage

8021x

Displays the 802.1X Configuration Menu. To view menu options, see page 292.

amp

Displays the Active MultiPath Protocol (AMP) Configuration menu. To view menu options, see page 298.

mrst

Displays the Rapid Spanning Tree/Multiple Spanning Tree Protocol Configuration Menu. To view menu options, see page 302.

nostp enable disable

When enabled, globally turns Spanning Tree off. All ports are placed into forwarding state. Any BPDUs received are flooded. BPDU Guard is not affected by this command.

stq <group number (1-128)>

Displays the Spanning Tree Configuration Menu. To view menu options, see page 306.

fdb

Displays the Forwarding Database Menu. To view menu options, see page 309.

Table 200. Layer 2 Configuration Menu (/cfg/l2) (continued)

Command Syntax and Usage

еср

Displays the Edge Control Protocol menu. To view menu options, see page 311.

Displays the LLDP Menu. To view menu options, see page 312.

trunk <trunk number>

Displays the Trunk Group Configuration Menu. To view menu options, see page 316.

thash

Displays the Trunk Hash Menu. To view menu options, see page 317.

lacp

Displays the Link Aggregation Control Protocol Menu. To view menu options, see page 320.

failovr

Displays the Failover Configuration Menu. To view menu options, see page 322.

hotlink

Displays the Hot Links Configuration menu. To view menu options, see page 327.

vlan <*VLAN number (1-4095)*>

Displays the VLAN Configuration Menu. To view menu options, see page 330.

vlanstq enable disable

Enables or disables VLAN Automatic STG Assignment (VASA). When enabled, each time a new VLAN is configured, the switch will automatically assign the new VLAN its own STG. Conversely, when a VLAN is deleted, if its STG is not associated with any other VLAN, the STG is returned to the available pool.

Note: VASA applies only to PVRST mode.

pvstcomp enable|disable

Enables or disables VLAN tagging of Spanning Tree BPDUs. The default setting is enabled.

loopgrd enable disable

Enables or disables Spanning Tree Loop Guard.

macnotif enable disable

Enables or disables MAC Address Notification. With MAC Address Notification enabled, the switch generates a syslog message when a MAC address is added or removed from the MAC address table.

Table 200. Layer 2 Configuration Menu (/cfg/l2) (continued)

Command Syntax and Usage

```
upfast enable|disable
```

Enables or disables Fast Uplink Convergence, which provides rapid Spanning Tree convergence to an upstream switch during failover.

Note: When enabled, this feature increases bridge priorities to 65535 for all STGs and path cost by 3000 for all external STP ports.

```
update <10-200>
```

Configures the station update rate. The default value is 40.

cur

Displays current Layer 2 parameters.

/cfg/12/8021x

802.1X Configuration Menu

```
[802.1x Configuration Menu]
global - Global 802.1x configuration menu
port - Port 802.1x configuration menu
ena - Enable 802.1x access control
dis - Disable 802.1x access control
cur - Show 802.1x configuration
```

This feature allows you to configure the VFSM as an IEEE 802.1X Authenticator, to provide port-based network access control.

Table 201. 802.1X Configuration Menu (/cfg/l2/8021x)

Command Syntax and Usage

global

Displays current 802.1X parameters.

/cfq/l2/8021x/qlobal

802.1X Global Configuration Menu

```
[802.1X Global Configuration Menu]
    gvlan - 802.1X Guest VLAN configuration menu
            - Set access control mode
    gtperiod - Set EAP-Request/Identity quiet time interval
    txperiod - Set EAP-Request/Identity retransmission timeout
    suptmout - Set EAP-Request retransmission timeout
    svrtmout - Set server authentication request timeout
    maxreq - Set max number of EAP-Request retransmissions
    raperiod - Set reauthentication time interval
    reauth - Set reauthentication status to on or off
    vassign - Set dynamic VLAN assignment status to on or off
    default - Restore default 802.1X configuration
             - Display current 802.1X configuration
```

The global 802.1X menu allows you to configure parameters that affect all ports in the VFSM.

Table 202. 802.1X Global Configuration Menu Options (/cfg/l2/8021x/global)

Command Syntax and Usage

qvlan

Displays the 802.1X Guest VLAN Configuration Menu. To view menu options, see page 295.

mode force-unauth|auto|force-auth

Sets the type of access control for all ports:

- force-unauth: the port is unauthorized unconditionally.
- auto: the port is unauthorized until it is successfully authorized by the RADIUS server.
- force-auth: the port is authorized unconditionally, allowing all traffic.

The default value is force-auth.

```
gtperiod <0-65535>
```

Sets the time, in seconds, the authenticator waits before transmitting an EAP-Request/ Identity frame to the supplicant (client) after an authentication failure in the previous round of authentication. The default value is 60 seconds.

```
txperiod <1-65535>
```

Sets the time, in seconds, the authenticator waits for an EAP-Response/Identity frame from the supplicant (client) before retransmitting an EAP-Request/Identity frame. The default value is 30 seconds.

```
suptmout <1-65535>
```

Sets the time, in seconds, the authenticator waits for an EAP-Response packet from the supplicant (client) before retransmitting the EAP-Request packet to the authentication server. The default value is 30 seconds.

Table 202. 802.1X Global Configuration Menu Options (/cfg/l2/8021x/global) (continued)

Command Syntax and Usage

svrtmout <1-65535>

Sets the time, in seconds, the authenticator waits for a response from the RADIUS server before declaring an authentication timeout. The default value is 30 seconds.

The time interval between transmissions of the RADIUS Access-Request packet containing the supplicant's (client's) EAP-Response packet is determined by the current setting of /cfg/sys/radius/timeout (default is 3 seconds).

maxreq <1-10>

Sets the maximum number of times the authenticator retransmits an EAP-Request packet to the supplicant (client). The default value is 2.

raperiod <1-604800>

Sets the time, in seconds, the authenticator waits before re-authenticating a supplicant (client) when periodic re-authentication is enabled. The default value is 3600 seconds.

reauth on off

Sets the re-authentication status to on or off. The default value is off.

vassign on off

Sets the dynamic VLAN assignment status to on or off. The default value is off.

default

Resets the global 802.1X parameters to their default values.

cur

Displays current global 802.1X parameters.

/cfg/l2/8021x/global/gvlan

802.1X Guest VLAN Configuration Menu

[802.1X Guest VLAN Configuration Menu] vlan - Set 8021.x Guest VLAN number - Enable 8021.xGuest VLAN ena - Disable 8021.x Guest VLAN - Display current Guest VLAN configuration

The 802.1X Guest VLAN menu allows you to configure a Guest VLAN for unauthenticated ports. The Guest VLAN provides limited access to switch functions.

Table 203. 802.1X Guest VLAN Configuration Menu (/cfg/l2/8021x/global/gvlan)

Command Syntax and Usage vlan <*VLAN number*> Configures the Guest VLAN number. ena Enables the 802.1X Guest VLAN. dis Disables the 802.1X Guest VLAN. cur Displays current 802.1X Guest VLAN parameters.

/cfg/l2/8021x/port cfg/l2/8021x/port cort alias or number>

802.1X Port Configuration Menu

```
[802.1X Port Configuration Menu]

mode - Set access control mode
qtperiod - Set EAP-Request/Identity quiet time interval
txperiod - Set EAP-Request/Identity retransmission timeout
suptmout - Set EAP-Request retransmission timeout
svrtmout - Set server authentication request timeout
maxreq - Set max number of EAP-Request retransmissions
raperiod - Set reauthentication time interval
reauth - Set reauthentication status to on or off
vassign - Set dynamic VLAN assignment status to on or off
default - Restore default 802.1X configuration
global - Apply current global 802.1X configuration to this port
cur - Display current 802.1X configuration
```

The 802.1X port menu allows you to configure parameters that affect the selected port in the VFSM. These settings override the global 802.1X parameters.

Table 204. 802.1X Port Configuration Menu Options (/cfg/l2/8021x/port)

Command Syntax and Usage

mode force-unauth auto force-auth

Sets the type of access control for the port:

- force-unauth the port is unauthorized unconditionally.
- auto the port is unauthorized until it is successfully authorized by the RADIUS server.
- force-auth the port is authorized unconditionally, allowing all traffic.

The default value is force-auth.

```
qtperiod <0-65535>
```

Sets the time, in seconds, the authenticator waits before transmitting an EAP-Request/ Identity frame to the supplicant (client) after an authentication failure in the previous round of authentication. The default value is 60 seconds.

```
txperiod <1-65535>
```

Sets the time, in seconds, the authenticator waits for an EAP-Response/Identity frame from the supplicant (client) before retransmitting an EAP-Request/Identity frame. The default value is 30 seconds.

```
suptmout <1-65535>
```

Sets the time, in seconds, the authenticator waits for an EAP-Response packet from the supplicant (client) before retransmitting the EAP-Request packet to the authentication server. The default value is 30 seconds.

Command Syntax and Usage

svrtmout <1-65535>

Sets the time, in seconds, the authenticator waits for a response from the RADIUS server before declaring an authentication timeout. The default value is 30 seconds.

The time interval between transmissions of the RADIUS Access-Request packet containing the supplicant's (client's) EAP-Response packet is determined by the current setting of /cfg/sys/radius/timeout (default is 3 seconds).

maxreq <1-10>

Sets the maximum number of times the authenticator retransmits an EAP-Request packet to the supplicant (client). The default value is 2.

raperiod <1-604800>

Sets the time, in seconds, the authenticator waits before re-authenticating a supplicant (client) when periodic re-authentication is enabled. The default value is 3600 seconds.

reauth on off

Sets the re-authentication status to on or off. The default value is off.

vassign on off

Sets the dynamic VLAN assignment status to on or off. The default value is off.

default

Resets the 802.1X port parameters to their default values.

global

Applies current global 802.1X configuration parameters to the port.

cur

Displays current 802.1X port parameters.

Active MultiPath Protocol Configuration

```
[Active Multipath Menu]

group - Active Multipath Group Configuration Menu

agglacp - Set active multipath aggregator LACP trunk

aggport - Set active multipath aggregator port

aggtrk - Set active multipath aggregator static trunk

interval - Set active multipath packet interval

priority - Set active multipath switch priority

timeout - Set active multipath timeout count to detect unhealthy links

type - Set active multipath switch type

on - Globally turn active multipath ON

off - Globally turn active multipath OFF

default - Default active multipath parameters

cur - Display current active multipath configuration
```

Use the following commands to configure Active Multipath (AMP) for the VFSM.

Table 205. AMP Configuration Options

Command Syntax and Usage

group <1-22>

Displays the AMP group menu. To view menu options, see page 300.

```
agglacp < 1-65535 > | 0
```

Configures an LACP *admin key* to be used as the AMP Aggregator link. LACP trunks formed with this *admin key* will be used to link the two AMP Aggregators. Enter 0 (zero) to clear the Aggregator link.

Note: This command does not apply to AMP Access switches.

```
aggport  <port alias or number> | 0
```

Configures a port to be used as the AMP Aggregator link. Enter 0 (zero) to clear the Aggregator link.

Note: This command does not apply to AMP Access switches.

```
aggtrk <trunk number> | 0
```

Configures a trunk to be used as the AMP Aggregator link. Enter 0 (zero) to clear the Aggregator link.

Note: This command does not apply to AMP Access switches.

```
interval <10-10000>
```

Configures the time interval between AMP *keep alive* messages, in centiseconds. The default value is 50.

```
priority <1-255>
```

Configures the AMP priority for the switch. The default value is 255.

A lower priority value denotes a higher precedence (so priority 1 is the highest priority.) It is recommended that aggregator switches be configured with lower priority values than access switches.

Table 205. AMP Configuration Options (continued)

Command Syntax and Usage

timeout < 1-20 >

Configures the timeout count, which is the number of unreceived keep-alive packets the switch waits before declaring a timeout due to loss of connectivity with the peer. The default value is 4.

type access aggregator

Defines the AMP switch type, as follows:

- Access: Connects to downstream servers. Only one AMP group can be configured on an access switch.
- Aggregator: Connects to upstream routers. Multiple AMP groups can be configured on an Aggregator switch.

The default switch type is access.

Note: It is recommended to configure the Virtual Fabric 10Gb Switch Module only as an access switch.

on

Globally turns Active MultiPath on.

off

Globally turns Active MultiPath off.

default

Resets Active MultiPath parameters to their default values, and optionally delete all AMP groups.

cur

Displays the current AMP parameters.

AMP Group Configuration

```
[AMP Group 1 Menu]
           - Add port to AMP group
    port
    port2 - Add second port to AMP group
    lacp - Add LACP trunk to AMP group
    lacp2 - Add second LACP trunk to AMP group
    trunk - Add static trunk to AMP group
    trunk2 - Add second static trunk to AMP group
    ena - Enable AMP group
            - Disable AMP group
    dis
    del
            - Delete AMP group
           - Display current AMP group configuration
    cur
```

Use the following commands to configure an AMP group.

```
Table 206. AMP Group Configuration Options
Command Syntax and Usage
port  port alias or number> | 0
   Adds the port as the first port in the AMP group. Enter 0 (zero) to clear the port.
port2 port alias or number> | 0
   Adds the port as the second port in the AMP group. Enter 0 (zero) to clear the
   port.
lacp <1-65535>|0
    Adds the first LACP admin key to the AMP group. LACP trunks formed with this
    admin key will be used for AMP communication. Enter 0 (zero) to clear the
   admin key.
lacp2 < 1-65535 > | 0
   Adds the second LACP admin key to the AMP group. LACP trunks formed with
   this admin key will be used for AMP communication. Enter 0 (zero) to clear the
   admin key.
trunk <trunk number> | 0
    Adds the first trunk group to the AMP group. Enter 0 (zero) to clear the trunk
   group.
trunk2 < trunk number > | 0
   Adds the second trunk group to the AMP group. Enter 0 (zero) to clear the
   trunk group.
ena
    Enables the AMP group.
dis
    Disables the AMP group.
```

Table 206. AMP Group Configuration Options (continued)

Command Syntax and Usage

del

Deletes the AMP group.

cur

Displays the current AMP group configuration.

RSTP/MSTP/PVRST Configuration Menu

```
[Multiple Spanning Tree Menu]

cist - Common and Internal Spanning Tree menu

name - Set MST region name

rev - Set revision level of this MST region

maxhop - Set Maximum Hop Count for MST (4 - 60)

mode - Spanning Tree Mode

cur - Display current MST parameters
```

IBM N/OS supports STP/PVST+, the IEEE 802.1w Rapid Spanning Tree Protocol (RSTP), IEEE 802.1s Multiple Spanning Tree Protocol (MSTP), and Per VLAN Rapid Spanning Tree Protocol (PVRST+). MSTP allows you to map many VLANs to a small number of Spanning Tree Groups (STGs), each with its own topology.

Up to 32 Spanning Tree Groups can be configured in mstp mode. MSTP is turned off by default and the default STP mode is PVRST.

Note: When Multiple Spanning Tree is turned on, VLAN 4095 is moved from Spanning Tree Group 128 to the Common Internal Spanning Tree (CIST). When Multiple Spanning Tree is turned off, VLAN 4095 is moved back to Spanning Tree Group 128.

Table 207. MSTP/RSTP/PVRST Configuration Menu Options (/cfg/l2/mrst)

Command Syntax and Usage

cist

Displays the Common Internal Spanning Tree (CIST) Menu. To view menu options, see page 303.

name <1-32 characters>

Configures a name for the MSTP region. All devices within a MSTP region must have the same region name.

rev <0-65535>

Configures a revision number for the MSTP region. The revision is used as a numerical identifier for the region. All devices within a MSTP region must have the same revision number.

maxhop <4-60>

Configures the maximum number of bridge hops a packet may traverse before it is dropped. The default is 20.

mode mstp|rstp|pvrst

Selects the Spanning Tree mode, as follows: Multiple Spanning Tree (mstp), Rapid Spanning Tree (rstp), Per VLAN Rapid Spanning Tree Plus (pvrst).

The default mode is STP/PVRST+.

cur

Displays the current RSTP/MSTP/PVRST+ configuration.

/cfq/l2/mrst/cist

Common Internal Spanning Tree Configuration Menu

```
[Common Internal Spanning Tree Menu]
    brg - CIST Bridge parameter menu
          - CIST Port parameter menu
- Add VLAN(s) to CIST
    port
    add
    default - Default Common Internal Spanning Tree and Member parameters
             - Display current CIST parameters
```

Table 208 describes the commands used to configure Common Internal Spanning Tree (CIST) parameters. The CIST provides compatibility with different MSTP regions and with devices running different Spanning Tree instances. It is equivalent to Spanning Tree Group 0.

Table 208. CIST Menu Options (/cfg/l2/mrst/cist)

Command Syntax and Usage brg Displays the CIST Bridge Menu. To view menu options, see page 304. port <port alias or number> Displays the CIST Port Menu. To view menu options, see page 305. add < VLAN numbers> Adds selected VLANs to the CIST. default Resets all CIST parameters to their default values. cur Displays the current CIST configuration.

/cfg/l2/mrst/cist/brg

CIST Bridge Configuration Menu

```
[CIST Bridge Menu]

prior - Set CIST bridge Priority (0-65535)

mxage - Set CIST bridge Max Age (6-40 secs)

fwd - Set CIST bridge Forward Delay (4-30 secs)

cur - Display current CIST bridge parameters
```

CIST bridge parameters are used only when the switch is in MSTP mode. CIST parameters do not affect operation of STP/PVST+.

Table 209. CIST Bridge Configuration Menu Options (/cfg/l2/mrst/cist/brg)

Command Syntax and Usage

```
prior <0-65535>
```

Configures the CIST bridge priority. The bridge priority parameter controls which bridge on the network is the MSTP root bridge. To make this switch the root bridge, configure the bridge priority lower than all other switches and bridges on your network. The lower the value, the higher the bridge priority.

The range is 0 to 65535, in steps of 4096 (0, 4096, 8192...). The default value is 61440.

```
mxage <6-40 seconds>
```

Configures the CIST bridge maximum age. The maximum age parameter specifies the maximum time the bridge waits without receiving a configuration bridge protocol data unit before it reconfigures the MSTP network. The range is 6 to 40 seconds, and the default is 20 seconds.

```
fwd <4-30 seconds>
```

Configures the CIST bridge forward delay parameter. The forward delay parameter specifies the amount of time that a bridge port has to wait before it changes from the listening state to the learning state and from the learning state to the forwarding state. The range is 4 to 30 seconds, and the default is 15 seconds.

cur

Displays the current CIST bridge configuration.

/cfq/l2/mrst/cist/port cfq/l2/mrst/cist/port cort alias or number>

CIST Port Configuration Menu

```
[CIST Port INT1 Menu]
    prior - Set port Priority (0-240)
    cost - Set port Path Cost (1-200000000, 0 for auto)
    hello - Set CIST port Hello Time (1-10 secs)
    pvst-pro - Enable/disable PVST Protection (for MSTP only)
    on - Turn port's Spanning Tree ON
            - Turn port's Spanning Tree OFF
            - Display current port Spanning Tree parameters
```

CIST port parameters are used to modify MRST operation on an individual port basis. CIST parameters do not affect operation of STP/PVST+, RSTP, or PVRST+. For each port, RSTP/MSTP is turned on by default.

Table 210. CIST Port Configuration Menu Options (/cfg/l2/mrst/cist/port)

Command Syntax and Usage

```
prior <0-240>
```

Configures the CIST port priority. The port priority helps determine which bridge port becomes the designated port. In a network topology that has multiple bridge ports connected to a single segment, the port with the lowest port priority becomes the designated port for the segment. The range is 0 to 240, in steps of 16 (0, 16, 32...), and the default is 128.

```
cost <0-200000000>
```

Configures the CIST port path cost. The port path cost is used to help determine the designated port for a segment. Port path cost is based on the port speed, and is calculated as follows:

- -100Mbps = 200000
- -1Gbps = 20000
- -10Gbps = 2000

The default value of 0 (zero) indicates that the default path cost will be computed for an auto negotiated link speed.

```
hello <1-10 seconds>
```

Configures the CIST port Hello time. The Hello time specifies how often the root bridge transmits a configuration bridge protocol data unit (BPDU). Any bridge that is not the root bridge uses the root bridge Hello value. The range is 1 to 10 seconds, and the default is 2 seconds.

```
pvst-pro enable|disable
```

Enables or disables PVST Protection (for MSTP only).

on

Enables MSTP CIST on the port.

off

Disables MSTP CIST on the port.

cur

Displays the current CIST port configuration.

/cfg/l2/stg <STP group index>

Spanning Tree Configuration Menu

```
[Spanning Tree Group 1 Menu]

brg - Bridge parameter menu

port - Port parameter menu

add - Add VLAN(s) to Spanning Tree Group

remove - Remove VLAN(s) from Spanning Tree Group

clear - Remove all VLANs from Spanning Tree Group

on - Globally turn Spanning Tree ON

off - Globally turn Spanning Tree OFF

default - Default Spanning Tree and Member parameters

cur - Display current bridge parameters
```

IBM N/OS supports the IEEE 802.1D Spanning Tree Protocol (STP). STP is used to prevent loops in the network topology. Up to 128 Spanning Tree Groups can be configured on the switch (STG 128 is reserved for management).

Note: When VRRP is used for active/active redundancy, STG must be turned on.

Table 211. Spanning Tree Configuration Menu (/cfg/l2/stg)

Command Syntax and Usage

brq

Displays the Bridge Spanning Tree Menu. To view menu options, see page 307.

port <port alias or number>

Displays the Spanning Tree Port Menu. To view menu options, see page 308.

add <*VLAN number*>

Associates a VLAN with a Spanning Tree and requires a VLAN ID as a parameter.

remove < VLAN number>

Breaks the association between a VLAN and a Spanning Tree and requires a VLAN ID as a parameter.

clear

Removes all VLANs from a Spanning Tree.

on

Globally enables Spanning Tree Protocol. STG is turned on by default.

off

Globally disables Spanning Tree Protocol.

default

Restores a Spanning Tree instance to its default configuration.

cur

Displays current Spanning Tree Protocol parameters.

/cfq/12/stq <STP group number>/brq

Spanning Tree Bridge Configuration Menu

```
[Bridge Spanning Tree Menu]
     prior - Set bridge Priority [0-65535]
             - Set bridge Hello Time [1-10 secs]
     hello
            - Set bridge Max Age (6-40 secs)
     fwd
             - Set bridge Forward Delay (4-30 secs)
             - Display current bridge parameters
```

Spanning Tree bridge parameters affect the global STG operation of the switch. STG bridge parameters include:

- Bridge priority
- Bridge hello time
- Bridge maximum age
- Forwarding delay

Table 212. Spanning Tree Bridge Menu Options (/cfg/l2/stg/brg)

Command Syntax and Usage

```
prior < new bridge priority (0-65535)>
```

Configures the bridge priority. The bridge priority parameter controls which bridge on the network is the STG root bridge. To make a switch the root bridge, configure the bridge priority lower than all other switches and bridges on your network. The lower the value, the higher the bridge priority. The default value is 65534.

RSTP/MSTP: The range is 0 to 61440, in steps of 4096 (0, 4096, 8192...), and the default is 61440.

```
hello < new bridge hello time (1-10 secs)>
```

Configures the bridge hello time. The hello time specifies how often the root bridge transmits a configuration bridge protocol data unit (BPDU). Any bridge that is not the root bridge uses the root bridge hello value. The range is 1 to 10 seconds, and the default is 2 seconds.

This command does not apply to MSTP (see CIST on page 303).

```
mxage < new bridge max age (6-40 secs)>
```

Configures the bridge maximum age. The maximum age parameter specifies the maximum time the bridge waits without receiving a configuration bridge protocol data unit before it re configures the STG network. The range is 6 to 40 seconds, and the default is 20 seconds.

This command does not apply to MSTP (see CIST on page 303).

```
fwd < new bridge Forward Delay (4-30 secs)>
```

Configures the bridge forward delay parameter. The forward delay parameter specifies the amount of time that a bridge port has to wait before it changes from the listening state to the learning state and from the learning state to the forwarding state. The range is 4 to 30 seconds, and the default is 15 seconds.

This command does not apply to MSTP (see CIST on page 303).

cur

Displays the current bridge STG parameters.

When configuring STG bridge parameters, the following formulas must be used:

- 2*(fwd-1) > mxage
- 2*(hello+1) < mxage

/cfg/l2/stg <STP group index>/port <port alias or number>

Spanning Tree Port Configuration Menu

```
[Spanning Tree Port INT1 Menu]

prior - Set port Priority (0-240)

cost - Set port Path Cost (1-200000000 (PVRST/MSTP/RSTP) / 0 for auto)

on - Turn port's Spanning Tree ON

off - Turn port's Spanning Tree OFF

cur - Display current port Spanning Tree parameters
```

By default for STP/PVST+, Spanning Tree is turned off for internal ports and management ports, and turned on for external ports. By default for RSTP/MSTP, Spanning Tree is turned off for internal ports and management ports, and turned on for external ports, with internal ports configured as edge ports. STG port parameters include:

- Port priority
- Port path cost

For more information about port Spanning Tree commands, see "Port Spanning Tree Configuration Menu" on page 264.

Table 213. Spanning Tree Port Menu Options (/cfg/l2/stg/port)

Command Syntax and Usage

```
prior < new port Priority (0-255)>
```

Configures the port priority. The port priority helps determine which bridge port becomes the designated port. In a network topology that has multiple bridge ports connected to a single segment, the port with the lowest port priority becomes the designated port for the segment. The default value is 128.

RSTP/MSTP: The range is 0 to 240, in steps of 16 (0, 16, 32...).

Note: In Stacking mode, the range is 0-255, in steps of 4 (0, 4, 8, 12...).

```
cost <1-65535, 0 for default)>
```

Configures the port path cost. The port path cost is used to help determine the designated port for a segment. Port path cost is based on the port speed, and is calculated as follows:

- -100Mbps = 19
- -1Gbps = 4
- 10Gbps = 2

The default value of 0 (zero) indicates that the default path cost will be computed for an auto negotiated link speed.

on

Enables STG on the port.

off

Disables STG on the port.

cur

Displays the current STG port parameters.

Forwarding Database Configuration Menu

[FDB Menu] - Static Multicast Menu mcast static - Static FDB Menu aging - Configure FDB aging value - Display current FDB configuration

Use the following commands to configure the Forwarding Database (FDB) for the

Table 214. FDB Menu Options (/cfg/l2/fdb)

Command Syntax and Usage

mcast

Displays the static Multicast menu. To view menu options, see page 310.

static

Displays the static FDB menu. To view menu options, see page 311.

aging <0-65535>

Configures the aging value for FDB entries, in seconds. The default value is 300.

cur

Displays the current FDB parameters.

Static Multicast MAC Configuration Menu

```
[Static Multicast Menu]

add - Add a Multicast Address entry

del - Delete a Multicast Address entry

clear - Clear all Multicast Address entries

cur - Display current Multicast Address configuration
```

The following options are available to control the forwarding of known and unknown multicast packets:

- All multicast packets are flooded to the entire VLAN. This is the default switch behavior.
- Known multicast packets are forwarded only to those ports specified. Unknown
 multicast packets are flooded to the entire VLAN. To configure this option, define
 the Multicast MAC address for the VLAN and specify ports that are to receive
 multicast packets (/cfg/12/fdb/mcast/add).
- Known multicast packets are forwarded only to those ports specified. Unknown multicast packets are dropped. To configure this option:
 - Define the Multicast MAC address for the VLAN and specify ports that are to receive multicast packets (/cfg/12/fdb/mcast/add).
 - Enable Flood Blocking on ports that are not to receive multicast packets (/cfg/port x/floodblk ena).

Use the following commands to configure static Multicast MAC entries in the Forwarding Database (FDB).

Table 215. Static Multicast MAC Menu Options (/cfg/l2/fdb/mcast)

```
add <MAC address> <VLAN number> {port <port alias or number> | trunk <trunk number> | adminkey <0-65535>}

Adds a static multicast entry. You can list ports separated by a space, or enter a range of ports separated by a hyphen (-). For example:

add 01:00:00:23:3f:01 200 int1-int4

del <MAC address> <VLAN number> <port alias or number>
Deletes a static multicast entry.

clear {mac <MAC address> | vlan <VLAN number> | port <port alias or number> | all}
Clears static multicast entries.

cur
Display current static multicast entries.

Static FDB Configuration Menu

```
[Static FDB Menu]
    add
            - Add a permanent FDB entry
    del
             - Delete a static FDB entry
    clear - Clear static FDB entries
            - Display current static FDB configuration
```

Use the following commands to configure static entries in the Forwarding Database (FBD).

Table 216. Static FDB Menu Options (/cfg/l2/fdb/static)

```
Command Syntax and Usage
add <MAC address> <VLAN number> {port <port alias or number>|
   trunk <trunk number> | adminkey <value> }
   Adds a permanent FDB entry. Enter the MAC address using the following
   format: xx:xx:xx:xx:xx
   For example, 08:00:20:12:34:56
   You can also enter the MAC address as follows:
   XXXXXXXXXX
   For example, 080020123456
del <MAC address> <VLAN number>
   Deletes a permanent FDB entry.
clear <MAC address>|all {mac|vlan|port}
   Clears static FDB entries.
cur
   Display current static FDB configuration.
```

ECP Configuration

```
[Edge Control Protocol Configuration Menu]
    retrans - Set ECP retransmission interval
             - Show current ECP parameters
```

Use the following commands to configure Edge Control Protocol (ECP).

Table 217. ECP Configuration Options

```
Command Syntax and Usage
retrans <100-9000>
   Sets the retransmission value in milliseconds. The default value is 1000ms.
cur
   Display the current ECP configuration.
```

LLDP Configuration Menu

```
[LLDP configuration Menu]

port - LLDP Port Menu

msgtxint - Set transmission interval for LLDPDU

msgtxhld - Set holdtime multiplier for LLDP advertisement

notifint - Set minimum interval for successive trap notification

txdelay - Set delay interval between LLDP advertisements

redelay - Set reinitialization delay interval

on - Globally turn LLDP On

off - Globally turn LLDP Off

cur - Show current LLDP parameters
```

Use the following commands to configure Link Layer Detection Protocol (LLDP).

Table 218. LLDP Menu Options (/cfg/l2/lldp)

Command Syntax and Usage

port port alias or number>

Displays the LLDP Port Configuration menu. To view menu options, see page 313.

```
msqtxint <5-32768>
```

Configures the message transmission interval, in seconds. The default value is 30.

```
msqtxhld <2-10>
```

Configures the message hold time multiplier. The hold time is configured as a multiple of the message transmission interval.

The default value is 4.

```
notifint <1-3600>
```

Configures the trap notification interval, in seconds. The default value is 5.

```
txdelay <1-8192>
```

Configures the transmission delay interval. The transmit delay timer represents the minimum time permitted between successive LLDP transmissions on a port.

The default value is 2.

```
redelay <1-10>
```

Configures the re-initialization delay interval, in seconds. The re-initialization delay allows the port LLDP information to stabilize before transmitting LLDP messages.

The default value is 2.

on

Globally turns LLDP on. The default setting is on.

Table 218. LLDP Menu Options (/cfg/l2/lldp) (continued)

Command Syntax and Usage

off

Globally turns LLDP off.

cur

Display current LLDP configuration.

/cfg/l2/lldp/port <port alias or number>

LLDP Port Configuration Menu

vlanname d|e
   Enables or disables the VLAN Name information type.
protid d|e
   Enables or disables the Protocol ID information type.
```

Table 220. Optional TLV Menu Options (/cfg/l2/lldp/port x/tlv) (continued)

Command Syntax and Usage

macphy d|e

Enables or disables the MAC/Phy Configuration information type.

powermdi d|e

Enables or disables the Power via MDI information type.

linkaggr d|e

Enables or disables the Link Aggregation information type.

framesz d|e

Enables or disables the Maximum Frame Size information type.

dcbx d|e

Enables or disables the Data Center Bridging Capability Exchange (DCBX) information type.

all d|e

Enables or disables all optional TLV information types.

cur

Display current Optional TLV configuration.

/cfg/l2/trunk <trunk group number>

Trunk Configuration Menu

```
[Trunk group 1 Menu]

add - Add port to trunk group

rem - Remove port from trunk group

ena - Enable trunk group

dis - Disable trunk group

del - Delete trunk group

cur - Display current Trunk Group configuration
```

Trunk groups can provide super-bandwidth connections between VFSMs or other trunk capable devices. A *trunk* is a group of ports that act together, combining their bandwidth to create a single, larger port. Up to 18 trunk groups can be configured on the VFSM, with the following restrictions:

- Any physical switch port can belong to no more than one trunk group.
- Up to 8 ports can belong to the same trunk group.
- Configure all ports in a trunk group with the same properties (speed, duplex, flow control, STG, VLAN, and so on).
- Trunking from non-IBM devices must comply with Cisco[®] EtherChannel[®] technology.

By default, each trunk group is empty and disabled.

Table 221. Trunk Configuration Menu Options (/cfg/l2/trunk)

Command Syntax and Usage add <port alias or number> Adds a physical port or ports to the current trunk group. You can add several ports, with each port separated by a comma (,) or a range of ports, separated by a dash (-). rem <port alias or number> Removes a physical port or ports from the current trunk group.

ena

Enables the current trunk group.

dis

Disables the current trunk group.

del

Removes the current trunk group configuration.

cur

Displays current trunk group parameters.

/cfq/12/thash

Trunk Hash Configuration Menu

```
[Trunk Hash Menu]
    12thash - L2 Trunk Hash Control
    13thash - L3 Trunk Hash Control
    ingress - Enable/disable ingress port hash
    L4port - Enable/disble L4 port hash
    localprf - Enable/disble dmlt local preference
             - Display current Trunk Hash configuration
```

Use the following commands to configure IP trunk hash settings for the VFSM. Trunk hash parameters are set globally for the VFSM. The trunk hash settings affect both static trunks and LACP trunks.

To achieve the most even traffic distribution, select options that exhibit a wide range of values for your particular network. You may use the configuration settings listed in Table 222 combined with the hash parameters listed in Table 223 and Table 224.

Table 222. Trunk Hash Settings (/cfg/l2/thash)

Command Syntax and Usage

12thash

Displays the Layer 2 Trunk Hash Settings menu. To view menu options, see page 318.

13thash

Displays the Layer 3 Trunk Hash Settings menu. To view menu options, see page 319.

ingress enable disable

Enables or disables trunk hash computation based on the ingress port. The default setting is disabled.

L4port enable disable

Enables or disables use of Layer 4 service ports (TCP, UDP, and so on) to compute the hash value. The default setting is disable.

localprf enable disable

Enables or disables Distributed Multi-Link Trunking (DMLT) local preference for the stack. The default setting is disable.

cur

Display current trunk hash configuration.

/cfg/l2/thash/l2thash

Layer 2 Trunk Hash Menu

```
[L2 Trunk Hash Menu]

smac - Enable/disable smac hash

dmac - Enable/disable dmac hash

cur - Display current trunk hash setting for L2 traffic
```

Layer 2 trunk hash parameters are set globally. You can enable one or both parameters, to configure any of the following valid combinations:

- SMAC (source MAC only)
- DMAC (destination MAC only)
- SMAC and DMAC

Use the following commands to configure Layer 2 trunk hash parameters for the switch.

Table 223. Layer 2 Trunk Hash Options (/cfg/l2/thash/l2thash)

```
Command Syntax and Usage

smac enable | disable
    Enables or disable Layer 2 trunk hashing on the source MAC.

dmac enable | disable
    Enables or disable Layer 2 trunk hashing on the destination MAC.

cur
    Displays current Layer 2 trunk hash settings.
```

/cfq/l2/thash/l3thash

Layer 3 Trunk Hash Menu

```
[L3 Trunk Hash Menu]
    useL2 - Enable/disable L2 hash for IP packet
            - Enable/disable sip hash for IP packet
            - Enable/disable dip hash for IP packet
            - Display current trunk hash setting for L3 traffic
```

Layer 3 trunk hash parameters are set globally. You can enable one or both parameters, to configure any of the following valid combinations:

- SIP (source IP only)
- DIP (destination IP only)
- SIP and DIP

Use the following commands to configure Layer 3 trunk hash parameters for the switch.

Table 224. Layer 3 Trunk Hash Options (/cfg/l2/thash/l3thash)

Command Syntax and Usage

useL2 enable disable

Enables or disables use of Layer 2 hash parameters only. When enabled, Layer 3 hashing parameters are cleared.

sip enable disable

Enables or disables Layer 3 trunk hashing on the source IP address.

dip enable disable

Enables or disables Layer 3 trunk hashing on the destination IP address.

cur

Displays current Layer 3 trunk hash settings.

LACP Configuration Menu

```
[LACP Menu]

port - LACP Port Menu

sysprio - Set LACP system priority

timeout - Set LACP system timeout scale for timing out partner info

delete - Delete an LACP trunk

default - Restore default LACP system configuration

cur - Display current LACP configuration
```

Use the following commands to configure Link Aggregation Control Protocol (LACP) for the VFSM.

Table 225. LACP Menu Options (/cfg/l2/lacp)

Command Syntax and Usage

port port alias or number>

Displays the LACP Port menu. To view menu options, see page 321.

sysprio <*1-65535*>

Defines the priority value (1 through 65535) for the VFSM. Lower numbers provide higher priority. The default value is 32768.

timeout short long

Defines the timeout period before invalidating LACP data from a remote partner. Choose short (3 seconds) or long (90 seconds). The default value is long.

Note: It is recommended that you use a timeout value of long, to reduce LACPDU processing. If your VFSM's CPU utilization rate remains at 100% for periods of 90 seconds or more, consider using static trunks instead of LACP.

delete <1-65535>

Deletes a selected LACP trunk, based on its *admin key*. This command is equivalent to disabling LACP on each of the ports configured with the same *admin key*.

default sysprio timeout

Restores the selected parameters to their default values.

cur

Display current LACP configuration.

/cfq/l2/lacp/port cfq/l2/lacp/port port alias or number>

LACP Port Configuration Menu

```
[LACP Port EXT1 Menu]
    mode - Set LACP mode
    prio - Set LACP port priority
    adminkey - Set LACP port admin key
    minlinks - Set LACP port minimum links
    default - Restore default LACP port configuration
            - Display current LACP port configuration
```

Use the following commands to configure Link Aggregation Control Protocol (LACP) for the selected port.

Table 226. LACP Port Menu Options (/cfg/l2/lacp/port)

Command Syntax and Usage

mode off active passive

Set the LACP mode for this port, as follows:

- off: Turn LACP off for this port. You can use this port to manually configure a static trunk. The default value is off.
- active: Turn LACP on and set this port to active. Active ports initiate
- passive: Turn LACP on and set this port to passive. Passive ports do not initiate LACPDUs, but respond to LACPDUs from active ports.

```
prio <1-65535>
```

Sets the priority value for the selected port. Lower numbers provide higher priority. The default value is 32768.

```
adminkey < 1-65535 >
```

Set the admin key for this port. Only ports with the same admin key and oper key (operational state generated internally) can form a LACP trunk group.

```
minlinks <1-8>
```

Set the minimum number of links for this port. If the specified minimum number of ports are not available, the trunk is placed in the down state.

```
default adminkey|mode|prio
```

Restores the selected parameters to their default values.

cur

Displays the current LACP configuration for this port.

Layer 2 Failover Configuration Menu

```
[Failover Menu]

trigger - Trigger Menu

vlan - Globally turn VLAN Monitor ON/OFF

on - Globally turn Failover ON

off - Globally turn Failover OFF

cur - Display current Failover configuration
```

Use this menu to configure Layer 2 Failover. For more information about Layer 2 Failover, see "High Availability" in the *IBM N/OS Application Guide*.

Table 227. Layer 2 Failover Menu Options (/cfg/l2/failovr)

Command Syntax and Usage trigger </-8> Displays the Failover Trigger menu. To view menu options, see page 323. vlan on|off Globally turns VLAN monitor on or off. When the VLAN Monitor is on, the switch automatically disables only internal ports that belong to the same VLAN as ports in the failover trigger. The default value is off. on Globally turns Layer 2 Failover on. off Globally turns Layer 2 Failover off. cur Displays current Layer 2 Failover parameters.

/cfq/l2/failovr/trigger <1-8>

Failover Trigger Configuration Menu

```
[Trigger 1 Menu]
   amon - Auto Monitor Menu
   mmon - Manual Monitor Menu
   limit - Limit of Trigger
   ena - Enable Trigger
   dis - Disable Trigger
   del
           - Delete Trigger
    cur - Display current Trigger configuration
```

Table 228. Failover Trigger Menu Options (/cfg/l2/failovr/trigger)

Command Syntax and Usage

amon

Displays the Auto Monitor menu for the selected trigger. To view menu options, see page 324.

mmon

Displays the Manual Monitor menu for the selected trigger. To view menu options, see page 324.

limit <0-1024>

Configures the minimum number of operational links allowed within each trigger before the trigger initiates a failover event. If you enter a value of zero (0), the switch triggers a failover event only when no links in the trigger are operational.

ena

Enables the selected trigger.

dis

Disables the selected trigger.

del

Deletes the selected trigger.

cur

Displays the current failover trigger settings.

/cfg/l2/failovr/trigger <1-8>/amon

Auto Monitor Configuration Menu

```
[Auto Monitor Menu]

addtrnk - Add trunk to Auto Monitor

remtrnk - Remove trunk from Auto Monitor

addkey - Add LACP port adminkey to Auto Monitor

remkey - Remove LACP port adminkey from Auto Monitor

cur - Display current Auto Monitor configuration
```

Table 229. Auto Monitor Menu Options (/cfg/l2/failovr/trigger/amon)

Command Syntax and Usage

addtrnk <trunk group number)>

Adds a trunk group to the Auto Monitor.

remtrnk <trunk group number>

Removes a trunk group from the Auto Monitor.

addkey <1-65535>

Adds an LACP *admin key* to the Auto Monitor. LACP trunks formed with this *admin key* will be included in the Auto Monitor.

remkey <1-65535>

Removes an LACP admin key from the Auto Monitor.

cur

Displays the current Auto Monitor settings.

/cfg/l2/failovr/trigger <1-8>/mmon

Manual Monitor Configuration Menu

```
[Manual Monitor Menu]
monitor - Monitor Menu
control - Control Menu
cur - Display current Manual Monitor configuration
```

Use this menu to configure Failover Manual Monitor. These menus let you manually define both the monitor and control ports that participate in failover teaming.

Note: AMON and MMON configurations are mutually exclusive.

Table 230. Failover Manual Monitor options (/cfg/l2/failovr/trigger/mmon)

Command Syntax and Usage

monitor

Displays the Manual Monitor - Monitor menu for the selected trigger.

control

Displays the Manual Monitor - Control menu for the selected trigger.

cur

Displays the current Manual Monitor settings.

/cfg/l2/failovr/trigger <1-8>/mmon/monitor

Manual Monitor Port Configuration Menu

```
[Monitor Menu]
    addport - Add port to Monitor
    remport - Remove port from Monitor
    addtrnk - Add trunk to Monitor
    remtrnk - Remove trunk from Monitor
    addkey - Add LACP port adminkey to Monitor
    remkey - Remove LACP port adminkey from Monitor
             - Display current Monitor configuration
```

Use this menu to define the port link(s) to monitor. The Manual Monitor Port configuration accepts only external uplink ports.

Table 231. Failover Manual Monitor Port Options (/cfg/l2/failovr/trigger/mmon/monitor)

Command Syntax and Usage

addport port alias or number>

Adds the selected port to the Manual Monitor Port configuration.

remport <port alias or number>

Removes the selected port from the Manual Monitor Port configuration.

addtrnk <trunk number>

Adds a trunk group to the Manual Monitor Port configuration.

remtrnk <trunk number>

Removes a trunk group from the Manual Monitor Port configuration.

addkey <1-65535>

Adds an LACP admin key to the Manual Monitor Port configuration. LACP trunks formed with this admin key will be included in the Manual Monitor Port configuration.

remkey < 1-65535 >

Removes an LACP admin key from the Manual Monitor Port configuration.

Displays the current Manual Monitor Port configuration.

/cfg/l2/failovr/trigger <1-8>/mmon/control

Manual Monitor Control Configuration Menu

```
[Control Menu]

addport - Add port to Control

remport - Remove port from Control

addtrnk - Add trunk to Control

remtrnk - Remove trunk from Control

addkey - Add LACP port adminkey to Control

remkey - Remove LACP port adminkey from Control

cur - Display current Control configuration
```

Use this menu to define the port link(s) to control. The Manual Monitor Control configuration accepts internal and external ports, but not management ports.

Table 232. Failover Manual Monitor Control Options (/cfg/l2/failovr/trigger/mmon/control)

Command Syntax and Usage

addport <port alias or number>

Adds the specified port or ports to the Manual Monitor Control configuration.

remport <port alias or number>

Removes the specified port or ports from the Manual Monitor Control configuration.

addtrnk <trunk number>

Adds a trunk group to the Manual Monitor Control configuration.

remtrnk <trunk number>

Removes a trunk group from the Manual Monitor Control configuration.

addkey <1-65535>

Adds an LACP *admin key* to the Manual Monitor Control configuration. LACP trunks formed with this *admin key* will be included in the Manual Monitor Control configuration.

remkey <1-65535>

Removes an LACP admin key from the Manual Monitor Control configuration.

cur

Displays the current Manual Monitor Control configuration.

/cfq/l2/hotlink

Hot Links Configuration Menu

```
[Hot Links Menu]
     trigger - Trigger Menu
     bpdu - Enable/disable BPDU flood
sndfdb - Enable/disable FDB update
     sndrate - Set FDB update rate
              - Globally turn Hot Links ON
              - Globally turn Hot Links OFF
              - Display current Hot Links configuration
```

Table 233 describes the Hot Links menu options.

Table 233. Hot Links Menu Options (/cfg/l2/hotlink)

Command Syntax and Usage

trigger <1-200>

Displays the Hot Links Trigger menu. To view menu options, see page 328.

bpdu enable|disable

Enables or disables flooding of Spanning-Tree BPDUs on the active Hot Links interface when the interface belongs to a Spanning Tree group that is globally turned off. This feature can prevent unintentional loop scenarios (for example, if two uplinks come up at the same time).

The default setting is disabled.

sndfdb enable|disable

Enables or disables FDB Update, which allows the switch to send FDB and MAC update packets over the active interface.

The default setting is disabled.

sndrate <10-200>

Configures the FDB update rate in packets per second.

on

Globally turns Hot Links on. The default value is off.

off

Globally turns Hot Links off.

cur

Displays current Hot Links configuration.

/cfg/l2/hotlink/trigger <1-200>

Hot Links Trigger Configuration Menu

```
[Trigger 2 Menu]

master - Master Menu
backup - Backup Menu
fdelay - Set Forward Delay (secs)
name - Set Trigger Name
preempt - Enable/disable Preemption
ena - Enable Trigger
dis - Disable Trigger
del - Delete Trigger
cur - Display current Trigger configuration
```

Table 234. Hot Links Trigger Menu Options (/cfg/l2/hotlink/trigger)

Command Syntax and Usage

master

Displays the Master interface menu for the selected trigger. To view menu options, see page 329.

backup

Displays the Backup interface menu for the selected trigger. To view menu options, see page 329.

fdelay <0-3600>

Configures the Forward Delay interval, in seconds. The default value is 1.

name <1-32 characters>

Configures a name for the trigger.

preempt e d

Enables or disables pre-emption, which allows the Master interface to transition to the Active state whenever it becomes available.

The default setting is enabled.

ena

Enables the Hot Links trigger.

dis

Disables the Hot Links trigger.

del

Deletes the Hot Links trigger.

cur

Displays the current Hot Links trigger configuration.

/cfg/l2/hotlink/trigger <1-200>/master

Hot Links Trigger Master Configuration Menu

```
[Master Menu]
   port - Set port in Master
    trunk - Set trunk in Master
    adminkey - Set adminkey in Master
    cur - Display current Master configuration
```

Table 235. Hot Links Trigger Master menu (/cfg/l2/hotlink/trigger/master)

Command Syntax and Usage

port <port alias or number>

Adds the selected port to the Master interface. Enter 0 (zero) to clear the port.

```
trunk <trunk number> | 0
```

Adds the selected trunk group to the Master interface. Enter 0 (zero) to clear the trunk group.

```
adminkey <0-65535>
```

Adds an LACP admin key to the Master interface. LACP trunks formed with this admin key are included in the Master interface. Enter 0 (zero) to clear the admin key.

cur

Displays the current Hot Links Master interface configuration.

/cfg/l2/hotlink/trigger <1-200>/backup

Hot Links Trigger Backup Configuration Menu

```
[Backup Menu]
   port - Set port in Backup
    trunk - Set trunk in Backup
    adminkey - Set adminkey in Backup
    cur - Display current Backup configuration
```

Table 236. Hot Links Trigger Backup menu (/cfg/l2/hotlink/trigger/backup)

Command Syntax and Usage

port <port alias or number>

Adds the selected port to the Backup interface. Enter 0 (zero) to clear the port.

trunk < trunk number > | 0

Adds the selected trunk to the Backup interface. Enter 0 (zero) to clear the trunk group.

adminkey <0-65535>

Adds an LACP admin key to the Backup interface. LACP trunks formed with this admin key are included in the Backup interface. Enter 0 (zero) to clear the admin key.

cur

Displays the current Hot Links Backup interface settings.

/cfq/12/vlan < VLAN number>

VLAN Configuration Menu

```
[VLAN 1 Menu]
    pvlan - Protocol VLAN Menu
    privlan - Private-VLAN Menu
    name
             - Set VLAN name
            - Assign VLAN to a Spanning Tree Group
          - Set VMAP for this vlan
    vmap
            - Add port to VLAN
    add
            - Remove port from VLAN
    def
            - Define VLAN as list of ports
            - Enable/Disable this VLAN as additional management VLAN
    mgmt
            - Enable VLAN
    ena
    dis
            - Disable VLAN
            - Delete VLAN
    del
    cur
            - Display current VLAN configuration
```

The commands in this menu configure VLAN attributes, change the status of each VLAN, change the port membership of each VLAN, and delete VLANs.

By default, VLAN 1 is the only VLAN configured on the switch. Internal server ports and external uplink ports are members of VLAN 1 by default. Up to 1024 VLANs can be configured on the VFSM.

VLANs can be assigned any number between 1 and 4094. VLAN 4095 is reserved for switch management.

Table 237. VLAN Configuration Menu Options (/cfg/l2/vlan)

Command Syntax and Usage

pvlan <1-8>

Displays the Protocol-based VLAN menu. To view menu options, see page 332.

privlan

Displays the Private VLAN menu. To view menu options, see page 334.

name

Assigns a name to the VLAN or changes the existing name. The default VLAN name is the first one.

stg <Spanning Tree Group index>

Assigns a VLAN to a Spanning Tree Group.

```
vmap {add|rem} <1-128> [extports|intports]
```

Adds or removes a VLAN Map to the VLAN membership. You can choose to limit operation of the VLAN Map to internal ports only or external ports only. If you do not select a port type, the VMAP is applied to the entire VLAN.

add <port alias or number>

Adds port(s) to the VLAN membership.

rem port alias or number>

Removes port(s) from this VLAN.

Table 237. VLAN Configuration Menu Options (/cfg/l2/vlan) (continued)

Command Syntax and Usage

def <list of port numbers>

Defines which ports are members of this VLAN. Every port must be a member of at least one VLAN. By default, internal server ports (INTx) and external ports (EXTx) are in VLAN 1.

mgmt enable|disable

Configures this VLAN as a management VLAN. You must add the management ports (MGT1 and MGT2) to each new management VLAN. External ports cannot be added to management VLANs.

ena

Enables this VLAN.

dis

Disables this VLAN without removing it from the configuration.

del

Deletes this VLAN.

cur

Displays the current VLAN configuration.

Note: All ports must belong to at least one VLAN. Any port which is removed from a VLAN and which is not a member of any other VLAN is automatically added to default VLAN 1. You cannot remove a port from VLAN 1 if the port has no membership in any other VLAN. Also, you cannot add a port to more than one VLAN unless the port has VLAN tagging turned on (see the tag command on page 256).

/cfq/l2/vlan/pvlan cfq/l2/vlan/pvlan cfq/l2/vlan/pvlan

Protocol-Based VLAN Configuration Menu

```
[VLAN 1 Protocol 1 Menu]
   pty - Set protocol type
    protocol - Select a predefined protocol
    prio - Set priority to protocol
           - Add port to PVLAN
    add
    rem - Remove port from PVLAN
    ports - Add/Remove a list of ports to/from PVLAN
    tagpvl - Enable/Disable port tagging for PVLAN
    taglist - Enable tagging a port list for PVLAN
    ena - Enable protocol
    dis
           - Disable protocol
    del
            - Delete protocol
           - Display current PVLAN configuration
```

Use this menu to configure Protocol-based VLAN (PVLAN) for the selected VLAN.

```
Table 238. PVLAN Menu Options (/cfg/l2/vlan/pvlan)
Command Syntax and Usage
pty <(Ether2|SNAP|LLC)> <Ethernet type>
   Configures the frame type and the Ethernet type for the selected protocol.
   Ethernet type consists of a 4-digit (16 bit) hex code, such as 0080 (IPv4).
protocol <Protocol type>
   Selects a pre-defined protocol, as follows:
   - decEther2:DEC Local Area Transport
   - ipv4Ether2:Internet IP (IPv4)
   - ipv6Ether2:IPv6
   - ipx802.2:Novell IPX 802.2
   - ipx802.3:Novell IPX 802.3
   - ipxEther2:Novell IPX
   ipxSnap:Novell IPX SNAP
   - netbios: NetBIOS 802.2
   - rarpEther2:Reverse ARP
   - sna802.2:SNA 802.2

    snaEther2:IBM SNA Service on Ethernet

   - vinesEther2:Banyan VINES
   - xnsEther2:XNS Compatibility
prio <0-7>
   Configures the priority value for this PVLAN.
add <port alias or number>
   Adds a port to the selected PVLAN.
rem <port alias or number>
   Removes a port from the selected PVLAN.
```

Table 238. PVLAN Menu Options (/cfg/l2/vlan/pvlan) (continued)

Command Syntax and Usage

Defines a list of ports that belong to the selected protocol on this VLAN. Enter 0 (zero) to remove all ports.

tagpvl enable disable

Enables or disables port tagging on this PVLAN.

taglist { < port alias or number, or a list or range of ports > | empty}

Defines a list of ports that will be tagged by the selected protocol on this VLAN. Enter empty to disable tagging on all ports by this PVLAN.

ena

Enables the selected protocol on the VLAN.

dis

Disables the selected protocol on the VLAN.

del

Deletes the selected protocol configuration from the VLAN.

cur

Displays current parameters for the selected PVLAN.

/cfg/l2/vlan/privlan

Private VLAN Configuration Menu

```
[privlan Menu]

type - Set Private-VLAN type

map - Associate secondary VLAN with a primary VLAN

ena - Enable Private-VLAN

dis - Disable Private-VLAN

cur - Display current Private-VLAN configuration
```

Use this menu to configure a Private VLAN.

Table 239. Private VLAN Menu Options (/cfg/l2/vlan/privlan)

Command Syntax and Usage

type {none|primary|isolated|community}

Defines the VLAN type, as follows:

- none: Clears the Private VLAN type.
- primary: A Private VLAN must have only one primary VLAN. The primary VLAN carries unidirectional traffic to ports on the isolated VLAN or to community VLAN.
- isolated: The isolated VLAN carries unidirectional traffic from host ports.
 A Private VLAN may have only one isolated VLAN.
- community: Community VLANs carry upstream traffic from host ports. A Private VLAN may have multiple community VLANs.

```
map <2-4094> | none
```

Configures Private VLAN mapping between a secondary VLAN (isolated or community) and a primary VLAN. Enter the primary VLAN ID.

ena

Enables the Private VLAN.

dis

Disables the Private VLAN.

cur

Displays current parameters for the selected Private VLAN.

Layer 3 Configuration Menu

To view menu options, see page 345. arp Displays the Address Resolution Protocol Menu. To view menu options, see page 346.

Table 240. Layer 3 Configuration Menu (/cfg/l3) (continued)

Command Syntax and Usage

frwd

Displays the IP Forwarding Menu. To view menu options, see page 348.

nwf < network filter number (1-256)>

Displays the Network Filter Configuration Menu. To view menu options see page 349.

rmap < route map number (1-32)>

Displays the Route Map Menu. To view menu options see page 350.

rip

Displays the Routing Interface Protocol Menu. To view menu options, see page 354.

ospf

Displays the OSPF Menu. To view menu options, see page 358.

bgp

Displays the Border Gateway Protocol Menu. To view menu options, see page 369.

mld

Displays the Multicast Listener Discovery Menu. To view menu options, see page 375.

igmp

Displays the IGMP Menu. To view menu options, see page 377.

ikev2

Displays the IKEv2 Menu. To view menu options, see page 387.

ipsec

Displays the IPsec Menu. To view menu options, see page 390.

dns

Displays the IP Domain Name System Menu. To view menu options, see page 400.

bootp

Displays the Bootstrap Protocol Menu. To view menu options, see page 401.

vrrp

Displays the Virtual Router Redundancy Configuration Menu. To view menu options, see page 405.

qw6 < gateway number (1, 132)>

Displays the IPv6 Gateway Configuration Menu. To view menu options, see page 415.

Table 240. Layer 3 Configuration Menu (/cfg/l3) (continued)

Command Syntax and Usage

route6

Displays the IPv6 Routing Configuration Menu. To view menu options, see page 416.

nbrcache

Displays the IPv6 Neighbor Discovery Cache Configuration Menu. To view menu options, see page 417.

ip6pmtu

Displays the IPv6 Path MTU menu. To view menu options, see page 418.

ospf3

Displays the OSPFv3 Configuration Menu. To view menu options, see page 419.

ndprefix

Displays the IPv6 Neighbor Discovery Prefix menu. To view menu options, see page 431.

ppt

Displays the Prefix Policy Table menu. To view menu options, see page 434.

loopif

Displays the IP Loopback Interface Menu. To view menu options, see page 435.

rtrid <IP address (such as, 192.4.17.101)>

Sets the router ID.

flooding

Displays the Flooding Configuration Menu. To view menu options, see page 436.

Displays the DHCP Configuration Menu. To view menu options, see page 436.

cur

Displays the current IP configuration.

/cfg/l3/if <interface number>

IP Interface Configuration Menu

```
[IP Interface 1 Menu]

ip6nd - IP6 Neighbor Discovery Menu

addr - Set IP address

secaddr6 - Set Secondary IPv6 address on IPv6 interface

maskplen - Set subnet mask/prefix len

vlan - Set VLAN number

relay - Enable/disable BOOTP relay

ip6host - Enable/disable IPv6 host mode

ip6dstun - Enable/disable ICMPv6 destination unreachable messages

ena - Enable IP interface

dis - Disable IP interface

del - Delete IP interface

cur - Display current interface configuration
```

The VFSM can be configured with up to 128 IP interfaces. Each IP interface represents the VFSM on an IP subnet on your network. The Interface option is disabled by default.

Interface 128 is reserved for switch management. If the IPv6 feature is enabled, interface 127 is also reserved.

Note: To maintain connectivity between the management module and the VFSM, use the management module interface to change the IP address of the switch.

Table 241. IP Interface Menu Options (/cfg/l3/if)

Command Syntax and Usage

ip6nd

Displays the IPv6 Neighbor Discovery menu. To view menu options, see page 340.

addr <IPv4 address (such as 192.4.17.101)>

IPv4: Configures the IPv4 address of the switch interface, using dotted decimal notation.

addr <IPv6 address (such as 3001:0:0:0:0:0:0:abcd:12)> [anycast]

IPv6: Configures the IPv6 address of the switch interface, using hexadecimal format with colons.

Configures the secondary IPv6 address of the switch interface, using hexadecimal format with colons.

maskplen < IPv4 subnet mask (such as 255.255.255.0)>

IPv4: Configures the IPv4 subnet address mask for the interface, using dotted decimal notation.

maskplen < IPv6 prefix length (1-128)>

IPv6: Configures the subnet IPv6 prefix length. The default value is 0 (zero).

Table 241. IP Interface Menu Options (/cfg/l3/if) (continued)

Command Syntax and Usage

vlan <*VLAN number*>

Configures the VLAN number for this interface. Each interface can belong to only one VLAN.

IPv4: Each VLAN can contain multiple IPv4 interfaces.

IPv6: Each VLAN can contain only one IPv6 interface.

relay disable enable

Enables or disables the BOOTP relay on this interface. The default setting is enabled.

ip6host enable disable

Enables or disables the IPv6 Host Mode on this interface. The default setting is disabled for data interfaces, and enabled for the management interface.

ip6dstun enable|disable

Enables or disables sending of ICMP Unreachable messages. The default setting is enabled.

ena

Enables this IP interface.

dis

Disables this IP interface.

del

Removes this IP interface.

cur

Displays the current interface settings.

/cfg/l3/if <interface number>/ip6nd

IPv6 Neighbor Discovery Configuration Menu

```
[IP6 Neighbor Discovery Menu]
rtradv - Enable/disable router advertisement
managed - Enable/disable Managed config flag
othercfg - Enable/disable Other config flag
ralife - Set Router Advertisement lifetime
dad - Set number of duplicate address detection attempts
reachtm - Set advertised reachability time
advint - Set Router Advertisement maximum interval
advmint - Set Router Advertisement minimum interval
retimer - Set Router Advertisement Retrans Timer
hoplmt - Set Router Advertisement Hop Limit
advmtu - Enable/disable Advertise MTU option
cur - Display current Neighbor Discovery configuration
```

Table 242 describes the IPv6 Neighbor Discovery configuration options.

Table 242. IPv6 Neighbor Discovery Options

Command Syntax and Usage

rtradv e d

Enables or disables IPv6 Router Advertisements on the interface. The default value is disabled.

managed e d

Enables or disables the *managed address configuration* flag of the interface. When enabled, the host IP address can be set automatically through DHCP. The default value is disabled.

othercfg e|d

Enables or disables the *other stateful configuration* flag, which allows the interface to use DHCP for other stateful configuration. The default value is disabled.

ralife <0-9000>

Configures the IPv6 Router Advertisement lifetime interval. The RA lifetime interval must be greater than or equal to the RA maximum interval (advint), or 0 (zero).

The default value is 1800 seconds.

dad < 1-10 >

Configures the maximum number of duplicate address detection attempts. The default value is 1.

```
reachtm <0-3600> reachtm <0-3600000> ms
```

Configures the advertised reachability time, in seconds or milliseconds (ms). The default value is 30 seconds.

Table 242. IPv6 Neighbor Discovery Options

advint <4-1800>

Configures the Router Advertisement maximum interval. The default value is 600 seconds.

Note: Set the maximum RA interval to a value greater than or equal to 4/3 of the minimum RA interval.

advmint <3-1800>

Configures the Router Advertisement minimum interval. The default value is 198 seconds.

Note: Set the minimum RA interval to a value less than or equal to 0.75 of the maximum RA interval.

retimer <0-4294967> retimer <0-4294967295> ms

> Configures the Router Advertisement re-transmit timer, in seconds or milliseconds (ms).

The default value is 1 second.

hoplmt <0-255>

Configures the Router Advertisement hop limit. The default value is 64.

advmtu e d

Enables or disables the MTU option in Router Advertisements. The default setting is enabled.

cur

Displays the current Neighbor Discovery parameters.

Default Gateway Configuration Menu

```
[Default gateway 1 Menu]

addr - Set IP address

intr - Set interval between ping attempts

retry - Set number of failed attempts to declare gateway DOWN

arp - Enable/disable ARP only health checks

ena - Enable default gateway

dis - Disable default gateway

del - Delete default gateway

cur - Display current default gateway configuration
```

The switch can be configured with up to 132 IPv4 gateways. Gateway 132 is reserved for switch management.

This option is disabled by default.

Table 243. Default Gateway Menu Options (/cfg/l3/gw)

Command Syntax and Usage

addr < default gateway address (such as, 192.4.17.44)>

Configures the IP address of the default IP gateway using dotted decimal notation.

intr <0-60 seconds>

The switch pings the default gateway to verify that it's up. The intr option sets the time between health checks. The range is from 0 to 60 seconds. The default is 2 seconds.

retry < number of attempts (1-120)>

Sets the number of failed health check attempts required before declaring this default gateway inoperative. The range is from 1 to 120 attempts. The default is 8 attempts.

arp disable|enable

Enables or disables Address Resolution Protocol (ARP) health checks. The default value is disabled. The arp option does not apply to management gateways.

ena

Enables the gateway for use.

dis

Disables the gateway.

del

Deletes the gateway from the configuration.

cur

Displays the current gateway settings.

/cfq/13/route

IPv4 Static Route Configuration Menu2

```
[IP Static Route Menu]
    add - Add static route
    rem
            - Remove static route
    clear - Clear static routes
    interval - Change ECMP route health check ping interval
    retries - Change the number of retries for ECMP health check
    ecmphash - Choose ECMP hash mechanism sip/dipsip
    bgptoecmp - Enable/disable BGP to ECMP functionality
             - Display current static routes
```

Up to 128 IPv4 static routes can be configured.

Table 244. IP Static Route Configuration Menu Options (cfg/l3/route)

Command Syntax and Usage

```
add <destination> <mask> <gateway> [<interface number>]
```

Adds a static route. You will be prompted to enter a destination IP address, destination subnet mask, and gateway address. Enter all addresses using dotted decimal notation.

Note: You may add multiple routes with the same IP address, but with different gateways. These routes become Equal Cost Multipath (ECMP) routes. The maximum number of gateways for each destination is five (5).

```
rem <destination> <mask> [<interface number>]
```

Removes a static route. The destination address of the route to remove must be specified using dotted decimal notation.

Note: The gateway IP address is optional. Include the gateway when you remove an ECMP route. If you do not include the gateway, then all ECMP paths for the route are deleted.

```
clear <destination IP address> | <gateway IP address> | all <value>
```

Clears the selected IPv4 static routes.

Note: Use the gateway IP address to clear a single gateway for an ECMP route.

```
interval <1-60>
```

Configures the ping interval for ECMP health checks, in seconds. The default value is one second.

```
retries < 1-60>
```

Configures the number of health check retries allowed before the switch declares that the gateway is down. The default value is 3.

```
ecmphash [sip] [dipsip]
```

Configures ECMP route hashing parameters. You may choose one of the following parameters:

- sip: Source IP address
- dipsip: Destination IP address and source IP address

Table 244. IP Static Route Configuration Menu Options (cfg/l3/route) (continued)

bgptoecmp enable disable

Enables or disables BGP to ECMP route selection. When enabled, the switch checks new BGP routes to see if there is an ECMP route with the same gateway as the new route. If one such route exists, then the switch adds a new ECMP route with the same paths but with the new destination.

When a new BGP route has the next hop in one of the subnets to which an ECMP static route exists, the switch adds that BGP route as a static ECMP route.

cur

Displays the current IPv4 static routes.

IP Multicast Route Configuration Menu

```
[IPMC Static Route Menu]
    addport - Add static IP Multicast route for port
    remport - Remove static IP Multicast route for port
    addtrnk - Add static IP Multicast route for trunk
    remtrnk - Remove static IP Multicast route for trunk
    addkey - Add static IP Multicast route for Lacp adminkey
    remkey - Remove static IP Multicast route or Lacp adminkey
            - Display current static IPMC route configuration
```

The following table describes the IP Multicast (IPMC) route menu options. Before you can add an IPMC route, IGMP must be turned on (/cfg/13/igmp on), and either IGMP Relay or IGMP Snooping (/cfg/13/igmp/snoop/ena) must be enabled (/cfq/13/iqmp/relay/ena).

Table 245. IPMC Route Configuration Options

Command Syntax and Usage

```
addport <IPMC destination> <VLAN number> <port alias or number>
   primary|backup|host <virtual router ID>|none
```

Adds a static multicast route. You will be prompted to enter a destination IP address (in dotted decimal notation), VLAN, and member port. If IGMP Relay is enabled, indicate whether the static mroute is a primary, backup or host multicast route.

```
remport <IPMC destination> <VLAN number> <port alias or number>
  primary|backup|host <virtual router ID>|none
```

Removes a static multicast route. The destination address, VLAN, and member port of the route to remove must be specified.

```
addtrnk <IPMC destination> <VLAN number> <trunk group number>
   primary | backup | host < virtual router ID > | none
```

Adds a static multicast route. You will be prompted to enter a destination IP address (in dotted decimal notation), VLAN, and member trunk group. If IGMP Relay is enabled, indicate whether the static mroute is a primary, backup or host multicast route.

```
remtrnk <IPMC destination> <VLAN number> <trunk group number>
   primary|backup|host <virtual router ID>|none
```

Removes a static multicast route. The destination address, VLAN, and member trunk group of the route to remove must be specified.

```
addkey < IPMC destination> < VLAN number> < LACP adminkey>
   primary|backup|host < virtual router ID> |none
```

Adds a static multicast route. You will be prompted to enter a destination IP address (in dotted decimal notation), VLAN, and LACP adminkey. If IGMP Relay is enabled, indicate whether the static mroute is a primary, backup or host multicast route.

Table 245. IPMC Route Configuration Options

```
remkey <IPMC destination> <VLAN number> <LACP adminkey> primary | backup | host <virtual router ID> | none
```

Removes a static multicast route. The destination address, VLAN, and LACP adminkey of the route to remove must be specified.

cur

Displays the current IP multicast routes.

/cfg/l3/arp

ARP Configuration Menu

Address Resolution Protocol (ARP) is the TCP/IP protocol that resides within the Internet layer. ARP resolves a physical address from an IP address. ARP queries machines on the local network for their physical addresses. ARP also maintains IP to physical address pairs in its cache memory. In any IP communication, the ARP cache is consulted to see if the IP address of the computer or the router is present in the ARP cache. Then the corresponding physical address is used to send a packet.

```
[ARP Menu]
static - Static ARP Menu
rearp - Set re-ARP period in minutes
cur - Display current ARP configuration
```

Table 246. ARP Configuration Menu Options (/cfg/l3/arp)

Command Syntax and Usage

static

Displays Static ARP menu. To view options, see page 347.

```
rearp <2-120 minutes>
```

Defines re-ARP period, in minutes, for entries in the switch arp table. When ARP entries reach this value the switch will re-ARP for the address to attempt to refresh the ARP cache. The default value is 5 minutes.

cur

Displays the current ARP configurations.

/cfq/l3/arp/static

ARP Static Configuration Menu

Static ARP entries are permanent in the ARP cache and do not age out like the ARP entries that are learned dynamically. Static ARP entries enable the switch to reach the hosts without sending an ARP broadcast request to the network. Static ARPs are also useful to communicate with devices that do not respond to ARP requests. Static ARPs can also be configured on some gateways as a protection against malicious ARP Cache corruption and possible DOS attacks.

```
[Static ARP Menu]
            - Add a permanent ARP entry
    del
            - Delete an ARP entry
    clear - Clear static ARP entries
            - Display current static ARP configuration
```

Table 247. ARP Static Configuration Menu Options (/cfg/l3/arp/static)

```
Command Syntax and Usage
add <IP address> <MAC address> <VLAN number> <port number>
   Adds a permanent ARP entry.
del <IP address (such as, 192.4.17.101)>
   Deletes a permanent ARP entry.
clear [all|if <interface number>|vlan <VLAN number>|port <port number>]
   Clears static ARP entries.
cur
   Displays current static ARP configuration.
```

IP Forwarding Configuration Menu

cur

```
[IP Forwarding Menu]
dirbr - Enable or disable forwarding directed broadcasts
noicmprd - Enable/disable No ICMP Redirects
icmp6rd - Enable/disable ICMPv6 Redirects
on - Globally turn IP Forwarding ON
off - Globally turn IP Forwarding OFF
cur - Display current IP Forwarding configuration
```

Table 248. IP Forwarding Configuration Menu Options (/cfg/l3/frwd)

Displays the current IP forwarding settings.

dirbr disable|enable Enables or disables forwarding directed broadcasts. The default setting is disabled. noicmprd disable|enable Enables or disables ICMP re-directs. The default setting is disabled. icmp6rd disable|enable Enables or disables IPv6 ICMP re-directs. The default setting is disabled. on Enables IP forwarding (routing) on the VFSM. Forwarding is turned on by default. off Disables IP forwarding (routing) on the VFSM.

/cfq/13/nwf < 1-256 >

Network Filter Configuration Menu

```
[IP Network Filter 1 Menu]
     addr - IP Address
             - IP network filter mask
     mask
     enable - Enable Network Filter
     disable - Disable Network Filter
     delete - Delete Network Filter
             - Display current Network Filter configuration
```

Table 249. IP Network Filter Menu Options (/cfg/l3/nwf)

Command Syntax and Usage

addr <IP address, such as 192.4.17.44>

Sets the IP address that will be accepted by the peer when the filter is enabled. If used with the mask option, a range of IP addresses is accepted. The default address is 0.0.0.0

For Border Gateway Protocol (BGP), assign the network filter to an access-list in a route map, then assign the route map to the peer.

mask <IP network filter mask>

Sets the network filter mask that is used with addr. The default value is 0.0.0.0

For Border Gateway Protocol (BGP), assign the network filter to a route map, then assign the route map to the peer.

enable

Enables the Network Filter configuration.

disable

Disables the Network Filter configuration.

delete

Deletes the Network Filter configuration.

cur

Displays the current the Network Filter configuration.

/cfg/l3/rmap < route map number >

Routing Map Configuration Menu

Note: The *map number* (1-32) represents the routing map you wish to configure.

```
[IP Route Map 1 Menu]

alist - Access List number

aspath - AS Filter Menu

ap - Set as-path prepend of the matched route

lp - Set local-preference of the matched route

metric - Set metric of the matched route

type - Set OSPF metric-type of the matched route

prec - Set the precedence of this route map

weight - Set weight of the matched route

enable - Enable route map

disable - Disable route map

delete - Delete route map

cur - Display current route map configuration
```

Routing maps control and modify routing information.

Table 250. Routing Map Menu Options (/cfg/l3/rmap)

Command Syntax and Usage alist <number 1-8> Displays the Access List menu. For more information, see page 352. aspath <number 1-8> Displays the Autonomous System (AS) Filter menu. For more information, see page 353.

ap <AS number> [<AS number>] [<AS number>]|none
Sets the AS path preference of the matched route. You can configure up to
three path preferences.

```
lp <(0-4294967294)>|none
```

Sets the local preference of the matched route, which affects both inbound and outbound directions. The path with the higher preference is preferred.

```
metric <(1-4294967294)> none
```

Sets the metric of the matched route.

```
type \langle value(1|2) \rangle | none
```

Assigns the type of OSPF metric. The default is type 1.

- Type 1—External routes are calculated using both internal and external metrics
- Type 2—External routes are calculated using only the external metrics.
 Type 1 routes have more cost than Type 2.
- none—Removes the OSPF metric.

```
prec <value (1-255)>
```

Sets the precedence of the route map. The smaller the value, the higher the precedence. Default value is 10.

Table 250. Routing Map Menu Options (/cfg/l3/rmap) (continued)

weight <*value (0-65534)*>|none

Sets the weight of the route map.

enable

Enables the route map.

disable

Disables the route map.

delete

Deletes the route map.

cur

Displays the current route configuration.

/cfg/l3/rmap <route map number>/alist <access list number>

IP Access List Configuration Menu

Note: The *route map number (*1-32) and the *access list number* (1-8) represent the IP access list you wish to configure.

```
[IP Access List 1 Menu]

nwf - Network Filter number

metric - Metric

action - Set Network Filter action

enable - Enable Access List

disable - Disable Access List

delete - Delete Access List

cur - Display current Access List configuration
```

Table 251. IP Access List Menu Options (/cfg/l3/rmap/alist)

```
Command Syntax and Usage
nwf <network filter number (1-256)>
    Sets the network filter number. See "/cfg/l3/nwf <1-256>" on page 349 for
   details.
metric <(1-4294967294)>|none
   Sets the metric value in the AS-External (ASE) LSA.
action permit deny
   Permits or denies action for the access list.
enable
   Enables the access list.
disable
   Disables the access list.
delete
   Deletes the access list.
cur
   Displays the current Access List configuration.
```

/cfg/l3/rmap <route map number> /aspath <autonomous system path> **Autonomous System Filter Path Menu**

Note: The rmap number (1-32) and the path number (1-8) represent the AS path you wish to configure.

```
[AS Filter 1 Menu]
     as - AS number
     action - Set AS Filter action
     enable - Enable AS Filter
     disable - Disable AS Filter
     delete - Delete AS Filter
            - Display current AS Filter configuration
```

Table 252. AS Filter Menu Options (/cfg/l3/rmap/aspath)

Command Syntax and Usage as <AS number (1-65535)> Sets the Autonomous System filter's path number. action < permit | deny (p | d) >Permits or denies Autonomous System filter action. enable Enables the Autonomous System filter. disable Disables the Autonomous System filter. delete Deletes the Autonomous System filter. cur Displays the current Autonomous System filter configuration.

Routing Information Protocol Configuration Menu

```
[Routing Information Protocol Menu]

if - RIP Interface Menu

update - Set update period in seconds

redist - RIP Route Redistribute Menu

on - Globally turn RIP ON

off - Globally turn RIP OFF

current - Display current RIP configuration
```

The RIP Menu is used for configuring Routing Information Protocol (RIP) parameters. This option is turned off by default.

Table 253. RIP Menu Options (/cfg/l3/rip)

Command Syntax and Usage

if <interface number>

Displays the RIP Interface menu. For more information, see page 355.

update <1-120>

Configures the time interval for sending for RIP table updates, in seconds. The default value is 30 seconds.

redist fixed|static|ospf|eospf|ebgp|ibgp

Displays the RIP Route Redistribution menu. For more information, see page 357.

on

Globally turns RIP on.

off

Globally turns RIP off.

cur

Displays the current RIP configuration.

/cfq/l3/rip/if <interface number>

Routing Information Protocol Interface Configuration Menu

```
[RIP Interface 1 Menu]
   version - Set RIP version
    supply - Enable/disable supplying route updates
   listen - Enable/disable listening to route updates
   poison - Enable/disable poisoned reverse
   split - Enable/disable split horizon
   trigg - Enable/disable triggered updates
            - Enable/disable multicast updates
   mcast.
    default - Set default route action
    metric - Set metric
            - Set authentication type
           - Set authentication key
    kev
    enable - Enable interface
    disable - Disable interface
    current - Display current RIP interface configuration
```

The RIP Interface Menu is used for configuring Routing Information Protocol parameters for the selected interface.

Note: Do not configure RIP version 1 parameters if your routing equipment uses RIP version 2.

Table 254. RIP Interface Menu Options (/cfg/l3/rip/if)

Command Syntax and Usage

version 1|2|both

Configures the RIP version used by this interface. The default value is version

supply disable enable

When enabled, the switch supplies routes to other routers. The default value is enabled.

listen disable enable

When enabled, the switch learns routes from other routers. The default value is enabled.

poison disable enable

When enabled, the switch uses split horizon with poisoned reverse. When disabled, the switch uses only split horizon. The default value is disabled.

split disable enable

Enables or disables split horizon. The default value is enabled.

trigg disable enable

Enables or disables Triggered Updates. Triggered Updates are used to speed convergence. When enabled, Triggered Updates force a router to send update messages immediately, even if it is not yet time for the update message. The default value is enabled.

mcast disable enable

Enables or disables multicast updates of the routing table (using address 224.0.0.9). The default value is enabled.

Table 254. RIP Interface Menu Options (/cfg/l3/rip/if) (continued)

default none|listen|supply|both

When enabled, the switch accepts RIP default routes from other routers, but gives them lower priority than configured default gateways. When disabled, the switch rejects RIP default routes. The default value is none.

metric <1-15>

Configures the route metric, which indicates the relative distance to the destination. The default value is 1.

auth none password

Configures the authentication type. The default is none.

key <password> | none

Configures the authentication key password.

enable

Enables this RIP interface.

disable

Disables this RIP interface.

current

Displays the current RIP configuration.

/cfq/l3/rip/redist fixed|static|ospf|eospf|ebqp|ibqp

RIP Route Redistribution Configuration Menu

[RIP Redistribute Fixed Menu] - Add rmap into route redistribution list - Remove rmap from route redistribution list export - Export all routes of this protocol - Display current route-maps added

The following table describes the RIP Route Redistribute Menu options.

Table 255. RIP Redistribution Menu Options (/cfg/l3/rip/redist)

Command Syntax and Usage

Adds selected routing maps to the RIP route redistribution list. To add specific route maps, enter routing map numbers, separated by a comma (,). To add all 32 route maps, type all.

The routes of the redistribution protocol matched by the route maps in the route redistribution list will be redistributed.

Removes the route map from the RIP route redistribution list.

To remove specific route maps, enter routing map numbers, separated by a comma (,). To remove all 32 route maps, type all.

Exports the routes of this protocol in which the metric and metric type are specified. To remove a previous configuration and stop exporting the routes of the protocol, enter none.

cur

Displays the current RIP route redistribute configuration.

Open Shortest Path First Configuration Menu

```
[Open Shortest Path First Menu]
aindex - OSPF Area (index) menu
range - OSPF Summary Range menu
if - OSPF Interface menu
loopif - OSPF Loopback Interface Menu
virt - OSPF Virtual Links menu
md5key - OSPF MD5 Key Menu
host - OSPF Host Entry menu
redist - OSPF Route Redistribute menu
lsdb - Set the LSDB limit
default - Originate default route information
on - Globally turn OSPF ON
off - Globally turn OSPF OFF
cur - Display current OSPF configuration
```

Table 256. OSPF Configuration Menu (/cfg/l3/ospf)

Command Syntax and Usage

aindex < area index (0-2)>

Displays the area index menu. This area index does not represent the actual OSPF area number. See page 360 to view menu options.

range <1-16>

Displays the summary range menu. See page 362 to view menu options.

if <interface number>

Displays the OSPF interface configuration menu. See page 363 to view menu options.

loopif <1-5>

Displays the OSPF loopback interface configuration menu. See page 365 to view menu options.

virt <virtual link (1-3)>

Displays the Virtual Links menu used to configure OSPF for a Virtual Link. See page 366 to view menu options.

md5key < key ID (1-255) >

Assigns a string to MD5 authentication key.

host <1-128>

Displays the menu for configuring OSPF for the host routes. Up to 128 host routes can be configured. Host routes are used for advertising network device IP addresses to external networks to perform server load balancing within OSPF. It also makes Area Border Route (ABR) load sharing and ABR failover possible. See page 367 to view menu options.

redist fixed|static|rip|ebgp|ibgp

Displays Route Distribution Menu. See page 368 to view menu options.

Table 256. OSPF Configuration Menu (/cfg/l3/ospf) (continued)

lsdb <LSDB limit (0-12288, 0 for no limit)>

Sets the link state database limit.

default < metric (1-16777214)> < metric-type 1 | 2> | none

Sets one default route among multiple choices in an area. Use none for no default.

on

Enables OSPF on the VFSM.

off

Disables OSPF on the VFSM.

cur

Displays the current OSPF configuration settings.

/cfq/l3/ospf/aindex < area index>

Area Index Configuration Menu

```
[OSPF Area (index) 1 Menu]
    areaid - Set area ID
    type - Set area type
    metric - Set stub area metric
    auth - Set authentication type
    spf - Set time interval between two SPF calculations
    enable - Enable area
    disable - Disable area
    delete - Delete area
    cur - Display current OSPF area configuration
```

Table 257. Area Index Configuration Menu Options (/cfg/l3/ospf/aindex)

Command Syntax and Usage

```
areaid <IP address (such as, 192.4.17.101)>
```

Defines the IP address of the OSPF area number.

```
type transit|stub|nssa
```

Defines the type of area. For example, when a virtual link has to be established with the backbone, the area type must be defined as transit.

Transit area: allows area summary information to be exchanged between routing devices. Any area that is not a stub area or NSSA is considered to be transit area.

Stub area: is an area where external routing information is not distributed. Typically, a stub area is connected to only one other area.

NSSA: Not-So-Stubby Area (NSSA) is similar to stub area with additional capabilities. For example, routes originating from within the NSSA can be propagated to adjacent transit and backbone areas. External routes from outside the Autonomous System (AS) can be advertised within the NSSA but are not distributed into other areas.

```
metric < metric value (1-65535)>
```

Configures a stub area to send a numeric metric value. All routes received via that stub area carry the configured metric to potentially influencing routing decisions.

Metric value assigns the priority for choosing the switch for default route. Metric type determines the method for influencing routing decisions for external routes.

auth none|password|md5

- none: No authentication required.
- password: Authenticates simple passwords so that only trusted routing devices can participate.
- md5: This parameter is used when MD5 cryptographic authentication is required.

Table 257. Area Index Configuration Menu Options (/cfg/l3/ospf/aindex) (continued)

spf <interval (1-255)>

Configures the minimum time interval, in seconds, between two successive SPF (shortest path first) calculations of the shortest path tree using the Dijkstra's algorithm. The default value is 10 seconds.

enable

Enables the OSPF area.

disable

Disables the OSPF area.

delete

Deletes the OSPF area.

cur

Displays the current OSPF configuration.

/cfg/l3/ospf/range <range number>

OSPF Summary Range Configuration Menu

```
[OSPF Summary Range 1 Menu]
addr - Set IP address
mask - Set IP mask
aindex - Set area index
hide - Enable/disable hide range
enable - Enable range
disable - Disable range
delete - Delete range
cur - Display current OSPF summary range configuration
```

Table 258. OSPF Summary Range Configuration Menu Options (/cfg/l3/ospf/range)

```
addr <IP Address (such as, 192.4.17.101)>
Configures the base IP address for the range.

mask <IP mask (such as, 255.255.255.0)>
Configures the IP address mask for the range.

aindex <area index (0-2)>
Configures the area index used by the VFSM.

hide disable|enable
Hides the OSPF summary range.

enable
Enables the OSPF summary range.

disable
Disables the OSPF summary range.

delete
Deletes the OSPF summary range.

cur
Displays the current OSPF summary range.
```

/cfq/l3/ospf/if <interface number>

OSPF Interface Configuration Menu

```
[OSPF Interface 1 Menu]
     aindex - Set area index
     prio - Set interface router priority
     cost - Set interface cost
     hello - Set hello interval in seconds or milliseconds
     dead - Set dead interval in seconds or milliseconds
     trans - Set transit delay in seconds
     retra - Set retransmit interval in seconds
             - Set authentication key
     key
     mdkey - Set MD5 key ID
     passive - Enable/disable passive interface
     ptop - Enable/disable point-to-point interface
     enable - Enable interface
     disable - Disable interface
     delete - Delete interface
     cur - Display current OSPF interface configuration
```

Table 259. OSPF Interface Configuration Menu Options (/cfg/l3/ospf/if)

Command Syntax and Usage

aindex < area index (0-2)>

Configures the OSPF area index.

prio <priority value (0-255)>

Configures the priority value for the VFSM's OSPF interfaces.

(A priority value of 255 is the highest and 1 is the lowest. A priority value of 0 specifies that the interface cannot be used as Designated Router (DR) or Backup Designated Router (BDR).)

```
cost <1-65535>
```

Configures cost set for the selected path—preferred or backup. Usually the cost is inversely proportional to the bandwidth of the interface. Low cost indicates high bandwidth.

```
hello < 1-65535 >
hello <50-65535ms>
```

Configures the interval, in seconds or milliseconds, between the hello packets for the interfaces.

```
dead < 1-65535 >
dead < 1000-65535ms >
```

Configures the health parameters of a hello packet, in seconds or milliseconds, before declaring a silent router to be down.

```
trans < 1-3600 >
```

Configures the transit delay in seconds.

retra <1-3600>

Configures the retransmit interval in seconds.

Table 259. OSPF Interface Configuration Menu Options (/cfg/l3/ospf/if) (continued)

key < key > | none

Sets the authentication key to clear the password.

mdkey < key ID (1-255) > | none

Assigns an MD5 key to the interface.

passive enable disable

Sets the interface as passive. On a passive interface, you can disable OSPF protocol exchanges, but the router advertises the interface in its LSAs so that IP connectivity to the attached network segment will be established.

ptop enable disable

Sets the interface as point-to-point.

enable

Enables OSPF interface.

disable

Disables OSPF interface.

delete

Deletes OSPF interface.

cur

Displays the current settings for OSPF interface.

/cfg/l3/ospf/loopback <1-5>

OSPF Loopback Interface Configuration Menu

```
[OSPF Loopback Interface 1 Menu]
   aindex - Set area index
    enable - Enable interface
   disable - Disable interface
    delete - Delete interface
    cur - Display current OSPF interface configuration
```

Table 260. OSPF Loopback Interface Configuration Options (/cfg/l3/ospf/loopif)

Command Syntax and Usage

aindex < area index (0-2)>

Configures the area index used by the loopback interface.

enable

Enables the loopback interface.

disable

Disables the loopback interface.

delete

Deletes the OSPF loopback interface.

cur

Displays the current parameters for the OSPF loopback interface.

/cfq/l3/ospf/virt < link number>

OSPF Virtual Link Configuration Menu

```
[OSPF Virtual Link 1 Menu]
aindex - Set area index
hello - Set hello interval in seconds or milliseconds
dead - Set dead interval in seconds or milliseconds
trans - Set transit delay in seconds
retra - Set retransmit interval in seconds
nbr - Set router ID of virtual neighbor
key - Set authentication key
mdkey - Set MD5 key ID
enable - Enable interface
disable - Disable interface
delete - Delete interface
cur - Display current OSPF interface configuration
```

Table 261. OSPF Virtual Link Configuration Menu Options (/cfg/l3/ospf/virt)

Command Syntax and Usage

aindex < area index (0-2)>

Configures the OSPF area index.

```
hello <1-65535> hello <50-65535ms>
```

Configures the authentication parameters of a hello packet, in seconds or milliseconds. The default value is 10 seconds.

```
dead <1-65535> dead <1000-65535ms>
```

Configures the health parameters of a hello packet, in seconds or milliseconds. The default value is 60 seconds.

```
trans <1-3600>
```

Configures the delay in transit, in seconds. The default value is one second.

```
retra <1-3600>
```

Configures the retransmit interval, in seconds. The default value is five seconds.

```
nbr < NBR router ID (IP address)>
```

Configures the router ID of the virtual neighbor. The default value is 0.0.0.0.

```
key <password> | none
```

Configures the password (up to eight characters) for each virtual link. The default value is none.

```
mdkey < key ID (1-255) > | none
```

Sets MD5 key ID for each virtual link. The default value is none.

enable

Enables OSPF virtual link.

Table 261. OSPF Virtual Link Configuration Menu Options (/cfg/l3/ospf/virt) (continued)

Command Syntax and Usage disable Disables OSPF virtual link. delete Deletes OSPF virtual link. cur

Displays the current OSPF virtual link settings.

/cfg/l3/ospf/host <host number>

OSPF Host Entry Configuration Menu

```
[OSPF Host Entry 1 Menu]
     addr - Set host entry IP address
     aindex - Set area index
            - Set cost of this host entry
     cost
     enable - Enable host entry
     disable - Disable host entry
     delete - Delete host entry
            - Display current OSPF host entry configuration
```

Table 262. OSPF Host Entry Configuration Menu Options (/cfg/l3/ospf/host)

Command Syntax and Usage addr < IP address (such as, 192.4.17.101)> Configures the base IP address for the host entry. aindex < area index (0-2)> Configures the area index of the host. cost <1-65535> Configures the cost value of the host. enable Enables OSPF host entry. disable Disables OSPF host entry. delete Deletes OSPF host entry. Displays the current OSPF host entries.

/cfg/l3/ospf/redist fixed|static|rip|ebgp|ibgp

OSPF Route Redistribution Configuration Menu

```
[OSPF Redistribute Fixed Menu]

add - Add rmap into route redistribution list

rem - Remove rmap from route redistribution list

export - Export all routes of this protocol

cur - Display current route-maps added
```

Table 263. OSPF Route Redistribution Menu Options (/cfg/l3/ospf/redist)

Command Syntax and Usage

```
add (<route map (1-32)> <route map (1-32)>... |all
```

Adds selected routing maps to the rmap list. To add all the 32 route maps, enter all. To add specific route maps, enter routing map numbers one per line, NULL at the end.

This option adds a route map to the route redistribution list. The routes of the redistribution protocol matched by the route maps in the route redistribution list will be redistributed.

```
rem (<route map (1-32)> <route map (1-32)> ... |all
```

Removes the route map from the route redistribution list.

Removes routing maps from the rmap list. To remove all 32 route maps, enter all. To remove specific route maps, enter routing map numbers one per line, NULL at end.

```
export < metric (1-16777214)> < metric type (1-2)> | none
```

Exports the routes of this protocol as external OSPF AS-external LSAs in which the metric and metric type are specified. To remove a previous configuration and stop exporting the routes of the protocol, enter none.

cur

Displays the current route map settings.

/cfq/l3/ospf/md5key < key ID>

OSPF MD5 Key Configuration Menu

```
[OSPF MD5 Key 1 Menu]

/cfg/l3/bgp

Border Gateway Protocol Configuration Menu

```
[Border Gateway Protocol Menu]
    peer
            - Peer menu
            - Aggregation menu
           - Set Autonomous System (AS) number
    as
    pref - Set Local Preference
           - Globally turn BGP ON
    on
     off - Globally turn BGP OFF
            - Display current BGP configuration
```

Border Gateway Protocol (BGP) is an Internet protocol that enables routers on a network to share routing information with each other and advertise information about the segments of the IP address space they can access within their network with routers on external networks. BGP allows you to decide what is the "best" route for a packet to take from your network to a destination on another network, rather than simply setting a default route from your border router(s) to your upstream provider(s). You can configure BGP either within an autonomous system or between different autonomous systems. When run within an autonomous system, it's called internal BGP (iBGP). When run between different autonomous systems, it's called external BGP (eBGP). BGP is defined in RFC 1771.

BGP commands enable you to configure the switch to receive routes and to advertise static routes, fixed routes and virtual server IP addresses with other internal and external routers. In the current IBM N/OS implementation, the VFSM does not advertise BGP routes that are learned from one iBGP speaker to another iBGP speaker.

BGP is turned off by default.

Note: Fixed routes are subnet routes. There is one fixed route per IP interface.

Table 265. Border Gateway Protocol Menu (/cfg/l3/bgp)

Command Syntax and Usage

peer peer number (1-16)>

Displays the menu used to configure each BGP *peer*. Each border router, within an autonomous system, exchanges routing information with routers on other external networks. To view menu options, see page 371.

aggr <aggregate number (1-16)>

Displays the Aggregation Menu. To view menu options, see page 374.

as **<0-65535>**

Set Autonomous System number.

pref <local preference (0-4294967294)>

Sets the local preference. The path with the higher value is preferred.

When multiple peers advertise the same route, use the route with the shortest AS path as the preferred route if you are using eBGP, or use the local preference if you are using iBGP.

on

Globally turns BGP on.

off

Globally turns BGP off.

cur

Displays the current BGP configuration.

/cfg/l3/bgp/peer /cfg/l3/bgp/peer /cfg/l3/bgp/peer

BGP Peer Configuration Menu

```
[BGP Peer 1 Menu]
    redist - Redistribution menu
             - Set remote IP address
     addr
     ras - Set remote autonomous system number
     usrc - Set local IP interface
     uloopsrc - Set local IP loopback interface
     hold - Set hold time
     alive
             - Set keep alive time
            - Set min time between advertisements
     advert
     retry
             - Set connect retry interval
             - Set min time between route originations
     orig
             - Set time-to-live of IP datagrams
     t.t.l
     addi - Add rmap into in-rmap list
     addo - Add rmap into out-rmap list
     remi
            - Remove rmap from in-rmap list
     remo
             - Remove rmap from out-rmap list
     enable - Enable peer
     disable - Disable peer
     delete
             - Delete peer
     passwd - Set password
             - Display current peer configuration
     cur
```

This menu is used to configure BGP peers, which are border routers that exchange routing information with routers on internal and external networks. The peer option is disabled by default.

Table 266. BGP Peer Configuration Menu Options (/cfg/l3/bgp/peer)

Command Syntax and Usage

redist

Displays BGP Redistribution Menu. To view the menu options, see page 373.

```
addr < IP address (such as 192.4.17.101)>
```

Defines the IP address for the specified peer (border router), using dotted decimal notation. The default address is 0.0.0.0.

```
ras <AS number (0-65535)>
```

Sets the remote autonomous system number for the specified peer.

```
usrc <interface number>
```

Sets the local IP interface for this peer.

```
uloopsrc <1-5>
```

Sets the loopback interface number for this peer.

```
hold < hold time (0, 3-65535)>
```

Sets the period of time, in seconds, that will elapse before the peer session is torn down because the switch hasn't received a "keep alive" message from the peer. The default value is 180.

```
alive < keepalive time (0, 1-21845)>
```

Sets the keep-alive time for the specified peer in seconds. The default value is

Table 266. BGP Peer Configuration Menu Options (/cfg/l3/bgp/peer) (continued)

advert < min adv time (1-65535)>

Sets time, in seconds, between advertisements. The default value is 60 seconds.

retry <connect retry interval (1-65535)>

Sets connection retry interval, in seconds. The default value is 120 seconds.

orig <min orig time (1-65535)>

Sets the minimum time between route originations, in seconds. The default value is 15 seconds.

ttl < number of router hops (1-255)>

Time-to-live (TTL) is a value in an IP packet that tells a network router whether or not the packet has been in the network too long and should be discarded. TTL specifies a certain time span in seconds that, when exhausted, would cause the packet to be discarded. The TTL is determined by the number of router hops the packet is allowed before it must be discarded.

This command specifies the number of router hops that the IP packet can make. This value is used to restrict the number of "hops" the advertisement makes. It is also used to support multi-hops, which allow BGP peers to talk across a routed network. The default number is set at 1.

Note: The TTL value is significant only to eBGP peers, for iBGP peers the TTL value in the IP packets is always 255 (regardless of the configured value).

addi <route map ID (1-32)>

Adds route map into in-route map list.

addo < route map ID (1-32)>

Adds route map into out-route map list.

remi < route map ID (1-32)>

Removes route map from in-route map list.

remo < route map ID (1-32)>

Removes route map from out-route map list.

enable

Enables this peer configuration.

disable

Disables this peer configuration.

delete

Deletes this peer configuration.

passwd < 1-16 characters > | none

Configures the BGP peer password.

cur

Displays the current BGP peer configuration.

/cfq/l3/bqp/peer/redist

BGP Redistribution Configuration Menu

```
[Redistribution Menu]
     metric - Set default-metric of advertised routes
     default - Set default route action
     rip - Enable/disable advertising RIP routes
     ospf - Enable/disable advertising OSPF routes
     fixed - Enable/disable advertising fixed routes
     static - Enable/disable advertising static routes
            - Display current redistribution configuration
```

Table 267. BGP Redistribution Menu Options (/cfg/l3/bgp/peer/redist)

Command Syntax and Usage

metric < metric (1-4294967294)> | none

Sets default metric of advertised routes.

default none|import|originate|redistribute

Sets default route action. Default routes can be configured as follows:

- none: No routes are configured
- import: Import these routes.
- originate: The switch sends a default route to peers if it does not have any default routes in its routing table.
- redistribute: Default routes are either configured through default gateway or learned through other protocols and redistributed to peer. If the routes are learned from default gateway configuration, you have to enable static routes since the routes from default gateway are static routes. Similarly, if the routes are learned from a certain routing protocol, you have to enable that protocol in this redistribute submenu.

rip disable enable

Enables or disables advertising RIP routes

ospf disable enable

Enables or disables advertising OSPF routes.

fixed disable enable

Enables or disables advertising fixed routes.

static disable enable

Enables or disables advertising static routes.

cur

Displays current redistribution configuration.

/cfg/l3/bgp/aggr <aggregation number>

BGP Aggregation Configuration Menu

```
[BGP Aggr 1 Menu]

addr - Set aggregation IP address

mask - Set aggregation network mask

enable - Enable aggregation

disable - Disable aggregation

delete - Delete aggregation

cur - Display current aggregation configuration
```

This menu enables you to configure BGP aggregation to specify the routes/range of IP destinations a peer router accepts from other peers. All matched routes are aggregated to one route, to reduce the size of the routing table. By default, the first aggregation number is enabled and the rest are disabled.

Table 268. BGP Aggregation Configuration Menu Options (/cfg/l3/bgp/aggr)

Command Syntax and Usage

addr <IP address (such as 192.4.17.101)>

Defines the starting subnet IP address for this aggregation, using dotted decimal notation. The default address is 0.0.0.0.

mask < IP subnet mask (such as, 255.255.255.0)>

This IP address mask is used with addr to define the range of IP addresses that will be accepted by the peer when the aggregation is enabled. The default address is 0.0.0.0.

ena

Enables this BGP aggregation.

dis

Disables this BGP aggregation.

del

Deletes this BGP aggregation.

cur

Displays the current BGP aggregation configuration.

/cfg/l3/mld

MLD Configuration Menu

```
[MLD Menu]
               - MLD Interface Menu

llistnr - Set MLD last listener query interval

qri - Set MLD query response interval

dmrtr - Enable/disable dynamic Mrouter learning on interface

ena - Enable MLD on interface

dis - Disable MLD on interface

default - Set MLD settings to factory default

cur - Display current MLD configuration for this interface
```

Table 270 describes the commands used to configure Multicast Listener Discovery parameters for an interface.

Table 270. MLD Interface Menu Options (/cfg/l3/mld/if)

Command Syntax and Usage

version < 1-2 >

Defines the MLD protocol version number.

robust <2-10>

Configures the MLD Robustness variable, which allows you to tune the switch for expected packet loss on the subnet. If the subnet is expected to be lossy (high rate of packet loss), increase the value. The default value is 2.

qintrval <2-65535>

Configures the interval for MLD Query messages. The default value is 125 seconds.

llistnr <*1-32*>

Configures the query interval for the Querier to send a query after receiving a host done message from a host on the subnet. The default value is 1 second.

qri <1000-65535>

Configures the maximum response delay for MLD General Queries. This can be used to tune the bursting of MLD messages on the link.

The default value is 10,000 milliseconds.

dmrtr enable disable

Enables or disables dynamic Mrouter learning on the interface. The default setting is disabled.

ena

Enables this MLD interface.

dis

Disables this MLD interface.

Table 270. MLD Interface Menu Options (/cfg/l3/mld/if) (continued)

Command Syntax and Usage

default

Resets MLD parameters for the selected interface to their default values.

cur

Displays the current MLD interface configuration.

/cfg/l3/igmp

IGMP Configuration Menu

```
[IGMP Menu]
            - IGMP Snoop Menu
    snoop
    relay - IGMP Relay Menu
    mrouter - Static Multicast Router Menu

            - IGMP Advanced Menu
            - Globally turn IGMP ON
    off
            - Globally turn IGMP OFF
            - Display current IGMP configuration
```

Table 271 describes the commands used to configure basic IGMP parameters.

Table 271. IGMP Menu Options (/cfg/l3/igmp)

Command Syntax and Usage Displays the IGMP Snoop Menu. To view menu options, see page 378. relay Displays the IGMP Relay Menu. To view menu options, see page 380. mrouter Displays the Static Multicast Router Menu. To view menu options, see page 382. igmpflt Displays the IGMP Filtering Menu. To view menu options, see page 383. adv Displays the IGMP Advanced Menu. To view menu options, see page 386. on Globally turns IGMP on. off Globally turns IGMP off. cur Displays the current IGMP configuration parameters.

/cfq/l3/iqmp/snoop

IGMP Snooping Configuration Menu

```
[IGMP Snoop Menu]
    igmpv3 - IGMP Version3 Snoop Menu
     mrto - Set multicast router timeout
     aggr - Aggregate IGMP report
     srcip - Set source ip to use when proxying GSQ
     add - Add VLAN(s) to IGMP Snooping
            - Remove VLAN(s) from IGMP Snooping
     rem
     clear - Remove all VLAN(s) from IGMP Snooping
     ena
            - Enable IGMP Snooping
     dis
            - Disable IGMP Snooping
     def
            - Set IGMP Snooping settings to factory default
     cur - Display current IGMP Snooping configuration
```

IGMP Snooping allows the switch to forward multicast traffic only to those ports that request it. IGMP Snooping prevents multicast traffic from being flooded to all ports. The switch learns which server hosts are interested in receiving multicast traffic, and forwards it only to ports connected to those servers.

Table 272 describes the commands used to configure IGMP Snooping.

Table 272. IGMP Snoop Menu Options (/cfg/l3/igmp/snoop)

Command Syntax and Usage

iqmpv3

Displays the IGMP version 3 Menu. To view menu options, see page 379.

mrto <1-600 seconds>

Configures the timeout value for IGMP Membership Queries (mrouter). Once the timeout value is reached, the switch removes the multicast router from its IGMP table, if the proper conditions are met. The range is from 1 to 600 seconds. The default is 255 seconds.

aggr enable|disable

Enables or disables IGMP Membership Report aggregation.

srcip <IP address (such as, 192.4.17.101)>

Configures the source IP address used as a proxy for IGMP Group Specific Queries.

add < VLAN number>

Adds the selected VLAN(s) to IGMP Snooping.

rem < VLAN number>

Removes the selected VLAN(s) from IGMP Snooping.

clear

Removes all VLANs from IGMP Snooping.

ena

Enables IGMP Snooping.

Table 272. IGMP Snoop Menu Options (/cfg/l3/igmp/snoop) (continued)

Command Syntax and Usage

dis

Disables IGMP Snooping.

def

Resets IGMP Snooping parameters to their default values.

cur

Displays the current IGMP Snooping parameters.

/cfq/l3/iqmp/snoop/iqmpv3

IGMP Version 3 Configuration Menu

```
[IGMP V3 Snoop Menu]
    sources - Set the number of sources to snoop in group record
    v1v2 - Enable/disable snooping IGMPv1/v2 reports

dis - Disable IGMP Relay
cur - Display current IGMP Relay configuration
```

Table 274 describes the commands used to configure IGMP Relay.

Table 274. IGMP Relay Menu Options (/cfg/l3/igmp/relay)

Command Syntax and Usage mrtr <multicast router number (1-2)> Displays the Upstream Multicast Router Menu. To view menu options, see page 381. add <VLAN number> Adds the VLAN to the list of IGMP Relay VLANs. rem <VLAN number> Removes the VLAN from the list of IGMP Relay VLANs.

clear

Removes all VLANs from the list of IGMP Relay VLANs.

```
report <10-150>
```

Configures the interval between unsolicited Join reports sent by the switch, in seconds.

The default value is 10.

ena

Enables IGMP Relay.

dis

Disables IGMP Relay.

cur

Displays the current IGMP Relay configuration.

/cfq/l3/iqmp/relay/mrtr < Mrouter number>

IGMP Relay Multicast Router Configuration Menu

```
[Multicast router 2 Menu]
   addr - Set IP address of multicast router
   intr - Set interval between ping attempts
   retry - Set number of failed attempts to declare router DOWN
   restr - Set number of successful attempts to declare router UP
   version - Set IGMP version
   ena - Enable multicast router
   dis
           - Disable multicast router
           - Delete multicast router
           - Display current multicast router configuration
```

Table 275 describes the commands used to configure the IGMP Relay multicast router.

Table 275. IGMP Relay Mrouter Menu Options (/cfg/l3/igmp/relay/mrtr)

Command Syntax and Usage

addr <IP address (such as, 224.0.1.0)>

Configures the IP address of the IGMP multicast router used for IGMP Relay.

intr <1-60>

Configures the time interval between ping attempts to the upstream Mrouters, in seconds.

The default value is 2.

retry <1-120>

Configures the number of failed ping attempts required before the switch declares this Mrouter is down. The default value is 4.

restr <1-128>

Configures the number of successful ping attempts required before the switch declares this Mrouter is up. The default value is 5.

version <1-2>

Configures the IGMP version (1 or 2) of the multicast router.

ena

Enables the multicast router.

dis

Disables the multicast router.

del

Deletes the multicast router from IGMP Relay.

cur

Displays the current IGMP Relay multicast router parameters.

/cfg/l3/igmp/mrouter

IGMP Static Multicast Router Configuration Menu

```
[Static Multicast Router Menu]

add - Add port as Multicast Router Port

rem - Remove port as Multicast Router Port

clear - Remove all Static Multicast Router Ports

cur - Display current Multicast Router configuration
```

Table 276 describes the commands used to configure a static multicast router.

Note: When static Mrouters are used, the switch continues learning dynamic Mrouters via IGMP snooping. However, dynamic Mrouters may not replace static Mrouters. If a dynamic Mrouter has the same port and VLAN combination as a static Mrouter, the dynamic Mrouter is not learned.

Table 276. IGMP Static Multicast Router Menu Options (/cfg/l3/igmp/mrouter) Command Syntax and Usage add <port number> <VLAN number> <IGMP version number> Selects a port/VLAN combination on which the static multicast router is connected, and configures the IGMP version (1, 2, or 3) of the multicast router. rem <port number> <VLAN number> <IGMP version number> Removes a static multicast router from the selected port/VLAN combination. clear Clears all static multicast routers from the switch. cur Displays the current IGMP Static Multicast Router parameters.

IGMP Advanced Configuration Menu

```
[IGMP Advanced Menu]
qintrval - Set IGMP query interval
robust - Set expected packet loss on subnet
timeout - Set report timeout
fastlv - Enable/disable Fastleave processing in VLAN
rtralert - Send IGMP messages with Router Alert option
cur - Display current IGMP Advanced configuration
```

Table 280 describes the commands used to configure advanced IGMP parameters.

Table 280. IGMP Advanced Menu Options (/cfg/l3/igmp/adv)

Command Syntax and Usage

```
qinterval <1-600>
```

Configures the interval for IGMP Query Reports. The default value is 125 seconds.

```
robust <2-10>
```

Configures the IGMP Robustness variable, which allows you to tune the switch for expected packet loss on the subnet. If the subnet is expected to be lossy (high rate of packet loss), increase the value. The default value is 2.

```
timeout <1-255>
```

Configures the timeout value for IGMP Membership Reports (host). Once the timeout value is reached, the switch removes the host from its IGMP table, if the conditions are met. The range is from 1 to 255 seconds. The default is 10 seconds.

```
fastlv < VLAN number > disable | enable
```

Enables or disables Fastleave processing. Fastleave allows the switch to immediately remove a port from the IGMP port list, if the host sends a Leave message, and the proper conditions are met. This command is disabled by default.

```
retralert ena dis
```

Enables or disables the Router Alert option in IGMP messages.

cur

Displays the current IGMP Advanced parameters.

Table 281. IKEv2 Menu Options (/cfg/l3/ikev2)

Command Syntax and Usage

Displays the IKEv2 Proposal Menu. To view menu options, see page 388.

tx-time < 1-20 >

Sets the retransmission timeout, in seconds, for IKEv2 negotiation. The default value is 20 seconds.

psk

Displays the IKEv2 Preshare Key Menu. To view menu options, see page 388.

ident

Displays the IKEv2 Identification Menu. To view menu options, see page 389.

cookie enable|disable

Enables or disables cookie notification. The default value is disable.

cur

Displays the current IKEv2 settings.

/cfq/l3/ikev2/prop

IKEv2 Proposal Configuration Menu

```
[IKEv2 Proposal Menu]

cipher - Set encryption algorithm

auth - Set the integrity algorithm type

group - Set DH group

cur - Display current IKEv2 proposal configuration
```

Table 282 describes the commands used to configure an IKEv2 proposal.

Table 282. IKEv2 Proposal Menu Options (/cfg/l3/ikev2/prop)

```
Command Syntax and Usage

cipher des | 3des | aes
Sets the encryption algorithm. The default value is 3des.

auth sha1 | md5 | none
Sets the authentication algorithm type. The default value is sha1.

group 1 | 2 | 5 | 14 | 24
Sets the Diffie-Hellman (DH) group. The default group is 2.

cur
Displays the current IKEv2 proposal settings.
```

/cfg/l3/ikev2/psk

IKEv2 Preshare Key Configuration Menu

```
[IKEv2 Preshare-key Menu]
loc-key - Set local preshare key
rem-key - Remote Preshare Key Menu
cur - Display current IKEv2 preshare key configuration
```

Table 283 describes the commands used to configure an IKEv2 preshared key.

Table 283. IKEv2 Preshare Key Menu Options (/cfg/l3/ikev2/psk)

```
Command Syntax and Usage

loc-key <1-256 characters>
Sets the local preshare key. The default value is ibm123.

rem-key <1-10>
Displays the Remote ID menu. To view menu options, see page 389.

cur
Displays the current IKEv2 preshare key settings.
```

/cfq/l3/ikev2/psk/rem-key

IKEv2 Preshare Key Remote ID Configuration Menu

```
[IKEv2 Preshare-key Menu]
    loc-key - Set local preshare key
    rem-key - Remote Preshare Key Menu
            - Display current IKEv2 preshare key configuration
```

Table 284 describes the commands used to configure an IKEv2 preshared key remote ID.

Table 284. IKEv2 Remote ID Menu Options (/cfg/l3/ikev2/psk/rem-key)

Command Syntax and Usage

addr < IPv6 address>

Sets the remote IPv6 address.

key <1-32 characters>

Sets the remote preshare key. The default value is ibm123.

del

Deletes the remote preshare key.

Displays the current IKEv2 preshare key remote ID settings.

/cfq/l3/ikev2/ident

IKEv2 Identification Configuration Menu

```
[IKEv2 Identification Menul
    addr - Set IPv6 address as identification
             - Set fully-qualified domain name as identification
    email
             - Set email address as identification
             - Display current IKEv2 identification configuration
```

Table 285 describes the commands used to configure IKEv2 identification.

Table 285. IKEv2 Identification Menu Options (/cfg/l3/ikev2/ident)

Command Syntax and Usage

addr < IPv6 address>

Sets the supplied IPv6 address as identification.

fqdn <fully-qualified domain name>

Sets the fully-qualified domain name (such as "example.com") as identification.

email < Email address >

Sets the supplied email address (such as "xyz@example.com") as identification.

cur

Displays the current IKEv2 identification settings.

/cfg/l3/ipsec

IPsec Configuration Menu

```
[IPsec Menu]

txform - IPSec transform-set Menu

Domain Name System Configuration Menu

```
[Domain Name System Menu]

prima - Set IP address of primary DNS server

secon - Set IP address of secondary DNS server

requer - Set the IP version of DNS record to request first

dname - Set default domain name

cur - Display current DNS configuration
```

The Domain Name System (DNS) Menu is used for defining the primary and secondary DNS servers on your local network, and for setting the default domain name served by the switch services. DNS parameters must be configured prior to using hostname parameters with the ping, traceroute, and tftp commands.

Table 297. Domain Name Service Menu Options (/cfg/l3/dns)

```
Command Syntax and Usage

prima <IPv4 or IPv6 address>
Sets the IPv4 or IPv6 address for your primary DNS server.

secon <IPv4 or IPv6 address>
Sets the IPv4 or IPv6 address for your secondary DNS server. If the primary DNS server fails, the configured secondary is used instead.

reqver v4 | v6
Configures the protocol used for the first request to the DNS server, as follows:
- v4: IPv4
- v6: IPv6

dname <dotted DNS notation> | none
Sets the default domain name used by the switch. For example:
mycompany.com

cur
Displays the current Domain Name System settings.
```

/cfq/13/bootp

Bootstrap Protocol Relay Configuration Menu

```
[Bootstrap Protocol Relay Menu]
   server - Set BOOTP server properties
    bdomain - Broadcast domain menu
    option82 - BOOTP option 82 menu
    on - Globally turn BOOTP relay ON
           - Globally turn BOOTP relay OFF
    off
    cur - Display current BOOTP relay configuration
```

The Bootstrap Protocol (BOOTP) Relay Menu is used to allow hosts to obtain their configurations from a Dynamic Host Configuration Protocol (DHCP) server. The BOOTP configuration enables the switch to forward a client request for an IP address to two DHCP/BOOTP servers with IP addresses that have been configured on the VFSM.

BOOTP relay is turned off by default.

Table 298. Global BOOTP Relay Configuration Options

Command Syntax and Usage

server <1-4>

Displays the BOOTP Server menu, which allows you to configure an IP address for up to 4 global BOOTP servers. To view menu options, see page 402.

bdomain <1-10>

Displays the BOOTP Broadcast Domain menu, which allows you to configure BOOTP servers for a specific broadcast domain. To view menu options, see page 403.

option82

Displays the BOOTP DHCP Relay Option 82 menu, which enables you to configure a field that a DHCP server can use to assign IP addresses based on a client device's location in the network. To view menu options, see page 404.

on

Globally turns on BOOTP relay.

Globally turns off BOOTP relay.

cur

Displays the current BOOTP relay configuration.

/cfg/l3/bootp/server <1-4>

BOOTP Relay Server Configuration

[BOOTP Server 2 Menu]

address - Set BOOTP server address

delete - Delete BOOTP server

This menu allows you to configure an IP address for a global BOOTP server.

Table 299. BOOTP Relay Server Configuration Options

Command Syntax and Usage

address < IPv4 address>

Sets the IP address of the BOOTP server.

delete

Deletes the selected BOOTP server configuration.

/cfq/l3/bootp/bdomain <1-10>

BOOTP Relay Broadcast Domain Configuration

```
[Broadcast Domain 2 Menu]
   vlan - VLAN number
    server - Set IP address of BOOTP server
    enable - Enable broadcast domain
    disable - Disable broadcast domain
    delete - Delete broadcast domain
            - Display current broadcast domain configuration
```

This menu allows you to configure a BOOTP server for a specific broadcast domain, based on its associated VLAN.

Table 300. BOOTP Relay Broadcast Domain Configuration Options

Command Syntax and Usage

vlan <*VLAN number*>

Configures the VLAN of the broadcast domain. Each broadcast domain must have a unique VLAN.

server <1-4>

Displays the BOOTP Server menu, which allows you to configure an IP address for the BOOTP server. To view menu options, see page 402.

enable

Enables BOOTP Relay for the broadcast domain.

disable

Disables BOOTP Relay for the broadcast domain. When disabled, BOOTP Relay is performed by one of the global BOOTP servers.

delete

Deletes the selected broadcast domain configuration.

cur

Displays the current parameters for the BOOTP Relay Broadcast Domain.

/cfg/l3/bootp/option82

BOOTP DHCP Relay Option 82 Configuration

```
[DHCP relay option 82 menu Menu]
on - Turn on BOOTP option 82
off - Turn off BOOTP option 82
policy - BOOTP option 82 policy
reset - Reset BOOTP option 82
cur - Display BOOTP option 82 configuration
```

This menu lets you configure use of "option 82," a field that a DHCP server can use to assign IP addresses based on a client device's location in the network.

Table 301. BOOTP DHCP Relay Option 82 Configuration Options

on Turns on BOOTP option 82. off Turns off BOOTP option 82. policy keep | drop | replace Enables BOOTP Relay for the broadcast domain. reset Resets BOOTP option 82 settings. cur Displays the current BOOTP option 82 configuration.

VRRP Configuration Menu

```
[Virtual Router Redundancy Protocol Menu]
    vr - VRRP Virtual Router menu
     group - VRRP Virtual Router Group menu
     if
            - VRRP Interface menu
     track - VRRP Priority Tracking menu
     hotstan - Enable/disable hot-standby processing
     on - Globally turn VRRP ON
     off - Globally turn VRRP OFF
     cur - Display current VRRP configuration
```

Virtual Router Redundancy Protocol (VRRP) support on VFSMs provides redundancy between routers in a LAN. This is accomplished by configuring the same virtual router IP address and ID number on each participating VRRP-capable routing device. One of the virtual routers is then elected as the master, based on a number of priority criteria, and assumes control of the shared virtual router IP address. If the master fails, one of the backup virtual routers will assume routing authority and take control of the virtual router IP address.

By default, VRRP is disabled. IBM N/OS has extended VRRP to include virtual servers as well, allowing for full active/active redundancy between switches. For more information on VRRP, see the "High Availability" chapter in the Application Guide.

Table 302. VRRP Menu Options (/cfg/l3/vrrp)

Command Syntax and Usage

vr <virtual router number (1-128)>

Displays the VRRP Virtual Router Menu. This menu is used for configuring virtual routers on this switch. To view menu options, see page 407.

Displays the VRRP virtual router group menu, used to combine all virtual routers together as one logical entity. Group options must be configured when using two or more switches in a hot-standby failover configuration where only one switch is active at any given time. To view menu options, see page 410.

if <interface number>

Displays the VRRP Virtual Router Interface Menu. To view menu options, see page 413.

track

Displays the VRRP Tracking Menu. This menu is used for weighting the criteria used when modifying priority levels in the master router election process. To view menu options, see page 414.

hotstan disable enable

Enables or disables hot standby processing, in which two or more switches provide redundancy for each other. By default, this option is disabled.

on

Globally enables VRRP on this switch.

Table 302. VRRP Menu Options (/cfg/l3/vrrp) (continued)

Command Syntax and Usage

off

Globally disables VRRP on this switch.

cur

Displays the current VRRP parameters.

/cfq/l3/vrrp/vr <router number>

Virtual Router Configuration Menu

```
[VRRP Virtual Router 1 Menu]
    track - Priority Tracking Menu
     vrid - Set virtual router ID
     addr - Set IP address
     if
            - Set interface number
     prio - Set router priority
     adver - Set advertisement interval
     preem - Enable or disable preemption
             - Enable virtual router
     ena
     dis
            - Disable virtual router
            - Delete virtual router
     del
            - Display current VRRP virtual router configuration
```

This menu is used for configuring virtual routers for this switch. A virtual router is defined by its virtual router ID and an IP address. On each VRRP-capable routing device participating in redundancy for this virtual router, a virtual router will be configured to share the same virtual router ID and IP address.

Virtual routers are disabled by default.

Table 303. VRRP Virtual Router Menu Options (/cfg/l3/vrrp/vr)

Command Syntax and Usage

track

Displays the VRRP Priority Tracking Menu for this virtual router. Tracking is a IBM N/OS proprietary extension to VRRP, used for modifying the standard priority system used for electing the master router. To view menu options, see page 409.

```
vrid <virtual router ID (1-255)>
```

Defines the virtual router ID. This is used in conjunction with addr (below) to define a virtual router on this switch. To create a pool of VRRP-enabled routing devices which can provide redundancy to each other, each participating VRRP device must be configured with the same virtual router: one that shares the same vrid and addr combination.

The vrid for standard virtual routers (where the virtual router IP address is not the same as any virtual server) can be any integer between 1 and 255. The default value is 1.

All vrid values must be unique within the VLAN to which the virtual router's IP interface belongs.

```
addr < IP address (such as, 192.4.17.101)>
```

Defines the IP address for this virtual router using dotted decimal notation. This is used in conjunction with the vrid (above) to configure the same virtual router on each participating VRRP device. The default address is 0.0.0.0.

Table 303. VRRP Virtual Router Menu Options (/cfg/l3/vrrp/vr) (continued)

Command Syntax and Usage

if <interface number>

Selects a switch IP interface. If the IP interface has the same IP address as the addr option above, this switch is considered the "owner" of the defined virtual router. An owner has a special priority of 255 (highest) and will always assume the role of master router, even if it must preempt another virtual router which has assumed master routing authority. This preemption occurs even if the preem option below is disabled. The default interface is 1.

prio <1-254>

Defines the election priority bias for this virtual server. This can be any integer between 1 and 254. The default value is 100.

During the master router election process, the routing device with the highest virtual router priority number wins. If there is a tie, the device with the highest IP interface address wins. If this virtual router's IP address (addr) is the same as the one used by the IP interface, the priority for this virtual router will automatically be set to 255 (highest).

When priority tracking is used (/cfg/13/vrrp/track or /cfg/13/vrrp/vr #/track), this base priority value can be modified according to a number of performance and operational criteria.

adver <1-255>

Defines the time interval between VRRP master advertisements. This can be any integer between 1 and 255 seconds. The default value is 1.

preem disable enable

Enables or disables master preemption. When enabled, if this virtual router is in backup mode but has a higher priority than the current master, this virtual router will preempt the lower priority master and assume control. Note that even when preem is disabled, this virtual router will always preempt any other master if this switch is the owner (the IP interface address and virtual router addr are the same). By default, this option is enabled.

ena

Enables this virtual router.

dis

Disables this virtual router.

del

Deletes this virtual router from the switch configuration.

cur

Displays the current configuration information for this virtual router.

/cfq/l3/vrrp/vr < router number > / track

Virtual Router Priority Tracking Configuration Menu

```
[VRRP Virtual Router 1 Priority Tracking Menu]
    vrs - Enable/disable tracking master virtual routers
    ifs - Enable/disable tracking other interfaces
    ports - Enable/disable tracking VLAN switch ports
     cur - Display current VRRP virtual router configuration
```

This menu is used for modifying the priority system used when electing the master router from a pool of virtual routers. Various tracking criteria can be used to bias the election results. Each time one of the tracking criteria is met, the priority level for the virtual router is increased by an amount defined through the VRRP Tracking Menu (see page 414).

Criteria are tracked dynamically, continuously updating virtual router priority levels when enabled. If the virtual router pre-emption option (see preem in Table 303 on page 407) is enabled, this virtual router can assume master routing authority when its priority level rises above that of the current master.

Some tracking criteria (vrs. ifs. and ports below) apply to standard virtual routers. otherwise called "virtual interface routers." A virtual server router is defined as any virtual router whose IP address (addr) is the same as any configured virtual server IP address.

Table 304. Virtual Router Priority Tracking Options (/cfg/l3/vrrp/vr #/track)

Command Syntax and Usage

```
vrs disable|enable
```

When enabled, the priority for this virtual router will be increased for each virtual router in master mode on this switch. This is useful for making sure that traffic for any particular client/server pairing are handled by the same switch, increasing routing and load balancing efficiency. This command is disabled by default.

ifs disable enable

When enabled, the priority for this virtual router will be increased for each other IP interface active on this switch. An IP interface is considered active when there is at least one active port on the same VLAN. This helps elect the virtual routers with the most available routes as the master. This command is disabled by default.

ports disable enable

When enabled, the priority for this virtual router will be increased for each active port on the same VLAN. A port is considered "active" if it has a link and is forwarding traffic. This helps elect the virtual routers with the most available ports as the master. This command is disabled by default.

cur

Displays the current configuration for priority tracking for this virtual router.

/cfg/l3/vrrp/group

Virtual Router Group Configuration Menu

```
[VRRP Virtual Router Group Menu]

track - Priority Tracking Menu

vrid - Set virtual router ID

if - Set interface number

prio - Set renter priority

adver - Set advertisement interval

preem - Enable or disable preemption

ena - Enable virtual router

dis - Disable virtual router

del - Delete virtual router

cur - Display current VRRP virtual router configuration
```

The Virtual Router Group menu is used for associating all virtual routers into a single logical virtual router, which forces all virtual routers on the VFSM to either be master or backup as a group. A virtual router is defined by its virtual router ID and an IP address. On each VRRP-capable routing device participating in redundancy for this virtual router, a virtual router will be configured to share the same virtual router ID and IP address.

Note: This option is required to be configured only when using at least two VFSMs in a hot-standby failover configuration, where only one switch is active at any time.

Table 305. Virtual Router Group Menu Options (/cfg/l3/vrrp/group)

Command Syntax and Usage

track

Displays the VRRP Priority Tracking Menu for the virtual router group. Tracking is a IBM N/OS proprietary extension to VRRP, used for modifying the standard priority system used for electing the master router. To view menu options, see page 412.

vrid <virtual router ID (1-255)>

Defines the virtual router ID.

The vrid for standard virtual routers (where the virtual router IP address is not the same as any virtual server) can be any integer between 1 and 255. All vrid values must be unique within the VLAN to which the virtual router's IP interface (see if below) belongs. The default virtual router ID is 1.

if <interface number>

Selects a switch IP interface. The default switch IP interface number is 1.

Table 305. Virtual Router Group Menu Options (/cfg/l3/vrrp/group) (continued)

Command Syntax and Usage

prio <1-254>

Defines the election priority bias for this virtual router group. This can be any integer between 1 and 254. The default value is 100.

During the master router election process, the routing device with the highest virtual router priority number wins.

Each virtual router group is treated as one entity regardless of how many virtual routers are in the group. When the switch tracks the virtual router group, it measures the resources contained in the group (such as interfaces, VLAN ports, real servers). The priority is updated as a group. Every virtual router in the group has the same priority.

The *owner* parameter does not apply to the virtual router group. The group itself cannot be an owner and therefore the priority is 1-254.

adver <1-255>

Defines the time interval between VRRP master advertisements. This can be any integer between 1 and 255 seconds. The default is 1.

preem disable enable

Enables or disables master preemption. When enabled, if the virtual router group is in backup mode but has a higher priority than the current master, this virtual router will preempt the lower priority master and assume control. Note that even when preem is disabled, this virtual router will always preempt any other master if this switch is the owner (the IP interface address and virtual router addr are the same). By default, this option is enabled.

ena

Enables the virtual router group.

dis

Disables the virtual router group.

del

Deletes the virtual router group from the switch configuration.

cur

Displays the current configuration information for the virtual router group.

/cfg/l3/vrrp/group/track

Virtual Router Group Priority Tracking Configuration Menu

[Virtual Router Group Priority Tracking Menu]

ifs - Enable/disable tracking other interfaces

ports - Enable/disable tracking VLAN switch ports

cur - Display current VRRP Group Tracking configuration

Note: If *Virtual Router Group Tracking* is enabled, then the tracking option will be available only under *group* option. The tracking setting for the other individual virtual routers will be ignored.

Table 306. Virtual Router Group Priority Tracking Menu (/cfg/l3/vr/group/track)

Command Syntax and Usage

ifs disable enable

When enabled, the priority for this virtual router will be increased for each other IP interface active on this switch. An IP interface is considered active when there is at least one active port on the same VLAN. This helps elect the virtual routers with the most available routes as the master. This command is disabled by default.

ports disable enable

When enabled, the priority for this virtual router will be increased for each active port on the same VLAN. A port is considered "active" if it has a link and is forwarding traffic. This helps elect the virtual routers with the most available ports as the master. This command is disabled by default.

cur

Displays the current configuration for priority tracking for this virtual router.

/cfg/l3/vrrp/if <interface number>

VRRP Interface Configuration Menu

Note: The interface-number represents the IP interface on which authentication parameters must be configured.

```
[VRRP Interface 1 Menu]
     auth - Set authentication types
     passw - Set plain-text password
            - Delete interface
            - Display current VRRP interface configuration
```

This menu is used for configuring VRRP authentication parameters for the IP interfaces used with the virtual routers.

Table 307. VRRP Interface Menu Options (/cfg/l3/vrrp/if)

Command Syntax and Usage

auth none password

Defines the type of authentication that will be used: none (no authentication), or password (password authentication).

passw <password>

Defines a plain text password up to eight characters long. This password will be added to each VRRP packet transmitted by this interface when password authentication is chosen (see auth above).

del

Clears the authentication configuration parameters for this IP interface. The IP interface itself is not deleted.

cur

Displays the current configuration for this IP interface's authentication parameters.

/cfg/l3/vrrp/track

VRRP Tracking Configuration Menu

```
[VRRP Tracking Menu]

vrs - Set priority increment for virtual router tracking

ifs - Set priority increment for IP interface tracking

ports - Set priority increment for VLAN switch port tracking

cur - Display current VRRP Priority Tracking configuration
```

This menu is used for setting weights for the various criteria used to modify priority levels during the master router election process. Each time one of the tracking criteria is met (see "VRRP Virtual Router Priority Tracking Menu" on page 409), the priority level for the virtual router is increased by an amount defined through this menu.

Table 308. VRRP Tracking Menu Options (/cfg/l3/vrrp/track)

Command Syntax and Usage

```
vrs <0-254>
```

Defines the priority increment value (0 through 254) for virtual routers in master mode detected on this switch. The default value is 2.

```
ifs < 0-254 >
```

Defines the priority increment value (0 through 254) for active IP interfaces detected on this switch. The default value is 2.

```
ports <0-254>
```

Defines the priority increment value (0 through 254) for active ports on the virtual router's VLAN. The default value is 2.

cur

Displays the current configuration of priority tracking increment values.

Note: These priority tracking options only define increment values. These options do not affect the VRRP master router election process until options under the VRRP Virtual Router Priority Tracking Menu (see page 409) are enabled.

/cfg/13/gw6 < gateway number>

IPv6 Default Gateway Configuration Menu

```
[Default IP6 gateway 1 Menu]
    addr - Set IP address
          - Enable default gateway
- Disable default gateway
    ena
    dis
            - Delete default gateway
    del
            - Display current default gateway configuration
    cur
```

The switch supports IPv6 default gateways:

- Gateway 1 is used for data traffic.
- Gateway 132 is reserved for management.

The following table describes the IPv6 default gateway configuration options.

Table 309. IPv6 Default Gateway Menu Options (/cfg/l3/gw6)

Command Syntax and Usage addr < IPv6 address, such as 3001:0:0:0:0:0:abcd:12> Configures the IPv6 address of the default gateway, in hexadecimal format with colons. Enables the default gateway. dis Disables the default gateway. del Deletes the default gateway. cur Displays current IPv6 default gateway settings.

IPv6 Static Route Configuration Menu

```
[IP6 Static Route Menu]

add - Add static route

rem - Remove static route

clear - Clear static routes

cur - Display current IP6 static route configuration
```

The following table describes the IPv6 static route configuration options.

Table 310. IP6 Static Route Menu Options (/cfg/l3/route6)

Command Syntax and Usage

```
add <IPv6 address, such as 3001:0:0:0:0:0:0:abcd:12> <Prefix length> <gateway address> [<interface number>]
```

Adds an IPv6 static route.

```
rem <IPv6 address, such as 3001:0:0:0:0:0:0:0:abcd:12> <Prefix length> [<interface number>]
```

Removes the IPv6 static route.

clear

Clears IPv6 static routes. You are prompted to select the routes to clear, based on the following criteria:

- dest: Destination IPv6 address of the route
- gw: Default gateway address used by the route
- if: Default interface used by the route
- all: All IPv6 static routes

cur

Displays the current IPv6 static route configuration.

/cfq/l3/nbrcache

IPv6 Neighbor Discovery Cache Configuration Menu

```
[Static NBR Cache Menu]
    add - Add a static NBR Cache entry
            - Delete a static NBR Cache entry
    del
    clear - Clear static neighbor cache table
            - Display current static NBR Cache configuration
```

The following table describes the IPv6 Neighbor Discovery cache configuration options.

Table 311. Static NBR Cache Menu Options (/cfg/l3/nbrcache)

Command Syntax and Usage

add <IPv6 address, such as 3001:0:0:0:0:0:0:abcd:12> <MAC address, such as 00:60:af:00:02:30> <VLAN number> <port number or alias>

Adds a static entry to the Neighbor Discovery cache table. You are prompted for the following information:

- IP address
- MAC address
- VLAN number
- Port

del <IPv6 address, such as 3001:0:0:0:0:0:0:abcd:12>

Deletes the selected entry from the Neighbor Discovery cache table.

clear

Clears static entries in the Neighbor Discovery cache table. You are prompted to select the entries to clear, based on the following criteria:

- IF: Entries associated with the selected interface
- VLAN: Entries associated with the selected VLAN
- Port: Entries associated with the selected port
- All: All IPv6 Neighbor cache entries.

cur

Displays the current configuration of the Neighbor Discovery static cache table.

IPv6 Path MTU Configuration

```
[IP6 Path MTU Menu]

timeout - Set timeout duration of PMTU cache in minutes

clear - Clear IP6 Path MTU stats

cur - Display current PMTU configuration
```

The following table describes the configuration options for Path MTU (Maximum Transmission Unit). The Path MTU cache can consume system memory and affect performance. These commands allow you to manage the Path MTU cache.

Table 312. IPv6 Path MTU Options

Command Syntax and Usage

timeout 0 | < 10-100 >

Sets the timeout value for Path MTU cache entries, in minutes. Enter 0 (zero) to set the timeout to infinity (no timeout).

The default value is 10 minutes.

clear

Clears all entries in the Path MTU cache.

cur

Displays the current Path MTU configuration.

/cfq/l3/ospf3

Open Shortest Path First Version 3 Configuration Menu

```
[Open Shortest Path First v3 Menu]
   aindex - OSPFv3 Area (index) Menu
            - OSPFv3 Summary Range Menu
    summpref - OSPFv3 AS-External Range Menu
    if - OSPFv3 Interface Menu
    virt - OSPFv3 Virtual Links Menu
    host - OSPFv3 Host Entry Menu
    rdstcfg - OSPFv3 Route Redistribute Entry Menu
    redist - OSPFv3 Route Redistribution Menu
    abrtype - Set the alternative ABR type
    lsdb - Set the LSDB limit for external LSA
    exoverfl - Set exit overflow interval in seconds
    refbw - Set reference bandwidth for dflt intf metric calc
    spfdelay - Set delay between topology change and SPF calc
    spfhold - Set hold time between two consecutive SPF calc
    rtrid - Set a fixed router ID
    nasbrdfr - Enable/disable set P-bit by an NSSA internal ASBR
    on - Globally turn OSPFv3 ON
    off - Globally turn OSPFv3 OFF
    cur - Display current OSPFv3 configuration
```

Table 313. OSPFv3 Configuration Menu (/cfg/l3/ospf3)

Command Syntax and Usage

aindex < area index (0-2)>

Displays the area index menu. This area index does not represent the actual OSPFv3 area number. See page 421 to view menu options.

range <1-16>

Displays summary routes menu for up to 16 IP addresses. See page 423 to view menu options.

summpref < 1-16 >

Displays the OSPFv3 summary prefix configuration menu. See page 424 to view menu options.

if <interface number>

Displays the OSPFv3 interface configuration menu. See page 425 to view menu options.

virt <virtual link (1-3)>

Displays the Virtual Links menu used to configure OSPFv3 for a Virtual Link. See page 427 to view menu options.

host <1-128>

Displays the menu for configuring OSPFv3 for the host routes. Up to 128 host routes can be configured. Host routes are used for advertising network device IP addresses to external networks to perform server load balancing within OSPF. It also makes Area Border Route (ABR) load sharing and ABR failover possible. See page 428 to view menu options.

Table 313. OSPFv3 Configuration Menu (/cfg/l3/ospf3) (continued)

Command Syntax and Usage

rdstcfg <1-128>

Displays the OSPF route redistribution entry menu. See page 429 to view menu options.

redist connected static

Displays route redistribution menu. See page 430 to view menu options.

abrtype {standard|cisco|ibm}

Configures the Area Border Router (ABR) type, as follows:

- Standard
- Cisco
- IBM

The default setting is standard.

lsdb < LSDB limit (0-2147483647)> | none

Sets the link state database limit.

exoverf1 <0-4294967295>

Configures the number of seconds that a router takes to exit Overflow State. The default value is 0 (zero).

refbw <0-4294967295>

Configures the reference bandwidth, in kilobits per second, used to calculate the default interface metric. The default value is 100,000.

spfdelay <0-65535>

Configures the number of seconds that SPF calculation is delayed after a topology change message is received. The default value is 5.

spfhold < 0-65535 >

Configures the number of seconds between SPF calculations. The default value is 10.

rtrid <IP address>

Defines the router ID.

nasbrdfr e|d

Enables or disables setting of the P-bit in the default Type 7 LSA generated by an NSSA internal ASBR. The default setting is disabled.

on

Enables OSPFv3 on the switch.

off

Disables OSPFv3 on the switch.

cur

Displays the current OSPF configuration settings.

/cfq/13/ospf3/aindex < area index>

Area Index Configuration Menu

```
[OSPFv3 Area (index) 1 Menu]
areaid - Set area ID
type - Set area type
metric - Set metric for the default route into stub/NSSA area
mettype - Set default metric for stub/NSSA area
stb - Set stability interval for the NSSA area
trnsrole - Set translation role for the NSSA area
nosumm - Enable/disable prevent sending summ LSA into stub/NSSA area
        - Enable area
disable - Disable area
delete - Delete area
        - Display current OSPF area configuration
```

Table 314. OSPFv3 Area Index Configuration Options (/cfg/l3/ospf3/aindex)

Command Syntax and Usage

areaid <IP address (such as, 192.4.17.101)>

Defines the IP address of the OSPFv3 area index.

```
type transit|stub|nssa
```

Defines the type of area. For example, when a virtual link has to be established with the backbone, the area type must be defined as transit.

Transit area: allows area summary information to be exchanged between routing devices. Any area that is not a stub area or NSSA is considered to be transit area.

Stub area: is an area where external routing information is not distributed. Typically, a stub area is connected to only one other area.

NSSA: Not-So-Stubby Area (NSSA) is similar to stub area with additional capabilities. For example, routes originating from within the NSSA can be propagated to adjacent transit and backbone areas. External routes from outside the Autonomous System (AS) can be advertised within the NSSA but are not distributed into other areas.

```
metric <metric value (1-16777215)>
```

Configures the cost for the default summary route in a stub area or NSSA.

```
mettype < 1-3 >
```

Configures the default metric type applied to the route.

This command applies only to area type of Stub/NSSA.

```
stb <1-255>
```

Configures the stability interval for an NSSA, in seconds. When the interval expires, an elected translator determines that its services are no longer required. The default value is 40.

Table 314. OSPFv3 Area Index Configuration Options (/cfg/l3/ospf3/aindex) (continued)

Command Syntax and Usage

trnsrole always | candidate

Configures the translation role for an NSSA area, as follows:

- always: Type 7 LSAs are always translated into Type 5 LSAs.
- candidate: An NSSA border router participates in the translator election process.

The default setting is candidate.

nosumm e d

Enables or disables the no-summary option. When enabled, the area-border router neither originates nor propagates Inter-Area-Prefix LSAs into stub/NSSA areas. Instead it generates a default Inter-Area-Prefix LSA.

The default setting is disabled.

enable

Enables the OSPFv3 area.

disable

Disables the OSPFv3 area.

delete

Deletes the OSPFv3 area.

cur

Displays the current OSPFv3 area configuration.

/cfq/l3/ospf3/range < range number >

OSPFv3 Summary Range Configuration Menu

```
[OSPFv3 Summary Range 1 Menu]
   addr - Set IPv6 address
   preflen - Set IPv6 prefix length
   aindex - Set area index
   lsatype - Set LSA type for aggregation
    tag - Set route tag
    hide
            - Enable/disable hide range
    enable - Enable range
    disable - Disable range
    delete - Delete range
            - Display current OSPFv3 summary range configuration
```

Table 315. OSPFv3 Summary Range Configuration Options (/cfg/l3/ospf3/range)

Command Syntax and Usage addr < IPv6 address> Configures the base IPv6 address for the range. preflen <IPv6 prefix length (1-128)> Configures the subnet IPv6 prefix length. The default value is 0 (zero). aindex < area index (0-2)> Configures the area index used by the switch. lsatype summary | Type7 Configures the LSA type, as follows: - Summary LSA - Type7 LSA tag <0-4294967295> Configures the route tag. hide disable enable Hides the OSPFv3 summary range. enable Enables the OSPFv3 summary range. disable Disables the OSPFv3 summary range. delete Deletes the OSPFv3 summary range. cur Displays the current OSPFv3 summary range configuration.

/cfg/l3/ospf3/summpref < range number >

OSPFv3 AS-External Range Configuration Menu

```
[OSPFv3 AS-External Range 1 Menu]
   addr - Set IPv6 address
   preflen - Set IPv6 prefix length
   aindex - Set area index
   aggreff - Set aggregation effect
   transl - Enable/disable set P-bit in the generated LSA
   enable - Enable range
   disable - Disable range
   delete - Delete range
   cur - Display current OSPFv3 AS-External range configuration
```

Table 316. OSPFv3 AS_External Range Configuration Options (/cfg/l3/ospf3/range)

Command Syntax and Usage

addr < IPv6 address>

Configures the base IPv6 address for the range.

preflen < IPv6 prefix length (1-128)>

Configures the subnet IPv6 prefix length. The default value is 0 (zero).

aindex < area index (0-2)>

Configures the area index used by the switch.

aggreff allowAll|denyAll|advertise|not-advertise

Configures the aggregation effect, as follows:

- allowAll: If the area ID is 0.0.0.0, aggregated Type-5 LSAs are generated.
 Aggregated Type-7 LSAs are generated in all the attached NSSAs for the range.
- denyAll: Type-5 and Type-7 LSAs are not generated.
- advertise: If the area ID is 0.0.0.0, aggregated Type-5 LSAs are generated. For other area IDs, aggregated Type-7 LSAs are generated in the NSSA area.
- not-advertise: If the area ID is 0.0.0.0, Type-5 LSAs are not generated, while all NSSA LSAs within the range are cleared and aggregated Type-7 LSAs are generated for all NSSAs. For other area IDs, aggregated Type-7 LSAs are not generated in the NSSA area.

transl e|d

When enabled, the P-bit is set in the generated Type-7 LSA. When disabled, the P-bit is cleared. The default setting is disabled.

enable

Enables the OSPFv3 AS-external range.

disable

Disables the OSPFv3 AS-external range.

delete

Deletes the OSPFv3 AS-external range.

cur

Displays the current OSPFv3 AS-external range.

/cfq/l3/ospf3/if <interface number>

OSPFv3 Interface Configuration Menu

```
[OSPFv3 Interface 1 Menu]
   aindex - Set area index
    instance - Set instance id
   prio - Set interface router priority
    cost - Set interface cost
    hello - Set hello interval in seconds
    dead
            - Set dead interval in seconds
    transm
           - Set transmit delay in seconds
    retra - Set retransmit interval in seconds
    passive - Enable/disable passive interface
    enable - Enable interface
    disable - Disable interface
    delete - Delete interface
    cur - Display current OSPFv3 interface configuration
```

Table 317. OSPFv3 Interface Configuration Options (/cfg/l3/ospf3/if)

Command Syntax and Usage

aindex < area index (0-2)>

Configures the OSPFv3 area index.

instance <0-255>

Configures the instance ID for the interface.

prio <pri>priority value (0-255)>

Configures the priority value for the switch's OSPFv3 interface.

A priority value of 255 is the highest and 1 is the lowest. A priority value of 0 specifies that the interface cannot be used as Designated Router (DR).

cost <1-65535>

Configures the metric value for sending a packet on the interface.

hello < 1-65535 >

Configures the indicated interval, in seconds, between the hello packets, that the router sends on the interface.

dead < 1-65535 >

Configures the time period, in seconds, for which the router waits for hello packet from the neighbor before declaring this neighbor down.

transm <1-1800>

Configures the estimated time, in seconds, taken to transmit LS update packet over this interface.

retra <1-1800>

Configures the interval in seconds, between LSA retransmissions for adjacencies belonging to interface.

Table 317. OSPFv3 Interface Configuration Options (/cfg/l3/ospf3/if) (continued)

Command Syntax and Usage

passive enable disable

Enables or disables the passive setting on the interface. On a passive interface, OSPFv3 protocol packets are suppressed.

enable

Enables the OSPFv3 interface.

disable

Disables the OSPFv3 interface.

delete

Deletes the OSPFv3 interface.

cur

Displays the current settings for OSPFv3 interface.

/cfq/l3/ospf3/virt < link number>

OSPFv3 Virtual Link Configuration Menu

```
[OSPFv3 Virtual Link 1 Menu]
    aindex - Set area index
    hello - Set hello interval in seconds
    dead - Set dead interval in seconds
    trans - Set transit delay in seconds

            - Set router ID of virtual neighbor
    nbr
            - Enable interface
    enable
    disable - Disable interface
    delete - Delete interface
            - Display current OSPFv3 interface configuration
```

Table 318. OSPFv3 Virtual Link Configuration Options (/cfg/l3/ospf3/virt)

Command Syntax and Usage

aindex $\langle area index (0-2) \rangle$

Configures the OSPFv3 area index.

hello < 1-65535 >

Configures the indicated interval, in seconds, between the hello packets, that the router sends on the interface.

dead < 1-65535 >

Configures the time period, in seconds, for which the router waits for hello packet from the neighbor before declaring this neighbor down.

trans <1-1800>

Configures the estimated time, in seconds, taken to transmit LS update packet over this interface.

retra <1-1800>

Configures the interval, in seconds, between link-state advertisement (LSA) retransmissions for adjacencies belonging to the OSPFv3 virtual link interface. The default value is five seconds.

nbr < NBR router ID (IP address)>

Configures the router ID of the virtual neighbor. The default setting is 0.0.0.0

enable

Enables OSPFv3 virtual link.

disable

Disables the OSPFv3 virtual link.

Deletes the OSPFv3 virtual link.

cur

Displays the current OSPFv3 virtual link settings.

/cfg/l3/ospf3/host <host number>

OSPFv3 Host Entry Configuration Menu

```
[OSPF Host Entry 1 Menu]

addr - Set host entry IP address

aindex - Set area index

cost - Set cost of this host entry

enable - Enable host entry

disable - Disable host entry

delete - Delete host entry

cur - Display current OSPF host entry configuration
```

Table 319. OSPFv3 Host Entry Configuration Options (/cfg/l3/ospf3/host)

```
addr <IPv6 address>
Configures the base IPv6 address for the host entry.

aindex <area index (0-2)>
Configures the area index of the host.

cost <I-65535>
Configures the cost value of the host.

enable
Enables OSPF host entry.

disable
Disables OSPF host entry.

delete
Deletes OSPF host entry.

cur
Displays the current OSPF host entries.
```

/cfq/l3/ospf3/rdstcfq <1-128>

OSPFv3 Redist Entry Configuration Menu

```
[OSPFv3 Redist Entry 1 Menu]
   addr - Set redist entry IPv6 address
   preflen - Set IPv6 prefix length
   metric - Set metric to be applied to the route
   mettype - Set metric type
   tag - Set route tag
    enable - Enable redist entry
    disable - Disable redist entry
    delete - Delete redist entry
            - Display current OSPF redist entry configuration
```

Table 320. OSPFv3 Redist Entry Configuration Options (/cfg/l3/ospf3/rdstcfg)

Command Syntax and Usage

addr < IPv6 address>

Configures the base IPv6 address for the redistribution entry.

preflen <IPv6 prefix length (1-128)>

Configures the subnet IPv6 prefix length. The default value is 64.

metric <1-16777215>

Configures the route metric value applied to the route before it is advertised into the OSPFv3 domain.

mettype asExttype1|asExttype2

Configures the metric type applied to the route before it is advertised into the OSPFv3 domain.

tag <0-4294967295>|unset

Configures the route tag. To clear the route tag, enter unset.

enable

Enables the OSPFv3 redistribution entry.

disable

Disables the OSPFv3 redistribution entry.

Deletes the OSPFv3 redistribution entry.

cur

Displays the current OSPFv3 redistribution configuration entries.

/cfg/l3/ospf3/redist connected|static

OSPFv3 Redistribute Configuration Menu

```
[OSPF Redistribute Static Menu]
export - Export all routes of this protocol
cur - Display current redistribution setting
```

Table 321. OSPFv3 Redistribute Configuration Options (/cfg/l3/ospf3/redist)

Command Syntax and Usage

```
export [<metric value (1-16777215)> | none] [<metric type (1-2)>] [<tag (0-4294967295)> | unset]
```

Exports the routes of this protocol as external OSPFv3 AS-external LSAs in which the metric, metric type, and route tag are specified. To remove a previous configuration and stop exporting the routes of the protocol, enter

To clear the route tag, enter unset.

cur

Displays the current OSPFv3 route redistribution settings.

/cfq/l3/ndprefix

IPv6 Neighbor Discovery Prefix Configuration

```
[IP6 Neighbor Discovery Prefix Menu]
    profile - Profile of ND Prefix
    add - Add Neighbour Discovery Prefix
    rem
            - Remove Neighbour Discovery Prefix
    clear - Clear Neighbour Discovery Prefix
           - Display current Neighbour Discovery Prefix configuration
    cur
```

The following table describes the Neighbor Discovery prefix configuration options. These commands allow you to define a list of prefixes to be placed in Prefix Information options in Router Advertisement messages sent from an interface.

Table 322. IPv6 Neighbor Discovery Prefix Options

Command Syntax and Usage

profile <1-127>

Displays the Neighbor Discovery Profile menu. You can configure up to 127 profiles. You must attach a profile to each Neighbor Discovery prefix.

add {<IPv6 prefix> <prefix length> <interface number> <prefile index>}

Adds a Neighbor Discovery prefix to an interface.

Note: A profile index of 0 (zero) adds the default profile, as follows:

- Prefix Advertisement: enabled
- Valid Lifetime: 2592000
- Valid Lifetime Fixed Flag: enabled
- Preferred Lifetime: 604800
- Preferred Lifetime Fixed Flag: enabled
- On-link Flag: enabled
- Autonomous Flag: enabled

```
rem { < IPv6 prefix > < prefix length > }
```

Removes a Neighbor Discovery prefix.

```
clear <interface number>|all
```

Clears the selected Neighbor Discovery prefixes. If you include an interface number, all ND prefixes for that interface are cleared.

cur

Displays current Neighbor Discovery prefix parameters.

/cfg/l3/ndprefix/profile <1-127>

IPv6 Neighbor Discovery Profile Configuration

```
[IP6 Neighbor Discovery Profile 1 Menu]

valft - Set Prefix Valid lifetime

valftfix - Set Prefix Valid lifetime FIXED Flag

prlft - Set Prefix Preferred lifetime

prlftfix - Set Prefix Preferred lifetime FIXED Flag

onlink - Set Prefix on-link Flag

autoflag - Set Prefix Autonomous Flag

ena - Enable Prefix advertisement

dis - Disable Prefix advertisement

del - Delete profile

cur - Display current Neighbor Discovery Prefix configuration
```

The following table describes the Neighbor Discovery Profile configuration options. Information in the ND profile can be used to supplement information included in an ND prefix.

Table 323. IPv6 Neighbor Discovery Profile Options

Command Syntax and Usage

```
valft <0-4294967295>
```

Configures the Valid Lifetime of the prefix, in seconds. The Valid Lifetime is the length of time (relative to the time the packet is sent) that the prefix is valid for the purpose of on-link determination. Enter the maximum value to configure a Valid Lifetime of infinity.

The default value is 2592000.

```
valftfix enable|disable
```

Enables of disables the Valid Lifetime fixed flag. When enabled, the Valid Lifetime value represents a fixed time that stays the same in consecutive advertisements.

When disabled, the Valid Lifetime value represents a time that decrements in real time, that is, one that will result in a value of zero at a specified time in the future.

The default setting is enabled.

```
prlft <0-4294967295>
```

Configures the Preferred Lifetime of the prefix, in seconds. The Preferred Lifetime is the length of time (relative to the time the packet is sent) that addresses generated from the prefix via stateless address autoconfiguration remain preferred. Enter the maximum value to configure a Preferred Lifetime value of infinity.

The default value is 604800.

Note: The Preferred Lifetime value must not exceed the Valid Lifetime value.

Table 323. IPv6 Neighbor Discovery Profile Options (continued)

Command Syntax and Usage

prlftfix enable disable

Enables or disables the Preferred Lifetime fixed flag. When enabled, the Preferred Lifetime value represents a fixed time that stays the same in consecutive advertisements.

When disabled, the Preferred Lifetime value represents a time that decrements in real time, that is, one that will result in a value of zero at a specified time in the future.

The default setting is enabled.

onlink enable disable

Enables or disables the on-link flag. When enabled, indicates that this prefix can be used for on-link determination. When disabled, the advertisement makes no statement about on-link or off-link properties of the prefix.

The default setting is enabled.

autoflag enable disable

Enables or disables the autonomous flag. When enabled, indicates that the prefix can be used for stateless address configuration.

The default setting is enabled.

ena

Enables the selected profile.

dis

Disables the selected profile

del

Delete the selected Neighbor Discovery profile.

cur

Displays the current Neighbor Discovery profile parameters.

IPv6 Prefix Policy Table Configuration

```
[Prefix Policy Table Menu]

add - Add prefix Policy

rem - Remove prefix policy

cur - Display prefix policy table
```

The following table describes the configuration options for the IPv6 Prefix Policy Table. The Prefix Policy Table allows you to override the default address selection criteria.

Table 324. IPv6 Prefix Policy Table Options

Command Syntax and Usage

- IPv6 address prefix
- Prefix length
- Precedence: The precedence is used to sort destination addresses.
 Prefixes with a higher precedence are sorted before those with a lower precedence.
- Label: The label allows you to select prefixes based on matching labels.
 Source prefixes are coupled with destination prefixes if their labels match.

```
rem <IPv6 prefix> <prefix length> <precedence (0-100)> <label (0-100)> Removes a prefix policy table entry.
```

cur

Displays the current Prefix Policy Table configuration.

/cfg/l3/loopif <interface number (1-5)>

IP Loopback Interface Configuration Menu

```
[IP Loopback Interface 2 Menu]
    addr
          - Set IP address
    mask
            - Set subnet mask
    ena
            - Enable IP interface
    dis
           - Disable IP interface
            - Delete IP interface
    del
           - Display current interface configuration
```

An IP loopback interface is not connected to any physical port. A loopback interface is always accessible over the network.

Table 325. IP Loopback Interface Menu Options (/cfg/l3/loopif)

Command Syntax and Usage addr < IP address> Defines the loopback interface IP address. mask <*subnet mask*> Defines the loopback interface subnet mask. ena Enables the loopback interface. dis Disables the loopback interface. del Deletes the selected loopback interface. cur Displays the current IP loopback interface parameters.

/cfq/13/flooding

Flooding Configuration Menu

```
[flooding Menu]
vlan - VLAN Flooding Menu
cur - Display current Flooding configuration
```

Table 326. Flooding Menu Options (/cfq/l3/flooding)

Command Syntax and Usage

```
vlan <VLAN number>
```

Displays the flooding configuration menu for the VLAN. See page 436 to view menu options.

cur

Displays the current flooding parameters.

/cfg/l3/flooding/vlan <*VLAN number*>

Flooding VLAN Configuration Menu

```
[VLAN 1 Flooding Menu]
flood - Flood unregistered IPMC
cpu - Send unregistered IPMC to CPU
optflood - Enable/disable optimized flooding
cur - Display current Flooding configuration for this vlan
```

Table 327. Flooding VLAN Menu Options (/cfg/l3/flooding/vlan)

Command Syntax and Usage

```
flood enable disable
```

Configures the switch to flood unregistered IP multicast traffic to all ports. The default setting is <code>enabled</code>.

Note: If IGMP Relay is enabled and none of the IGMP hosts reside on the same VLAN as the streaming server, disable IPMC flooding to ensure that the multicast data is routed to the clients.

```
cpu enable|disable
```

Configures the switch to forward unregistered IP multicast traffic to the MP, which adds an entry in the IPMC table. The default setting is enabled.

Note: If both ${\tt flood}$ and ${\tt cpu}$ are disabled, then the switch drops all unregistered IPMC traffic.

```
optflood enable | disable
```

Enables or disables optimized flooding. When enabled, optimized flooding avoids packet loss during the learning period. The default setting is disabled.

cur

Displays the current flooding parameters for the selected VLAN.

/cfq/13/dhcp

Dynamic Host Configuration Protocol Configuration Menu

```
[Dynamic Host Configuration Protocol Menu]
    snooping - DHCP Snooping Configuration Menu
```

Table 328. DHCP Configuration Menu Options (/cfg/l3/dhcp)

Command Syntax and Usage

snooping

Displays the DHCP Snooping Configuration menu. See page 437 to view menu options.

/cfq/l3/dhcp/snooping

DHCP Snooping Configuration Menu

```
[DHCP Snooping Menu]
    addvlan - Enable DHCP snooping on the VLANs
    rmvlan - Disable DHCP snooping on the VLANs
    addbind - Add a static entry to DHCP Snooping binding table
    rmbind - remove an entry from DHCP Snooping binding table
    on - Globally turn DHCP Snooping on off - Globally turn DHCP Snooping off
    option82 - Enable/Disable DHCP Snooping option82 function
    cur - Display current DHCP Snooping configuration
```

Table 329. DHCP Snooping Configuration Menu Options (/cfg/l3/dhcp/snooping)

```
Command Syntax and Usage
addvlan < VLAN number or range>
   Enables DHCP snooping on the specified VLANs.
rmvlan < VLAN number or range>
   Disables DHCP snooping on the specified VLANs.
addbind <MAC address> <IP address> <VLAN number> <port number>
   <lease time (1-4294967295)>
   Adds a static entry to the DHCP snooping binding table.
rmbind all | mac <MAC address> | port port number> |
   vlan <VLAN number>
   Removes an entry from the DHCP snooping binding table.
on
   Globally turns DHCP snooping on.
off
   Globally turns DHCP snooping off.
```

Table 329. DHCP Snooping Configuration Menu Options (/cfg/l3/dhcp/snooping)

Command Syntax and Usage

option82 enable|disable

Enables or disables the DHCP snooping Option 82 function. The default setting is disable.

cur

Displays the current DHCP snooping configuration.

/cfg/cee

Converged Enhanced Ethernet Configuration

```
[CEE Configuration Menu]
global - Global CEE Configuration Menu
port - Port CEE Configuration Menu
iscsi - Globally turn ISCSI TLV advertisement ON/OFF
on - Globally turn CEE Features ON
off - Globally turn CEE Features OFF
cur - Display current CEE configuration
```

Table 330 describes the Converged Enhanced Ethernet (CEE) configuration menu options.

Table 330. CEE Configuration Options (/cfg/cee)

Command Syntax and Usage

global

Displays the CEE Global Configuration menu. To view menu options, see page 439.

port

Displays the CEE Port Configuration menu. To view menu options, see page 442.

iscsi e|d

Enables or disables ISCSI TLV advertisements.

on

Globally turns CEE on.

off

Globally turns CEE off.

cur

Displays the current CEE parameters.

/cfq/cee/qlobal

CEE Global Configuration

```
[Global CEE Configuration Menu]
            - Enhanced Transmission Selection Menu
    ets
             - Priority Flow Control Menu
    pfc
    cur
             - Display current CEE configuration
```

Table 331 describes the global CEE configuration options.

Table 331. CEE Global Options (/cfg/cee/global)

Command Syntax and Usage

ets

Displays the Enhanced Transmission Selection menu. To view menu options, see page 439.

pfc

Displays the Priority Flow Control menu. To view menu options, see page 441.

cur

Displays the current global CEE parameters.

/cfg/cee/global/ets

ETS Global Configuration

```
[Global Enhanced Transmission Selection Menu]
             - Priority Group Menu
             - Displays current ETS configuration
```

Enhanced Transmission Selection (ETS) allows you to allocate bandwidth to different traffic types, based on 802.1p priority.

Table 332 describes the global ETS configuration options.

Note: ETS configuration supersedes the QoS 802.1p menu. When ETS is enabled, you cannot configure the 802.1p menu options.

Table 332. CEE Global ETS Options (/cfg/cee/global/ets)

Command Syntax and Usage pg <0-7, 15>

Displays the Enhanced Transmission Selection menu for the selected Priority Group. To view menu options, see page 440. 2

cur

Displays the current global CEE parameters.

/cfg/cee/global/ets/pg < 0-7, 15>

ETS Global Priority Group Configuration

```
[PGID 1 Menu]

create - Create Priority Group

bw - Set bandwidth percentage for the Priority Group

prio - Assign one or more 802.1p priorities to Priority Group

desc - Set description for the Priority Group

cur - Display current Priority Group configuration
```

An ETS Priority Group can be assigned one or more 802.1p priority values. Switch bandwidth is allocated by percentage to each Priority Group.

Table 333 describes the global ETS Priority Group configuration options. The internal COS7 is used for stack communication; hence the ETS Priority Group 7 is not available for configuration.

Table 333. Global ETS Priority Group Options (/cfg/cee/global/ets/pg)

Command Syntax and Usage

```
create { < bandwidth percentage (0, 10-100) > } < 802.1p value (0-7) >
```

Allows you to configure Priority Group parameters. You can enter the link bandwidth percentage allocated to the Priority Group, and also assign one or more 802.1p values to the Priority Group.

```
bw <bandwidth percentage (0, 10-100)>
```

Configures the link bandwidth allocation for the Priority Group, as a percentage from 10% to 100%. Enter 0 (zero) to disable bandwidth allocation to the Priority Group.

```
prio <0-7>
```

Adds one or more 802.1p priority values to the Priority Group. Enter one value per line, null to end.

```
desc <1-31 characters>
```

Enter text that describes this Priority Group.

cur

Displays the current ETS global Priority Group parameters.

/cfq/cee/qlobal/pfc

Priority Flow Control Global Configuration

```
[Global Priority Flow Control Menu]
    pri - 802.1p Priority PFC Menu
            - Globally turn PFC ON
    on
    off
            - Globally turn PFC OFF
            - Display current PFC configuration
```

Priority-based Flow Control (PFC) enhances flow control by allowing the switch to pause traffic based on its 802.1p priority value, while allowing traffic at other priority levels to continue.

Table 334 describes the global Priority Flow Control (PFC) configuration options.

Table 334. Global Priority Flow Control Options (/cfg/cee/global/pfc)

```
Command Syntax and Usage
pri <0-7>
   Displays the 802.1p Priority PFC menu. To view menu options, see page 442.
on
    Globally turns PFC on.
off
    Globally turns PFC off.
cur
   Displays the current Priority Flow Control parameters.
```

/cfg/cee/global/pfc/pri <0-7>

802.1p Priority Flow Control Configuration

```
[Priority 1 Menu]

ena - Enable PFC on this priority queue

dis - Disable PFC on this priority queue

desc - Set a description string to identify the priority queue

cur - Display current PFC configuration
```

Table 335 describes the global Priority Flow Control (PFC) configuration options.

Table 335. Global PFC 802.1p Options (/cfg/cee/global/pfc/pri)

Command Syntax and Usage

ena

Enables Priority Flow Control on the selected 802.1p priority.

Note: PFC can be enabled on 802.1p priority 3 and one other priority only.

dis

Disables Priority Flow Control on the selected 802.1p priority.

desc <1-31 characters>

Enter text to describe the 802.1p priority value.

cur

Displays the current 802.1p Priority Flow Control parameters.

/cfg/cee/port <port alias or number>

CEE Port Configuration

```
[Port 1 CEE Configuration Menu]

dcbx - DCB Capability Exchange Protocol (DCBX) Menu

pfc - Priority Flow Control Menu

cur - Display current Port CEE configuration
```

Table 336 describes the Converged Enhanced Ethernet (CEE) port configuration options.

Table 336. CEE Port Options (/cfg/cee/port)

Command Syntax and Usage

dcbx

Displays the DCB Capability Exchange Protocol (DCBX) menu for the selected port. To view menu options, see page 443.

pfc

Displays the Priority Flow Control (PFC) menu for the selected port. To view menu options, see page 444.

cur

Displays the current CEE port parameters.

/cfq/cee/port /cfq/cee/port /cfq/cee/port /dcbx

DCBX Port Configuration

```
[Port EXT1 DCBX Config Menu]
    appadv - Set Advertise flag for Application Protocol
    appwill - Set Willing flag for Application Protocol
            - Set Advertise flag for PG
    etswill - Set Willing flag for PG
    pfcadv - Set Advertise flag for PFC
    pfcwill - Set Willing flag for PFC
            - Disable DCBX
            - Enable DCBX
            - Display current port DCBX configuration
    cur
```

Data Center Bridging Capability Exchange (DCBX) protocol is used by Converged Enhanced Ethernet (CEE) networks to exchange advanced detection and configuration data.

Table 337 describes the port DCB Capability Exchange Protocol (DCBX) configuration options.

Table 337. Port DCBX Options (/cfg/cee/port x/dcbx)

Command Syntax and Usage

appadv enable disable

Enables or disables DCBX Application Protocol advertisements of configuration data. When enabled, the Advertisement flag is set to 1 (advertise data to the peer device).

appwill enable disable

Enables or disables Application Protocol willingness to accept configuration data from the peer device. When enabled, the Willing flag is set to 1 (willing to accept data).

etsadv enable disable

Enables or disables DCBX ETS advertisements of configuration data. When enabled, the Advertisement flag is set to 1 (advertise data to the peer device).

etswill enable disable

Enables or disables ETS willingness to accept configuration data from the peer device. When enabled, the Willing flag is set to 1 (willing to accept data).

pfcadv enable|disable

Enables or disables DCBX PFC advertisements of configuration data. When enabled, the Advertisement flag is set to 1 (advertise data to the peer device).

pfcwill enable disable

Enables or disables PFC willingness to accept configuration data from the peer device. When enabled, the Willing flag is set to 1 (willing to accept data).

dis

Disables DCBX on the port.

Table 337. Port DCBX Options (/cfg/cee/port x/dcbx) (continued)

Command Syntax and Usage

ena

Enables DCBX on the port.

cur

Displays the current DCBX parameters on the port.

/cfg/cee/port port alias or number/pfc

PFC Port Configuration

```
[Port EXT2 PFC Configuration Menu]

pri - 802.1p Priority PFC Menu

on - Turn ON PFC

off - Turn OFF PFC

cur - Display current PFC configuration
```

Table 338 describes the port Priority Flow Control (PFC) configuration options.

Table 338. Port PFC Options (/cfg/cee/port x/pfc)

Command Syntax and Usage

pri <0-7>

Displays the 802.1p Priority PFC menu for the selected port. To view menu options, see page 445.

on

Turns PFC on for the selected port.

off

Turns PFC off for the selected port.

cur

Displays the current PFC parameters for the selected port.

/cfg/cee/port <port alias or number>/pfc/pri <0-7>

802.1p PFC Port Configuration

```
[Priority 1 Menu]
            - Enable PFC on this priority queue
    ena
            - Disable PFC on this priority queue
    desc - Set a description string to identify the priority queue
            - Display current PFC configuration
```

Table 339 describes the port-level Priority Flow Control (PFC) configuration options.

Table 339. Port 802.1p PFC Options (/cfg/cee/port x/pfc/pri)

Command Syntax and Usage

ena

Enables Priority Flow Control on the selected 802.1p priority.

Note: PFC can be enabled on 802.1p priority 3 and one other priority only.

dis

Disables Priority Flow Control on the selected 802.1p priority.

desc <1-31 characters>

Enter text to describe the 802.1p priority value.

cur

Displays the current 802.1p Priority Flow Control parameters.

/cfq/fcoe

Fiber Channel over Ethernet Configuration

```
[Fiber Channel over Ethernet Configuration Menu]
             - FCoE Initialization Protocol (FIP) Snooping Menu
             - Display current FCOE configuration
```

Fiber Channel over Ethernet (FCoE) transports Fiber Channel frames over an Ethernet fabric. The CEE features and FCoE features allow you to create a lossless Ethernet transport mechanism.

Table 340 describes the FCoE configuration options.

Table 340. FCoE Options (/cfg/fcoe)

Command Syntax and Usage

fips

Displays the FCoE Initialization Protocol (FIP) Snooping menu. To view menu options, see page 446.

cur

Displays the current FCoE parameters.

FIPS Configuration

```
[FIP Snooping Configuration Menu]

port - Port FIP snooping Menu

on - Globally turn FIP snooping ON

off - Globally turn FIP snooping OFF

aclto - Enable/Disable the removal of expired FCFs and FCOE ACLs

cur - Display current FIP snooping global configuration
```

FIP Snooping allows the switch to monitor FCoE Initialization Protocol (FIP) frames to gather discovery, initialization, and maintenance data. This data is used to automatically configure ACLs that provide FCoE connections and data security.

Table 341 describes the FCoE Initialization Protocol (FIP) Snooping configuration options.

Table 341. FIP Snooping Options (/cfg/fcoe/fips)

Command Syntax and Usage

port port number>

Displays the FCoE Initialization Protocol (FIP) Snooping menu for the selected port. To view menu options, see page 447.

on

Globally turns FIP Snooping on.

off

Globally turns FIP Snooping off.

```
aclto e d
```

Enables or disables ACL time-out removal. When enabled, ACLs associated with expired FCFs and FCoE connections are removed from the system.

```
autovlan e|d
```

Enables or disables automatic VLAN creation, based on response received from the connected device.

cur

Displays the current FIP Snooping parameters.

/cfg/fcoe/fips/port port alias or number>

FIPS Port Configuration

[Port 1 FIP Snooping Configuration Menu] fcfmode - Set whether FCF is connected to this port - Enable FIP snooping ena dis - Disable FIP snooping - Display current FIP snooping configuration

Table 335 describes the port FCoE Initialization Protocol (FIP) Snooping configuration options.

Table 342. Port FIP Snooping Options (/cfg/fcoe/fips/port)

Command Syntax and Usage

fcfmode auto on off

Configures FCoE Forwarding (FCF) on the port, as follows:

- on: Configures the port as a Fiber Channel Forwarding (FCF) port.
- off: Configures the port as an FCoE node (ENode).
- auto: Automatically detect the configuration of the connected device, and configure this port to match.

ena

Enables FIP Snooping on the port. The default setting is enabled.

Note: If IPv6 ACLs are assigned to the port, you cannot enable FCoE.

dis

Disables FIP Snooping on the port.

Displays the current FIP Snooping parameters.

Remote Monitoring Configuration

[RMON Menu]
hist - RMON History Menu
event - RMON Event Menu
alarm - RMON Alarm Menu
cur - Display current RMON configuration

Remote Monitoring (RMON) allows you to monitor traffic flowing through the switch. The RMON MIB is described in RFC 1757.

Table 343 describes the Remote Monitoring (RMON) configuration menu options.

Table 343. Remote Monitoring (RMON) Menu Options (/cfg/rmon)

Command Syntax and Usage

hist <1-65535>

Displays the RMON History Configuration menu. To view menu options, see page 449.

event <1-65535>

Displays the RMON Event Configuration menu. To view menu options, see page 450.

alarm <1-65535>

Displays the RMON Alarm Configuration menu. To view menu options, see page 451.

cur

Displays the current RMON parameters.

/cfq/rmon/hist < 1-65535>

RMON History Configuration Menu

```
[RMON History 2 Menu]
    ifoid - Set interface MIB object to monitor
            - Set the number of requested buckets
    rbnum
    intrval - Set polling interval
    owner - Set owner for the RMON group of statistics
    delete - Delete this history and restore defaults
            - Display current history configuration
```

Table 344 describes the RMON History Menu options.

Table 344. RMON History Menu Options (/cfg/rmon/hist)

Command Syntax and Usage

ifoid <1-127 characters>

Configures the interface MIB Object Identifier. The IFOID must correspond to the standard interface OID, as follows:

1.3.6.1.2.1.2.2.1.1.x

where x is the ifIndex

rbnum <1-65535>

Configures the requested number of buckets, which is the number of discrete time intervals over which data is to be saved. The default value is 30.

The maximum number of buckets that can be granted is 50.

intrval <1-3600>

Configures the time interval over which the data is sampled for each bucket. The default value is 1800.

owner <1-127 characters>

Enter a text string that identifies the person or entity that uses this History index.

delete

Deletes the selected History index.

cur

Displays the current RMON History parameters.

/cfg/rmon/event < 1-65535 >

RMON Event Configuration Menu

```
[RMON Event 2 Menu]

descn - Set description for the event

type - Set event type

owner - Set owner for the event

delete - Delete this event and restore defaults

cur - Display current event configuration
```

Table 345 describes the RMON Event Menu options.

Table 345. RMON Event Menu Options (/cfg/rmon/event)

Command Syntax and Usage

descn <1-127 characters>

Enter a text string to describe the event.

type none|log|trap|both

Selects the type of notification provided for this event. For log events, an entry is made in the log table and sent to the configured syslog host. For trap events, an SNMP trap is sent to the management station.

owner <1-127 characters>

Enter a text string that identifies the person or entity that uses this event index.

delete

Deletes the selected RMON Event index.

cur

Displays the current RMON Event parameters.

/cfg/rmon/alarm < 1-65535>

RMON Alarm Configuration Menu

```
[RMON Alarm 2 Menu]
    oid - Set MIB oid datasource to monitor
    intrval - Set alarm interval
    sample - Set sample type
    almtype - Set startup alarm type
    rlimit - Set rising threshold
    flimit - Set falling threshold
    revtidx - Set event index to fire on rising threshold crossing
    fevtidx - Set event index to fire on falling threshold crossing
    owner - Set owner for the alarm
    delete - Delete this alarm and restore defaults
            - Display current alarm configuration
```

The Alarm RMON group can track rising or falling values for a MIB object. The MIB object must be a counter, gauge, integer, or time interval. Each alarm index must correspond to an event index that triggers once the alarm threshold is crossed.

Table 346 describes the RMON Alarm Menu options.

Table 346. RMON Alarm Menu Options (/cfg/rmon/alarm)

Command Syntax and Usage

oid <1-127 characters>

Configures an alarm MIB Object Identifier.

intrval <1-65535>

Configures the time interval over which data is sampled and compared with the rising and falling thresholds. The default value is 1800.

```
sample abs delta
```

Configures the method of sampling the selected variable and calculating the value to be compared against the thresholds, as follows:

- abs—absolute value, the value of the selected variable is compared directly with the thresholds at the end of the sampling interval.
- delta-delta value, the value of the selected variable at the last sample is subtracted from the current value, and the difference compared with the thresholds.

almtype rising|falling|either

Configures the alarm type as rising, falling, or either (rising or falling).

```
rlimit <-2147483647 - 2147483647>
```

Configures the rising threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single event is generated.

```
flimit <-2147483647 - 214748364)
```

Configures the falling threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single event is generated.

Table 346. RMON Alarm Menu Options (/cfg/rmon/alarm)

revtidx <1-65535>

Configures the rising alarm event index that is triggered when a rising threshold is crossed.

fevtidx <1-65535>

Configures the falling alarm event index that is triggered when a falling threshold is crossed.

owner <1-127 characters>

Enter a text string that identifies the person or entity that uses this alarm index.

delete

Deletes the selected RMON Alarm index.

cur

Displays the current RMON Alarm parameters.

Virtualization Configuration

```
[Virtualization Menu]
    vmpolicy - Virtual Machines Policy Configuration Menu
          - vNIC Configuration Menu
    vmcheck - VM Check Menu
    vmgroup - Virtual Machines Groups Menu
    vmprof - Virtual Machine Profiles Menu
    vmware - VMware-specific Settings Menu
    vmrmisc - Miscellaneous VMready Configuration Menu
    enavmr - Enable VMready
    disvmr - Disable VMready
         - Display all current virtualization settings
```

Table 347 describes the general virtualization configuration options. More detailed information is available in the following sections.

Table 347. Virtualization Configuration Options (/cfg/virt)

Command Syntax and Usage

vmpolicy

Displays the Virtual Machines Policy menu. To view menu options, see page 454.

vnic

Displays the Virtual NIC (vNIC) menu. To view menu options, see page 456.

vmcheck

Displays the VM Check menu. To view menu options, see page 459.

vmgroup <1-1024>

Displays the Virtual Machine Groups menu. To view menu options, see page 461.

vmprof

Displays the Virtual Machine Profiles menu. To view menu options, see page 463.

vmware

Displays the VMware settings menu. To view menu options, see page 465.

vmrmisc

Displays the Miscellaneous VMready Configuration menu. To view menu options, see page 467.

enavmr

Enables VMready.

disvmr

Disables VMready.

cur

Displays the current virtualization parameters.

/cfg/virt/vmpolicy

Virtual Machines Policy Configuration

```
[VM Policy Configuration Menu]
vmbwidth - VM Bandwidth Configuration Menu
```

Table 348 describes the Virtual Machines (VM) policy configuration options.

Table 348. VM Policy Options (/cfg/virt/vmpolicy)

Command Syntax and Usage

vmbwidth <MAC address> | <UUID> | <name> | <IP address> | <index number>

Displays the bandwidth management menu for the selected Virtual Machine. Enter a unique identifier to select a VM.

/cfq/virt/vmpolicy/vmbwidth < VM identifier>

VM Policy Bandwidth Management

```
[VM Bandwidth Management Menu]
  txrate - Set VM Transmit Bandwidth (Ingress for switch)
  rxrate - Set VM Receive Bandwidth (Egress for switch)
  bwctrl - Enable/Disable VM Bandwidth Control
  delete - Delete VM bandwidth control Entry
  cur - Display current VM bandwidth configuration
```

Table 349 describes the bandwidth management options for the selected VM. Use these commands to limit the bandwidth used by each VM.

Table 349. VM Bandwidth Management Options (/cfg/virt/vmpolicy/vmbwidth)

Command Syntax and Usage

```
txrate <64-10000000> [32|64|128|256|512|1024|2048|4096] <1-256>
```

The first value configures Committed Rate—the amount of bandwidth available to traffic transmitted from the VM to the switch, in kilobits per second. Enter the value in multiples of 64.

The second values configures the maximum burst size, in kilobits. Enter one of the following values: 32, 64, 128, 256, 512, 1024, 2048, 4096.

The third value represents the ACL assigned to the transmission rate. The ACL is automatically, in sequential order, if not specified by the user. If there are no available ACLs, the TXrate cannot be configured. Each TXrate configuration reduces the number of available ACLs by one.

```
rxrate <64-1000000> [32|64|128|256|512|1024|2048|4096]
```

The first value configures Committed Rate—the amount of bandwidth available to traffic transmitted from the switch to the VM, in kilobits per second. Enter the value in multiples of 64.

The second values configures the maximum burst size, in Kilobits. Enter one of the following values: 32, 64, 128, 256, 512, 1024, 2048, 4096.

```
bwctrl e|d
```

Enables or disables bandwidth control on the VM policy.

delete

Deletes the bandwidth management settings from this VM policy.

cur

Displays the current VM bandwidth management parameters.

Virtual NIC Configuration

```
[VNIC Global Configuration Menu]

port - Port vNIC Configuration Menu
vnicgrp - VNIC Group Configuration Menu
emeter - Globally enable/disable vNIC egress metering
ulshare - Globally enable/disable vNIC uplink sharing
on - Globally turn vNIC feature ON
off - Globally turn vNIC feature OFF
cur - Display current vNIC configuration
```

Table 350 describes the Virtual NIC (vNIC) configuration options.

Table 350. Virtual NIC Options (/cfg/virt/vnic)

```
Command Syntax and Usage

port port port number>
    Displays the port vNIC menu. To view menu options, see page 457.

vnicgrp <1-32>
    Displays the vNIC group menu. To view menu options, see page 458.

emeter ena | dis
    Enables or disables vNIC egress metering.

ulshare ena | dis
    Enables or disables vNIC uplink sharing. The default is dis.

on
    Globally turns vNIC on.

off
    Globally turns vNIC off.

cur
    Displays the current vNIC parameters.
```

/cfg/virt/vnic/port <port alias or number>

vNIC Port Configuration

```
[Port 1 vNICs Menu]
    vnic - VNIC Configuration Menu
             - Display current port vNIC configuration
```

Table 351 describes the Virtual NIC (vNIC) port configuration options.

Table 351. vNIC Port Options (/cfg/virt/vnic/port)

Command Syntax and Usage

vnic <1-4>

Displays the vNIC menu for the selected vNIC. To view menu options, see page 457.

cur

Displays the current vNIC port parameters.

/cfq/virt/vnic/port <port alias or number>/vnic <vNIC number> **vNIC Port Configuration**

```
[vNIC 1.1 Menu]
            - Set maximum bandwidth of the vNIC
             - Enable vNIC
            - Disable vNIC
    dis
             - Display current vNIC configuration
```

Table 352 describes the Virtual NIC (vNIC) port configuration options.

Table 352. Port vNIC Options (/cfg/virt/vnic/port/vnic)

Command Syntax and Usage bw < 1-100 >

Configures the maximum bandwidth allocated to this vNIC, in increments of 100 Mbps. For example:

- -1 = 100 Mbps
- -10 = 1000 Mbps

ena

Enables the selected vNIC.

dis

Disables the selected vNIC.

cur

Displays the current vNIC port parameters.

/cfq/virt/vnic/vnicgrp <1-32>

Virtual NIC Group Configuration

```
[vNIC Group 1 Menu]
    vnicvlan - Set VLAN number to vNIC group
    failover - Enable/disable uplink failover
    addvnic - Add vNIC to vNIC group
    remvnic - Remove vNIC from vNIC group
    addport - Add port to vNIC group
    remport - Remove port from vNIC group
    addtrnk - Add trunk to vNIC group
    remtrnk - Remove trunk from vNIC group
    addkey - Add LACP trunk to vNIC group
    remkey - Remove LACP trunk from vNIC group
            - Enable vNIC group
            - Disable vNIC group
    del
            - Delete vNIC group
    cur - Display current vNIC group configuration
```

Table 353 describes the Virtual NIC (vNIC) group configuration options.

Table 353. Port vNIC Group options (/cfg/virt/vnic/vnicgrp)

Command Syntax and Usage vnicvlan <*VLAN number*> Assigns a VLAN to the vNIC group. failover e|d Enables or disables uplink failover for the vNIC Group. Uplink Failover for the vNIC Group will disable only the affected vNIC links on the port. Other port functions continue to operate normally. The default setting is disabled. addvnic <vNICID> Adds a vNIC to the vNIC Group. The vNIC ID is comprised of the port number and the vNIC number. For example: int1.1 remvnic <vNICID> Removes the selected vNIC from the vNIC Group. addport port number> Adds the selected switch port to the vNIC Group. Removes the selected switch port from the vNIC Group. addtrnk <trunk number> Adds the selected trunk group to the vNIC Group. remtrnk <trunk number> Removes the selected trunk group from the vNIC Group. addkey <trunk number> Adds the specified LACP trunk to the vNIC Group.

Table 353. Port vNIC Group options (/cfg/virt/vnic/vnicgrp)

remkey

Removes all LACP trunks from the vNIC Group.

ena

Enables the vNIC Group.

dis

Disables the vNIC Group.

del

Deletes the vNIC Group.

cur

Displays the current vNIC Group parameters.

/cfq/virt/vmcheck

VM Check Configuration

```
[VM Check Settings Menu]
    action - Actions to take for spoofed VMs
    acls - Number of ACLs to use for spoofed macs
    trust - Add a port to trusted ports
    notrust - Remove a port from trusted ports
    cur - Show current VM Check settings
```

Table 354 describes the the VM Check validation options used for MAC address spoof prevention.

Table 354. VM Check Options

Command Syntax and Usage

action

Configures the actions taken when detecting MAC address spoofing. To view menu options, see page 460

acls <1-256>

Configures the maximum number of ACLs that can be set up for MAC address spoofing prevention in advanced validation mode. Default value is 50.

trust <ports>

Enables trusted ports for VM communication. By default, all ports are disabled.

notrust <ports>

Disables trusted ports for VM communication.

cur

Displays the current VM Check settings.

/cfq/virt/vmcheck/action

VM Check Actions Configuration

```
[VM Check actions settings Menu]

basic - Action to take in basic mode validation
advanced - Action to take in advanced mode validation
cur - Show current VM Check Action settings
```

Table 355 describes the VM Check actions available for handling MAC address spoof attempts.

Table 355. VM Check Action Options

Command Syntax and Usage

basic < log|link>

Sets up action taken when detecting MAC address spoofing in basic validation mode:

- log registers a syslog entry
- link registers a syslog entry and disables the corresponding switch port

Default setting is link.

advanced < log | acl | link >

Sets up action taken when detecting MAC address spoofing in advanced validation mode:

- log registers a syslog entry
- acl registers a syslog entry and installs an ACL to drop traffic incoming on the corresponding switch port originating from the spoofed MAC address
- link registers a syslog entry and disables the corresponding switch port

Default setting is acl.

cur

Displays the current VM Check actions settings.

/cfq/virt/vmgroup <1-1024>

VM Group Configuration

```
[VM group 1 Menu]
  vlan - Set the group's vlan (only for groups with no VM profile)
  vmap
           - Set VMAP for this group
          - Enable vlan tagging on all VM group ports
  addvm - Add a virtual entity to the group
  remvm - Remove a virtual entity from the group
  validate - Sets secure mode for all VMs in this group
  addprof - Add a VM profile to the group
  remprof - Delete any VM profile associated with the group
  addport - Add ports to the group
  remport - Remove ports from the group
  addtrunk - Add trunk to the group
  remtrunk - Remove trunk from the group
  addkey - Add LACP trunk to the group
  remkey - Remove LACP trunk from the group
          - Assign VM group vlan to a Spanning Tree Group
          - Delete group
          - Display current group configuration
```

Table 356 describes the Virtual Machine (VM) group configuration options. A VM group is a collection of members, such as VMs, ports, or trunk groups. Members of a VM group share certain properties, including VLAN membership, ACLs (VMAP), and VM profiles.

Table 356. VM Group Options (/cfg/virt/vmgroup)

Command Syntax and Usage

vlan <*VLAN number*>

Assigns a VLAN to this VM group. If you do not assign a VLAN to the VM group, the switch automatically assigns an unused VLAN when adding a port or a VM to the VM Group.

Note: If you add a VM profile to this group, the group will use the VLAN assigned to the profile.

```
vmap add|rem <VMAP number> intports|extports
```

Assigns the selected VLAN Map to this VM group. You can choose to limit operation of the VLAN Map to internal ports only or external ports only. If you do not select a port type, the VMAP is applied to the entire VM Group.

For more information about configuring VLAN Maps, see "VMAP Configuration" on page 287.

```
taq e|d
```

Enables or disables VLAN tagging on ports in this VM group.

```
addvm <MAC address> | <UUID> | <name> | <IP address> | <index number>
```

Adds a VM to the VM group. Enter a unique identifier to select a VM. The UUID and name parameters apply only if Virtual Center information is configured (/cfq/virt/vmware/vcspec). The VM index number is found in the VM information dump (/info/virt/vm/dump).

Note: If the VM is connected to a port that is contained within the VM group, do not add the VM to the VM group.

Table 356. VM Group Options (/cfg/virt/vmgroup) (continued)

remvm <MAC address> | <UUID> | <name> | <IP address> | <index number>

Removes a VM from the VM group. Enter a unique identifier to select a VM. The UUID and name parameters apply only if Virtual Center information is configured (/cfg/virt/vmware/vcspec).

The VM index number is found in the VM information dump (/info/virt/vm/dump).

validate [disable|basic|advanced]

Configures MAC address spoof prevention for the VM group. Default setting is disabled.

- basic validation ensures lightweight port-based protection by cross-checking VM MAC address, switch port and switch ID between the switch and the hypervisor. Applicable for "trusted" hypervisors, which are not susceptible to duplicating or reusing MAC addresses on virtual machines.
- advanced validation ensures heavyweight VM-based protection by cross-checking the VM MAC address, VM UUID, switch port and switch ID between the switch and the hypervisor. Applicable for "untrusted" hypervisors, which are susceptible to duplicating or reusing MAC addresses on virtual machines.
- disable stops MAC address spoof prevention.

addprof rofile name (1-39 characters)>

Adds the selected VM profile to the VM group.

remprof

Removes the VM profile assigned to the VM group.

addport port number or alias>

Adds the selected port to the VM group.

Note: Add a port to a VM group only if no VMs on that port are members of the VM group.

remport port number or alias>

Removes the selected port from the VM group.

addtrunk <trunk number>

Adds the selected trunk group to the VM group.

remtrunk <trunk number>

Removes the selected trunk group from the VM group.

addkey <1-65535>

Adds an LACP admin key to the VM group. LACP trunks formed with this admin key will be included in the VM group.

remkey <1-65535>

Removes an LACP admin key from the VM group.

Table 356. VM Group Options (/cfg/virt/vmgroup) (continued)

stg <STG number>

Assigns the VM group VLAN to a Spanning Tree Group (STG).

del

Deletes the VM group.

cur

Displays the current VM group parameters.

/cfg/virt/vmprof

VM Profile Configuration

```
[VM Profiles Menu]
    create - Create a VM profile
    edit - Edit a VM profile
            - Display details of all VM profiles
```

Configuration of VMs with the VM Agent requires the use of VM profiles, which ease the configuration and management of VM Agent-based VM groups. The VM profile contains a set of properties that will be configured on the Virtual Switch.

After a VM profile has been defined, it can be assigned to a VM group or exported to one or more VMware hosts.

Table 357 describes the VM Profiles configuration options.

Table 357. VM Profile options (/cfg/virt/vmprof)

Command Syntax and Usage

create <profile name (1-39 characters)>

Defines a name for the VM profile. The switch supports up to 32 VM profiles.

edit <profile name>

Displays the VM Profile Edit menu for the selected profile. To view menu options, see page 464.

cur

Displays the current VM Profiles parameters.

/cfg/virt/vmprof/edit cfg/virt/vmprof/edit cfg/virt/vmprof/edit cfg/virt/vmprof/edit

VM Profile Edit

```
[VM profile "myProfile" Menu]

vlan - Set the VM profile's VLAN ID

shaping - Set or delete the VM profile's traffic shaping parameters

eshaping - Set or delete the VM profile's traffic egress shaping parameters

delete - Delete this VM profile

cur - Show details of the current VM profile
```

Table 358 describes the VM Profile Edit options.

Table 358. Edit VM Profile options (/cfg/virt/vmprof/edit)

Command Syntax and Usage

vlan <*VLAN number*>

Assigns a VLAN to the VM profile.

Configures traffic shaping parameters implemented in the hypervisor, as follows:

- Average traffic, in Kilobits per second
- Maximum burst size, in Kilobytes
- Peak traffic, in Kilobits per second
- Delete traffic shaping parameters.

Configures traffic egress shaping parameters implemented in the hypervisor, as follows:

- Average traffic, in Kilobits per second
- Maximum burst size, in Kilobytes
- Peak traffic, in Kilobits per second
- Delete traffic shaping parameters

delete

Deletes the selected VM Profile.

cur

Displays the current VM Profiles parameters.

/cfq/virt/vmware

VMWare Configuration

```
[VMware-specific Settings Menu]
 hbport - Set ESX/ESXi server to vCenter heartbeat UDP port number
 vcspec - Create, update or delete Virtual Center access information
 hello
         - VM HELLO menu
         - Display current VMware-specific settings
```

Table 359 describes the VMware configuration options. When the user configures the VMware Virtual Center, the VM Agent module in the switch can perform advanced functionality by communicating with the VMware management console. The Virtual Center provides VM and Host names, IP addresses, Virtual Switch and port group information. The VM Agent on the switch communicates with the Virtual Center to synchronize VM profiles between the switch and the VMware virtual switch.

Table 359. VMware Options (/cfg/virt/vmware)

Command Syntax and Usage

```
hbport <1-65535>
```

Configures the UDP port number used for heartbeat communication from the VM host to the Virtual Center. The default value is port 902.

```
vcspec [<IP address>| [<username> noauth] | [delete]
```

Defines the Virtual Center credentials on the switch. Once you configure the Virtual Center, VM Agent functionality is enabled across the system.

You are prompted for the following information:

- IP address of the Virtual Center
- User name and password for the Virtual Center
- Whether to authenticate the SSL security certificate (yes or no)

hello

Displays the VM Hello menu. To view menu options, see page 465.

cur

Displays the current VMware parameters.

/cfq/virt/vmware/hello

VM Hello Configuration

```
[VM HELLO-specific settings Menu]
   ena - Enable HELLO advertisements
    dis
            - Disable HELLO advertisements
    addport - Add PORT to HELLO
    rmport
            - Remove PORT from HELLO
    haddr
            - HELLO address
    htimer - HELLO periodicity
            - Show current HELLO settings
```

VM Hello configures the CDP (Cisco Discovery Protocol) advertisements sent periodically to VMware ESX hypervisors. Exchanging CDP message with ESX hypervisors, facilitates MAC address spoof prevention. Table 360 describes the VM Hello configuration options.

Table 360. VM Hello Configuration Options

Command Syntax and Usage

ena

Enables CDP advertisements transmission. Default setting is disabled.

dis

Disables CDP advertisements transmission.

addport <ports>

Add ports to the list of ports that can transmit CDP advertisements.

rmport <ports>

Remove ports from the list of ports that can transmit CDP advertisements.

haddr <IP address>

Advertises a specific IP address instead of the default 0.0.0.0 IP.

htimer <1-60>

Sets the number of seconds between successive CDP advertisements. Default value is 30.

cur

Displays current VM Hello settings.

/cfq/virt/vmrmisc

Miscellaneous VMready Configuration

```
[Misc. VMready Configuration Menu]
    addoui - Add MAC OUI
remoui - Remove MAC OUI
showoui - Show all the configured MAC OUIs
     lmacena - Treat locally administered MAC addresses as VMs
     lmacdis - Do not treat locally administered MAC addresses as VMs
```

You can pre-configure MAC addresses as VM Organization Unique Identifiers (OUIs). These configuration commands are only available using the IBM N/OS CLI and the Miscellaneous VMready Configuration Menu. Table 359 describes the VMready configuration options.

Table 361. VMready Configuration Options

Command Syntax and Usage

addoui <3 byte VM MAC OUI> < Vendor Name>

Adds a MAC OUI.

remoui <3 byte VM MAC OUI>

Removes a MAC OUI.

showoui

Displays all the configured MAC OUIs.

Enables the switch to treat locally administered MAC addresses as VMs.

lmacdis

Disables the switch from treating locally administered MAC addresses as VMs.

Edge Virtual Bridge Configuration

```
[Edge Virtual Bridge Configuration Menu]

vsidb - Virtual Station Interface Type DataBase

profile - evb profile menu

cur - Show current EVB parameters
```

You can configure your switch to use Edge Virtual Bridging. These configuration commands are only available using the IBM N/OS CLI and the Miscellaneous VMready Configuration Menu. Table 359 describes the Edge Virtual Bridge configuration options.

Table 362. Edge Virtual Bridge Configuration Options

```
vsidb
Displays the Virtual Station Interface Type database menu. To view menu options, see page 468.

profile
Displays the EVB Profile menu. To view menu options, see page 469.

cur
Displays the current EVB parameters.
```

/cfq/virt/evb/vsidb

Virtual Station Interface Type DataBase Configuration

```
[VSI Type DB 1 Menu]

managrip - Set VSI DB Manager IP

port - Set VSI DB Manager Port

docpath - Set VSI DB Document Path

alltypes - Set VSI DB Document Path

interval - Set VSI DB Update Interval

cur - Display current VSI Type configuration

reset - Reset VSIDB Info
```

Table 363 describes the Virtual Station Interface Type database configuration options.

Table 363. Virtual Station Interface Type DataBase Configuration Options

```
Command Syntax and Usage

managrip <IP address>
Sets the Virtual Station Interface DataBase manager IP address.

port <I-65534>
Sets the Virtual Station Interface DataBase manager port.

docpath <file path>
Sets the Virtual Station Interface DataBase document path.
```

Table 363. Virtual Station Interface Type DataBase Configuration Options

alltypes <*URI*>

Sets the Virtual Station Interface All DataBase URI.

interval <5-300>

Sets the Virtual Station Interface DataBase update interval, in seconds.

cur

Displays the current VSI type parameters.

reset

Resets VSIDB parameters.

/cfg/virt/evb/profile

Edge Virtual Bridge Profile Configuration

```
[evb profile menu]
```

rr - Enable/Disable VEPA Mode (Reflective Relay Capability)

vsidisc - Enable/Disable VSI Discovery (ECP and VDP)

- Display current configuration

Table 364 describes the Edge Virtual Bridge Profile configuration options.

Table 364. Edge Virtual Bridge Profile Configuration Options

Command Syntax and Usage

rr enable disable

Enables or disables VEPA Mode (Reflective Relay Capability).

vsidisc enable|disable

Enables or disables VSI Discovery (ECP and VDP).

cur

Displays the current profile configuration.

/cfg/dump

Dump

The dump program writes the current switch configuration to the terminal screen. To start the dump program, at the Configuration# prompt, enter:

Configuration# dump

The configuration is displayed with parameters that have been changed from the default values. The screen display can be captured, edited, and placed in a script file, which can be used to configure other switches through a Telnet connection. When using Telnet to configure a new switch, paste the configuration commands from the script file at the command line prompt of the switch. The active configuration can also be saved or loaded via TFTP, as described on page 471.

/cfg/ptcfg <FTP/TFTP server> <filename> <username>

Saving the Active Switch Configuration

When the ptcfg command is used, the switch's active configuration commands (as displayed using /cfg/dump) will be uploaded to the specified script configuration file on the FTP/TFTP server. To start the switch configuration upload, at the Configuration# prompt, enter:

Configuration# ptcfg <FTP or TFTP server> <filename>

Where *server* is the FTP/TFTP server IPv4/IPv6 address or hostname, and *filename* is the name of the target script configuration file.

Notes:

- The output file is formatted with line-breaks but no carriage returns and cannot be viewed with editors that require carriage returns (such as Microsoft Notepad).
- If the FTP/TFTP server is running SunOS or the Solaris operating system, the specified ptcfg file must exist prior to executing the ptcfg command and must be writable (set with proper permission, and not locked by any application). The contents of the specified file will be replaced with the current configuration data.

/cfg/gtcfg <FTP/TFTP server> <filename>

Restoring the Active Switch Configuration

When the gtcfg command is used, the active configuration will be replaced with the commands found in the specified configuration file. The file can contain a full switch configuration or a partial switch configuration. The configuration loaded using gtcfg is not activated until the apply command is used. If the apply command is found in the configuration script file loaded using this command, the apply action will be performed automatically.

To start the switch configuration download, at the Configuration# prompt, enter:

Configuration# gtcfg <FTP or TFTP server> <filename> <username>

Where server is the FTP/TFTP server IPv4/IPv6 address or hostname, and filename is the name of the target script configuration file.

Chapter 7. The Operations Menu

The Operations Menu is generally used for commands that affect switch performance immediately, but do not alter permanent switch configurations. For example, you can use the Operations Menu to immediately disable a port (without the need to apply or save the change), with the understanding that when the switch is reset, the port returns to its normally configured operation.

/oper

Operations Menu

```
[Operations Menu]
    port
            - Operational Port Menu
            - Operational Fiber Channel Over Ethernet Menu
    fcoe
    vrrp
            - Operational Virtual Router Redundancy Menu
    ip
            - Operational IP Menu
            - Protected Mode Menu
           - Operational System Menu
    sys
            - Virtualization Operations Menu
    passwd - Change current user password
    clrlog - Clear syslog messages
    tnetsshc - Close all telnet/SSH connections
    conlog - Enable/disable session console logging
    cfgtrk - Track last config change made
    ntpreq - Send NTP request
```

The commands of the Operations Menu enable you to alter switch operational characteristics without affecting switch configuration.

Table 365. Operations Menu (/oper)

Command Syntax and Usage Displays the Operational Port Menu. To view menu options, see page 475. fcoe Displays the Fiber Channel over Ethernet (FCoE) Operations Menu. To view menu options, see page 476. vrrp Displays the Operational Virtual Router Redundancy Menu. To view menu options, see page 477. ip Displays the IP Operations Menu, which has one sub-menu/option, the Operational Border Gateway Protocol Menu. To view menu options, see page 478. prm Displays the Protected Mode menu. To view menu options, see page 479. sys Displays the Operational System menu. To view menu options, see page 480.

Table 365. Operations Menu (/oper) (continued)

virt

Displays the Virtualization Operations Menu. To view menu options, see page 480.

passwd <1-128 characters>

Allows the user to change the password. You need to enter the current password in use for validation.

clrlog

Clears all Syslog messages.

tnetsshc

Closes all open Telnet and SSH connections.

conlog enable disable

Enables of disables console logging of the current session.

cfgtrk

Displays a list of configuration changes made since the last apply command. Each time the apply command is sent, the configuration-tracking log is cleared.

ntpreq

Allows the user to send requests to the NTP server.

/oper/port port alias or number>

Operations-Level Port Options Menu

```
[Operations Port INT1 Menu]
    8021x - 8021.x Menu
    rmon - Enable, - - Enable port
             - Enable/disable RMON for port
           - Disable port
    dis
    cur
           - Current port state
```

Operations-level port options are used for temporarily disabling or enabling a port, and for re-setting the port.

Table 366. Operations-Level Port Menu Options (/oper/port)

Command Syntax and Usage

8021x

Displays the 802.1X Port Menu. To view menu options, see page 476.

rmon e|d

Enables or disables Remote Monitoring (RMON) for the port. The default setting is disabled.

Temporarily enables the port. The port will be returned to its configured operation mode when the switch is reset.

dis

Temporarily disables the port. The port will be returned to its configured operation mode when the switch is reset.

cur

Displays the current settings for the port.

/oper/port /port alias or number>/8021x

Operations-Level Port 802.1X Options Menu

```
[802.1X Operation Menu]

reset - Reinitialize 802.1X access control on this port
reauth - Initiate reauthentication on this port now
```

Operations-level port 802.1X options are used to temporarily set 802.1X parameters for a port.

Table 367. Operations-Level Port 802.1X Menu Options (/oper/port x/8021x)

Command Syntax and Usage

reset

Re-initializes the 802.1X access-control parameters for the port. The following actions take place, depending on the 802.1X port configuration:

- force unauth the port is placed in unauthorized state, and traffic is blocked.
- auto the port is placed in unauthorized state, then authentication is initiated.
- force auth the port is placed in authorized state, and authentication is not required.

reauth

Re-authenticates the supplicant (client) attached to the port. This command only applies if the port's 802.1X mode is configured as auto.

/oper/fcoe

Operations-Level FCoE Menu

```
[Operational FCOE Menu]
fips - Operational FIP Snooping Menu
```

Table 368. Operations-Level FCoE Options (/oper/fcoe)

Command Syntax and Usage

fips

Displays the FCoE Initialization Protocol Snooping operations menu.

/oper/fcoe/fips

FCoE FIP Snooping Operations

```
[FIP Snooping Operational Menu]
    delfcf - Delete an FCF entry and the associated ACLs from the database
```

Table 369. FIP Snooping Operations (/oper/fcoe/fips)

Command Syntax and Usage

delfcf <MAC address>

Deletes the selected FCoE Forwarder (FCF), and any associated ACLs.

/oper/vrrp

Operations-Level VRRP Options Menu

```
[VRRP Operations Menu]
       back - Set virtual router to backup
```

Table 370. Operations-Level VRRP Menu Options (/oper/vrrp)

Command Syntax and Usage

back <virtual router number (1-255)>

Forces the specified master virtual router on this switch into backup mode. This is generally used for passing master control back to a preferred switch once the preferred switch has been returned to service after a failure. When this command is executed, the current master gives up control and initiates a new election by temporarily advertising its own priority level as 0 (lowest). After the new election, the virtual router forced into backup mode by this command will resume master control in the following cases:

- This switch owns the virtual router (the IP addresses of the virtual router and its IP interface are the same)
- This switch's virtual router has a higher priority and preemption is enabled.
- There are no other virtual routers available to take master control.

Operations-Level IP Options Menu

```
[IP Operations Menu]
bgp - Operational Border Gateway Protocol Menu
```

Table 371. Operations-Level IP Menu Options (/oper/ip)

Command Syntax and Usage

bgp

Displays the Border Gateway Protocol Operations Menu. To view the menu options, see page 478.

/oper/ip/bgp

Operations-Level BGP Options Menu

```
[Border Gateway Protocol Operations Menu]
start - Start peer session
stop - Stop peer session
cur - Current BGP operational state
```

Table 372. Operations-Level BGP Menu Options (/oper/ip/bgp)

Command Syntax and Usage start <peer number (1-16)> Starts the peer session. stop <peer number (1-16)> Stops the peer session. cur Displays the current BGP operational state.

Protected Mode Options Menu

```
[Protected Mode Menu]
   mgt - Enable/disable local control of external management
   ext - Enable/disable local control of external ports
   fact - Enable/disable local control of factory default reset
   mif - Enable/disable local control of Mgmt VLAN interface
   on - Turn on/alter protected mode by applying enabled features
   off - Turn off protected mode by removing all features
   cur - Display current PRM configuration
```

Protected Mode is used to secure certain switch management options, so they cannot be changed by the management module.

Table 373. Protected Mode Options (/oper/prm)

Command Syntax and Usage

```
mgt enable disable
```

Enables exclusive local control of switch management. When Protected Mode is set to on, the management module cannot be used to disable external management on the switch. The default value is enabled.

Note: Due to current management module implementation, this setting cannot be disabled.

```
ext enable disable
```

Enables exclusive local control of external ports. When Protected Mode is set to on, the management module cannot be used to disable external ports on the switch. The default value is enabled.

Note: Due to current management module implementation, this setting cannot be disabled.

```
fact enable disable
```

Enables exclusive local control of factory default resets. When Protected Mode is set to on, the management module cannot be used to reset the switch software to factory default values. The default value is enabled.

Note: Due to current management module implementation, this setting cannot be disabled.

```
mif enable disable
```

Enables exclusive local control of the management interface. When Protected Mode is set to on, the management module cannot be used to configure parameters for the management interface. The default value is enabled.

Note: Due to current management module implementation, this setting cannot be disabled.

on

Turns Protected Mode on. When Protected Mode is turned on, the switch takes exclusive local control of all enabled options.

Table 373. Protected Mode Options (/oper/prm) (continued)

off

Turns Protected Mode off. When Protected Mode is turned off, the switch relinquishes exclusive local control of all enabled options.

cur

Displays the current Protected Mode configuration.

/oper/sys

System Operations Menu

```
[Operational System Menu]
i2c - System I2C
```

I2C device commands are to be used only by Technical Support personnel.

/oper/virt

Virtualization Operations

```
[Virtualization Operations Menu]
vmware - VMware Operations Menu
evb - EVB Operations Menu
```

Table 374 describes general virtualization operations options. More details are available in the following sections.

Table 374. Virtualization Options (/oper/virt)

Command Syntax and Usage

vmware

Displays the VMware operations menu. To view the menu options, see page 481.

evb

Displays the Edge Virtual Bridge (EVB) operations menu. To view the menu options, see page 487.

/oper/virt/vmware

VMware Operations

```
[VMware Operations Menu]
    dvswitch - VMware dvSwitch Operations
            - VMware distributed port group operation
    addpg
            - Add a port group to a Host
    addvsw - Add a Vswitch to a Host
    delpg - Delete a port group from a Host
    delvsw - Delete a Vswitch from a Host
    export - Create or update a VM profile on one or more Hosts
    scan - Perform a VM Agent scan operation now
    vmacpg - Change a VM NIC's port group
    updpg - Update a port group on a Host
```

Use these commands to perform minor adjustments to the VMware operation. Use these commands to perform Virtual Switch operations directly from the switch. Note that these commands require the configuration of Virtual Center access information (/cfg/virt/vmware/vcspec).

Table 375. VMware Operations (/oper/virt/vmware)

Command Syntax and Usage

dvswitch

Displays the VMware Distributed Virtual Switch operations menu. To view the menu options see page 484.

dpg

Displays the VMware distributed port group operations menu. To view the menu options see page 485.

```
addpg [<Port Group name> <host ID> <Vswitch name> <VLAN number>
   <shaping-enabled> <average-Kbps> <burst-KB> <peak-Kbps>]
```

Adds a Port Group to a VMware host. You are prompted for the following information:

- Port Group name
- VMware host ID (Use host UUID, host IP address, or host name.)
- Virtual Switch name
- VLAN ID of the Port Group
- Whether to enable the traffic-shaping profile (y or n). If you choose y (yes), you are prompted to enter the traffic shaping parameters.

```
addvsw < host ID> < Virtual Switch name>
```

Adds a Virtual Switch to a VMware host. Use one of the following identifiers to specify the host:

- UUID
- IP address
- Host name

Table 375. VMware Operations (/oper/virt/vmware) (continued)

dvswitch

Displays the VMware Distributed Virtual Switch operations menu. To view the menu options see page 484.

dpg

Displays the VMware distributed port group operations menu. To view the menu options see page 485.

delpg <Port Group name> <host ID>

Removes a Port Group from a VMware host. Use one of the following identifiers to specify the host:

- UUID
- IP address
- Host name

delvsw <host ID> <Virtual Switch name>

Removes a Virtual Switch from a VMware host. Use one of the following identifiers to specify the host:

- UUID
- IP address
- Host name

Exports a VM Profile to one or more VMware hosts. This command allows you to distribute a VM Profile to VMware hosts.

Use one of the following identifiers to specify each host:

- UUID
- IP address
- Host name

The switch displays a list of available Virtual Switches. You may enter a VSwitch name from the list, or enter a new name to create a new Virtual Switch.

scan

Performs a scan of the VM Agent, and updates VM information.

Table 375. VMware Operations (/oper/virt/vmware) (continued)

dvswitch

Displays the VMware Distributed Virtual Switch operations menu. To view the menu options see page 484.

dpg

Displays the VMware distributed port group operations menu. To view the menu options see page 485.

vmacpg <MAC address> <Port Group name>

Changes a VM NIC's configured Port Group.

updpg <Port Group name> <host ID> <VLAN number> [<shaping enabled> <average (1-1000000000)> <burst (1-1000000000)> <peak (1-1000000000)>]

Updates a VMware host's Port Group parameters. Use one of the following identifiers for the host ID:

- UUID
- IP address
- Host name

Enter the traffic shaping parameters as follows:

- Shaping enabled
- Average traffic, in Kilobits per second
- Maximum burst size, in Kilobytes
- Peak traffic, in Kilobits per second
- Delete traffic shaping parameters.

/oper/virt/vmware/dvswitch

VMware Distributed Virtual Switch Operations

```
[VMware dvSwitch operations Menu]

add - Add a dvSwitch to a DataCenter

del - Delete a dvSwitch from a DataCenter

addhost - Add a host to a dvSwitch

remhost - Remove a host from a dvSwitch

addUplink - Add a physical NIC to dvSwitch uplink ports

remUplink - Remove a physical NIC from dvSwitch uplink ports
```

Use these commands to administer a VMware Distributed Virtual Switch (dvSwitch).

Table 376. VMware dvSwitch Operations (/oper/virt/vmware/dvswitch)

Command Syntax and Usage

add < datacenter name > < dvSwitch name > < dvSwitch version > Adds the specified dvSwitch to the specified DataCenter.

del <datacenter name> <dvSwitch name>

Removes the specified dvSwitch from the specified DataCenter.

addhost < dvSwitch name> < host UUID | IP address | host name>

Adds the specified host to the specified dvSwitch. Use one of the following identifiers to specify the host:

- UUID
- IP address
- Host name

remhost <dvSwitch name> <host UUID | IP address | host name>

Removes the specified host from the specified dvSwitch. Use one of the following identifiers to specify the host:

- UUID
- IP address
- Host name

addUplink <dvSwitch name> <host ID> <uplink name>

Adds the specified physical NIC to the specified dvSwitch uplink ports.

remUplink <dvSwitch name> <host ID> <uplink name>

Removes the specified physical NIC from the specified dvSwitch uplink ports.

/oper/virt/vmware/dpq

VMware Distributed Port Group Operations

```
[VMware distributed port group operations Menu]
    add - Add a port group to a dvSwitch
    addmac
            - Add a VM NIC to a port group
    update - Update a port group on a dvSwitch
            - Delete a port group from a dvSwitch
```

Use these commands to administer a VMware distributed port group.

Table 377. VMware Distributed Port Group Operations (/oper/virt/vmware/dpg)

Command Syntax and Usage

add

Adds the specified port group to the specified dvSwitch. You are prompted to enter the following:

- Port group name
- dvSwitch name
- VLAN ID
- Ingress shaping (y or n). If "y", specify the following parameters:
 - average bandwidth in KB per second (1-1000000000)
 - burst size in KB (1-1000000000)
 - peak bandwidth in KB per second (1-1000000000)
- Egress shaping (y or n). If "y", specify the following parameters:
 - average bandwidth in KB per second (1-1000000000)
 - burst size in KB (1-1000000000)
 - peak bandwidth in KB per second (1-1000000000)

addmac <vNIC MAC> <port group name>

Adds the specified VM NIC to the specified port group.

Table 377. VMware Distributed Port Group Operations (/oper/virt/vmware/dpg) (continued)

Command Syntax and Usage

update

Updates the specified port group on the specified dvSwitch. You are prompted to enter the following:

- Port group name
- dvSwitch name
- VLAN ID
- Ingress shaping (e or d) for "enabled or "disabled." If "e", specify the following parameters:
 - average bandwidth in KB per second (1-1000000000)
 - burst size in KB (1-1000000000)
 - peak bandwidth in KB per second (1-1000000000)
- Egress shaping (e or d) for "enabled or "disabled." If "e", specify the following parameters:
 - average bandwidth in KB per second (1-1000000000)
 - burst size in KB (1-1000000000)
 - peak bandwidth in KB per second (1-1000000000)

del <port group name> <dvSwitch name>

Removes the specified port group from the specified dvSwitch.

/oper/virt/evb

EVB Operations

```
[EVB Operations Menu]
      cleanvms - Clean VM Associations
      dbupdate - Update VSI DataBase
dbclean - Clean VSI DataBase
```

Use these commands to perform adjustments to Edge Virtual Bridge operations directly from the switch. Note that these commands require the configuration of EVB information (/cfg/virt/evb).

Table 378. EVB Operations (/oper/virt/evb)

Command Syntax and Usage

cleanvms [port <port number>| mac <MACID>| vlan <VLAN number> | typeid <Type ID number>]

Clean VM associations for the specified parameter, or cleans all VM associations if no parameter is specified.

dbupdate

Updates the Virtual Station Interface database.

dbclean

Cleans the Virtual Station Interface database cache.

Chapter 8. The Boot Options Menu

To use the Boot Options Menu, you must be logged in to the switch as the administrator. The Boot Options Menu provides options for:

- Selecting a switch software image to be used when the switch is next reset
- Selecting a configuration block to be used when the switch is next reset
- Downloading or uploading a new software image to the switch via FTP/TFTP

In addition to the Boot Menu, you can use a Web browser or SNMP to work with switch image and configuration files. To use SNMP, refer to "Switch Images and Configuration Files" on page 548.

/boot

Boot Menu

```
[Boot Options Menu]
    bm
            - Bridge Module Menu
           - Stacking Menu
    stack
    sched - Scheduled Switch Reset Menu
   image - Select software image to use on next boot
    conf - Select config block to use on next boot
    netboot - NetBoot and NetConfig menu
    mode
            - Select CLI mode to use on next boot
    prompt - Prompt for selectable boot mode
    gtimg - Download new software image via TFTP
            - Upload selected software image via TFTP
    ptima
            - Reset switch [WARNING: Restarts Spanning Tree]
            - Display current boot options
    cur
```

Each of these options is discussed in greater detail in the following sections.

© Copyright IBM Corp. 2012 489

/boot/bm
 bridge module number>

Bridge Module Menu

```
[Bridge Module 4 Menu]

bandw - Select bandwidth to the bridge module

ena - Enable connection to bridge module

dis - Disable connection to bridge module

cur - Display current bridge module configuration
```

Use these commands to configure connectivity between the VFSM and the BladeCenter's Fibre Channel Bridge Module. For more information about Bridge Module connections, see the *Application Guide*.

Two Bridge Module connections are available, depending on the switch location, as follows:

BCH chassis

HSSM Bay 7	HSSM Bay 8	HSSM Bay 9	HSSM Bay 10
BM Bay 5	BM Bay 4	BM Bay 3	BM Bay 6
BM Bay 3	BM Bay 6	BM Bay 5	BM Bay 4

· BCHT chassis

HSSM Bay 7	HSSM Bay 8	HSSM Bay 9	HSSM Bay 10
BM Bay 3	BM Bay 1	BM Bay 4	BM Bay 2
BM Bay 4	BM Bay 2	BM Bay 3	BM Bay 1

Table 379. Bridge Module menu options (/boot/bm)

Command Syntax and Usage

bandw 0 | 20 | 40

Configures the bandwidth for the selected Bridge Module, in Gigabits per second.

Note: Each connection to the Bridge Module requires the use of multiple 10Gb external switch ports (EXTx), as follows:

- 20Gb = 2 ports
- 40Gb = 4 ports

ena

Enables the connection to the selected Bridge Module.

dis

Disables the connection to the selected Bridge Module.

cur

Displays the current Bridge Module configuration.

/boot/stack

Stacking Boot Menu

```
[Boot Stacking Menu]
    mode - Set the stacking mode for the switch
    stktrnk - Set external 10G ports for Stack Trunks
    vlan
            - Set VLAN number for control communication
    clear - Set stacking parameters to factory default
            - Enable the stacking mode
            - Disable the stacking mode
            - Display current stacking boot parameters
```

The Stacking Boot menu is used to define the role of the switch in a stack: either as the Master that controls the stack, or as a participating Member switch. Options are available for loading stack software to individual Member switches, and to configure the VLAN that is reserved for inter-switch stacking communications.

You must enable Stacking and reset the switch to enter Stacking mode. When the switch enters Stacking mode, the Stacking configuration menu appears. For more information, see "Stacking Configuration Menu" on page 265.

Table 380 lists the Boot Stacking command options.

Table 380. Boot Stacking Options (/boot/stack)

Command Syntax and Usage

mode master | member

Configures the Stacking mode for the selected switch.

stktrnk < list of ports>

Configures the ports used to connect the switch to the stack. Enter only 10Gb external ports.

vlan <*VLAN number*>

Configures the VLAN used for Stacking control communication.

clear

Resets the Stacking boot parameters to their default values.

ena

Enables the switch stack.

dis

Disables the switch stack.

cur

Displays current Stacking boot parameters.

When in stacking mode, the following standalone features are not supported:

- Active Multi-Path Protocol (AMP)
- SFD
- sFlow port monitoring
- Uni-Directional Link Detection (UDLD)
- Port flood blocking
- BCM rate control
- Link Layer Detection Protocol (LLDP)
- Private VLANs
- RIP
- OSPF and OSPFv3
- IPv6
- Virtual Router Redundancy Protocol (VRRP)
- Loopback Interfaces
- Router IDs
- Route maps
- Border Gateway Protocol (BGP)
- · MAC address notification
- Static MAC address adding
- Static multicast
- Static routes
- Converged Enhanced Ethernet (CEE) and Fibre Channel over Ethernet (FCOE)
- MSTP and RSTP settings for CIST, Name, Rev, and Maxhop
- IGMP Relay and IGMPv3
- Virtual NICs

Switch menus and commands for unsupported features may be unavailable, or may have no effect on switch operation.

/boot/sched

Scheduled Reboot Menu

```
[Boot Schedule Menu]
    set
         - Set switch reset time
    cancel - Cancel pending switch reset
         - Display current switch reset schedule
    cur
```

This feature allows you to schedule a reboot to occur at a particular time in the future. This feature is particularly helpful if the user needs to perform switch upgrades during off-peak hours. You can set the reboot time, cancel a previously scheduled reboot, and check the time of the currently set reboot schedule.

Table 381. Boot Scheduling Options (/boot/sched)

Command Syntax and Usage

set

Defines the reboot schedule. Follow the prompts to configure schedule options.

cancel

Cancels the next pending scheduled reboot.

cur

Displays the current reboot scheduling parameters.

Netboot Configuration Menu

```
[Netboot configuration Menu]
ena - Enable netconfig
dis - Disable netconfig
tftpaddr - TFTP Server IP address
cfgfile - Location of config file on tftp server
cur - Display current configuration
```

Netboot allows the switch to automatically download its configuration file over the network during switch reboot, and apply the new configuration. Upon reboot, the switch includes the following options in its DHCP requests:

- Option 66 (TFTP server address)
- Option 67 (file path)

If the DHCP server returns the information, the switch initiates a TFTP file transfer, and loads the configuration file into the active configuration block. As the switch boots up, it applies the new configuration file. Note that the option 66 TFTP server address must be specified in IP-address format (host name is not supported).

If DHCP is not enabled, or the DHCP server does not return the required information, the switch uses the manually-configured TFTP server address and file path.

Table 382. Netboot Options (/boot/netboot)

Command Syntax and Usage

ena

Enables Netboot. When enabled, the switch boots into factory-default configuration, and attempts to download a new configuration file.

dis

Disables Netboot.

tftpaddr <IP address>

Configures the IP address of the TFTP server used for manual configuration. This server is used if DHCP is not enabled, or if the DHCP server does not return the required information.

cfqfile <1-31 characters>

Defines the file path for the configuration file on the TFTP server. For example:

/directory/sub/config.cfg

cur

Displays the current Netboot parameters.

Updating the Switch Software Image

The switch software image is the executable code running on the Virtual Fabric 10Gb Switch Module (VFSM). A version of the image ships with the switch, and comes pre-installed on the device. As new versions of the image are released, you can upgrade the software running on your switch. To get the latest version of software available for your switch, go to:

http://www-304.ibm.com/jct01004c/systems/support

On the support site, click on software updates. On the switch, use the /boot/cur command to determine the current software version.

The typical upgrade process for the software image consists of the following steps:

- Place the new image onto a FTP or TFTP server on your network, or on a local computer.
- Transfer the new image to your switch.
- Select the new software image to be loaded into switch memory the next time the switch is reset.

Loading New Software to Your Switch

The switch can store up to two different software images, called image1 and image2, as well as boot software, called boot. When you load new software, you must specify where it should be placed: either into image1, image2, or boot.

For example, if your active image is currently loaded into image1, you would probably load the new image software into image2. This lets you test the new software and reload the original active image (stored in image1), if needed.

Using the BBI

You can use the Browser-Based Interface to load software onto the VFSM. The software image to load can reside in one of the following locations:

- FTP server
- TFTP server
- Local computer

After you log onto the BBI, perform the following steps to load a software image:

- 1. Click the Configure context button in the toolbar.
- In the Navigation Window, select System > Config/Image Control.

Switch Image and Configuration Management version 6.8.0, downloaded 0:45:39 Thu Mar 2, 2011 NormalConnect Image 1 Version Image 2 Version version 6.5.0, downloaded 0:41:27 Thu Mar 2, 2011 NormalConnect Boot Version version 6.8.0 Active Image Version 6.8.0 Next Boot Image Selection | image 1 💌 Active Configuration Block factory config Next Boot Configuration Block Selection factory config IBMNOS CLI Next CLI Boot Mode Selection ENABLE V Prompt for selectable boot mode NetBoot NetConfig for next boot DISABLE TFTP IP Address 10.10.20.1 Config file FTP/TFTP Settings Hostname or IP Address of FTP/TFTP server Username for FTP Server or Blank for TFTP Server Password for FTP Server Image Settings Image for Transfer image 1 💌 Image Filename (on server) 6.8.0_os.img Get Image Put Image

The Switch Image and Configuration Management page appears.

- If you are loading software from your computer (HTTP client), go to Step 4.
 If you are loading software from a FTP/TFTP server, enter the server's information in the FTP/TFTP Settings section.
- 4. In the Image Settings section, select the image version you want to replace (Image for Transfer).
 - If you are loading software from a FTP/TFTP server, enter the file name and click Get Image.

Browse...

Download via Browser

If you are loading software from your computer, click Browse.
 In the File Upload Dialog, select the file and click OK.
 Click Download via Browser.

Once the image has loaded, the page refreshes to show the new software.

Image Filename (on HTTP Client)

Using the CLI

To load a new software image to your switch, you need the following:

- The image or boot software loaded on a FTP/TFTP server on your network
- The hostname or IPv4/IPv6 address of the FTP/TFTP server
- The name of the new software image or boot file

Note: The DNS parameters must be configured if specifying hostnames. See "Domain Name System Configuration Menu" on page 400.

When the preceding requirements are met, use the following procedure to download the new software to your switch.

1. At the Boot Options# prompt, enter:

```
Boot Options# gtimg
```

2. Enter the name of the switch software to be replaced:

```
Enter name of switch software image to be replaced
 ["image1"/"image2"/"boot"]: <image>
```

3. Enter the hostname or IPv4/IPv6 address of the FTP or TFTP server.

```
Enter hostname or IP address of FTP/TFTP server: <name or IP address>
```

4. Enter the name of the new software file on the server.

```
Enter name of file on FTP/TFTP server: <filename>
```

The exact form of the name will vary by server. However, the file location is normally relative to the FTP or TFTP directory (usually /tftpboot).

5. Enter your username for the server, if applicable.

```
Enter username for FTP server or hit return for TFTP server: <username> or <Enter>
```

6. The system prompts you to confirm your request.

You will next select a software image to run, as described in the following section.

Selecting a Software Image to Run

You can select which software image (image1 or image2) you want to run in switch memory for the next reboot.

1. At the Boot Options# prompt, enter:

```
Boot Options# image
```

2. Enter the name of the image you want the switch to use upon the next boot. The system informs you of which image is currently set to be loaded at the next reset, and prompts you to enter a new choice:

```
Currently set to use switch software "image1" on next reset.

Specify new image to use on next reset ["image1"/"image2"]:
```

Uploading a Software Image from Your Switch

You can upload a software image from the switch to a FTP or TFTP server.

1. At the Boot Options# prompt, enter:

```
Boot Options# ptimg
```

The system prompts you for information. Enter the desired image:

```
Enter name of switch software image to be uploaded ["image1"|"image2"|"boot"]: <image>
```

Enter the name or the IPv4/IPv6 address of the FTP or TFTP server:

```
Enter hostname or IP address of FTP/TFTP server: <name or IP address>
```

Enter the name of the file into which the image will be uploaded on the FTP or TFTP server:

```
Enter name of file on FTP/TFTP server: <filename>
```

5. The system then requests confirmation of what you have entered. To have the file uploaded, enter Y.

```
image2 currently contains Software Version 7.4
  that was downloaded at 0:23:39 Thu Jan 4, 2010.
Upload will transfer image2 (2788535 bytes) to file "image1"
  on FTP/TFTP server 192.1.1.1.
Confirm upload operation (y/n) ? y
```

Selecting a Configuration Block

When you make configuration changes to the VFSM, you must save the changes so that they are retained beyond the next time the switch is reset. When you perform the save command, your new configuration changes are placed in the active configuration block. The previous configuration is copied into the backup configuration block.

There is also a factory configuration block. This holds the default configuration set by the factory when your VFSM was manufactured. Under certain circumstances, it may be desirable to reset the switch configuration to the default. This can be useful when a custom-configured VFSM is moved to a network environment where it will be re-configured for a different purpose.

Note: You also can use Netboot to automatically download a configuration file when the switch reboots. For more details, see "Netboot Configuration" Menu" on page 494.

Use the following procedure to set which configuration block you want the switch to load the next time it is reset:

1. At the Boot Options# prompt, enter:

Boot Options# conf

2. Enter the name of the configuration block you want the switch to use: The system informs you of which configuration block is currently set to be loaded at the next reset, and prompts you to enter a new choice:

Currently set to use active configuration block on next reset. Specify new block to use ["active"/"backup"/"factory"]:

Resetting the Switch

You can reset the switch to make your software image file and configuration block changes occur.

Note: Resetting the switch causes the Spanning Tree Group to restart. This process can be lengthy, depending on the topology of your network.

To reset the switch, at the Boot Options# prompt, enter:

>> Boot Options# reset

You are prompted to confirm your request.

Accessing the ISCLI

The default command-line interface for the VFSM is the IBM N/OS CLI. To access the ISCLI, enter the following command and reset the VFSM:

Main# boot/mode iscli

To access the IBM N/OS CLI, enter the following command from the ISCLI and reload the VFSM:

Switch (config) # boot cli-mode ibmnos-cli

Users can select the CLI mode upon login, if the /boot/prompt command is enabled. Only an administrator can view and enable /boot/prompt. When /boot/prompt is enabled, the first user to log in can select the CLI mode. Subsequent users must use the selected CLI mode, until all users have logged out.

Using the Boot Management Menu

The Boot Management menu allows you to switch the software image, reset the switch to factory defaults, or to recover from a failed software download.

You can interrupt the boot process and enter the Boot Management menu from the serial console port. When the system displays Memory Test, press <Shift B>. The Boot Management menu appears.

```
Resetting the System ...

Memory Test ......

Boot Management Menu

1 - Change booting image

2 - Change configuration block

3 - Xmodem download

4 - Exit

Please choose your menu option: 1

Current boot image is 1. Enter image to boot: 1 or 2: 2

Booting from image 2
```

The Boot Management menu allows you to perform the following actions:

- To change the booting image, press 1 and follow the screen prompts.
- To change the configuration block, press 2, and follow the screen prompts.
- To perform an Xmodem download, press 3 and follow the screen prompts.
- To exit the Boot Management menu, press 4. The booting process continues.

Recovering from a Failed Upgrade

Use the following procedure to recover from a failed software upgrade.

- 1. Connect a PC to the serial port of the switch.
- Open a terminal emulator program that supports XModem Download (for example, HyperTerminal, CRT, PuTTY) and select the following serial port characteristics:
 - Speed: 9600 bps
 - Data Bits: 8
 - Stop Bits: 1
 - Parity: None
 - Flow Control: None
- 3. Boot the switch and access the Boot Management menu by pressing <Shift B> while the Memory Test is in progress and the dots are being displayed.
- Select 3 for Xmodem download. When you see the following message, change the Serial Port characteristics to 115200 bps:

```
## Switch baudrate to 115200 bps and press ENTER ...
```

 Press <Enter> to set the system into download accept mode. When the readiness meter displays (a series of "C" characters), start XModem on your terminal emulator. 6. Select the Boot Image to download. The XModem initiates the file transfer. When the download is complete, a message similar to the following is displayed:

```
yzModem - CRC mode, 62494(SOH)/0(STX)/0(CAN) packets, 6 retries
Extracting images ... Do *NOT* power cycle the switch.
**** VMLINUX ****
Un-Protected 10 sectors
Erasing Flash..... done
Writing to Flash.....done
Protected 10 sectors
**** RAMDISK ****
Un-Protected 44 sectors
Erasing Flash...... done
Writing to Flash......done
Protected 44 sectors
**** BOOT CODE ****
Un-Protected 8 sectors
Erasing Flash..... done
Writing to Flash.....done
Protected 8 sectors
```

7. When you see the following message, change the Serial Port characteristics to 9600 bps:

```
## Switch baudrate to 9600 bps and press ESC ...
```

- 8. Press the Escape key (<Esc>) to re-display the Boot Management menu.
- 9. Select 3 to start a new XModem Download. When you see the following message, change the Serial Port characteristics to 115200 bps:

```
## Switch baudrate to 115200 bps and press ENTER ...
```

10. Press <Enter> to continue the download.

11. Select the OS Image to download. The XModem initiates the file transfer. When the download is complete, a message similar to the following is displayed:

```
yzModem - CRC mode, 27186(SOH)/0(STX)/0(CAN) packets, 6 retries

Extracting images ... Do *NOT* power cycle the switch.

**** Switch OS ****

Please choose the Switch OS Image to upgrade [1|2|n]:
```

12. Select the image number to load the new image (1 or 2). It is recommended that you select 1. A message similar to the following is displayed:

13. When you see the following message, change the Serial Port characteristics to 9600 bps:

```
## Switch baudrate to 9600 bps and press ESC ...
```

14. Press the Escape key (<Esc>) to re-display the Boot Management menu. Select 4 to exit and boot the new image.

Chapter 9. The Maintenance Menu

The Maintenance Menu is used to manage dump information and forward database information. It also includes a debugging menu to help with troubleshooting.

/maint

Maintenance Menu

Note: To use the Maintenance Menu, you must be logged in to the switch as the administrator.

```
[Maintenance Menu]
           - System Maintenance Menu
            - Forwarding Database Manipulation Menu
    fdb
    debug - Debugging Menu
    dcbx
            - DCBX Debug Menu
    lldp
            - LLDP Cache Manipulation Menu
           - ARP Cache Manipulation Menu
    route - IP Route Manipulation Menu
    igmp - IGMP Multicast Group Menu
    mld - MLD Multicast Group Menu
    nbrcache - IP6 NBR Cache Manipulation Menu
    route6 - IP6 Route Manipulation Menu
    uudmp - Uuencode FLASH dump
    ptdmp - Upload FLASH dump via FTP/TFTP
          - Upload file via TFTP
    ptlog
    cldmp
            - Clear FLASH dump
           - Tech support dump
    tsdmp
    pttsdmp - Upload tech support dump via FTP/TFTP
```

Dump information contains internal switch state data that is written to flash memory on the Virtual Fabric 10Gb Switch Module (VFSM) after any one of the following occurs:

- The watchdog timer forces a switch reset. The purpose of the watchdog timer is to reboot the switch if the switch software freezes.
- The switch detects a hardware or software problem that requires a reboot.

Table 383. Maintenance Menu (/maint)

Sys Displays the System Maintenance Menu. To view menu options, see page 507. fdb Displays the Forwarding Database Manipulation Menu. To view menu options, see page 508. debug Displays the Debugging Menu. To view menu options, see page 509. dcbx Displays the DCBX Debugging Menu. To view menu options, see page 510

© Copyright IBM Corp. 2012 505

Table 383. Maintenance Menu (/maint)

Command Syntax and Usage

lldp

Displays the LLDP Cache Manipulation Menu. To view menu options, see page 511.

arp

Displays the ARP Cache Manipulation Menu. To view menu options, see page 512.

route

Displays the IP Route Manipulation Menu. To view menu options, see page 513.

igmp

Displays the IGMP Maintenance Menu. To view menu options, see page 514.

mld

Displays the MLD Multicast Group Maintenance Menu. To view menu options, see page 517.

nbrcache

Displays the IPv6 Neighbor Cache Manipulation Menu. To view menu options, see page 518.

route6

Displays the IPv6 Route Manipulation Menu. To view menu options, see page 518.

uudmp

Displays dump information in unencoded format. For details, see page 519.

ptdmp <host name> <file name>

Saves the system dump information via TFTP. For details, see page 519.

ptlog

Saves the system log file (SYSLOG) via TFTP.

cldmp

Clears dump information from flash memory. For details, see page 520.

tsdmp

Dumps all VFSM information, statistics, and configuration. You can log the tsdump output into a file.

pttsdmp

Redirects the technical support dump (tsdmp) to an external TFTP server.

/maint/sys

System Maintenance Menu

This menu is reserved for use by IBM Service Support. The options are used to perform system debugging.

```
[System Maintenance Menu]
     flags - Set NVRAM flag word
     tmask - Set MP trace mask word
```

Table 384. System Maintenance Menu Options (/maint/sys)

Command Syntax and Usage

flags <new NVRAM flags word as 0xXXXXXXXX>

This command sets the flags that are used for debugging purposes by Technical Support personnel.

tmask < new trace mask word as 0xXXXXXXXX [p]

This command sets the trace mask that is used for debugging purposes by Technical Support personnel.

Forwarding Database Maintenance Menu

```
[FDB Manipulation Menu]
    find - Show a single FDB entry by MAC address
    port
            - Show FDB entries for a single port
    trunk - Show FDB entries for a single trunk
            - Show FDB entries for a single VLAN
    vlan
    dump - Show all FDB entries
    del
           - Delete an FDB entry
    clear - Clear entire FDB
    mcdump - Display all Multicast MAC entries added
    mcreload - Reload all Multicast MAC entries
```

The Forwarding Database Manipulation Menu can be used to view information and to delete a MAC address from the forwarding database or clear the entire forwarding database. This is helpful in identifying problems associated with MAC address learning and packet forwarding decisions.

Table 385. FDB Manipulation Menu Options (/maint/fdb)

Command Syntax and Usage find <MAC address> [<VLAN number>] Displays a single database entry by its MAC address. You are prompted to enter the MAC address of the device. Enter the MAC address using one of the following formats: - xx:xx:xx:xx:xx (such as 08:00:20:12:34:56) - xxxxxxxxxx (such as 080020123456) port port alias or number> Displays all FDB entries for a particular port. trunk <trunk group number> Displays all FDB entries for a particular Trunk Group. vlan <*VLAN number*> Displays all FDB entries on a single VLAN. dump Displays all entries in the Forwarding Database. For details, see page 51. del <MAIC address> [<VLAN number>] Removes a single FDB entry. clear Clears the entire Forwarding Database from switch memory. mcdump Displays all Multicast MAC entries in the FDB. mcreload Reloads static Multicast MAC entries.

/maint/debug

Debugging Menu

```
[Miscellaneous Debug Menu]
    tbuf
           - Show MP trace buffer
             - Show MP snap (or post-mortem) trace buffer
    snap
    clrcfg - Clear all flash configs
```

The Miscellaneous Debug Menu displays trace buffer information about events that can be helpful in understanding switch operation. You can view the following information using the debug menu:

- Events traced by the Management Processor (MP)
- Events traced to a buffer area when a reset occurs

If the switch resets for any reason, the MP trace buffer is saved into the snap trace buffer area. The output from these commands can be interpreted by Service Support personnel.

Table 386. Miscellaneous Debug Menu Options (/maint/debug)

Command Syntax and Usage

tbuf

Displays the Management Processor trace buffer. Header information similar to the following is shown:

MP trace buffer at 13:28:15 Fri May 30, 2008; mask: 0x2ffdf748 The buffer information is displayed after the header.

snap

Displays the Management Processor snap (or post-mortem) trace buffer. This buffer contains information traced at the time that a reset occurred.

clrcfq

Deletes all flash configuration blocks.

DCBX Maintenance

```
[DCBX Debug Menu]

featcfg - Display Feature Configuration

ctrlst - Display Control State Machine state

featst - Display Feature State Machine state

txlist - Display DCBX TX TLV list

rxlist - Display DCBX RX TLV list

vniccur - Display current VNIC cfg

vnicpeer - Display if the peers on port support VNIC
```

Table 387. DCBX Maintenance Options

featcfg Displays DCBX feature information. ctrlst <port alias or number> Displays information about the Control state machine for the selected port. featst <port alias or number> Displays information about the Feature state machine for the selected port. txlist Displays the Type-Length-Value (TLV) list transmitted in the DCBX TLV. rxlist Displays the Type-Length-Value (TLV) list received in the DCBX TLV. vniccur <port alias or number> Displays the current vNIC configuration parameters for the selected port. vnicpeer Displays a list of peers that support vNIC functionality.

/maint/lldp

LLDP Cache Manipulation Menu

```
[LLDP Menu]
    port
             - Show LLDP port information
             - Show LLDP receive state machine information
    rx
             - Show LLDP transmit state machine information
    remodev - Show LLDP remote devices information
    instance - Show LLDP remote devices information
           - Show all LLDP information
    clear
          - Clear LLDP remote devices information
```

Table 388 describes the LLDP cache manipulation commands.

Table 388. LLDP Cache Manipulation Options (/maint/lldp)

```
Command Syntax and Usage
Displays Link Layer Discovery Protocol (LLDP) port information.
rx
   Displays information about the LLDP receive state machine.
tx
   Displays information about the LLDP transmit state machine.
remodev [<1-256>|detail]
   Displays information received from LLDP -capable devices. To view
   information about a specific device, enter the index number of that device. To
   view detailed information about all devices, use the detail option.
instance
   Displays instance information received from LLDP -capable devices.
dump
   Displays all LLDP information.
clear
   Clears the LLDP cache.
```

ARP Cache Maintenance Menu

```
[Address Resolution Protocol Menu]

find - Show a single ARP entry by IP address
port - Show ARP entries on a single port
vlan - Show ARP entries on a single VLAN
addr - Show ARP entries for switch's interfaces
dump - Show all ARP entries
clear - Clear ARP cache
```

Table 389 describes the ARP cache maintenance menu options.

Table 389. ARP Maintenance Menu Options (/maint/arp)

```
find <IP address (such as, 192.4.17.101)>
Shows a single ARP entry by IP address.

port <port alias or number>
Shows ARP entries on a single port.

vlan <VLAN number>
Shows ARP entries on a single VLAN.

addr
Shows the list of IP addresses which the switch will respond to for ARP requests.

dump
Shows all ARP entries.

clear
Clears the entire ARP list from switch memory.
```

Note: To display all ARP entries currently held in the switch, or a portion according to one of the options listed on the menu above (find, port, vlan, dump), you can also refer to "ARP Information" on page 75.

/maint/route

IPv4 Route Manipulation Menu

```
[IP Routing Menu]
    find - Show a single route by destination IP address
            - Show routes to a single gateway
           - Show routes of a single type
           - Show routes of a single tag
    tag
           - Show routes on a single interface
    dump - Show all routes
    clear - Clear route table
```

Table 390 describes the IPv4 route manipulation menu options.

Table 390. IPv4 Route Manipulation Menu Options (/maint/route)

```
Command Syntax and Usage
find <IP address (such as, 192.4.17.101)>
   Shows a single route by destination IP address.
gw <default gateway address (such as, 192.4.17.44)>
   Shows routes to a default gateway.
type indirect|direct|local|broadcast|martian|multicast
   Shows routes of a single type. For a description of IP routing types, see
   Table 37 on page 73.
tag fixed|static|addr|rip|ospf|bgp|broadcast|martian|multicast
   Shows routes of a single tag. For a description of IP routing tags, see Table 38
   on page 74.
if <interface number>
   Shows routes on a single interface.
dump
   Shows all routes.
clear
   Clears the route table from switch memory.
```

Note: To display all routes, you can also refer to "IPv4 Routing Information" on page 72.

IGMP Maintenance Menu

```
[IGMP Multicast Group Menu]
group - Multicast Group Menu
mrouter - IGMP Multicast Router Port Menu
clear - Clear group and mrouter tables
```

Table 391 describes the IGMP Maintenance commands.

Table 391. IGMP Maintenance Menu Options (/maint/igmp)

Command Syntax and Usage

group

Displays the Multicast Group menu. To view menu options, see page 515.

mrouter

Displays the Multicast Router Port menu. To view menu options, see page 514.

clear

Clears the IGMP group table and Mrouter tables.

/maint/igmp/group

IGMP Group Maintenance Menu

```
[IGMP Multicast Group Menu]
    find - Show a single group by IP group address
    vlan - Show groups on a single vlan
port - Show groups on a single port
    trunk - Show groups on a single trunk
    detail - Show detail of a single group by IP address
    dump - Show all groups
    clear - Clear group tables
```

Table 392 describes the IGMP Maintenance commands.

Table 392. IGMP Multicast Group Maintenance Menu Options (/maint/igmp/group)

```
Command Syntax and Usage
find <IP address>
    Displays a single IGMP multicast group by its IP address.
vlan <VLAN number>
    Displays all IGMP multicast groups on a single VLAN.
port  port number or alias>
    Displays all IGMP multicast groups on a single port.
trunk <trunk number>
    Displays all IGMP multicast groups on a single trunk group.
detail <IP address>
    Displays detailed information about a single IGMP multicast group.
dump
    Displays information for all multicast groups.
clear
    Clears the IGMP group tables.
```

IGMP Multicast Routers Maintenance Menu

```
[IGMP Multicast Routers Menu]

vlan - Show all multicast router ports on a single vlan

dump - Show all multicast router ports

clear - Clear multicast router port table
```

Table 393 describes the IGMP multicast router (Mrouter) maintenance commands.

Table 393. IGMP Mrouter Maintenance Menu Options (/maint/igmp/mrouter)

Command Syntax and Usage vlan < VLAN number> Shows all IGMP multicast router ports on a single VLAN. dump Shows all multicast router ports. clear Clears the IGMP Multicast Router port table.

MLD Multicast Group Manipulation

```
[MLD Multicast Group Menu]
    groups - Show all groups
     find - Show a single group by IP group address
vlan - Show groups on a single vlan
port - Show groups on a single port
     trunk - Show groups on a single trunk
if - Show interface(s) mld information
     mrclear - Clear dynamic MLD mrouter group tables
     grclear - Clear dynamic MLD registerd group tables
      clear - Clear dynamic MLD group tables
```

Table 395 describes the IPv6 Neighbor Discovery cache manipulation options.

Table 394. IPv6 Neighbor Discovery Cache Manipulation (/maint/nbrcache)

Command Syntax and Usage		
groups Shows all MLD groups.		
find <ipv6 address=""> Shows a MLD single group by IP group address.</ipv6>		
vlan < VLAN number> Shows MLD groups on a single VLAN.		
port <pre>port alias or number> Shows MLD groups on a single port.</pre>		
trunk < trunk group number> Shows MLD groups on a single trunk.		
if <interface number=""> Shows MLD groups on the specified interface.</interface>		
mrclear Clears all dynamic MLD multicast router group tables.		
grclear Clears all dynamic MLD registered group tables.		
clear Clears all dynamic MLD group tables.		

IPv6 Neighbor Discovery Cache Manipulation

```
[Neighbor Cache Manipulation Menu]

find - Show a single NBR Cache entry by IP address

port - Show NBR Cache entries on a single port

vlan - Show NBR Cache entries on a single VLAN

dump - Show all NBR Cache entries

clear - Clear neighbor cache
```

Table 395 describes the IPv6 Neighbor Discovery cache manipulation options.

Table 395. IPv6 Neighbor Discovery Cache Manipulation (/maint/nbrcache)

```
Command Syntax and Usage

find <IPv6 address>
Shows a single IPv6 Neighbor Discovery cache entry by IP address.

port <port alias or number>
Shows IPv6 Neighbor Discovery cache entries on a single port.

vlan <VLAN number>
Shows IPv6 Neighbor Discovery cache entries on a single VLAN.

dump
Shows all IPv6 Neighbor Discovery cache entries.

clear
Clears all IPv6 Neighbor Discovery cache entries from switch memory.
```

/maint/route6

IPv6 Route Manipulation Menu

```
[IP6 Routing Menu]
dump - Show all routes
clear - Clear route table
```

Table 396 describes the IPv6 Route maintenance options.

Table 396. IPv6 Route Manipulation (/maint/route6)

```
Command Syntax and Usage

dump
Shows all IPv6 routes.

clear
Clears all IPv6 routes from switch memory.
```

/maint/uudmp

Uuencode Flash Dump

Using this command, dump information is presented in uuencoded format. This format makes it easy to capture the dump information as a file or a string of characters.

If you want to capture dump information to a file, set your communication software on your workstation to capture session data prior to issuing the uudmp command. This will ensure that you do not lose any information. Once entered, the audmp command will cause approximately 23,300 lines of data to be displayed on your screen and copied into the file.

Using the uudmp command, dump information can be read multiple times. The command does not cause the information to be updated or cleared from flash memory.

Note: Dump information is not cleared automatically. In order for any subsequent dump information to be written to flash memory, you must manually clear the dump region. For more information on clearing the dump region, see page 520.

To access dump information, at the Maintenance# prompt, enter:

Maintenance# uudmp

The dump information is displayed on your screen and, if you have configured your communication software to do so, captured to a file. If the dump region is empty, the following appears:

No FLASH dump available.

/maint/ptdmp <FTP/TFTP server> <filename>

FTP/TFTP System Dump Put

Use this command to put (save) the system dump to a FTP/TFTP server.

Note: If the FTP/TFTP server is running SunOS or the Solaris operating system. the specified ptdmp file must exist prior to executing the ptdmp command, and must be writable (set with proper permission, and not locked by any application). The contents of the specified file will be replaced with the current dump data.

To save dump information via FTP/TFTP, at the Maintenance# prompt, enter:

Maintenance# ptdmp <FTP/TFTP server> <filename>

Where server is the FTP/TFTP server IPv4/IPv6 address or hostname, and filename is the target dump file.

/maint/cldmp

Clearing Dump Information

To clear dump information from flash memory, at the Maintenance# prompt, enter:

Maintenance# cldmp

The switch clears the dump region of flash memory and displays the following message:

FLASH dump region cleared.

If the flash dump region is already clear, the switch displays the following message:

FLASH dump region is already clear.

Unscheduled System Dumps

If there is an unscheduled system dump to flash memory, the following message is displayed when you log on to the switch:

Note: A system dump exists in FLASH. The dump was saved at 13:43:22 Wednesday January 30, 2010. Use /maint/uudmp to extract the dump for analysis and /maint/cldmp to clear the FLASH region. The region must be cleared before another dump can be saved.

Appendix A. IBM N/OS System Log Messages

The Virtual Fabric 10Gb Switch Module (VFSM) uses the following syntax when outputting system log (syslog) messages:

```
<Time stamp><Log Label>IBMOS<Thread ID>:<Message>
```

The following parameters are used:

• < Timestamp>

The time of the message event is displayed in the following format:

```
<month (3 characters)> <day> <hour (1-24)>:<minute>:<second>
```

For example: Aug 19 14:20:30

<Log Label>

The following types of log messages are recorded: LOG_CRIT, LOG_WARNING, LOG_ALERT, LOG_ERR, LOG_NOTICE, and LOG_INFO

<Thread ID>

This is the software thread that reports the log message. For example: stg, ip, console, telnet, vrrp, system, web server, ssh, bgp

• <*Message*>: The log message

Following is a list of potential syslog messages. To keep this list as short as possible, only the <*Thread ID>* and <*Message>* are shown. The messages are sorted by <*Log Label>*.

Where the <*Thread ID*> is listed as mgmt, one of the following may be shown: console, telnet, web server, or ssh.

Appendix B. IBM N/OS SNMP Agent

© Copyright IBM Corp. 2012 545

SNMP Overview

The IBM N/OS SNMP agent supports SNMP version 3. Security is provided through SNMP community strings. The default community strings are "public" for SNMP GET operation and "private" for SNMP SET operation. The community string can be modified only through the Command Line Interface (CLI). IBM is registered as Vendor 26543.

Detailed SNMP MIBs and trap definitions of the IBM N/OS SNMP agent are contained in the following IBM N/OS enterprise MIB document:

```
GbESM-24-10G-L2L3.mib
```

The IBM N/OS SNMP agent supports the following standard MIBs:

- rfc1213.mib
- rfc1215.mib
- rfc1493.mib
- rfc1573.mib
- rfc1643.mib
- rfc1757.mib
- rfc1907.mib
- rfc2037.mib
- rfc2571.mib
- rfc2572.mib
- rfc2573.mib
- rfc2574.mib
- rfc2575.mib
- rfc2576.mib
- ieee8021ab.mib
- dot1x.mib
- rfc1657.mib
- rfc1850.mib

The IBM N/OS SNMP agent supports the following generic traps as defined in RFC 1215:

- ColdStart
- WarmStart
- LinkDown
- LinkUp
- AuthenticationFailure

The SNMP agent also supports two Spanning Tree traps as defined in RFC 1493:

- NewRoot
- TopologyChange

The following are the enterprise SNMP traps supported in IBM N/OS:

Table 397. IBM N/OS-Supported Enterprise SNMP Traps

Trap Name	Description
altSwDefGwUp	Signifies that the default gateway is alive.
altSwDefGwDown	Signifies that the default gateway is down.
altSwDefGwInService	Signifies that the default gateway is up and in service
altSwDefGwNotInService	Signifies that the default gateway is alive but not in service
altSwVrrpNewMaster	Indicates that the sending agent has transitioned to 'Master' state.
altSwVrrpNewBackup	Indicates that the sending agent has transitioned to 'Backup' state.
altSwVrrpAuthFailure	Signifies that a packet has been received from a router whose authentication key or authentication type conflicts with this router's authentication key or authentication type. Implementation of this trap is optional.
altSwLoginFailure	Signifies that someone failed to enter a valid username/password combination.
altSwTempExceedThreshold	Signifies that the switch temperature has exceeded maximum safety limits.
altSwTempReturnThreshold	Signifies that the switch temperature has returned below maximum safety limits.
altSwStgNewRoot	Signifies that the bridge has become the new root of the STG.
altSwStgTopologyChanged	Signifies that there was a STG topology change.
altSwStgBlockingState	An altSwStgBlockingState trap is sent when port state is changed in blocking state.
altSwCistNewRoot	Signifies that the bridge has become the new root of the CIST.
altSwCistTopologyChanged	Signifies that there was a CIST topology change.
altSwHotlinksMasterUp	Signifies that the Master interface is active.
altSwHotlinksMasterDn	Signifies that the Master interface is not active.
altSwHotlinksBackupUp	Signifies that the Backup interface is active.
altSwHotlinksBackupDn	Signifies that the Backup interface is not active.
altSwHotlinksNone	Signifies that there are no active interfaces.

Table 397. IBM N/OS-Supported Enterprise SNMP Traps (continued)

Trap Name	Description
altSwValidLogin	Signifies that a user login has occurred.
altSwValidLogout	Signifies that a user logout has occurred.
altVMGroupVMotion	Signifies that a virtual machine has moved from a port to another.
altVMGroupVMOnline	Signifies that a advance provisioned virtual machine has came online.
altVMGroupVMVlanChange	Signifies that a virtual machine has entered into a VLAN, or changed the VLAN.

Switch Images and Configuration Files

This section describes how to use MIB calls to work with switch images and configuration files. You can use a standard SNMP tool to perform the actions, using the MIBs listed in Table 398.

Table 398 lists the MIBS used to perform operations associated with the Switch Image and Configuration files.

Table 398. MIBs for Switch Image and Configuration Files

MIB Name	MIB OID
agTransferServer	1.3.6.1.4.1872.2.5.1.1.7.1.0
agTransferImage	1.3.6.1.4.1872.2.5.1.1.7.2.0
agTransferImageFileName	1.3.6.1.4.1872.2.5.1.1.7.3.0
agTransferCfgFileName	1.3.6.1.4.1872.2.5.1.1.7.4.0
agTransferDumpFileName	1.3.6.1.4.1872.2.5.1.1.7.5.0
agTransferAction	1.3.6.1.4.1872.2.5.1.1.7.6.0
agTransferLastActionStatus	1.3.6.1.4.1872.2.5.1.1.7.7.0
agTransferUserName	1.3.6.1.4.1872.2.5.1.1.7.9.0
agTransferPassword	1.3.6.1.4.1.1872.2.5.1.1.7.10.0
agTransferTSDumpFileName	1.3.6.1.4.1.1872.2.5.1.1.7.11.0

The following SNMP actions can be performed using the MIBs listed in Table 398.

- Load a new Switch image (boot or running) from a FTP/TFTP server
- Load a previously saved switch configuration from a FTP/TFTP server
- Save the switch configuration to a FTP/TFTP server
- Save a switch dump to a FTP/TFTP server

Loading a New Switch Image

To load a new switch image with the name "MyNewImage-1.img" into image2, follow the steps below. This example assumes you have a FTP/TFTP server at 192.168.10.10.

1. Set the FTP/TFTP server address where the switch image resides:

```
Set agTransferServer.0 "192.168.10.10"
```

2. Set the area where the new image will be loaded:

```
Set agTransferImage.0 "image2"
```

3. Set the name of the image:

```
Set agTransferImageFileName.0 "MyNewImage-1.img"
```

4. If you are using an FTP server, enter a username:

```
Set aqTransferUserName.0 "MyName"
```

5. If you are using an FTP server, enter a password:

```
Set agTransferPassword.0 "MyPassword"
```

6. Initiate the transfer. To transfer a switch image, enter 2 (gtimg):

```
Set agTransferAction.0 "2"
```

Loading a Saved Switch Configuration

To load a saved switch configuration with the name "MyRunningConfig.cfg" into the switch, follow the steps below. This example assumes you have a TFTP server at 192.168.10.10.

1. Set the FTP/TFTP server address where the switch Configuration File resides:

```
Set agTransferServer.0 "192.168.10.10"
```

2. Set the name of the configuration file:

```
Set agTransferCfgFileName.0 "MyRunningConfig.cfg"
```

3. If you are using an FTP server, enter a username:

```
Set aqTransferUserName.0 "MyName"
```

4. If you are using an FTP server, enter a password:

```
Set agTransferPassword.0 "MyPassword"
```

5. Initiate the transfer. To restore a running configuration, enter 3:

```
Set agTransferAction.0 "3"
```

Saving the Switch Configuration

To save the switch configuration to a FTP/TFTP server follow the steps below. This example assumes you have a FTP/TFTP server at 192.168.10.10.

1. Set the FTP/TFTP server address where the configuration file is saved:

```
Set agTransferServer.0 "192.168.10.10"
```

2. Set the name of the configuration file:

```
Set agTransferCfgFileName.0 "MyRunningConfig.cfg"
```

3. If you are using an FTP server, enter a username:

```
Set agTransferUserName.0 "MyName"
```

4. If you are using an FTP server, enter a password:

```
Set agTransferPassword.0 "MyPassword"
```

5. Initiate the transfer. To save a running configuration file, enter 4:

```
Set agTransferAction.0 "4"
```

Saving a Switch Dump

To save a switch dump to a FTP/TFTP server, follow the steps below. This example assumes you have a FTP/TFTP server at 192.168.10.10.

1. Set the FTP/TFTP server address where the configuration will be saved:

```
Set agTransferServer.0 "192.168.10.10"
```

2. Set the name of dump file:

```
Set agTransferDumpFileName.0 "MyDumpFile.dmp"
```

3. If you are using an FTP server, enter a username:

```
Set agTransferUserName.0 "MyName"
```

4. If you are using an FTP server, enter a password:

```
Set agTransferPassword.0 "MyPassword"
```

5. Initiate the transfer. To save a dump file, enter 5:

```
Set agTransferAction.0 "5"
```

Appendix C. Getting help and technical assistance

If you need help, service, or technical assistance or just want more information about IBM products, you will find a wide variety of sources available from IBM to assist you. This section contains information about where to go for additional information about IBM and IBM products, what to do if you experience a problem with your system, and whom to call for service, if it is necessary.

Before you call

Before you call, make sure that you have taken these steps to try to solve the problem yourself:

- Check all cables to make sure that they are connected.
- Check the power switches to make sure that the system and any optional devices are turned on.
- Use the troubleshooting information in your system documentation, and use the diagnostic tools that come with your system. Information about diagnostic tools is in the *Problem Determination and Service Guide* on the IBM *Documentation* CD that comes with your system.
- Go to the IBM support website at http://www.ibm.com/systems/support/ to check for technical information, hints, tips, and new device drivers or to submit a request for information.

You can solve many problems without outside assistance by following the troubleshooting procedures that IBM provides in the online help or in the documentation that is provided with your IBM product. The documentation that comes with IBM systems also describes the diagnostic tests that you can perform. Most systems, operating systems, and programs come with documentation that contains troubleshooting procedures and explanations of error messages and error codes. If you suspect a software problem, see the documentation for the operating system or program.

Using the documentation

Information about your IBM system and pre-installed software, if any, or optional device is available in the documentation that comes with the product. That documentation can include printed documents, online documents, ReadMe files, and Help files. See the troubleshooting information in your system documentation for instructions for using the diagnostic programs. The troubleshooting information or the diagnostic programs might tell you that you need additional or updated device drivers or other software. IBM maintains pages on the World Wide Web where you can get the latest technical information and download device drivers and updates. To access these pages, go to http://www.ibm.com/systems/support/ and follow the instructions. Also, some documents are available through the IBM Publications Center at http://www.ibm.com/shop/publications/order/.

Getting help and information on the World Wide Web

On the World Wide Web, the IBM website has up-to-date information about IBM systems, optional devices, services, and support. The address for IBM System $x^{(B)}$ and xSeries information is http://www.ibm.com/systems/x/. The address for IBM BladeCenter information is http://www.ibm.com/systems/bladecenter/. The address for IBM IntelliStation information is http://www.ibm.com/intellistation/.

© Copyright IBM Corp. 2012 551

You can find service information for IBM systems and optional devices at http://www.ibm.com/systems/support/.

Software service and support

Through IBM Support Line, you can get telephone assistance, for a fee, with usage, configuration, and software problems with System x and x Series servers, BladeCenter products, IntelliStation workstations, and appliances. For information about which products are supported by Support Line in your country or region, see http://www.ibm.com/services/sl/products/.

For more information about Support Line and other IBM services, see http://www.ibm.com/services/, or see http://www.ibm.com/planetwide/ for support telephone numbers. In the U.S. and Canada, call 1-800-IBM-SERV (1-800-426-7378).

Hardware service and support

You can receive hardware service through your IBM reseller or IBM Services. To locate a reseller authorized by IBM to provide warranty service, go to http://www.ibm.com/partnerworld/ and click **Find Business Partners** on the right side of the page. For IBM support telephone numbers, see http://www.ibm.com/planetwide/. In the U.S. and Canada, call 1-800-IBM-SERV (1-800-426-7378).

In the U.S. and Canada, hardware service and support is available 24 hours a day, 7 days a week. In the U.K., these services are available Monday through Friday, from 9 a.m. to 6 p.m.
