Guidelines for trained service technicians

This section contains information for trained service technicians.

Inspecting for unsafe conditions

Use this information to help you identify potential unsafe conditions in a device that you are working on.

Each device, as it was designed and manufactured, has required safety items to protect users and service technicians from injury. The information in this section addresses only those items. Use good judgment to identify potential unsafe conditions that might be caused by unsupported alterations or attachment of unsupported features or optional devices that are not addressed in this section. If you identify an unsafe condition, you must determine how serious the hazard is and whether you must correct the problem before you work on the product.

Consider the following conditions and the safety hazards that they present:

• Electrical hazards, especially primary power. Primary voltage on the frame can cause serious or fatal electrical shock.

• Explosive hazards, such as a damaged CRT face or a bulging capacitor.

• Mechanical hazards, such as loose or missing hardware.

To inspect the product for potential unsafe conditions, complete the following steps:

1. Make sure that the power is off and the power cords are disconnected.

2. Make sure that the exterior cover is not damaged, loose, or broken, and observe any sharp edges.

3. Check the power cords:

   • Make sure that the third-wire ground connector is in good condition. Use a meter to measure third-wire ground continuity for 0.1 ohm or less between the external ground pin and the frame ground.

   • Make sure that the power cords are the correct type.

   • Make sure that the insulation is not frayed or worn.

4. Remove the cover.

5. Check for any obvious unsupported alterations. Use good judgment as to the safety of any unsupported alterations.

6. Check inside the system for any obvious unsafe conditions, such as metal filings, contamination, water or other liquid, or signs of fire or smoke damage.

7. Check for worn, frayed, or pinched cables.

8. Make sure that the power-supply cover fasteners (screws or rivets) have not been removed or tampered with.

Guidelines for servicing electrical equipment

Observe these guidelines when you service electrical equipment.

- Check the area for electrical hazards such as moist floors, nongrounded power extension cords, and missing safety grounds.

- Use only approved tools and test equipment. Some hand tools have handles that are covered with a soft material that does not provide insulation from live electrical current.

- Regularly inspect and maintain your electrical hand tools for safe operational condition. Do not use worn or broken tools or testers.

- Do not touch the reflective surface of a dental mirror to a live electrical circuit. The surface is conductive and can cause personal injury or equipment damage if it touches a live electrical circuit.

- Some rubber floor mats contain small conductive fibers to decrease electrostatic discharge. Do not use this type of mat to protect yourself from electrical shock.

- Do not work alone under hazardous conditions or near equipment that has hazardous voltages.

- Locate the emergency power-off (EPO) switch, disconnecting switch, or electrical outlet so that you can turn off the power quickly in the event of an electrical accident.

- Disconnect all power before you perform a mechanical inspection, work near power supplies, or remove or install main units.

- Before you work on the equipment, disconnect the power cord. If you cannot disconnect the power cord, have the customer power-off the wall box that supplies power to the equipment and lock the wall box in the off position.

- Never assume that power has been disconnected from a circuit. Check it to make sure that it has been disconnected.

- If you have to work on equipment that has exposed electrical circuits, observe the following precautions:
  – Make sure that another person who is familiar with the power-off controls is near you and is available to turn off the power if necessary.
  – When you work with powered-on electrical equipment, use only one hand. Keep the other hand in your pocket or behind your back to avoid creating a complete circuit that could cause an electrical shock.
  – When you use a tester, set the controls correctly and use the approved probe leads and accessories for that tester.
  – Stand on a suitable rubber mat to insulate you from grounds such as metal floor strips and equipment frames.

- Use extreme care when you measure high voltages.

- To ensure proper grounding of components such as power supplies, pumps, blowers, fans, and motor generators, do not service these components outside of their normal operating locations.

- If an electrical accident occurs, use caution, turn off the power, and send another person to get medical aid.

Safety statements

These statements provide the caution and danger information that is used in this documentation.

Important: Each caution and danger statement in this documentation is labeled with a number. This number is used to cross reference an English-language caution or danger statement with translated versions of the caution or danger statement in the *Safety Information* document.

For example, if a caution statement is labeled `Statement` 1, translations for that caution statement are in the *Safety Information* document under `Statement` 1.

Be sure to read all caution and danger statements in this documentation before you perform the procedures. Read any additional safety information that comes with your system or optional device before you install the device.

Statement 1

DANGER

Electrical current from power, telephone, and communication cables is hazardous.

To avoid a shock hazard:

- **Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.**
- **Connect all power cords to a properly wired and grounded electrical outlet.**
- **Connect to properly wired outlets any equipment that will be attached to this product.**
- **When possible, use one hand only to connect or disconnect signal cables.**
- **Never turn on any equipment when there is evidence of fire, water, or structural damage.**
- **Disconnect the attached power cords, telecommunications systems, networks, and modems before you open the device covers, unless instructed otherwise in the installation and configuration procedures.**
- **Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.**

To Connect:	To Disconnect:
1. Turn everything OFF.	1. Turn everything OFF.
2. First, attach all cables to devices.	2. First, remove power cords from outlet.
3. Attach signal cables to connectors.	3. Remove signal cables from connectors.
4. Attach power cords to outlet.	4. Remove all cables from devices.
5. Turn device ON.	

Statement 2

CAUTION:
When replacing the lithium battery, use only Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:

• **Throw or immerse into water**

• **Heat to more than 100°C (212°F)**

• **Repair or disassemble**

Dispose of the battery as required by local ordinances or regulations.

Statement 3

CAUTION:
When laser products (such as CD-ROMs, DVD drives, fiber optic devices, or transmitters) are installed, note the following:

• **Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.**

• **Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.**

DANGER

Some laser products contain an embedded Class 3A or Class 3B laser diode. Note the following.

Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.

Class 1 Laser Product
Laser Klasse 1
Laser Klass 1
Luokan 1 Laserlaite
Appareil À Laser de Classe 1

Statement 4

CAUTION: Use safe practices when lifting.
≥ 18 kg (39.7 lb)   ≥ 32 kg (70.5 lb)   ≥ 55 kg (121.2 lb)
Statement 5

CAUTION:
The power control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

Statement 6

CAUTION:
If you install a strain-relief bracket option over the end of the power cord that is connected to the device, you must connect the other end of the power cord to an easily accessible power source.

Statement 8

CAUTION:
Never remove the cover on a power supply or any part that has the following label attached.
Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

Statement 11

CAUTION:
The following label indicates sharp edges, corners, or joints nearby.
Statement 12

CAUTION:
The following label indicates a hot surface nearby.

Statement 13

DANGER

Overloading a branch circuit is potentially a fire hazard and a shock hazard under certain conditions. To avoid these hazards, ensure that your system electrical requirements do not exceed branch circuit protection requirements. Refer to the information that is provided with your device for electrical specifications.

Statement 15

CAUTION:
Make sure that the rack is secured properly to avoid tipping when the server unit is extended.

Statement 17

CAUTION:
The following label indicates moving parts nearby.

Statement 26

CAUTION:
Do not place any object on top of rack-mounted devices.
Statement 27

CAUTION:
Hazardous moving parts are nearby.

Chapter 1. The Lenovo System x3500 M5 Type 5464 server

This *Installation and Service Guide* contains information and instructions for setting up your Lenovo System x3500 M5 Type 5464 server, instructions for installing some optional devices, cabling and configuring the server, removing and replacing devices, and diagnostics and troubleshooting information.

In addition to the instructions in Chapter 2 "Installing optional devices" on page 25 for installing optional hardware devices, updating firmware and device drivers, and completing the installation, Business Partners must also complete the steps in "Instructions for Business Partners" on page 25.

The Lenovo System x3500 M5 Type 5464 server is next generation 2S high performance 5U[1] tower server with tower-to-rack conversion capability, which is designed for computational intensive computing. This high-performance server is ideally suited for enterprise environments that require superior input/output (I/O) flexibility and high manageability.

Performance, ease of use, reliability, and expansion capabilities were key considerations in the design of the server. These design features make it possible for you to customize the system hardware to meet your needs today and provide flexible expansion capabilities for the future.

The server comes with a limited warranty. For information about the terms of the warranty and getting service and assistance, see the Lenovo *Warranty Information* document that comes with the server.

The server contains Lenovo next generation technologies, which help increase performance and reliability. For more information, see "What your server offers" on page 10 and "Reliability, availability, and serviceability" on page 14.

You can obtain up-to-date information about the server and other Lenovo server products at http://shop.lenovo.com/us/en/systems/. At http://www.lenovo.com/support, you can create a personalized support page by identifying Lenovo products that are of interest to you. From this personalized page, you can subscribe to weekly email notifications about new technical documents, search for information and downloads, and access various administrative services.

If you participate in the client reference program, you can share information about your use of technology, best practices, and innovative solutions; build a professional network; and gain visibility for your business. For more information about the client reference program, see http://www.ibm.com/ibm/clientreference/.

If firmware and documentation updates are available, you can download them from the Lenovo website. The server might have features that are not described in the documentation that comes with the server, and the documentation might be updated occasionally to include information about those features, or technical updates might be available to provide additional information that is not included in the server documentation. To check for updates, go to http://www.lenovo.com/support.

Note: The illustrations in this document might differ slightly from your model.

Record information about the server in the following table.

---

1. Racks are measured in vertical increments of 4.45 cm (1.75 inches) each. Each increment is called a "U." A 1-U-high device is 1.75 inches tall

1

Table 1. Record of the system information

Product name	Machine Type (s)	Model number	Serial number
Lenovo System x3500 M5 Type 5464 server	Type 5464		

The model number and serial number are on the ID label on the front of the server, as shown in the following illustration.

Note: The illustrations in this document might differ slightly from your hardware.
Figure 1. ID label on the front of the server

You can download the Lenovo *ServerGuide Setup and Installation* CD to help you configure the hardware, install device drivers, and install the operating system.

For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.

See the *Rack Installation Instructions* document on the Lenovo *System x Documentation* CD for complete rack installation and removal instructions.

Note: This product complies with sub clause, 4.2.11, of IEC/UL 60950-1 via 41.2kg in rack mounted mode.

The Lenovo Documentation CD

The Lenovo *Documentation* CD contains documentation for the server in Portable Document Format (PDF) and includes the Lenovo Documentation Browser to help you find information quickly.

Hardware and software requirements

The hardware and software requirements of the Lenovo *Documentation* CD.

The Lenovo *Documentation* CD requires the following minimum hardware and software:

- Microsoft Windows or Red Hat Linux
- 100 MHz microprocessor
- 32 MB of RAM
- Adobe Acrobat Reader 3.0 (or later) or xpdf, which comes with Linux operating systems

The Documentation Browser

Use the Documentation Browser to browse the contents of the CD, read brief descriptions of the documents, and view documents, using Adobe Acrobat Reader or xpdf.

The Documentation Browser automatically detects the regional settings in use in your server and displays the documents in the language for that region (if available). If a document is not available in the language for that region, the English-language version is displayed. Use one of the following procedures to start the Documentation Browser:

- If Autostart is enabled, insert the CD into the CD or DVD drive. The Documentation Browser starts automatically.
- If Autostart is disabled or is not enabled for all users, use one of the following procedures:
  - If you are using a Windows operating system, insert the CD into the CD or DVD drive and click **Start ➔ Run**. In the Open field, type:
    `e:\win32.bat`
    where *e* is the drive letter of the CD or DVD drive, and click **OK**.
  - If you are using Red Hat Linux, insert the CD into the CD or DVD drive; then, run the following command from the `/mnt/cdrom` directory:
    `sh runlinux.sh`

Select the server from the **Product** menu. The **Available Topics** list displays all the documents for the server. Some documents might be in folders. A plus sign (+) indicates each folder or document that has additional documents under it. Click the plus sign to display the additional documents.

When you select a document, a description of the document is displayed under **Topic Description**. To select more than one document, press and hold the Ctrl key while you select the documents. Click **View Book** to view the selected document or documents in Acrobat Reader or xpdf. If you selected more than one document, all the selected documents are opened in Acrobat Reader or xpdf.

To search all the documents, type a word or word string in the **Search** field and click **Search**. The documents in which the word or word string appears are listed in order of the most occurrences. Click a document to view it, and press Crtl+F to use the Acrobat search function, or press Alt+F to use the xpdf search function within the document.

Click **Help** for detailed information about using the Documentation Browser.

Related documentation

This *Installation and Service Guide* contains general information about the server including how to set up and cable the server, how to install supported optional devices, how to configure the server, and information to help you solve problems yourself and information for service technicians.

The following documentation also comes with the server:

- *Environmental Notices and User Guide*

This document is in PDF format on the Lenovo*Documentation* CD. It contains translated environmental notices.

- *Lenovo License Agreement for Machine Code*

  This document is in PDF format on the Lenovo*Documentation* CD. It provides translated versions of the *Lenovo License Agreement for Machine Code* for your product.

- *Important Notices*This document is in printed format and comes with the server. It contains information about the safety, environmental, and electronic emission notices for your Lenovo product.

- *Licenses and Attributions Documents*

  This document is in PDF format on the Lenovo*Documentation* CD. It provides the open source notices.

- *Rack Safety Information*

  This multilingual document provides translated versions of the caution and danger statements that appear in the rack documentation. Each caution and danger statement has an assigned number, which you can use to locate the corresponding statement in your native language.

- *Safety Information*

  This document is in PDF format on the Lenovo *Documentation* CD. It contains translated caution and danger statements. Each caution and danger statement that appears in the documentation has a number that you can use to locate the corresponding statement in your language in the *Safety Information* document.

- *Safety Information Labels*

  This document provides the Simplified Chinese, Mongolian, Tibetan, Uygur, and Zhuang translated versions of the product safety labels.

- *Warranty Information*

  This document is in printed format and comes with the server. It contains warranty terms and a pointer to the Lenovo Statement of Limited Warranty on the Lenovo website.

Depending on the server model, additional documentation might be included on the Lenovo*Documentation* CD.

The ToolsCenter for System x and BladeCenter is an online information center that contains information about tools for updating, managing, and deploying firmware, device drivers, and operating systems. The ToolsCenter for System x and BladeCenter is at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-CENTER.

The server might have features that are not described in the documentation that you received with the server. The documentation might be updated occasionally to include information about those features, or technical updates might be available to provide additional information that is not included in the server documentation. These updates are available from the Lenovo website. To check for updates, go to http://www.lenovo.com/support.

Notices and statements in this document

The caution and danger statements in this document are also in the multilingual *Safety Information* document, which is on the Lenovo*Documentation* CD. Each statement is numbered for reference to the corresponding statement in your language in the *Safety Information* document.

The following notices and statements are used in this document:

- **Note:** These notices provide important tips, guidance, or advice.

- **Important:** These notices provide information or advice that might help you avoid inconvenient or problem situations.

- **Attention:** These notices indicate potential damage to programs, devices, or data. An attention notice is placed just before the instruction or situation in which damage might occur.
- **Caution:** These statements indicate situations that can be potentially hazardous to you. A caution statement is placed just before the description of a potentially hazardous procedure step or situation.
- **Danger:** These statements indicate situations that can be potentially lethal or extremely hazardous to you. A danger statement is placed just before the description of a potentially lethal or extremely hazardous procedure step or situation.

Server features and specifications

Use this information for an overview of the server features and specifications.

The following information is a summary of the features and specifications of the server. Depending on the model, some features might not be available, or some specifications might not apply.

Microprocessor (depending on the model):
- Supports up to two multi-core microprocessors (one installed)
- Two QuickPath Interconnect (QPI) links speed up to 9.6 GT per second

Notes:
- Use the Setup utility program to determine the type and speed of the microprocessors.
- For a list of supported microprocessors, see http://www.lenovo.com/us/en/ serverproven/.

Memory:
- Minimum: 4 GB
- Maximum: 1.5 TB
    - 384 GB using registered DIMMs (RDIMMs)
    - 1.5 TB using load reduction DIMMs (LRDIMMs)
- Type:
    - PC4-12800 (DDR4-1600), PC4-14900 (DDR4-1866) or PC4-17000 (DDR4-2133)
    - Single-rank, dual-rank, or quad-rank
    - Registered DIMM (RDIMM) or load reduced DIMM (LRDIMM)
- Slots: 24 dual inline
- Supports (depending on the model):
    - 4 GB, 8 GB and 16 GB registered DIMMs
    - 32 GB and 64 GB load reduction DIMM

Drives:
- SATA:
    - DVD-ROM
    - Multi-burner

    Note: Maximum of two devices can be installed.
- Supported hard disk drives:
    - Serial Attached SCSI (SAS)
    - Serial ATA (SATA)

Note: External SAS support depends on SPP Card.

Expansion bays (depending on the model):

- Up to thirty-two 2.5-inch HDD bays
- Up to twelve 3.5-inch HDD bays

  Attention: As a general consideration, do not mix standard 512-byte and advanced 4-KB format drives in the same RAID array because it might lead to potential performance issues.

PCI express slots:

- Seven PCI express slots on the system board:

  – Slot 1: PCI Express 3.0 x8 (x8 wired); full-height, half-length
  – Slot 2: PCI Express 3.0 x16 (x8 wired); full-height, full-length
  – Slot 3: PCI Express 3.0 x16 (x16 wired); full-height, full-length
  – Slot 4: PCI Express 3.0 x8 (x8 wired); full-height, full-length
  – Slot 5: PCI Express 3.0 x8 (x8 wired); full-height, half-length (required second processor)
  – Slot 6: PCI Express 3.0 x16 (x16 wired); full-height, full-length (required second processor)
  – Slot 7: PCI Express 3.0 x16 (x16 wired); full-height, full-length (required second processor)

  Note: Slot 3 and 6 support double-wide GPUs

Power supply (depending on the model):

- One microprocessor installed:

  – 550-watt ac

    1. Support up to sixteen 2.5-inch HDDs
    2. LRDIMM not supported.
    3. GPU not supported

  – 750-watt ac

    1. Support up to sixteen 2.5-inch HDDs
    2. LRDIMM not supported

  – 900-watt ac

    1. No limitation

- Two microprocessors installed:

  – 550-watt ac

    1. Support up to 90-watt processor
    2. Support up to eight 2.5-inch HDDs
    3. LRDIMM not supported
    4. GPU not supported

  – 750-watt ac

    1. Support up to sixteen 2.5-inch HDDs
    2. LRDIMM not supported
    3. GPU not supported

  – 900-watt ac (No GPU installed)

    1. Support up to sixteen 2.5-inch HDDs

2. Support up to eight LRDIMM

3. GPU not supported

– 900-watt ac (No GPU and no LRDIMM installed)

1. Support up to sixteen 2.5-inch HDDs and six 3.5-inch HDDs

2. LRDIMM not supported

3. GPU not supported

– 900-watt ac (One GPU installed)

1. Support up to six 3.5-inch HDDs

2. LRDIMM not supported

Notes:

- The different types of PSUs can not be mixed in one system.
- If a Tifanium PSU has been used, it requires the High-voltage (200-240V) power source.
- If a 900-watt PSU has been used with the low-voltage power source, the rating of power cord must above 13A.

Table 2. Power Supply Information

Power Supply	CPU Q'ty	CPU Limit (max W per CPU)	DIMM Q'ty (R)	DIMM Q'ty (LR)	Max. 3.5" HDD Q'ty	Max. 2.5" HDD Q'ty	3.5" and 2.5" Intermix	PCIe Q'ty (GPU incl.)	GPU Q'ty	Remark
550W	1	145W	12	0	12	16	6+8	4	0	RDIMM only & no GPU support
550W	2	90W	12	0	12	16	6+8	7	0	RDIMM only & no GPU support
750W	1	145W	12	12	12	32	6+16	4	0	Power configurator MUST be used
750W	1	145W	12	0	12	16	6+8	2+1GPU	1	RDIMM only
750W	2	145W	24	24	12	32	6+16	7	0	Power configurator MUST be used
900W	1	145W	12	12	12	32	6+16	4	0	No limitation
900W	1	145W	12	12	12	32	6+16	2+1GPU	1	
900W	2	145W	24	24	12	32	6+16	7	0	Power configurator MUST be used
900W	2	120W	12	12	12	16	6+8	4+1GPU	1	
900W	2	90W	12	0	6	8	0	2+2GPU	2	RDIMM only

Hot-swap fans:

- Two (one microprocessor installed)
- Four (two microprocessors installed)
- Two additional fans (for optional redundant cooling)

RAID controllers (depending on the model):

- A ServeRAID M1215 SAS/SATA adapter that provides RAID 0, 1, and 10 with optional FoD RAID 5/50 and SED (Self Encrypting Drive) upgrade.

- A ServeRAID M5210 SAS/SATA adapter that provides RAID 0, 1, and 10. Optional upgrade:
  - RAID 5/50 (1 GB Cache) with optional FoD RAID 6/60 and SED upgrade
  - RAID 5/50 (1 GB Flash) with optional FoD RAID 6/60 and SED upgrade
  - RAID 5/50 (2 GB Flash) with optional FoD RAID 6/60 and SED upgrade
  - RAID 5/50 (4 GB Flash) with optional FoD RAID 6/60 and SED upgrade
  - FoD RAID 6/60 Upgrade
  - FoD Zero Cache/RAID 5/50
  - FoD Performance Accelerator
  - FoD SSD Caching Enabler

Integrated functions:

- Integrated Management Module II (IMM2), which consolidates multiple management functions in a single chip.
- Broadcom 5719 Quad Port Gigabit Ethernet controller with Wake on LAN support
- Serial over LAN (SOL) and serial redirection over Telnet or Secure Shell (SSH)
- One systems-management 1 Gb Ethernet port for connection to a dedicated systems-management network. This system management connector is dedicated to the IMM2.1 functions.
- Light path diagnostics
- Six Universal Serial Bus ports on the front of server

  - Two (USB 2.0) on front of server
  - Two (USB 2.0) on rear of server
  - Two (USB 3.0) on rear of server

- One internal USB port for optional USB flash device with embedded hypervisor
- One internal USB tape connector

Video controller (integrated into IMM2.1):

- Matrox G200eR2

  Note: The maximum video resolution is 1600 x 1200 at 75 Hz.

  - SVGA compatible video controller
  - DDR3 528 MHz SDRAM video memory controller
  - Avocent Digital Video Compression
  - 16 MB of video memory (not expandable)

Size:

- Tower

  - 5 U
  - Height: 440 mm (17.3 in.)
  - Depth: 720 mm (28.3 in.)
  - Width: 217.5 mm (8.6 in.)
  - Weight: approximately 45.5 kg (100.3 lb) when fully configured or 30.8 kg (67.9 lb) minimum

- Rack

  - 5 U
  - Height: 217.5 mm (8.6 in.)

- Depth: 705.5 mm (27.8 in.)
- Width: 422.9 mm (16.6 in.)
- Weight: approximately 44.2kg (97.4 lb) when fully configured or 29.5kg (65.0 lb) minimum

Acoustical noise emissions:

- Sound power, idling: 6.0 bels
- Sound power, operating: 6.0 bels

Environment:

The Lenovo x3500M5 products are designed to operate in a general business environment, such as ASHRAE Class A3 or A4, temperature and humidity-controlled room.

Server on:

- Temperature:
  - 5°C to 45°C (41°F to 113°F)
  - Altitude: 0 to 950 m (3,117 ft); decrease the maximum system temperature by 1°C for every 175-m increase in altitude.
- Humidity:
  - Non-condensing: -12°C dew point (10.4°F)
  - Relative humidity: 8% to 90%
- Maximum dew point: 24°C (75.2°F)
- Maximum altitude: 3,050 m (10,000 ft), 5°C to 33°C (41°F to 91.4°F)
- Maximum rate of temperature change:
  - Tape drives: 5°C/hr (41°F/hr)
  - Hard disk drives: 20°C/hr (68°F/hr)

Server off:

- Temperature: 5°C to 45°C (41°F to 113°F)
- Relative humidity: 8% to 90%
- Maximum dew point: 27°C (80.6°F)

Storage (non-operating):

- Temperature: 1°C to 60°C (33.8°F to 140°F)
- Altitude: 3,050 m (10,000 ft)
- Relative humidity: 5% to 80%
- Maximum dew point: 29°C (84.2°F)

Shipment (non-operating):

- Temperature: -40°C to 60°C (-40°F to 140°F)
- Altitude: 10,700 m (35,105 ft)
- Relative humidity: 5% to 100%
- Maximum dew point: 29°C (84.2°F)

Attention: Design to ASHRAE Class A3 or A4, ambient supporting 45 C or below, with relaxed support:

- The system support redundant fan function under 40C when "Redundant Kit" installed, no redundant function support from 40C to 45C.

- The system might has performance de-gradation after 35C /3000'.

- Under no circumstance can any combination of worst-case workload and configuration result design exposure at 40C. Redundant fan installed support to 45C, and the system might result shutdown when fan failed from 40 to 45C.

Heat output:

Approximate heat output:

- Minimum configuration: 341 Btu per hour (100 watts)
- Maximum configuration: 6667 Btu per hour (1945 watts)

Electrical input:
- Sine-wave input (50/60 Hz) required
- For 550W/750W/900W Platinum power supplies:
  - Input voltage low range:
    - Minimum: 100 Vac
    - Maximum: 127 Vac
  - Input voltage high range:
    - Minimum: 200 V ac
    - Maximum: 240 V ac
- For 750W Titanium and 1500W Platinum power supplies:
  - Input voltage range:
    - Minimum: 200 V ac
    - Maximum: 240 V ac
- Maximum Input kilovolt-amperes (kVA), approximately:
  - Minimum: 0.10 kVA
  - Maximum: 1.967 kVA

Notes:

1. Power consumption and heat output vary depending on the number and type of optional features installed and the power-management optional features in use.

2. The noise emission level stated is the declared (upper limit) sound power level, in bels, for a random sample of machines. All measurements are made in accordance with ISO 7779 and reported in conformance with ISO 9296. Actual sound-pressure levels in a given location might exceed the average values stated because of room reflections and other nearby noise sources. The noise emission level stated in the declared (upper limit) sound-power level, in bels, for a random sample of system.

What your server offers

The server uses the following features and technologies.

- **Active Energy Manager**

  The Active Energy Manager solution is an Systems Director extension that measures and reports server power consumption as it occurs. This enables you to monitor power consumption in correlation to specific software application programs and hardware configurations. You can obtain the measurement values through the systems-management interface and view them, using Systems Director. For more information, including the required levels of Systems Director and Active Energy Manager, see the Systems Director Information Center at http://pic.dhe.ibm.com/infocenter/director/pubs/index.jsp, or see http://www.ibm.com/systems/software/director/resources.html.

- **Dynamic System Analysis (DSA)**

The server comes with the Dynamic System Analysis (DSA) Preboot diagnostic program stored in the integrated USB memory on the server. DSA collects and analyzes system information to aid in diagnosing server problems, as well as offering a rich set of diagnostic tests of the major components of the server. DSA creates a DSA log, which is a chronologically ordered merge of the system-event log (as the IPMI event log), the Integrated Management Module II (IMM2) event log (as the ASM event log), and the operating-system event logs. You can send the DSA log as a file to Lenovo Support or view the information as a text file or HTML file.

Two editions of Dynamic System Analysis are available: DSA Portable and DSA Preboot. For more information about both editions, see "DSA editions" on page 138.

- **Features on Demand software Ethernet support**

  The server provides Features on Demand software Ethernet support. You can purchase a Features on Demand software upgrade activation key for Fiber Channel over Ethernet and iSCSI storage protocols that is provided through the integrated Ethernet controller. For more information, see "Enabling Features on Demand RAID software" on page 112.

- **Features on Demand software RAID support**

  The server provides Features on Demand software RAID support for RAID levels 5, 6, 50, and 60 upgrade. Features on Demand software RAID upgrade is integrated into the Integrated Management Module II (IMM2). For more information, see "Enabling Features on Demand RAID software" on page 112.

- **Lenovo*ServerGuide Setup and Installation* CD**

  The *ServerGuide Setup and Installation* CD, which you can download from the web, provides programs to help you set up the server and install a Windows operating system. The ServerGuide program detects installed optional hardware devices and provides the correct configuration programs and device drivers. For more information about the *ServerGuide Setup and Installation* CD, see "Using the ServerGuide Setup and Installation CD" on page 99.

- **Systems Director**

  Systems Director is a platform-management foundation that streamlines the way you manage physical and virtual systems in a heterogeneous environment. By using industry standards, Systems Director supports multiple operating systems and virtualization technologies for Lenovo and non-Lenovo x86 platforms. For more information, see the Systems Director Information Center at http://www.ibm.com/systems/software/director/resources.html and "Systems Director" on page 15.

- **Integrated Management Module II (IMM2)**

  The Integrated Management Module II (IMM2) combines service processor functions, video controller, and remote presence and blue-screen capture features in a single chip. The IMM2.1 provides advanced service-processor control, monitoring, and alerting function. If an environmental condition exceeds a threshold or if a system component fails, the IMM2.1 lights LEDs to help you diagnose the problem, records the error in the IMM2.1 event log, and alerts you to the problem. Optionally, the IMM2.1 also provides a virtual presence capability for remote server management capabilities. The IMM2.1 provides remote server management through the following industry-standard interfaces:

  - Intelligent Platform Management Interface (IPMI) version 2.0
  - Simple Network Management Protocol (SNMP) version 3.0
  - Common Information Model (CIM)
  - Web browser

  For additional information, see "Using the Integrated Management Module II (IMM2)" on page 108 and the *Integrated Management Module II User's Guide* at the http://www.lenovo.com/support.

- **Integrated network support**

  The server comes with an integrated dual-port Intel Gigabit Ethernet controller, which supports connection to a 10 Mbps, 100 Mbps, or 1000 Mbps network. For more information, see "Configuring the Ethernet controller" on page 111.

- **Integrated Trusted Platform Module (TPM)**

  This integrated security chip performs cryptographic functions and stores private and public secure keys. It provides the hardware support for the Trusted Computing Group (TCG) specification. You can download the software to support the TCG specification, when the software is available. See http://www.ibm.com/systems/x/hardware/enterprise/index.html for details about the TPM implementation. You can enable TPM support through the Setup utility under the **System Security** menu choice (see "Using the Setup utility" on page 101).

- **Large data-storage capacity and hot-swap capability**

  The server can support a maximum of thirty-two 2.5-inch drives, twelve 3.5-inch drives, or a combination of both 2.5-inch and 3.5-inch drives when you use the supported SAS/SATA backplane configurations. The server supports 2.5-inch hot-swap Serial Attached SCSI (SAS) hard disk drives or hot-swap Serial ATA (SATA) hard disk drives, 2.5-inch hot-swap solid state drives (SSD), or 3.5-inch hot-swap solid state drives.

  With the hot-swap feature, you can add, remove, or replace hard disk drives without turning off the server.

- **Large system-memory capacity**

  The server can support up to 1536 GB of system memory. The server implements 12 DIMM slots per processor that system consists of 24 DIMM slots. The server memory controller supports error correcting code (ECC) for DDR4-2133, DDR4 (fourth-generation double-data-rate), synchronous dynamic random access memory (SDRAM) DIMMs.

- **Light path diagnostics**

  Light path diagnostics provides LEDs to help you diagnose problems. For more information about light path diagnostics and the LEDs, see "Light path diagnostics LEDs" on page 129.

- **Memory mirroring**

  Memory mirroring provides a redundant copy of all code and data that are addressable in the configured memory map. Through the microprocessor memory controller chip set, memory mirroring replicates and stores data across DIMMs on two or four memory channels simultaneously. If a failure occurs, the memory controller switches from the DIMMs on the primary channel to the DIMMs on the backup channel. To enable memory mirroring through the Setup utility, select **System Settings** ® **Memory** ® **Memory Mode** ® **Mirroring**. For information about installing DIMMs for memory mirroring, see "Memory module installation" on page 67 for more information.

- **Memory sparing**

  The server supports memory sparing. Memory sparing reserves memory capacity for failover in the event of a DIMM failure, and the reserved capacity is subtracted from the total available memory. Memory sparing provides less redundancy than memory mirroring does. If a predetermined threshold of correctable errors is reached, the contents of the failing DIMM are copied to the spare memory, and the failing DIMM or rank is disabled. To enable memory sparing through the Setup utility, select **System Settings** ® **Memory** ® **Memory Mode** ® **Sparing**. For information about installing DIMMs for memory sparing, see "Memory module installation" on page 67.

- **Multi-core processors**

  The server supports up to two Intel Xeon™ E5-2600 series multi-core microprocessors. The server comes with only one microprocessor installed.

- **PCI adapter capabilities**

  The server has seven PCI interface slots. See "Installing an adapter" on page 206 for detailed information.

- **Redundant connection**

  The addition of the optional Ethernet daughter card provides failover capability to a redundant Ethernet connection with the applicable application installed. If a problem occurs with the primary Ethernet connection and the optional Ethernet daughter card is installed on the server, all Ethernet traffic that is associated with the primary connection is automatically switched to the optional redundant Ethernet daughter card connection. If the applicable device drivers are installed, this switching occurs without data loss and without user intervention.

- **Redundant cooling and optional power capabilities**

  The server supports a maximum of two 550-watt or 750-watt or 900-watt hot-swap power supplies and four hot-swap fans, which provide redundancy and hot-swap capability for a typical configuration. The redundant cooling by the fans in the server enables continued operation if one of the fans fails. The server comes with one 750-watt or 900-watt hot-swap power supply and two fans.

  You must install fan 3 & 4 when you install the second microprocessor in the server. You can order the optional two fans for cooling redundancy. You can order the second optional power supply for power redundancy.

  Notes:

  1. You cannot mix 550-wat and 750-watt and 900-watt power supplies in the server.
  2. The server is not running in power redundant mode with two 225W GPUs installed, two 900-watt power supplies are required.

- **Remote presence and blue-screen capture features**

  The remote presence and blue-screen capture features are integrated functions of the Integrated Management Module II (IMM2). The remote presence feature provides the following functions:

  - Remotely viewing video with graphics resolutions up to 1600 x 1200 at 75 Hz, regardless of the system state
  - Remotely accessing the server, using the keyboard and mouse from a remote client
  - Mapping the CD or DVD drive, diskette drive, and USB flash drive on a remote client, and mapping ISO and diskette image files as virtual drives that are available for use by the server
  - Uploading a diskette image to the IMM2.1 memory and mapping it to the server as a virtual drive

  The blue-screen capture feature captures the video display contents before the IMM2.1 restarts the server when the IMM2.1 detects an operating-system hang condition. A system administrator can use the blue-screen capture feature to assist in determining the cause of the hang condition.

  See "Using the remote presence and blue-screen capture features" on page 109 for additional information.

- **ServeRAID support**

  The ServeRAID adapter provides hardware redundant array of independent disks (RAID) support to create configurations. The standard RAID adapter provides RAID levels 0, 1, and 10. An optional RAID adapter is available for purchase.

- **Systems-management capabilities**

  The server comes with an Integrated Management Module II (IMM2). When the IMM2.1 is used with the systems-management software that comes with the server, you can manage the functions of the server locally and remotely. The IMM2.1 also provides system monitoring, event recording, and network alert capability. The systems-management connector on the rear of the server is dedicated to the IMM2.1. The dedicated systems-management connector provides additional security by physically separating the management network traffic from the production network. You can use the Setup utility to configure the server to use a dedicated systems-management network or a shared network.

- **UEFI-compliant server firmware**

  The UEFI firmware offers several features, including Unified Extensible Firmware Interface (UEFI) version 2.1 compliance, Active Energy Management (AEM) technology, enhanced reliability, availability, and serviceability (RAS) capabilities, and basic input/output system (BIOS) compatibility support. UEFI replaces the BIOS and defines a standard interface between the operating system, platform firmware, and external devices. The server is capable of booting UEFI-compliant operating systems, BIOS-based operating systems, and BIOS-based adapters as well as UEFI-compliant adapters. For more information about UEFI-compliant firmware, go to http://www.ibm.com/support/entry/portal/docdisplay?Indocid=MIGR-5083207.

  Note: The server does not support DOS.

- **VMware ESXi embedded hypervisor**

  An optional USB flash device with VMware ESXi embedded hypervisor software is available for purchase. Hypervisor is virtualization software that enables multiple operating systems to run on a host system at the same time. Install the USB flash device in the USB embedded hypervisor flash device connectors on the system board (see "System-board internal connectors" on page 27). See "Using the embedded hypervisor" on page 111 for additional information.

Reliability, availability, and serviceability

Three important computer design features are reliability, availability, and serviceability (RAS). The RAS features help to ensure the integrity of the data that is stored in the server, the availability of the server when you need it, and the ease with which you can diagnose and correct problems.

Your server has the following RAS features:
- 3-year parts and 3-year labor limited warranty (Machine Type 5464)
- 24-hour support center
- Automatic error retry and recovery
- Automatic restart on nonmaskable interrupt (NMI)
- Automatic restart after a power failure
- Backup basic input/output system switching under the control of the Integrated Management Module II (IMM2)
- Built-in monitoring for fan, power, temperature, voltage, and power-supply redundancy
- Cable-presence detection on most connectors
- Chipkill memory protection
- Single-device data correction (SDDC) for x4 DRAM technology DIMMs (available on 16 GB DIMMs only). Ensures that data is available on a single x4 DRAM DIMM after a hard failure of up to two DRAM DIMMs. One x4 DRAM DIMM in each rank is reserved as a space device.
- Diagnostic support for ServeRAID and Ethernet adapters
- Error codes and messages
- Error correcting code (ECC) L3 cache and system memory
- Full Array Memory Mirroring (FAMM) redundancy
- Hot-swap cooling fans with speed-sensing capability
- Hot-swap hard disk drives
- Hot-swap power supplies
- Information and light path diagnostics LED panels
- Integrated Management Module II (IMM2)
- Light path diagnostics LEDs for DIMMs, microprocessors, hard disk drives, solid state drives, power supplies, and fans
- Memory mirroring and memory sparing support
- Memory error correcting code and parity test
- Memory downsizing (non-mirrored memory). After a restart of the server after the memory controller detects a non-mirrored uncorrectable error and the memory controller cannot recover operationally, the IMM2.1 logs the uncorrectable error and informs POST. POST logically maps out the memory with the uncorrectable error, and the server restarts with the remaining installed memory.
- Menu-driven setup, system configuration, and redundant array of independent disks (RAID) configuration programs
- Microprocessor built-in self-test (BIST), internal error signal monitoring, internal thermal trip signal monitoring, configuration checking, and microprocessor and voltage regulator module failure identification through light path diagnostics
- Nonmaskable interrupt (NMI) button
- Parity checking on the PCIe buses
- Power management: compliance with Advanced Configuration and Power Interface (ACPI)
- Power-on self-test (POST)
- Predictive Failure Analysis (PFA) alerts on memory, SAS/SATA hard disk drives or solid state drives
- Redundant Ethernet capabilities with failover support

- Redundant hot-swap power supplies and redundant hot-swap fans
- Redundant network interface card (NIC) support
- Remote system problem-determination support
- ROM-based diagnostics
- ROM checksums
- Serial Presence Detection (SPD) on memory, VPD on system board, power supply, and hard disk drive or solid state drive backplanes, microprocessor and memory expansion tray, and Ethernet adapters
- Single-DIMM isolation of excessive correctable error or multi-bit error by the Unified Extensible Firmware Interface (UEFI)
- Solid-state drives
- Standby voltage for systems-management features and monitoring
- Startup (boot) from LAN through remote initial program load (RIPL) or dynamic host configuration protocol/boot protocol (DHCP/BOOTP)
- System auto-configuring from the configuration menu
- System-error logging (POST and IMM2.1)
- Systems-management monitoring through the Inter-Integrated Circuit (I2C) protocol bus
- Uncorrectable error (UE) detection
- Upgradeable POST, Unified Extensible Firmware Interface (UEFI), diagnostics, IMM2.1 firmware, and read-only memory (ROM) resident code, locally or over the LAN
- Vital product data (VPD) on microprocessors, system board, power supplies, and SAS/SATA (hot-swap hard disk drive or solid state drive) backplane
- Wake on LAN capability

Systems Director

Systems Director is a platform-management foundation that streamlines the way you manage physical and virtual systems in a heterogeneous environment. By using industry standards, Systems Director supports multiple operating systems and virtualization technologies in Lenovo and non-Lenovo x86 platforms.

Through a single user interface, Systems Director provides consistent views for viewing managed systems, determining how these systems relate to one other, and identifying their statuses, helping to correlate technical resources with business needs. A set of common tasks that are included with Systems Director provides many of the core capabilities that are required for basic management, which means instant out-of-the-box business value. The common tasks include discovery, inventory, configuration, system health, monitoring, updates, event notification, automation for managed systems, hardware log, power, and light path.

The Systems Director web and command-line interfaces provide a consistent interface that is focused on driving these common tasks and capabilities:

- Discovering, navigating, and visualizing systems on the network with the detailed inventory and relationships to the other network resources

- Notifying users of problems that occur on systems and the ability to isolate the source of the problem

- Notifying users when systems need updates and distributing and installing updates on a schedule

- Analyzing real-time data for systems and setting critical thresholds that notify the administrator of emerging problems

- Configuring settings of a single system and creating a configuration plan that can apply those settings to multiple systems

- Updating installed plug-ins to add new features and functions to the base capabilities

- Managing the life cycles of virtual resources

For more information about Systems Director, see the Systems Director Information Center at http://pic.dhe.ibm.com/infocenter/director/pubs/index.jsp, and the Systems Management web page at

http://shop.lenovo.com/us/en/systems/solutions/, which presents an overview of Systems Management and Systems Director.

Server controls, LEDs, and power

This section describes the controls and light-emitting diodes (LEDs) and how to turn the server on and off.

For the locations of other LEDs on the system board, see "System-board LEDs and controls" on page 29.

Front view

The following illustration shows the controls, LEDs, and connectors on the front of the server.
Figure 2. Front view of server

Note: The front bezel is not shown so that the drive bays are visible.

- **Power-control button:** Press this button to turn the server on and off manually.
- **Hard disk drive activity LEDs:** This LED is used on hot-swap SAS or SATA hard disk drives. Each hot-swap hard disk drive has an activity LED, and when this LED is flashing, it indicates that the drive is in use.
- **Hard disk drive status LEDs:** This LED is used on hot-swap SAS or SATA hard disk drives. When this LED is lit, it indicates that the drive has failed. If an optional ServeRAID adaptor is installed in the server, when this LED is flashing slowly (one flash per second), it indicates that the drive is being rebuilt. When the LED is flashing rapidly (three flashes per second), it indicates that the controller is identifying the drive.
- **DVD drive activity LED:** When this LED is lit, it indicates that the DVD drive is in use.
- **DVD eject button:** Press this button to release a DVD or CD from the DVD drive.

- **Light path diagnostics panel:** Light path diagnostics is a system of LEDs on various external and internal components of the server. When an error occurs, LEDs are lit throughout the server. By viewing the LEDs in a particular order, you can often identify the source of the error. See "Light path diagnostics panel" on page 18 for more information about the light path diagnostics.

- **Operator information panel:** This panel contains controls and LEDs that provide information about the status of the server. For information about the controls and LEDs on the operator information panel, see "Operator information panel" on page 17.

- **System TPM physical presence button:** It indicates a physical presence to the system TPM when on.

- **USB connectors:** Connect a USB device, such as a USB mouse or keyboard to any of these connectors.

Operator information panel

The following illustration shows the controls and LEDs on the operator information panel.
Figure 3. Operator information panel

- **Power-on LED:**

  When this LED is lit and not flashing, it indicates that the server is turned on. The states of the power-on LED are as follows:

  - **Off:**

    Power is not present or the power supply, or the LED itself has failed.

  - **Flashing rapidly (4 times per second):**

    The server is turned off and is not ready to be turned on. The power-control button is disabled. This will last approximately 5 to 10 seconds.

  - **Flashing slowly (once per second):**

    The server is turned off and is ready to be turned on. You can press the power-control button to turn on the server.

  - **Lit:**

    The server is turned on.

- **Ethernet activity LEDs:**

  When any of these LEDs is flashing, they indicate that the server is transmitting to or receiving signals from the Ethernet LAN that is connected to the Ethernet port that corresponds to that LED.

- **System-locator LED:**

  Use this blue LED to visually locate the server among other servers. You can use Systems Director to light this LED remotely. This LED is controlled by the IMM2.1. When you light the system-locator LED, the LED will blink and it will continue to blink until you turn it off.

- **Check log LED:**

  When this yellow LED is lit, it indicates that there are errors that require further diagnosis. Check the IMM2.1 event log for additional information. See "Event logs" on page 134 for more information about event logs.

- **System-error LED:**

  When this yellow LED is lit, it indicates that a system error has occurred. An LED on the light path diagnostics panel is lit to help isolate the error. This LED is controlled by the IMM2.1.

The following table describes the LEDs on the operator information panel and suggested actions to correct the detected problems.

Table 3. Operator information panel LEDs

LED	Description	Action
System locator (blue)	Use this LED to visually locate the server among other servers. You can use Systems Director or IMM2.1 to light this LED remotely.	
Check log (yellow)	An error has occurred and cannot be isolated without performing certain procedures.	1. Check the IMM2.1 system event log and the system-error log for information about the error. 2. Save the log if necessary and clear the log afterwards.
System-error (yellow)	An error has occurred.	1. Check the light path diagnostics LEDs and follow the instructions. 2. Check the IMM2.1 system event log and the system-error log for information about the error. 3. Save the log if necessary and clear the log afterwards.

Light path diagnostics panel

The following illustration shows the front LEDs on the light path diagnostics panel. The light path diagnostic panel can be seen from the front bezel.

Note: The light path diagnostics LEDs remain lit only while the server is connected to power.

For more information about the LEDs on the light path diagnostics panel, see "Light path diagnostics LEDs" on page 129.

The following illustration shows the LEDs on the light path diagnostics panel.

PCI slot 5
PCI slot 6
PCI slot 7
Figure 5. Rear view of server

- **NMI button:** Press this button to force a nonmaskable interrupt to the microprocessor. It allows you to blue screen the server and take a memory dump (use this button only when directed by the Lenovo service support). You might have to use a pen or the end of a straightened paper clip to press the button.

- **PCI slot 1:** Insert a half-length, full-height PCI Express adapter into this slot.
- **PCI slot 2:** Insert a full-length, full-height PCI Express adapter into this slot.
- **PCI slot 3:** Insert a full-length, full-height PCI Express adapter into this slot.
- **PCI slot 4:** Insert a full-length, full-height PCI Express adapter into this slot.
- **PCI slot 5:** Insert a half-length, full-height PCI Express adapter into this slot.
- **PCI slot 6:** Insert a full-length, full-height PCI Express adapter into this slot.
- **PCI slot 7:** Insert a full-length, full-height PCI Express adapter into this slot.
- **Power connector:** Connect the power cord to this connector.

  Note: Power supply 1 is the default/primary power supply. If power supply 1 fails, you must replace it immediately.
- **Video connector:** Connect a monitor to this connector.

  Note: The maximum video resolution is 1600 x 1200 at 75 Hz.
- **Serial connector:** No external serial port, instead this server reserves an on-board connector so that a customer can order Option cable with a 9-pin male D-shell connector and install at the rear of the machine by occupying one PCI slot. The serial port is for system use and can be shared with the BMC for serial redirection functions. The serial port is software compatible with the 16550A. The pin assignments are defined for RS-232-C. The voltage levels are EIA only.
- **USB connectors:** Connect a USB device, such as a USB mouse or keyboard to any of these connectors.
- **Systems-management Ethernet connector:** Use this connector to connect the server to a network for full systems-management information control. This connector is used only by the Integrated Management Module II (IMM2). A dedicated management network provides additional security by physically separating the management network traffic from the production network. You can use the Setup utility to configure the server to use a dedicated systems management network or a shared network.
- **Ethernet connectors:** Use either of these connectors to connect the server to a network. When you enable shared Ethernet for IMM2.1 in the Setup utility, you can access the IMM2.1 using either the Ethernet 1 or the system-management Ethernet connector.

The following illustration shows the LEDs on the rear of the server.
Figure 6. The LEDs on the rear of the server

- **Ethernet activity LEDs:** When these LEDs are lit, they indicate that the server is transmitting to or receiving signals from the Ethernet LAN that is connected to the Ethernet port.
- **Ethernet link LEDs:** When these LEDs are lit, they indicate that there is an active link connection on the Ethernet port.
- **AC power LED:** Each hot-swap power supply has an ac power LED. When the ac power LED is lit, it indicates that sufficient power is coming into the power supply through the power cord. During typical operation, the ac power LED is lit.
- **DC power LED:** Each hot-swap power supply has a dc power LED and an ac power LED. When the dc power LED is lit, it indicates that the power supply is supplying adequate dc power to the system. During typical operation, both the ac and dc power LEDs are lit.
- **Power-supply error LED:** When the power-supply error LED is lit, it indicates that the power supply has failed.

  Note: Power supply 1 is the default/primary power supply. If power supply 1 fails, you must replace the power supply immediately.

Server power features

When the server is connected to a suitable input source but is not turned on, the operating system does not run, and all core logic except for the service processor (the integrated management module) is shut down.

However, the server can respond to requests to the service processor, such as a remote request to turn on the server. The power-on LED flashes to indicate that the server is connected to input power but is not turned on.

Turning on the server

Use this information to turn on the server.

Approximately 5 seconds after the server is connected to input power, one or more fans might start running and the power-on LED flashes quickly. Approximately 10 seconds after the server is connected to input power, the power-on button becomes active. After the power-on button becomes active, the power-on LED flashes slowly. You can turn on the server by pressing the power-on button.

Step 1. Press the power-on button to turn on the server.

Step 2. The server can also be turned on in any of the following ways:

- If a power failure occurs while the server is turned on, the server will restart automatically when power is restored.
- If your operating system supports the Wake on LAN feature, the Wake on LAN feature can turn on the server.

What to do next

1. When 4 GB or more of memory (physical or logical) is installed, some memory is reserved for various system resources and is unavailable to the operating system. The amount of memory that is reserved for system resources depends on the operating system, the configuration of the server, and the configured PCI options.

2. When you turn on the server with external graphical adapters installed, the Lenovo logo displays on the screen after approximately 3 minutes. This is normal operation while the system loads.

3. Make sure the left-side cover is closed.

Turning off the server

Use this information to turn off the server.

When you turn off the server and leave it connected to input power, the server can respond to requests to the service processor (the Integrated Management Module II (IMM2)), such as a remote request to turn on the server. While the server remains connected to input power, one or more fans might continue to run. To remove all power from the server, you must disconnect it from the power source.

Some operating systems require an orderly shutdown before you turn off the server. See your operating-system documentation for information about shutting down the operating system.

Statement 5

CAUTION:
The power control button on the device do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.
The server can be turned off in any of the following ways:

- You can turn off the server from the operating system, if your operating system supports this feature. After an orderly shutdown of the operating system, the server will turn off automatically.

- You can press the power-control button to start an orderly shutdown of the operating system and turn off the server, if your operating system supports this feature.
- If the operating system stops functioning, you can press and hold the power-control button for more than 4 seconds to turn off the server.
- The server can be turned off by Wake on LAN feature with the following limitation:

  Note: When you install any PCI adapter, the power cords must be disconnected from the power source before you remove the PCI Express assembly. Otherwise, the Wake on LAN feature might not work.
- The Integrated Management Module II (IMM2) can turn off the server as an automatic response to a critical system failure.
- The server turns off when the air baffle is opened.

Chapter 2. Installing optional devices

This chapter provides detailed instructions for installing optional hardware devices in the server.

In addition to the instructions in this chapter for installing optional hardware devices, updating the firmware and device drivers, and completing the installation, Business Partners must also complete the steps in "Instructions for Business Partners" on page 25.

Important: To help ensure that the devices that you install work correctly and do not introduce problems, observe the following precautions.

Step 1.   Make sure that the server and the installed firmware levels support the devices that you are installing. If necessary, update the UEFI and IMM2.1 firmware and any other firmware that is stored on the system board. For information about where firmware is stored in the server, see "Updating the firmware" on page 97. For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.

Step 2.   Use the best practices to apply current firmware and device-driver updates for the server and optional devices. To download the *Firmware Update Guides* document, go to http://www.lenovo.com/support. Additional hints and tips are available from the following website:

  • System x configuration tools: http://www.ibm.com/systems/x/hardware/configtools.html

Step 3.   Before you install optional hardware devices, make sure that the server is working correctly. Start the server and make sure that the operating system starts, if an operating system is installed, or that a 19990305 error code is displayed, indicating that an operating system was not found but the server is otherwise working correctly. If the server is not working correctly, see "Running DSA Preboot diagnostic programs" on page 138 for information about how to run diagnostics.

Step 4.   Follow the installation procedures in this chapter and use the correct tools. Incorrectly installed devices can cause system failure because of damaged pins in sockets or connectors, loose cabling, or loose components.

Instructions for Business Partners

Instructions for Business Partners on verifying the newly installed devices by running the Dynamic System Analysis (DSA) stress test.

In addition to the instructions in this chapter for installing optional hardware devices, updating firmware and device drivers, and completing the installation, Business Partners must also complete the following steps:

1. After you have confirmed that the server starts correctly and recognizes the newly installed devices and that no error LEDs are lit, run the Dynamic System Analysis (DSA) stress test. For information about using DSA, see " Dynamic System Analysis" on page 137.

2. Shut down and restart the server multiple times to ensure that the server is correctly configured and functions correctly with the newly installed devices.

3. Save the DSA log as a file and send it to Lenovo. For information about transferring data and logs, see "Sending DSA data to Lenovo" on page 26.

4. To ship the server, repackage it in the original undamaged packing material and observe Lenovo procedures for shipping.

Support information for Business Partners is available at http://www.ibm.com/partnerworld.

Sending DSA data to Lenovo

You can send DSA data to Lenovo with standard upload, standard upload with the system serial number, secure upload, and secure upload with the system serial number.

Before you send diagnostic data to Lenovo, read the terms of use at http://www.ibm.com/de/support/ecurep/terms.html.

You can use any of the following methods to send diagnostic data to Lenovo:

- **Standard upload:**

  http://www.ibm.com/de/support/ecurep/send_http.html

- **Standard upload with the system serial number:**

  http://www.ecurep.ibm.com/app/upload_hw

- **Secure upload:**

  http://www.ibm.com/de/support/ecurep/send_http.html#secure

- **Secure upload with the system serial number:**

  https://www.ecurep.ibm.com/app/upload_hw

Server components

The following illustration shows the major components in the server.

The illustrations in this document might differ slightly from your hardware.
Figure 7. Server components

System-board internal connectors

The following illustrations show the internal connectors on the system board.

The following illustration shows the internal connectors on the system board.
Figure 8. Internal connectors on system board

System-board external connectors

The following illustration shows the external connectors on the system board.
Figure 9. External connectors on system board

System-board switches and jumpers

The following illustration shows the location and description of the switches and jumpers.
Figure 10. Location and description of switches and jumpers

Note: If there is a clear protective sticker on the top of the switch blocks, you must remove and discard it to access the switches.

The following table describes the functions of the SW4 switch block on the system board.

Table 4. System board SW2 switch block definition

Switch number	Switch name	Default position	Description
1	UEFI boot recovery	Off	When this switch is off, the primary firmware ROM page is loaded. When this switch is on, the secondary (backup) firmware ROM page is loaded. **Note:** Changing the position of the UEFI boot back switch before the server is turned on alters which flash ROM page is loaded. Do not move the switch after the server is turned on. This can cause an unpredictable problem.
2	Power-on password override	Off	Bypasses the power-on password check the next time the server is turned on and starts the Setup utility so that you can change or delete the power-on password when on. **Notes:** 1. You do not have to move the switch back to the default position after the power-on password in overridden. 2. Changing the position of this switch does not affect the administrator password check if an administrator password is set. See "Passwords" on page 105 for additional information about passwords.
3	CMOS clear	Off	Clears CMOS memory when on.
4	System TPM physical presence	Off	Indicates a physical presence to the system TPM when on.

Notes:

1. Before you change any switch settings or move any jumpers, turn off the server. Review the information in "Safety" on page v, "Installation guidelines" on page 30, "Handling static-sensitive devices" on page 32, and "Turning off the server" on page 22.

2. Any system-board switch or jumper block that is not shown in the illustrations in this document are reserved.

System-board LEDs and controls

The following illustration shows the light-emitting diodes (LEDs) on the system board.

Any error LED can be lit after ac power has been removed from the system-board tray so that you can isolate a problem. After ac power has been removed from the system-board tray, power remains available to these LEDs for up to 90 seconds. To view the error LEDs, press and hold the light path button on the system board to light the error LEDs. The error LEDs that were lit while the system-board tray was running will be lit again while the button is pressed.

The following illustration shows the LEDs and controls on the system board.

DIMM 13-18

Installation guidelines

Use the installation guidelines to install the Lenovo System x3500 M5 Type 5464.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the system to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when removing or installing a hot-swap device.

Before you install optional devices, read the following information:

• Read the safety information in "Safety" on page v and the guidelines in "Working inside the server with the power on" on page 32, and "Handling static-sensitive devices" on page 32. This information will help you work safely.

• Make sure that the devices that you are installing are supported. For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.

• When you install your new server, take the opportunity to download and apply the most recent firmware updates. This step will help to ensure that any known issues are addressed and that your server is ready to function at maximum levels of performance. To download firmware updates for your server, go to http://www.ibm.com/support/fixcentral.

Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

For additional information about tools for updating, managing, and deploying firmware, see the ToolsCenter for System x and BladeCenter at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-CENTER

- Before you install optional hardware, make sure that the server is working correctly. Start the server, and make sure that the operating system starts, if an operating system is installed, or that a 19990305 error code is displayed, indicating that an operating system was not found but the server is otherwise working correctly. If the server is not working correctly, see "Running DSA Preboot diagnostic programs" on page 138 for information about how to run diagnostics.

- Observe good housekeeping in the area where you are working. Place removed covers and other parts in a safe place.

- Do not attempt to lift an object that you think is too heavy for you. If you have to lift a heavy object, observe the following precautions:

  - Make sure that you can stand safely without slipping.

  - Distribute the weight of the object equally between your feet.

  - Use a slow lifting force. Never move suddenly or twist when you lift a heavy object.

  - To avoid straining the muscles in your back, lift by standing or by pushing up with your leg muscles.

- Make sure that you have an adequate number of properly grounded electrical outlets for the server, monitor, and other devices.

- Back up all important data before you make changes to disk drives.

- Have a small flat-blade screwdriver available.

- To view the error LEDs on the system board and internal components, leave the server connected to power.

- You do not have to turn off the server to install or replace hot-swap power supplies, hot-swap fans, or hot-plug Universal Serial Bus (USB) devices. However, you must turn off the server before you perform any steps that involve removing or installing adapter cables and you must disconnect the power source from the server before you perform any steps that involve removing or installing a riser card.

- Blue on a component indicates touch points, where you can grip the component to remove it from or install it in the server, open or close a latch, and so on.

- Orange on a component or an orange label on or near a component indicates that the component can be hot-swapped, which means that if the server and operating system support hot-swap capability, you can remove or install the component while the server is running. (Orange can also indicate touch points on hot-swap components.) See the instructions for removing or installing a specific hot-swap component for any additional procedures that you might have to perform before you remove or install the component.

- When you are finished working on the server, reinstall all safety shields, guards, labels, and ground wires.

System reliability guidelines

The system reliability guidelines to ensure proper system cooling.

To help ensure proper system cooling and system reliability, make sure that the following requirements are met:

- Each of the drive bays has a drive or a filler panel and electromagnetic compatibility (EMC) shield installed in it.

- If the server has redundant power, each of the power-supply bays has a power supply installed in it.

- There is adequate space around the server to allow the server cooling system to work properly. Leave approximately 50 mm (2.0 in.) of open space around the front and rear of the server. Do not place objects in front of the fans. For proper cooling and airflow, replace the server cover before you turn on the server. Operating the server for extended periods of time (more than 30 minutes) with the server cover removed might damage server components.

- You have followed the cabling instructions that come with optional adapters.
- You have replaced a failed fan within 48 hours.
- You have replaced a hot-swap drive within 2 minutes of removal.
- You do not operate the server without the air baffle or the fan filler installed. Operating the server without the air baffle or the fan filler might cause the microprocessor to overheat.
- Microprocessor socket 2 always contains either a socket cover or a microprocessor and heat sink and 2 fans.

Working inside the server with the power on

Guidelines to work inside the server with the power on.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

The server supports hot-plug, hot-add, and hot-swap devices and is designed to operate safely while it is turned on and the server cover is removed. Follow these guidelines when you work inside a server that is turned on:

Note: In order to work inside the server with the power on, you have to disable the power cut-off switch before removing the server cover.

- Avoid wearing loose-fitting clothing on your forearms. Button long-sleeved shirts before working inside the server; do not wear cuff links while you are working inside the server.
- Do not allow your necktie or scarf to hang inside the server.
- Remove jewelry, such as bracelets, necklaces, rings, and loose-fitting wrist watches.
- Remove items from your shirt pocket, such as pens and pencils, that could fall into the server as you lean over it.
- Avoid dropping any metallic objects, such as paper clips, hairpins, and screws, into the server.

Handling static-sensitive devices

Use this information to handle static-sensitive devices.

Attention: Static electricity can damage the server and other electronic devices. To avoid damage, keep static-sensitive devices in their static-protective packages until you are ready to install them.

To reduce the possibility of damage from electrostatic discharge, observe the following precautions:

- Limit your movement. Movement can cause static electricity to build up around you.
- The use of a grounding system is recommended. For example, wear an electrostatic-discharge wrist strap, if one is available. Always use an electrostatic-discharge wrist strap or other grounding system when working inside the server with the power on.
- Handle the device carefully, holding it by its edges or its frame.
- Do not touch solder joints, pins, or exposed circuitry.
- Do not leave the device where others can handle and damage it.
- While the device is still in its static-protective package, touch it to an unpainted metal surface on the outside of the server for at least 2 seconds. This drains static electricity from the package and from your body.

- Remove the device from its package and install it directly into the server without setting down the device. If it is necessary to set down the device, put it back into its static-protective package. Do not place the device on the server cover or on a metal surface.
- Take additional care when handling devices during cold weather. Heating reduces indoor humidity and increases static electricity.

Hard disk drive backplane connectors

The following illustrations show the connectors on the 2.5-inch and 3.5-inch hard disk drive backplanes and the backplate assembly.
Figure 12. Connectors on the 3.5-inch hot-swap hard disk drive backplane
Figure 13. Connectors on the 3.5-inch simple-swap hard disk drive backplate assembly
Figure 14. Connectors on the 2.5-inch hot-swap hard disk drive backplane
Figure 15. Connectors on the 2.5-inch hot-swap hard disk drive backplane with the expander

Internal cable routing and connectors

The server uses cables to connect SATA attached, hot-swap SATA, hot-swap SAS and DVD drive devices to the power supply and to the system board.

Review the following information before connecting power and signal cables to internal drives:

- The drives that are preinstalled in the server come with power and signal cables attached. If you replace any drives, remember which cable is attached to which drive.

- When you route a cable, make sure that it does not block the airflow to the rear of the drives or over the microprocessor or DIMMs.

Power cable connection

The following illustration shows the power cable routing and the connectors from the power paddle card to the system board.

Note: The power paddle card is under the system board in this system.

System board	Planar power cable (22pin)
Power paddle card	Planar power cable (20pin)
	Planar control cable
Figure 16. Power cable routing in the system board and the microprocessor 2 expansion board

Operator information panel cable connection

The following illustration shows the internal cable routing and connectors from the operator information panel and the light path diagnostics panel to the system board.

Opening the bezel door

Use this information to unlock the left-side cover to open or remove the bezel.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To open the bezel doorfollow the steps below.

Step 1.   Unlock the left-side cover.

Note: You must unlock the left-side cover to open or remove the bezel door. When you lock the left-side cover, it locks both the cover and the bezel door.

Step 2.   From the left-top section of the bezel door, use the key to turn the tab up to unlock the left-side cover and the bezel door

Figure 32. Unlock bezel door

Step 3. Open the bezel door by pressing the button on the left edge of the bezel door, and rotate the left side of the bezel door away from the server.

Release button
Figure 33. Open the bezel door

Removing the left-side cover

Use this information to unlock and remove the left-side cover by using the key that comes with the server.

Important: Before you install optional hardware devices, make sure that the server is working correctly. Start the server and make sure that the operating system starts, if an operating system is installed, or that a 19990305 error code is displayed, indicating that an operating system was not found but the server is otherwise working correctly. If the server is not working correctly, see "Running DSA Preboot diagnostic programs" on page 138 for information about how to run diagnostics.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the left-side cover, complete the following steps.

Step 1. From the left-top section of the bezel door, use the key to turn the tab up to unlock the left-side cover and the bezel door

Figure 34. Unlock the left-side cover

Step 2. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Step 3. Press the cover-release latch down while you rotate the top edge of the cover away from the server; then, lift the cover off the server.
Figure 35. Left-side cover removal

Removing the air baffle

Use this information to remove the air baffle from the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Attention: The server automatically powers off when the air baffle is removed.

To remove the air baffle, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

> **Attention:** Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 3. Remove the air baffle from the server by press the release latches and set it aside.
Figure 36. Air baffle removal

Removing the fan cage assembly

Use this information to remove the fan cage assembly from the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the fan cage assembly, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

> **Attention:** Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove all full-length PCIe adapters from the system board.

Step 5. Disconnect the fan cage power cable from the system board (see "Internal cable routing and connectors" on page 34).

Step 6. Rotate the fan cage release latch to the open position. The fan cage will lift up slightly when the release latch is fully open.
Figure 37. Fan cage removal

Step 7. Grasp the fan cage assembly and lift it out of the server.

Installing a hot-swap fan

Use this information to install a hot-swap fan in the server.

Attention: To avoid unexpected system shutdown, ensure that you lay the server on its side with the cover facing up before you start.

The server comes with two 92 mm x 38 mm hot-swap fans in the fan cage assembly. The following instructions can be used to install any hot-swap fan in the server.
Figure 38. The available fan sockets in the server

Note: You can order the two additional fans for redundant cooling when only one microprocessor installed.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a hot-swap fan, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Step 2.   Touch the static-protective package that contains the hot-swap fan to any unpainted metal surface on the server; then, remove the fan from the package.

Step 3.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 4.   Open the fan-locking handle on the replacement fan.

Step 5.   Insert the fan into the socket and close the fan-locking handle to the locked position.
Figure 39. Insert fan into the socket

Step 6.   Install and lock the left-side cover (see "Replacing the left-side cover" on page 93).

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Hard disk drive installation

The following illustrations show the location of the drive bays in the server. Your hardware might differ, depending on the model.

Depending on the server model, the server might come with a SATA attached DVD-ROM drive in bay 1.

Note: If the server is configured for RAID operation using a ServeRAID adapter, you might have to reconfigure your disk arrays after you install drives. See the ServeRAID adapter documentation for additional information about RAID operation and complete instructions for using the ServeRAID adapter.

The following illustrations show the location of the drive bays in the 2.5-inch hot-swap hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 40. Server with eight 2.5-inch hot-swap hard disk drives

SATA/SAS hard disk drive bays
Figure 41. Server with sixteen 2.5-inch hot-swap hard disk drives

SATA/SAS hard disk drive bays
Figure 42. Server with twenty-four 2.5-inch hot-swap hard disk drives

SATA/SAS hard disk drive bays
Figure 43. Server with thirty-two 2.5-inch hot-swap hard disk drives

The following illustrations show the location of the drive bays in the 3.5-inch simple-swap or hot-swap hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 44. Server with six 3.5-inch hot-swap hard disk drives

SATA/SAS hard disk drive bays
Figure 45. Server with twelve 3.5-inch hot-swap hard disk drives

SATA hard disk drive bays
Figure 46. Server with eight 3.5-inch simple-swap hard disk drives

The following illustrations show the location of the drive bays in the 2.5-inch and 3.5-inch hot-swap or hot-swap hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 47. Server with six 3.5-inch hot-swap and eight 2.5-inch hot-swap hard disk drives
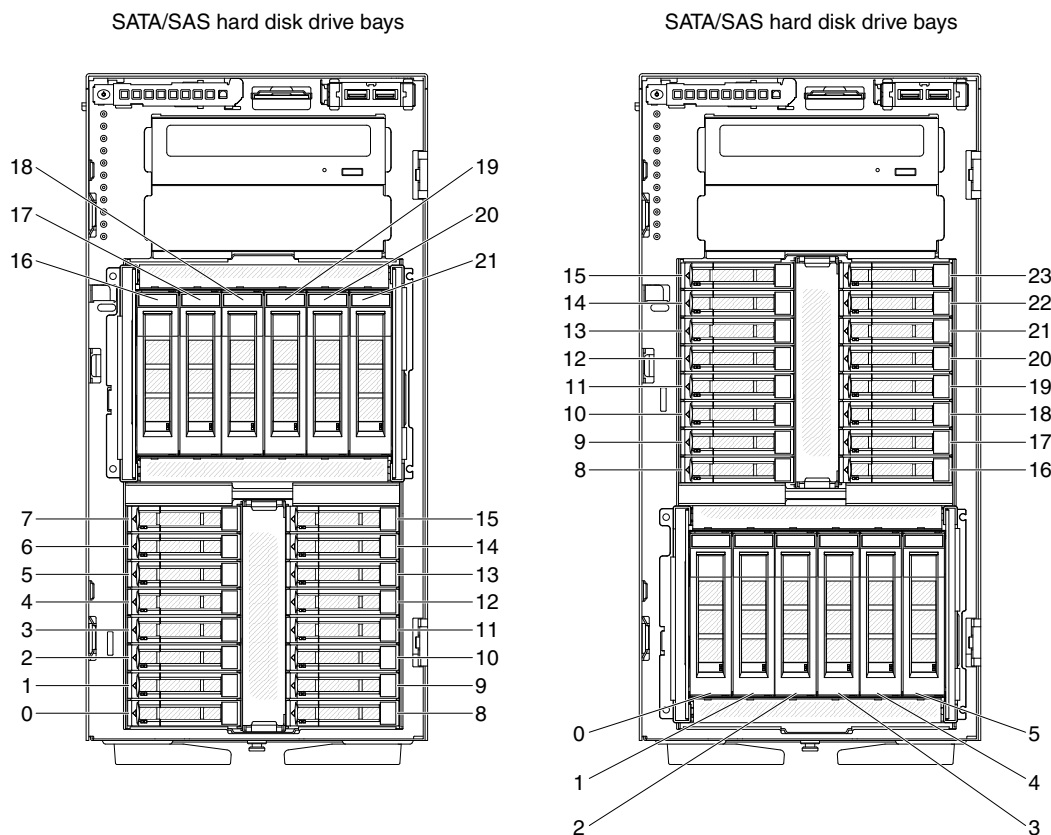

Figure 48. Server with six 3.5-inch hot-swap and sixteen 2.5-inch hot-swap hard disk drives

The following notes describe the types of drives that the server supports and other information that you must consider when installing a drive:

- Make sure that you have all the cables and other equipment that is specified in the documentation that comes with the drive.

- Check the instructions that come with the drive to see whether you have to set any switches or jumpers on the drive. If you are installing a SAS or SATA device, be sure to set the SAS or SATA ID for that device.

- Optional external tape drives and DVD-ROM drives are examples of removable-media drives. You can install removable-media drives only in bays 1 and 2 on models with six, twelve 3.5-inch, eight, sixteen, twenty-four, and thirty-two 2.5-inch hard disk drives.

- The electromagnetic interference (EMI) integrity and cooling of the server are protected by having all bays and PCIe slots covered or occupied. When you install a drive or PCI adapter, save the EMC shield and filler panel from the bay or the PCI adapter slot cover in the event that you later remove the drive or adapter.

- For a complete list of supported options for the server, see http://www.lenovo.com/us/en/ serverproven/.

Installing a 2.5-inch hot-swap hard disk drive

Use this information to install a 2.5-inch hot-swap hard disk drive.

The following notes describe the types of hard disk drives that the server supports and other information that you must consider when you install a hard disk drive:

- Depending on the model, the server supports up to eight or up to thirty-two 2.5-inch SAS/SATA hot-swap hard disk drives in the hot-swap bays.

- For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.
- Inspect the drive and drive bay for signs of damage.
- Make sure that the drive is correctly installed in the drive bay.
- See the documentation for the ServeRAID adapter for instructions for installing a hard disk drive.
- All hot-swap drives in the server must have the same throughput speed rating; using drives with different speed ratings might cause all drives to operate at the speed of the slowest drive.
- You do not have to turn off the server to install hot-swap drives in the hot-swap drive bays. However, you must turn off the server when you perform any steps that involve installing or removing cables.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 2.5-inch hot-swap hard disk drive, complete the following steps.

Step 1.   Unlock the left-side cover.

   Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.
Step 2.   Open the bezel (see "Removing the bezel" on page 177).
Step 3.   Remove the 2.5-inch filler panel, if one is present.
Step 4.   Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package.
Step 5.   Make sure that the drive handle is opened by press the latch; then, install the hard disk drive into the drive bay.
Step 6.   Rotate the drive handle until the drive is seated in the drive bay and the release latch clicks into place.

Figure 49. Hot-swap hard disk drive installation

Notes:

1. After you install the hard disk drive, check the disk drive status LEDs to verify that the hard disk drive is operating correctly. If the yellow hard disk drive status LED is lit continuously, that drive is faulty and must be replaced. If the green hard disk drive activity LED is flashing, the drive is being accessed.

2. If the server is configured for RAID operation through an optional ServeRAID adapter, you might have to reconfigure your disk arrays after you install hard disk drives. See the ServeRAID documentation on the *ServeRAID Support* CD for additional information about RAID operation and complete instructions for using ServeRAID manager.

Step 7. Close the bezel (see "Installing the bezel" on page 179).

Step 8. Lock the left-side cover.

Installing a 3.5-inch hot-swap hard disk drive

Use this information to install a 3.5-inch hot-swap SAS/SATA hard disk drive.

Before installing a 3.5-inch hot-swap hard disk drive, read the following information:

- Inspect the drive tray for signs of damage.
- To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.
- You do not have to turn off the server to install hot-swap drives in the hot-swap drive bays.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

To install a 3.5-inch hot-swap SAS/SATA hard disk drive, complete the following steps.

Step 1. Unlock the left-side cover.

Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2. Open the bezel (see "Opening the bezel door" on page 47).

Step 3. Remove the filler panel, if one is present.

Step 4. Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package and place it on a static-protective surface.

Step 5. Make sure that the drive tray handle is in the open position.

Step 6. Align the drive assembly with the guide rail in the bay; then, carefully slide the drive assembly into the drive bay until the drive snaps into place.
Figure 50. Hot-swap hard disk drive installation

Step 7. Rotate the drive tray handle to the closed position.

Step 8. Check the hard disk drive status indicator to make sure that the hard disk drive is operating correctly. After you replace a failed hard disk drive, the green activity LED flashes as the disk spins up. The yellow LED turns off after approximately 1 minute. If the new drive starts to rebuild, the yellow LED flashes slowly, and the green activity LED remains lit during the rebuild process. If the yellow LED remains lit, see the "Hard disk drive problems" on page 142 for more information.

Note: You might have to reconfigure the disk arrays after you install hard disk drives. See the RAID documentation on the website at http://www.lenovo.com/support for information about RAID adapters.

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing a 3.5-inch simple-swap hard disk drive

Use this information to install a 3.5-inch simple-swap hard disk drive.

Before installing a 3.5-inch simple-swap hard disk drive, read the following information:

- Inspect the drive tray for signs of damage.
- To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 3.5-inch simple-swap hard disk drive, complete the following steps.

Step 1. Turn off the server.

Step 2. Unlock the left-side cover.

> **Note:** You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 3. Open the bezel (see "Opening the bezel door" on page 47).

Step 4. Remove the filler panel, if one is present.

Step 5. Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package and place it on a static-protective surface.

Step 6. Grasp the black drive handle and slide the blue release latch to the right and align the drive assembly with the guide rail in the bay.
Figure 51. Simple-swap hard disk drive installation

Step 7. Gently push the drive into the bay until the drive stops.

Step 8. Reinstall the filler panel on the drive you just installed.

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing a DVD drive

Use this information to install a DVD drive.

If you are replacing a drive, make sure that:

- You have all the cables and other equipment that are specified in the documentation that comes with the new drive.
- You have checked the instructions that come with the new drive to determine whether you must set any switches or jumpers in the drive.
- You have removed the optical drive rail from the side of the old drive and have them available for installation on the new drive.

Notes:

- If you are installing a new DVD drive on the optical drive bay 2, an EMC shield should be removed firstly to continue the installation.
- If you are installing a drive that contains a laser, observe the following safety precautions.

Statement 3

CAUTION:
When laser products (such as CD-ROMs, DVD drives, fiber optic devices, or transmitters) are installed, note the following:

- **Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.**
- **Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.**

DANGER

Some laser products contain an embedded Class 3A or Class 3B laser diode.

Note the following. Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.

Class 1 Laser Product
Laser Klasse 1
Laser Klass 1
Luokan 1 Laserlaite
Appareil À Laser de Classe 1

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the DVD drive, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 2.   Open the bezel (see "Opening the bezel door" on page 47).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the fan cage assembly (see "Removing fan cage assembly" on page 251).

Step 5.   Touch the static-protective package that contains the DVD drive to any unpainted metal surface on the server; then, remove the DVD drive from the package.

Step 6.   Slide out the 1st Drive retainer clip from the chassis for use. (Or use the 2nd Drive retainer clip if the 1st Drive retainer clip has been used.)
Figure 52. The location of Drive retainer clips

Step 7.   Install the drive retainer clip to the DVD drive, using the holes nearest the center of the drive.

Step 8.   Follow the instructions that come with the drive to set jumpers or switches, if there is any.

Note: You might find it easier to install the new drive from the front and then attach the cables.

Step 9.   Align the rail on the DVD drive with the guides in the drive bay; then, slide the DVD drive into the drive bay until it clicks into place.
Figure 53. Slide the DVD drive into the drive bay

Step 10. Connect power and signal cables to the drive and the connectors on the system board (see "Internal cable routing and connectors" on page 34 for more information).

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Memory module installation

The following notes describe the types of DIMMs that the server supports and other information that you must consider when you install DIMMs.

- When you install or remove DIMMs, the server configuration information changes. When you restart the server, the system displays a message that indicates that the memory configuration has changed.

- The server supports only industry-standard double-data-rate 4 (DDR4), 1600, 1866, or 2133 MHz, PC4-12800, PC4-14900, or PC4-17000 registered or load deduction, synchronous dynamic random-access memory (SDRAM) dual inline memory modules (DIMMs) with error correcting code (ECC). See http://www.lenovo.com/us/en/ serverproven/ for a list of supported memory modules for the server.

    – The specifications of a DDR4 DIMM are on a label on the DIMM, in the following format.

    gggggeRxff PC4*v-wwwwwm-aa-bb-ccd*

    where:

    – *ggggg* is the total capacity of the DIMM (for example, 1GB, 2GB, or 4GB)

    – *eR* is the number of ranks

        1R = single-rank

        2R = dual-rank

        4R = quad-rank

    – *xff* is the device organization (bit width)

        x4 = x4 organization (4 DQ lines per SDRAM)

        x8 = x8 organization

        x16 = x16 organization

    – *v* is the SDRAM and support component supply voltage (VDD)

- Blank = 1.2 V specified
  - *wwwww* is the DIMM bandwidth, in MBps

    12800 = 12.80 GBps (DDR4-1600 SDRAMs, 8-byte primary data bus)

    14900 = 14.93 GBps (DDR4-1866 SDRAMs, 8-byte primary data bus)

    17000 = 17.00 GBps (DDR4-2133 SDRAMs, 8-byte primary data bus)
  - *m* is the DIMM type

    L = Load Reduction DIMM (LRDIMM)

    R = Registered DIMM (RDIMM)
  - *aa* is the CAS latency, in clocks at maximum operating frequency
  - *bb* is the JEDEC SPD Revision Encoding and Additions level
  - *cc* is the reference design file for the design of the DIMM
  - *d* is the revision number of the reference design of the DIMM

Note: To determine the type of a DIMM, see the label on the DIMM. The information on the label is in the format xxxxx nRxxx PC4v-xxxxxx-xx-xx-xxx. The numeral in the sixth numerical position indicates whether the DIMM is single-rank (n=1), dual-rank (n=2), or quad-rank (n=4).

- The following rules apply to DDR4 RDIMM speed as it relates to the number of RDIMMs in a channel:
  - When you install 1 RDIMM per channel, the memory runs at 2133 MHz
  - When you install 2 RDIMMs per channel, the memory runs at 1866 MHz
  - When you install 3 RDIMMs per channel, the memory runs at 1600 MHz
  - All channels in a server run at the fastest common frequency
  - Do not install registered and load reduction DIMMs in the same server
- The following rules apply to DDR4 RDIMM speed as it relates to the number of LRDIMMs in a channel:
  - When you install 1 LRDIMM per channel, the memory runs at 2133MHz
  - When you install 2 LRDIMMs per channel, the memory runs at 2133 MHz
  - When you install 3 LRDIMMs per channel, the memory runs at 1600 MHz
- The maximum memory speed is determined by the combination of the microprocessor, DIMM speed, DIMM type, Operating Modes in UEFI settings, and the number of DIMMs installed in each channel.
- The server supports a maximum of 24 single-rank, dual-rank RDIMMs or 24 quad-rank LRIMMs.
- The following table shows an example of the maximum amount of memory that you can install using ranked DIMMs:

Table 5. Maximum memory installation using ranked DIMMs

Number of DIMMs	DIMM type	DIMM size	Total memory
24	Single-rank RDIMMs	4 GB	96 GB
24	Dual-rank RDIMMs	8 GB	192 GB
24	Dual-rank RDIMMs	16 GB	384 GB
24	Quad-rank LRDIMMs	32 GB	768 GB
24	Quad-rank LRDIMMs	64 GB	1536 GB

- The RDIMM options that are available for the server are 4 GB, 8 GB, and 16 GB. The server supports a minimum of 4 GB and a maximum of 384 GB of system memory using RDIMMs.
- The LRDIMM option that is available for the server is 32 GB and 64 GB. The server supports a minimum of 32 GB and a maximum of 1536 GB of system memory using LRDIMMs.

Note: The amount of usable memory is reduced depending on the system configuration. A certain amount of memory must be reserved for system resources. To view the total amount of installed memory and the amount of configured memory, run the Setup utility. For additional information, see "Configuring the server" on page 98.

- A minimum of one DIMM must be installed for each microprocessor. For example, you must install a minimum of two DIMMs if the server has two microprocessors installed. However, to improve system performance, install a minimum of four DIMMs for each microprocessor.
- DIMMs in the server must be the same type (RDIMM or LRDIMM) to ensure that the server will operate correctly.

Note: You can install DIMMs for microprocessor 2 as soon as you install microprocessor 2; you do not have to wait until all of the DIMM slots for microprocessor 1 are filled.

The following illustration shows the location of the DIMM connectors on they system board.

Figure 54. The location of the DIMM connectors on the system board

DIMM installation sequence

Depending on the server model, the server may come with a minimum of one 8 GB or 16 GB DIMM installed in slot 1. When you install additional DIMMs, install them in the order shown in the following table to optimize system performance.

In general, all four channels on the memory interface for each microprocessor can be populated in any order and have no matching requirements.

Table 6. Independent mode DIMM installation sequence

Number of installed microprocessor	DIMM connector population sequence
One microprocessor installed	1, 4, 9, 12, 2, 5, 8, 11, 3, 6, 7, 10
Two microprocessors installed	1, 13, 4, 16, 9, 21, 12, 24, 2, 14, 5, 17, 8, 20, 11, 23, 3, 15, 6, 18, 7, 19, 10, 22

For optimal performance:

Make sure all four memory channels of each microprocessor are populated. Each memory channels should be populated with the same type and amount of memory per channel. Each microprocessor socket should be populated with the same type and amount of memory per socket. 1DPC (one DIMM per channel) or 2DPC (two DIMM per channel) memory configuration are recommended. Unless there is a need for memory capacity over memory frequency, 3DPC (three DIMMs per channel) configuration is not recommended since 3DPC configuration forces the memory subsystem to run at a lower frequency (1600 MHz).

Please refer to the Understanding and Optimizing Memory Performance for Intel Xeon Processor E5-2600 v3 Series in IBM Flex System, System x, and BladeCenter Platforms white paper for the detail.

Memory mirrored channel

Memory mirrored channel mode replicates and stores data on two pairs of DIMMs within two channels simultaneously. If a failure occurs, the memory controller switches from the primary pair of memory DIMMs to the backup pair of DIMMs.

If a failure occurs, the memory controller switches from the primary pair of memory DIMMs to the backup pair of DIMMs. To enable memory mirrored channel through the Setup utility, select **System Settings ➔ Memory**. For more information, see "Using the Setup utility" on page 101. When you use the memory mirrored channel feature, consider the following information:

- When you use memory mirrored channel, you must install a pair of DIMMs at a time. The two DIMMs in each pair must be identical in size, type, and rank (single, dual, or quad), and organization, but not in speed. The channels run at the speed of the slowest DIMM in any of the channels.

- The maximum available memory is reduced to half of the installed memory when memory mirrored channel is enabled. For example, if you install 64 GB of memory using RDIMMs, only 32 GB of addressable memory is available when you use memory mirrored channel.

The following diagram lists the DIMM connectors on each memory channel.

Figure 55. Connectors on each memory channel

Note: You can install DIMMs for microprocessor 2 as soon as you install microprocessor 2; you do not have to wait until all of the DIMM connectors for microprocessor 1 are filled.

The following table shows the installation sequence for memory mirrored mode:

Table 7. Memory mirrored channel mode DIMM population sequence

Number of DIMMs	Number of installed microprocessor	DIMM connector
First pair of DIMMs	1	1, 4
Second pair of DIMMs	1	9, 12
Third pair of DIMMs	1	2, 5
Fourth pair of DIMMs	1	8, 11
Fifth pair of DIMMs	1	7, 10
Sixth pair of DIMMs	1	3, 6
First pair of DIMMs	2	1, 4
Second pair of DIMMs	2	13, 16
Third pair of DIMMs	2	9, 12
Fourth pair of DIMMs	2	21, 24
Fifth pair of DIMMs	2	2, 5
Sixth pair of DIMMs	2	14, 17
Seventh pair of DIMMs	2	8, 11
Eighth pair of DIMMs	2	20, 23
Ninth pair of DIMMs	2	19, 22
Tenth pair of DIMMs	2	7, 10
Eleventh pair of DIMMs	2	15, 18
Twelfth pair of DIMMs	2	3, 6

When you install or remove DIMMs, the server configuration information changes. When you restart the server, the system displays a message that indicates that the memory configuration has changed.

Memory rank sparing

Sparing enables a failing rank to be replaced by ranks installed in an unoccupied space. An unused spare rank on the channel can be used to copy the contents of a failing rank on that channel.

You can enable rank sparing memory in the Setup utility (see "Starting the Setup utility" on page 101).

The following diagram lists the DIMM connectors on each memory channel.

```
DIMM 1  ⎱
DIMM 2  ⎰                          DIMM 13  ⎱
DIMM 3  ⎰                          DIMM 14  ⎰
DIMM 4  ⎱                          DIMM 15  ⎰
DIMM 5  ⎰                          DIMM 16  ⎱
DIMM 6  ⎰                          DIMM 17  ⎰
                                   DIMM 18  ⎰
```

Figure 56. Connectors on each memory channel

Note: You can install DIMMs for the microprocessor 2 once the microprocessor 2 is installed. You do not need to wait until all of the DIMM connectors for microprocessor 1 are filled.

The following table shows the installation sequence for memory rank sparing mode:

Table 8. Memory rank sparing mode DIMM population sequence

Number of DIMMs	Number of installed microprocessor	DIMM connector
First pair of DIMMs	1	1, 2
Second pair of DIMMs	1	4, 5
Third pair of DIMMs	1	8, 9
Fourth pair of DIMMs	1	11, 12
Fifth pair of DIMMs	1	7, 10
Sixth pair of DIMMs	1	3, 6
First pair of DIMMs	2	1, 2
Second pair of DIMMs	2	13, 14
Third pair of DIMMs	2	4, 5
Fourth pair of DIMMs	2	16, 17
Fifth pair of DIMMs	2	8, 9
Sixth pair of DIMMs	2	20, 21
Seventh pair of DIMMs	2	11, 12
Eighth pair of DIMMs	2	23, 24
Ninth pair of DIMMs	2	7, 10
Tenth pair of DIMMs	2	19, 22
Eleventh pair of DIMMs	2	3, 6
Twelfth pair of DIMMs	2	15, 18
Note: Rank Sparing is only supported when there is more than 1DPC or if a single QRDIMM is installed		

Installing a DIMM

Use this information to install a DIMM.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a DIMM, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Open the retaining clip on each end of the DIMM connector.

> **Attention:** To avoid breaking the retaining clips or damaging the DIMM connectors, open and close the clips gently.
Figure 57. DIMM installation

Step 4. Touch the static-protective package that contains the DIMM to any unpainted metal surface on the outside of the server. Then, remove the DIMM from the package.

Step 5. Turn the DIMM so that the alignment slot align correctly with the alignment tab.

Step 6. Insert the DIMM into the connector by aligning the edges of the DIMM with the slots at the ends of the DIMM connector (see "System-board internal connectors" on page 27) for the locations of the DIMM connectors).
Figure 58. Insert DIMM into connector

Step 7. Firmly press the DIMM straight down into the connector by applying pressure on both ends of the DIMM simultaneously. The retaining clips snap into the locked position when the DIMM is firmly seated in the connector.

> **Note:** If there is a gap between the DIMM and the retaining clips, the DIMM has not been correctly inserted; open the retaining clips, remove the DIMM, and then reinsert it.

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing an adapter

Use this information to install an adapter.

The following notes describe the types of adapters that the server supports and other information that you must consider when you install an adapter:

- To confirm that the server supports the adapter that you are installing, see http://www.lenovo.com/us/en/serverproven/.
- Locate the documentation that comes with the adapter and follow those instructions in addition to the instructions in this section.
- Do not set the maximum digital video adapter resolution above 1600 x 1200 at 75 Hz for an LCD monitor. This is the highest resolution that is supported for any add-on video adapter that you install in the server.
- Avoid touching the components and gold-edge connectors on the adapter.
- The server uses a rotational interrupt technique to configure PCI adapters so that you can install PCI adapters that do not support sharing of PCI interrupts.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to stop, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when working inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install an adapter, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

> **Attention:** Do not allow the server to fall over.

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 4. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 5. See the documentation that comes with the adapter for any cabling instructions and information about jumper or switch settings. (It might be easier for you to route cables before you install the adapter.)

Step 6. Touch the static-protective package that contains the adapter to any unpainted metal surface on the server; then, remove the adapter from the package.

Step 7. Determine the PCIe slot into which you will install the adapter.

Step 8. Rotate the adapter-retention brackets to the open position.
Figure 59. Rotate the adapter-retention brackets to the open position

Step 9.   Remove the PCIe slot filler, if installed. Keep the filler in a safe place for potential future use.

Step 10. Press the adapter *firmly* into the expansion slot.
Figure 60. Press adapter into expansion slot

Attention: Incomplete insertion might cause damage to the system board or the adapter.

Step 11. Close the adapter-retention bracket.

Step 12. Perform any configuration tasks that are required for the adapter.

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing an optional ServeRAID adapter memory module

Use this information to install an optional ServeRAID adapter memory module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install an optional ServeRAID adapter memory module, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Locate the ServeRAID adapter which you will install the memory module. Remove the ServeRAID adapter if necessary.

Step 4. Touch the static-protective package that contains the memory card to any unpainted metal surface on the server; then, remove the memory card from the package.

Step 5. Align the memory module with the connector on the ServeRAID adapter and push it into the connector until it is firmly seated.

Figure 61. Align the memory module

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing a RAID adapter battery or flash power module remotely in the server

Use this information to install a RAID adapter battery or flash power module remotely in the server.

Note: When you install any RAID adapter that comes with batteries, it is sometimes necessary to install the batteries in another location in the server to prevent the batteries from overheating.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a RAID adapter battery or flash power module remotely in the server, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Install the ServeRAID adapter on the system board (see "Installing an adapter" on page 206).

Step 4. Connect one end of the battery/flash power module cable to the battery/flash power module connector.

Step 5. Install the battery/flash power module:

a. Align the battery/flash power module cable connector with the slot on the battery/flash power module holder. Place the battery/flash power module into the battery/flash power module holder and make sure that the battery/flash power module holder engages the battery/flash power module securely.
Figure 62. Align the battery/flash power module cable connector

Note: The positioning of the remote battery/flash power module depends on the type of the remote batteries/flash power module that you install.

b. Connect the other end of the battery/flash power module cable to the battery/flash power module cable connector on the battery/flash power module.

c. Lower and press down on the retention clip until it snaps in place to hold the battery/flash power module firmly in place.

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Installing a microprocessor and heat sink

Use this information to install a microprocessor and heat sink.

The following notes describe the type of microprocessor that the server supports and other information that you must consider when you install a microprocessor and heat sink:

- Microprocessors are to be installed only by trained technicians. **Important:** Always use the microprocessor installation tool to install a microprocessor. Failing to use the microprocessor installation tool may damage the microprocessor sockets on the system board. Any damage to the microprocessor sockets may require replacing the system board.

- The server supports up to two multi-core microprocessors, which are designed for the LGA 2011 socket. See http://www.lenovo.com/us/en/ serverproven/ for a list of supported microprocessors.

- Do not mix microprocessors with different cores in the same server.

- The first microprocessor must always be installed in microprocessor socket 1 on the system board.

- When one microprocessor is installed, the air baffle must be installed to provide proper system cooling.

- Do not remove the first microprocessor from the system board when you install the second microprocessor.

- When you install the second microprocessor, you must also install additional memory, the air baffle, and fan 2. See "Memory module installation" on page 67 for details about the installation sequence.

- To ensure proper server operation when you install an additional microprocessor, use microprocessors that have the same QuickPath Interconnect (QPI) link speed, integrated memory controller frequency, core frequency, power segment, internal cache size, and type.

- Mixing microprocessors of different stepping levels within the same server model is supported.

- When mixing microprocessors with different stepping levels within the same server model, you do not have to install the microprocessor with lowest stepping level and features in microprocessor socket 1.

- Both microprocessor voltage regulator modules are integrated on the system board.

- Read the documentation that comes with the microprocessor to determine whether you have to update the server firmware. To download the latest level of server firmware and other code updates for your server, go to http://www.lenovo.com/support.

- The microprocessor speeds are automatically set for this server; therefore, you do not have to set any microprocessor frequency-selection jumpers or switches.

- If the thermal-grease protective cover (for example, a plastic cap or tape liner) is removed from the heat sink, do not touch the thermal grease on the bottom of the heat sink or set down the heat sink. For more information about applying or working with thermal grease, see "Thermal grease" on page 86.

  Note: Removing the heat sink from the microprocessor destroys the even distribution of the thermal grease and requires replacing the thermal grease.

- To order an additional optional microprocessor, contact your Lenovo sales representative or Lenovo reseller.

Installation tool has two settings for installing two different sizes of microprocessors. The settings that are marked on the tool are "L" for smaller low core microprocessors, and "H" for larger high core microprocessors.

Installation tool
Microprocessor

Figure 63. Microprocessor installation tools

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Attention: When you handle static-sensitive devices, take precautions to avoid damage from static electricity. For details about handling these devices, see "Handling static-sensitive devices" on page 32.

To replace a microprocessor and heat sink, complete the following steps:

Step 1. Turn off the server and peripheral devices and disconnect the power cords and all external cables.

Step 2. Remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 50).

Step 4. If you are replacing microprocessor 1, remove the memory modules from DIMM connectors 6 and 7. If you are replacing microprocessor 2, remove the memory modules from DIMM connectors 18 and 19. See "Installing a DIMM" on page 73 for instructions.

Step 5. Rotate the heat sink retention module release lever to the open position.

Heat sink
release lever

Lock tab

Retainer bracket
Figure 64. Heat-sink lever rotation

Step 6. Open the microprocessor socket release levers and retainer:
Figure 65. Microprocessor socket levers and retainer disengagement

a. Identify which release lever is labeled as the first release lever to open and open it.

b. Open the second release lever on the microprocessor socket.

c. Open the microprocessor retainer.

   Attention: Do not touch the connectors on the microprocessor and the microprocessor socket.

Step 7. Install the microprocessor on the microprocessor socket:

a. Touch the static-protective package that contains the new microprocessor to any *unpainted* on the chassis or any *unpainted* metal surface on any other grounded rack component; then, carefully remove the microprocessor from the package.

   Note: Do not touch the microprocessor contacts. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.

b. Align the installation tool with the microprocessor socket and lower down the installation tool. The installation tool rests flush on the socket only if properly aligned.
Figure 66. Installation tool alignment

   c. Install the microprocessor using the following instructions for your installation tool.

     • Twist the handle of the installation tool assembly counterclockwise to the unlocked position until you can not twist the handle any further; then, lift the installation tool out of the socket.
Figure 67. Installation tool handle adjustment

The following illustrations show the installation tool in the locked and unlocked positions.

🔒 Lock Position   **🔓 Unlock Position**
Figure 68. Installation tool
Microprocessor

Figure 69. Installation tool removal

Attention:

- Do not press the microprocessor into the socket.
- Make sure that the microprocessor is oriented and aligned correctly in the socket before you try to close the microprocessor retainer.
- Do not touch the thermal material on the bottom of the heat sink or on top of the microprocessor. Touching the thermal material will contaminate it.

Step 8. Remove the cover from the retainer bracket, if one is present. Store the cover in a safe place.
Figure 70. Socket cover removal

Attention: When you handle static-sensitive devices, take precautions to avoid damage from static electricity. For details about handling these devices, see "Handling static-sensitive devices" on page 32.

Step 9. Close the microprocessor socket release levers and retainer:
Figure 71. Microprocessor socket levers and retainer engagement

    a.   Close the microprocessor retainer on the microprocessor socket.

    b.   Identify which release lever is labeled as the first release lever to close and close it.

    c.   Close the second release lever on the microprocessor socket.

Step 10. Install the heat sink.

    Attention:

- Do not set down the heat sink after you remove the plastic cover.
- Do not touch the thermal grease on the bottom of the heat sink after you remove the plastic cover. Touching the thermal grease will contaminate it. See "Thermal grease" on page 86 for more information.
Figure 72. Thermal grease

a. Remove the plastic protective cover from the bottom of the heat sink.

b. Grasp the heat sink firmly to avoid possible damage to the heat sink.

c. Position the heat sink over the microprocessor. The heat sink is keyed to assist with proper alignment.
Figure 73. Heat sink installation

d. Align and insert the front tab of the heat sink under the retainer bracket tabs.

e. Align and place the heat sink on top of the microprocessor in the retention bracket, thermal material side down.

f. Press firmly on the heat sink.

g. Rotate the heat sink retention module release lever to the closed position and hook it underneath the lock tab.
Figure 74. Heat sink retention module release lever

Step 11. Reinstall the air baffle (see "Replacing the air baffle" on page 92).

Step 12. Install the left-side cover (see "Replacing the left-side cover" on page 93).

Step 13. Slide the server into the rack.

Step 14. Reconnect the power cords and any cables that you removed.

Step 15. Turn on the peripheral devices and the server.

Thermal grease

The thermal grease must be replaced whenever the heat sink has been removed from the top of the microprocessor and is going to be reused or when debris is found in the grease. Use this information to replace damaged or contaminated thermal grease on the microprocessor and heat sink.

When you are installing the heat sink on the same microprocessor that it was removed from, make sure that the following requirements are met:

- The thermal grease on the heat sink and microprocessor is not contaminated.
- Additional thermal grease is not added to the existing thermal grease on the heat sink and microprocessor.

Notes:

- Read the safety information in "Safety" on page v.
- Read the "Installation guidelines" on page 30.
- Read "Handling static-sensitive devices" on page 32.

To replace damaged or contaminated thermal grease on the microprocessor and heat sink, complete the following steps.

Step 1. Place the heat sink on a clean work surface.

Step 2. Remove the cleaning pad from its package and unfold it completely.

Step 3. Use the cleaning pad to wipe the thermal grease from the bottom of the heat sink.

Note: Make sure that all of the thermal grease is removed.

Step 4. Use a clean area of the cleaning pad to wipe the thermal grease from the microprocessor; then, dispose of the cleaning pad after all of the thermal grease is removed.

Figure 75. 9 uniformly spaced dots on the top of the microprocessor

Step 5. Use the thermal-grease syringe to place 9 uniformly spaced dots of 0.02 mL each on the top of the microprocessor. The outermost dots must be within approximately 5 mm of the edge of the microprocessor. This is to ensure uniform distribution of the grease.
Figure 76. Thermal-grease syringe

Note: 0.01 mL is one tick mark on the syringe. If the grease is properly applied, approximately half (0.22 mL) of the grease will remain in the syringe.

Step 6. Install the heat sink onto the microprocessor as described in "Installing a microprocessor and heat sink" on page 265.

Installing a hot-swap power supply

Use this information to install a hot-swap power supply.

The following notes describe the type of ac power supply that the server supports and other information that you must consider when you install a power supply:

- Make sure that the devices that you are installing are supported. For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.

- Before you install an additional power supply or replace a power supply with one of a different wattage, you may use the Power Configurator utility to determine current system power consumption. For more information and to download the utility, go to http://www.ibm.com/systems/bladecenter/resources/powerconfig.html.

- The server comes with one hot-swap 12-volt output power supply that connects to power supply bay 1. The input voltage is 110 V ac or 220 V ac auto-sensing.

- Power supplies in the server must be with the same power rating or wattage to ensure that the server will operate correctly.

- Power supply 1 is the default/primary power supply. If power supply 1 fails, you must replace the power supply with the same wattage immediately.
- You can order an optional power supply for redundancy.
- These power supplies are designed for parallel operation. In the event of a power-supply failure, the redundant power supply continues to power the system. The server supports a maximum of two power supplies.

Statement 5

CAUTION:
The power control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

Statement 8

CAUTION:
Never remove the cover on a power supply or any part that has the following label attached.

Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem,

always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

To install a hot-swap power supply, complete the following steps.

Step 1.   Touch the static-protective package that contains the hot-swap power supply to any unpainted metal surface on the server; then, remove the power supply from the package and place it on a static-protective surface.

Step 2.   Remove the power-supply filler panel from the power bay, if one is installed.

Figure 77. Power-supply filler panel removal

Step 3.   Install the power supply and push it in until it locks into place.

   Notes:

   1. If only one hot-swap power supply is installed in the server, a power-supply filler must be installed in the empty power bay.

   2. Do not mix power supplies with different wattage in the server.

Step 4.   Route the power cord through the handle and cable tie if any, so that it does not accidentally become unplugged.

Step 5.   Connect one end of the power cord for the new power supply into the connector on the back of the power supply; then, connect the other end of the power cord to a properly grounded electrical outlet.

   Note: If the server has been turned off, you must wait approximately 3 minutes after you connect the server power cord to an electrical outlet before the power-control button becomes active.

Step 6.   Make sure that the ac power LED and the dc power LED on the ac power supply are lit, indicating that the power supply is operating correctly. The two green LEDs are to the right of the power-cord connector.

Step 7.   When power supply is configured as zero-output mode, it keeps 12Vaux on, and sleep the 12V output to minimize its power consumption. At the same time, Power supply will keep DC_GOOD signal be asserted, and its fan rotating, the DC GOOD green LED should blink at a 1Hz rate.

Step 8.   If you are replacing a power supply with one of a different wattage, apply the power information label provided with the new power supply over the existing power information label on the server.

Figure 78. Power supply replacement

Installing a USB embedded hypervisor flash device

Use this information to install a USB embedded hypervisor flash device.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a hypervisor flash device, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Unlock the retention latch by pushing it down toward the system board.

Figure 79. Unlock retention latch

Step 4. Align the flash device with the USB connector on the system board and push it into the USB connector until it is firmly seated.

Step 5.   Return the retention latch to the locked position by pulling it away from the system board.

Figure 80. Return retention latch

If you have other devices to install or remove, do so now. Otherwise, go to "Completing the installation" on page 91.

Completing the installation

Use this information to complete the installation.

To complete the installation, complete the following steps.

Step 1.   If you removed the fan cage assembly, reinstall it (see "Replacing the fan cage assembly" on page 91).

Step 2.   If you removed the air baffle, reinstall it (see "Replacing the air baffle" on page 92).

Step 3.   If you removed the left-side cover, replace it (see "Replacing the left-side cover" on page 93).

Step 4.   Reconnect the cables and power cords (see "Connecting the cables" on page 94).

Step 5.   Update the server configuration (see "Updating the server configuration" on page 96).

Step 6.   Install the server in the rack cabinet (see the *Tower to Rack Installation Instructions* that come with the server for instructions).

Step 7.   Slide the server back into the rack, if necessary.

Step 8.   Start the server. Confirm that it starts correctly and recognizes the newly installed devices, and make sure that no error LEDs are lit.

Step 9.   (Business Partners only) Complete the additional steps in "Instructions for Business Partners" on page 25.

Replacing the fan cage assembly

Use this information to replace the fan cage assembly.

Attention: Make sure that all wires and cables inside the server are routed correctly before you install the fan cage assembly. Wiring that is not properly routed might be damaged or might prevent the fan cage assembly from seating properly in the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

To replace the fan cage assembly, complete the following steps.

Step 1.   Align the guides on the fan cage with the release latch to the open position on each side.

Step 2.   Push the fan cage assembly into the server.

Note: Make sure that the fan cage is fully seated.

Step 3.   Rotate the fan cage release latch to the close position. The fan cage will be fully seated when it is secured.
Fan cage assembly

Figure 81. Rotate the fan cage release latch

Step 4.   Connect the fan cage assembly power cable to the system board (see "Internal cable routing and connectors" on page 34).

Replacing the air baffle

Use this information to replace the air baffle.

Note: When you install the second microprocessor, you must also install fan 2 and the air baffle that come with the second microprocessor upgrade kit.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

To replace the air baffle (two microprocessors installed), complete the following steps.

Step 1.   Slide the air baffle down into the server until the positioning pins fit into the locating holes; then, press the release latch and put down the air baffle until it clicks into place.
Figure 82. Air baffle installation

Replacing the left-side cover

Use this information to replace the left-side cover.

Make sure that all cables, adapters, and other components are installed and seated correctly and that you have not left loose tools or parts inside the server. Also, make sure that all internal cables are correctly routed.

Important: Before you slide the cover forward, make sure that all the tabs on the front, rear, and side of the cover engage the chassis correctly. If all the tabs do not engage the chassis correctly, it will be very difficult to remove the cover later.

To replace the left-side server cover, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover-side facing up.

Step 2.   Set the bottom edge of the left-side cover on the bottom ledge of the server.

Step 3.   Pull down the cover release latch then rotate the top edge of the cover toward the server and press inward on the cover until it clicks into place.
Figure 83. Set the bottom edge of the left-side cover

Step 4. Lock the cover, using the key that comes with the server.

Connecting the cables

Use this information to connect the cables.

The following illustration shows the locations of the input and output connectors on the front of the server.
Figure 84. Front of server

The following illustration shows the locations of the input and output connectors on the rear of the server.
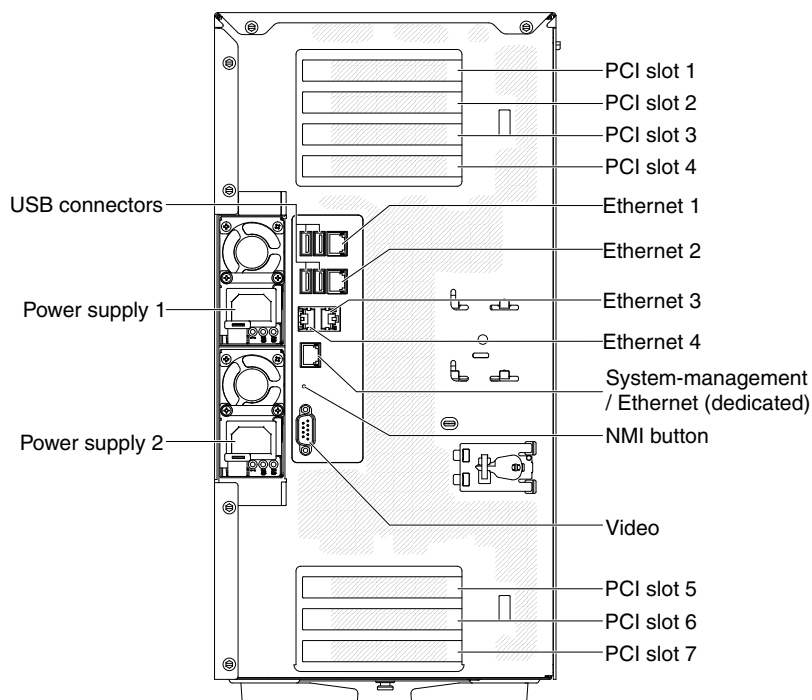

Figure 85. Rear of server

Step 1.   You must turn off the server before you connect or disconnect cables.

Step 2.   See the documentation that comes with any external devices for additional cabling instructions. It might be easier for you to route cables before you connect the devices to the server.

Updating the server configuration

Use this information to update the server configuration.

When you start the server for the first time after you add or remove a device, you might receive a message that the configuration has changed. The Setup utility starts automatically so that you can save the new configuration settings.

Some optional devices have device drivers that you must install. For information about installing device drivers, see the documentation that comes with each device.

If the server has an optional RAID adapter and you have installed or removed a hard disk drive, see the documentation that comes with the RAID adapter for information about reconfiguring the disk arrays.

For information about configuring the Ethernet controller, see "Configuring the Ethernet controller" on page 111.

Chapter 3. Configuration information and instructions

This chapter provides information about updating the firmware and using the configuration utilities.

Updating the firmware

Use this information to update the system firmware.

Important:

1. Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

2. Before you update the firmware, be sure to back up any data that is stored in the Trusted Platform Module (TPM), in case any of the TPM characteristics are changed by the new firmware. For instructions, see your encryption software documentation.

3. Installing the wrong firmware or device-driver update might cause the server to malfunction. Before you install a firmware or device-driver update, read any readme and change history files that are provided with the downloaded update. These files contain important information about the update and the procedure for installing the update, including any special procedure for updating from an early firmware or device-driver version to the latest version.

You can install code updates that are packaged as an Update*Xpress* System Pack or Update*Xpress* CD image. An Update*Xpress* System Pack contains an integration-tested bundle of online firmware and device-driver updates for your server. Use Update*Xpress* System Pack Installer to acquire and apply Update*Xpress* System Packs and individual firmware and device-driver updates. For additional information and to download the Update*Xpress* System Pack Installer, go to the ToolsCenter for System x and BladeCenter at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-CENTER and click **UpdateXpress System Pack Installer**.

When you click an update, an information page is displayed, including a list of the problems that the update fixes. Review this list for your specific problem; however, even if your problem is not listed, installing the update might solve the problem.

Be sure to separately install any listed critical updates that have release dates that are later than the release date of the Update*Xpress* System Pack or Update*Xpress* image.

The firmware for the server is periodically updated and is available for download on the website. To check for the latest level of firmware, such as the UEFI firmware, device drivers, and Integrated Management Module II (IMM2) firmware, go to http://www.ibm.com/support/fixcentral.

Download the latest firmware for the server; then, install the firmware, using the instructions that are included with the downloaded files.

When you replace a device in the server, you might have to update the firmware that is stored in memory on the device or restore the pre-existing firmware from a CD or DVD image.

The following list indicates where the firmware is stored:

- UEFI firmware is stored in ROM on the system board.
- IMM2.1 firmware is stored in ROM on the system board.
- Ethernet firmware is stored in ROM on the Ethernet controller and on the system board.

- ServeRAID firmware is stored in ROM on the system board and the RAID adapter (if one is installed).

- SAS/SATA firmware is stored in ROM on the SAS/SATA controller on the system board.

Configuring the server

The following configuration programs come with the server:

- **Setup utility**

  The Setup utility is part of the UEFI firmware. Use it to perform configuration tasks such as changing interrupt request (IRQ) settings, changing the startup-device sequence, setting the date and time, and setting passwords. For information about using this program, see "Using the Setup utility" on page 101.

- **Boot Manager program**

  The Boot Manager is part of the UEFI firmware. Use it to override the startup sequence that is set in the Setup utility and temporarily assign a device to be first in the startup sequence. For more information about using this program, see "Using the Boot Manager" on page 106.

- ***ServerGuide Setup and Installation* CD**

  The ServerGuide program provides software-setup tools and installation tools that are designed for the server. Use this CD during the installation of the server to configure basic hardware features, such as an integrated SAS/SATA controller with RAID capabilities, and to simplify the installation of your operating system. For information about using this CD, see "Using the ServerGuide Setup and Installation CD" on page 99.

- **Integrated Management Module II (IMM2)**

  Use the Integrated Management Module II (IMM2) for configuration, to update the firmware and sensor data record/field replaceable unit (SDR/FRU) data, and to remotely manage a network. For information about using the IMM2.1, see "Using the Integrated Management Module II (IMM2)" on page 108 and the *Integrated Management Module II User's Guide* at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=migr-5086346.

- **VMware ESXi embedded hypervisor**

  An optional USB flash device with VMware ESXi embedded hypervisor software is available for purchase. Hypervisor is virtualization software that enables multiple operating systems to run on a host system at the same time. The USB embedded hypervisor flash device can be installed in USB connectors 3 and 4 on the system board. For more information about using the embedded hypervisor, see "Using the embedded hypervisor" on page 111.

- **Remote presence capability and blue-screen capture**

  The remote presence and blue-screen capture features are integrated functions of the Integrated Management Module II (IMM2). The remote presence feature provides the following functions:

  - Remotely viewing video with graphics resolutions up to 1600 x 1200 at 75 Hz, regardless of the system state

  - Remotely accessing the server, using the keyboard and mouse from a remote client

  - Mapping the CD or DVD drive, diskette drive, and USB flash drive on a remote client, and mapping ISO and diskette image files as virtual drives that are available for use by the server

  - Uploading a diskette image to the IMM2.1 memory and mapping it to the server as a virtual drive

  The blue-screen capture feature captures the video display contents before the IMM2.1 restarts the server when the IMM2.1 detects an operating-system hang condition. A system administrator can use the blue-screen capture feature to assist in determining the cause of the hang condition. For more information, see "Using the remote presence and blue-screen capture features" on page 109.

- **Ethernet controller configuration**

For information about configuring the Ethernet controller, see "Configuring the Ethernet controller" on page 111.

- **Features on Demand software Ethernet software**

  The server provides Features on Demand software Ethernet support. You can purchase a Features on Demand software upgrade key for Fibre Channel over Ethernet (FCoE) and iSCSI storage protocols. For more information, see "Enabling Features on Demand Ethernet software" on page 112.

- **Features on Demand software RAID software**

  The server provides Features on Demand software RAID support. You can purchase a Features on Demand software upgrade key for RAID. For more information, see "Enabling Features on Demand RAID software" on page 112.

- **Advanced Settings Utility (ASU) program**

  Use this program as an alternative to the Setup utility for modifying UEFI settings and IMM2.1 settings. Use the ASU program online or out of band to modify UEFI settings from the command line without the need to restart the server to run the Setup utility. For more information about using this program, see " Advanced Settings Utility program" on page 112.

- **Configuring RAID arrays**

  For information about configuring RAID arrays, see "Configuring RAID arrays" on page 112.

  The following table lists the different server configurations and the applications that are available for configuring and managing the RAID arrays.

Table 9. Server configuration and applications for configuring and managing the RAID arrays

Server configuration	RAID array configuration (before operating system is installed)	RAID array management (after operating system is installed)
ServeRAID-M5210 adapter	MegaRAID BIOS, HII	MegaRAID Storage Manager (MSM), MegaCLI, and Systems Director

Notes:

1. For more information about the Human Interface Infrastructure (HII) and SAS2IRCU, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5088601.

2. For more information about the MegaRAID, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5073015.

Using the ServerGuide Setup and Installation CD

Use this information as an overview for using the ServerGuide Setup and Installation CD.

The *ServerGuide Setup and Installation* CD provides software setup tools and installation tools that are designed for your server. The ServerGuide program detects the server model and optional hardware devices that are installed and uses that information during setup to configure the hardware. The ServerGuide simplifies the operating-system installations by providing updated device drivers and, in some cases, installing them automatically.

You can download a free image of the *ServerGuide Setup and Installation CD* from http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-GUIDE.

In addition to the *ServerGuide Setup and Installation* CD, you must have your operating-system CD to install the operating system.

ServerGuide features

This information provides an overview of the ServerGuide features.

Features and functions can vary slightly with different versions of the ServerGuide program. To learn more about the version that you have, start the *ServerGuide Setup and Installation* CD and view the online overview. Not all features are supported on all server models.

The ServerGuide program has the following features:
• An easy-to-use interface
• Diskette-free setup, and configuration programs that are based on detected hardware
• Device drivers that are provided for the server model and detected hardware
• Operating-system partition size and file-system type that are selectable during setup

The ServerGuide program performs the following tasks:
• Sets system date and time
• Detects installed hardware options and provides updated device drivers for most adapters and devices
• Provides diskette-free installation for supported Windows operating systems
• Includes an online readme file with links to tips for your hardware and operating-system installation

Setup and configuration overview

Use this information for the ServerGuide setup and configuration.

When you use the *ServerGuide Setup and Installation* CD, you do not need setup diskettes. You can use the CD to configure any supported Lenovo server model. The setup program provides a list of tasks that are required to set up your server model. On a server with a ServeRAID adapter or SAS/SATA controller with RAID capabilities, you can run the SAS/SATA RAID configuration program to create logical drives.

Note: Features and functions can vary slightly with different versions of the ServerGuide program.

Typical operating-system installation

This section details the ServerGuide typical operating-system installation.

The ServerGuide program can reduce the time it takes to install an operating system. It provides the device drivers that are required for your hardware and for the operating system that you are installing. This section describes a typical ServerGuide operating-system installation.

Note: Features and functions can vary slightly with different versions of the ServerGuide program.

1. After you have completed the setup process, the operating-system installation program starts. (You will need your operating-system CD to complete the installation.)

2. The ServerGuide program stores information about the server model, service processor, hard disk drive controllers, and network adapters. Then, the program checks the CD for newer device drivers. This information is stored and then passed to the operating-system installation program.

3. The ServerGuide program presents operating-system partition options that are based on your operating-system selection and the installed hard disk drives.

4. The ServerGuide program prompts you to insert your operating-system CD and restart the server. At this point, the installation program for the operating system takes control to complete the installation.

Installing your operating system without using ServerGuide

Use this information to install the operating system on the server without using ServerGuide.

If you have already configured the server hardware and you are not using the ServerGuide program to install your operating system, you can download operating-system installation instructions for the server from http://www.lenovo.com/support.

Using the Setup utility

Use these instructions to start the Setup utility.

Use the Unified Extensible Firmware Interface (UEFI) Setup Utility program to perform the following tasks:

- View configuration information
- View and change assignments for devices and I/O ports
- Set the date and time
- Set and change passwords
- Set the startup characteristics of the server and the order of startup devices
- Set and change settings for advanced hardware features
- View, set, and change settings for power-management features
- View and clear error logs
- Change interrupt request (IRQ) settings
- Resolve configuration conflicts

Starting the Setup utility

Use this information to start up the Setup utility.

To start the Setup utility, complete the following steps:

Step 1.   Turn on the server.

Note: Approximately 5 to 10 seconds after the server is connected to power, the power-control button becomes active.

Step 2.   When the prompt **<F1> Setup** is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

Step 3.   Select settings to view or change.

Setup utility menu choices

Use the Setup utility main menu to view and configure server configuration data and settings.

The following choices are on the Setup utility main menu for the UEFI. Depending on the version of the firmware, some menu choices might differ slightly from these descriptions.

- **System Information**

  Select this choice to view information about the server. When you make changes through other choices in the Setup utility, some of those changes are reflected in the system information; you cannot change settings directly in the system information. This choice is on the full Setup utility menu only.

  – **System Summary**

    Select this choice to view configuration information, including the ID, speed, and cache size of the microprocessors, machine type and model of the server, the serial number, the system UUID, and the amount of installed memory. When you make configuration changes through other options in the Setup utility, the changes are reflected in the system summary; you cannot change settings directly in the system summary.

  – **Product Data**

    Select this choice to view the system-board identifier, the revision level or issue date of the firmware, the Integrated Management Module II (IMM2) and diagnostics code, and the version and date.

This choice is on the full Setup utility menu only.

- **System Settings**

  Select this choice to view or change the server component settings.

  – **Adapters and UEFI Drivers**

    Select this choice to view information about the UEFI 1.10 and UEFI 2.0 compliant adapters and drivers installed in the server.

  – **Processors**

    Select this choice to view or change the processor settings.

  – **Memory**

    Select this choice to view or change the memory settings.

  – **Devices and I/O Ports**

    Select this choice to view or change assignments for devices and input/output (I/O) ports. You can configure the serial ports, configure remote console redirection, enable or disable integrated Ethernet controllers, the SAS/SATA controllers, SATA optical drive channels, PCI slots, and video controller. If you disable a device, it cannot be configured, and the operating system will not be able to detect it (this is equivalent to disconnecting the device).

  – **Power**

    Select this choice to view or change power capping to control consumption, processors, and performance states.

  – **Operating Modes**

    Select this choice to view or change the operating profile (performance and power utilization).

  – **Legacy Support**

    Select this choice to view or set legacy support.

    – **Force Legacy Video on Boot**

      Select this choice to force INT video support, if the operating system does not support UEFI video output standards.

    – **Rehook INT 19h**

      Select this choice to enable or disable devices from taking control of the boot process. The default is **Disable**.

    – **Legacy Thunk Support**

      Select this choice to enable or disable UEFI to interact with PCI mass storage devices that are non-UEFI compliant. The default is **Enable**.

    – **Infinite Boot Retry**

      Select this choice to enable or disable UEFI to infinitely retry the legacy boot order. The default is **Disable**.

    – **BBS Boot**

      Select this choice to enable or disable legacy boot in BBS manner. The default is **Enable**.

  – **System Security**

    Select this choice to view or configure Trusted Platform Module (TPM) support.

  – **Integrated Management Module II (IMM2)**

    Select this choice to view or change the settings for the Integrated Management Module II (IMM2).

    – **Power Restore Policy**

      Select this choice to set the mode of operation after the power lost.

– **Commands on USB Interface**

Select this choice to enable or disable the Ethernet over USB interface on IMM2.1. The default is **Enable**.

– **Network Configuration**

Select this choice to view the system management network interface port, the IMM2.1 MAC address, the current IMM2.1 IP address, and host name; define the static IMM2.1 IP address, subnet mask, and gateway address, specify whether to use the static IP address or have DHCP assign the IMM2.1 IP address, save the network changes, and reset the IMM2.1.

– **Reset IMM2.1 to Defaults**

Select this choice to view or reset IMM2.1 to the default settings.

– **Reset IMM2.1**

Select this choice to reset IMM2.1.

– **Recovery**

Select this choice to view or change the system recovery parameters.

– **POST Attempts**

Select this choice to view or change the number of attempts to POST.

• **POST Attempts Limit**

Select this choice to view or change the Nx boot failure parameters.

– **System Recovery**

Select this choice to view or change system recovery settings.

• **POST Watchdog Timer**

Select this choice to view or enable the POST watchdog timer.

• **POST Watchdog Timer Value**

Select this choice to view or set the POST loader watchdog timer value.

• **Reboot System on NMI**

Select this choice to enable or disable restarting the system whenever a nonmaskable interrupt (NMI) occurs. **Enable** is the default.

• **Halt on Severe Error**

Select this choice to enable or disable the system from booting into OS, displaying the POST event viewer whenever a severe error was detected. **Disable** is the default.

– **Storage**

Select this choice to view or change the storage device settings.

– **Network**

Select this choice to view or change the network device options, such as iSCSI.

– **Drive Health**

Select this choice to view the status of the controllers installed in the blade server.

• **Date and Time**

Select this choice to set the date and time in the server, in 24-hour format (*hour*:*minute*:*second*).

This choice is on the full Setup utility menu only.

• **Start Options**

Select this choice to view or change the start options, including the startup sequence, keyboard NumLock state, PXE boot option, and PCI device boot priority. Changes in the startup options take effect when you start the server.

The startup sequence specifies the order in which the server checks devices to find a boot record. The server starts from the first boot record that it finds. If the server has Wake on LAN hardware and software and the operating system supports Wake on LAN functions, you can specify a startup sequence for the Wake on LAN functions. For example, you can define a startup sequence that checks for a disc in the CD-RW/DVD drive, then checks the hard disk drive, and then checks a network adapter.

This choice is on the full Setup utility menu only.

- **Boot Manager**

  Select this choice to view, add, delete, or change the device boot priority, boot from a file, select a one-time boot, or reset the boot order to the default setting.

- **System Event Logs**

  Select this choice to enter the System Event Manager, where you can view the POST event log and the system-event log. You can use the arrow keys to move between pages in the error log. This choice is on the full Setup utility menu only.

  The POST event log contains the most recent error codes and messages that were generated during POST.

  The system-event log contains POST and system management interrupt (SMI) events and all events that are generated by the baseboard management controller that is embedded in the Integrated Management Module II (IMM2).

  Important: If the system-error LED on the front of the server is lit but there are no other error indications, clear the system-event log. Also, after you complete a repair or correct an error, clear the system-event log to turn off the system-error LED on the front of the server.

  – **POST Event Viewer**

    Select this choice to enter the POST event viewer to view the POST error messages.

  – **System Event Log**

    Select this choice to view the system event log.

  – **Clear System Event Log**

    Select this choice to clear the system event log.

- **User Security**

  Select this choice to set, change, or clear passwords. See "Passwords" on page 105 for more information.

  This choice is on the full and limited Setup utility menu.

  – **Set Power-on Password**

    Select this choice to set or change a power-on password. See "Power-on password" on page 105 for more information.

  – **Clear Power-on Password**

    Select this choice to clear a power-on password. See "Power-on password" on page 105 for more information.

  – **Set Administrator Password**

    Select this choice to set or change an administrator password. An administrator password is intended to be used by a system administrator; it limits access to the full Setup utility menu. If an administrator password is set, the full Setup utility menu is available only if you type the administrator password at the password prompt. See "Administrator password" on page 106 for more information.

  – **Clear Administrator Password**

Select this choice to clear an administrator password. See "Administrator password" on page 106 for more information.

- **Save Settings**

  Select this choice to save the changes that you have made in the settings.

- **Restore Settings**

  Select this choice to cancel the changes that you have made in the settings and restore the previous settings.

- **Load Default Settings**

  Select this choice to cancel the changes that you have made in the settings and restore the factory settings.

- **Exit Setup**

  Select this choice to exit from the Setup utility. If you have not saved the changes that you have made in the settings, you are asked whether you want to save the changes or exit without saving them.

Passwords

From the **User Security** menu choice, you can set, change, and delete a power-on password and an administrator password.

The **User Security** menu choice is on the full Setup utility menu only.

If you set only a power-on password, you must type the power-on password to complete the system startup and to have access to the full Setup utility menu.

An administrator password is intended to be used by a system administrator; it limits access to the full Setup utility menu. If you set only an administrator password, you do not have to type a password to complete the system startup, but you must type the administrator password to access the Setup utility menu.

If you set a power-on password for a user and an administrator password for a system administrator, you must type the power-on password to complete the system startup. A system administrator who types the administrator password has access to the full Setup utility menu; the system administrator can give the user authority to set, change, and delete the power-on password. A user who types the power-on password has access to only the limited Setup utility menu; the user can set, change, and delete the power-on password, if the system administrator has given the user that authority.

Power-on password

If a power-on password is set, when you turn on the server, you must type the power-on password to complete the system startup. You can use any combination of 6 - 20 printable ASCII characters for the password.

When a power-on password is set, you can enable the Unattended Start mode, in which the keyboard and mouse remain locked but the operating system can start. You can unlock the keyboard and mouse by typing the power-on password.

If you forget the power-on password, you can regain access to the server in any of the following ways:

- If an administrator password is set, type the administrator password at the password prompt. Start the Setup utility and reset the power-on password.

  Attention: If you set an administrator password and then forget it, there is no way to change, override, or remove it. You must replace the system board.

- Remove the battery from the server, wait 30 seconds, and then reinstall it.

- Change the position of the power-on password switch (enable switch 3 of the system board switch block (SW4) to bypass the password check (see "System-board switches and jumpers" on page 28 for more information).
Figure 86. Power-on password switch

Attention: Before you change any switch settings or move any jumpers, turn off the server; then, disconnect all power cords and external cables. See the safety information that begins "Safety" on page v. Do not change settings or move jumpers on any system-board switch or jumper blocks that are not shown in this document.

The default for all of the switches on switch block SW3 is Off.

While the server is turned off, move switch 4 of the switch block SW3 to the On position to enable the power-on password override. You can then start the Setup utility and reset the power-on password. You do not have to return the switch to the previous position.

The power-on password override switch does not affect the administrator password.

Administrator password

If an administrator password is set, you must type the administrator password for access to the full Setup utility menu. You can use any combination of 6 to 20 printable ASCII characters for the password.

Attention: If you set an administrator password and then forget it, there is no way to change, override, or remove it. You must replace the system board.

Using the Boot Manager

Use this information for the Boot Manager.

The Boot Manager program is a built-in, menu-driven configuration utility program that you can use to temporarily redefine the first startup device without changing settings in the Setup utility.

To use the Boot Manager program, complete the following steps:

Step 1. Turn off the server.

Step 2. Restart the server.

Step 3. When the prompt `<F12> Select Boot Device` is displayed, press `F12`.

Step 4. Use the Up arrow and Down arrow keys to select an item from the menu and press Enter.

The next time the server starts, it returns to the startup sequence that is set in the Setup utility.

Starting the backup server firmware

Use this information to start the backup server firmware.

The system board contains a backup copy area for the server firmware. This is a secondary copy of the server firmware that you update only during the process of updating the server firmware. If the primary copy of the server firmware becomes damaged, use this backup copy.

To force the server to start from the backup copy, turn off the server; then, change the position of the UEFI boot backup switch (change switch 1 of the SW4 to the on position) to enable the UEFI recovery mode.

Use the backup copy of the server firmware until the primary copy is restored. After the primary copy is restored, turn off the server; then, change back the position of the UEFI boot backup switch (change switch 1 of the SW4 to the off position).

The Update*Xpress* System Pack Installer

The Update*Xpress* System Pack Installer detects supported and installed device drivers and firmware in the server and installs available updates.

For additional information and to download the Update*Xpress* System Pack Installer, go to the ToolsCenter for System x and BladeCenter at http://publib.boulder.ibm.com/infocenter/toolsctr/v1r0/ and click **UpdateXpress System Pack Installer**.

Changing the Power Policy option to the default settings after loading UEFI defaults

The default settings for the Power Policy option are set by the IMM2.1.

To change the Power Policy option to the default settings, complete the following steps.

Step 1. Turn on the server.

> **Note:** Approximately 20 seconds after the server is connected to AC power, the power-control button becomes active.

Step 2. When the prompt `<F1> Setup` is displayed, press `F1`. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

Step 3. Select **System Settings ➔ Integrated Management Module**, then set **Power Restore Policy** setting to `Restore`.

Step 4. Go back to **System Configuration and Boot Management ➔ Save Settings**.

Step 5. Go back and check the **Power Policy** setting to verify that it is set to `Restore` (the default).

Attention: If you set an administrator password and then forget it, there is no way to change, override, or remove it. You must replace the system board.

Using the Integrated Management Module II (IMM2)

The Integrated Management Module II (IMM2) is a second generation of the functions that were formerly provided by the baseboard management controller hardware. It combines service processor functions, video controller, and remote presence function in a single chip.

The IMM2.1 supports the following basic systems-management features:

- Active Energy Manager.
- Alerts (in-band and out-of-band alerting, PET traps - IPMI style, SNMP, e-mail).
- Auto Boot Failure Recovery (ABR).
- Automatic microprocessor disable on failure and restart in a two-microprocessor configuration when one microprocessor signals an internal error. When one of the microprocessors fail, the server will disable the failing microprocessor and restart with the other microprocessor.
- Automatic Server Restart (ASR) when POST is not complete or the operating system hangs and the operating system watchdog timer times-out. The IMM2.1 might be configured to watch for the operating system watchdog timer and reboot the system after a timeout, if the ASR feature is enabled. Otherwise, the IMM2.1 allows the administrator to generate a nonmaskable interrupt (NMI) by pressing an NMI button on the light path diagnostics panel for an operating-system memory dump. ASR is supported by IPMI.
- A virtual media key, which enables remote presence support (remote video, remote keyboard/mouse, and remote storage).
- Boot sequence manipulation.
- Command-line interface.
- Configuration save and restore.
- DIMM error assistance. The Unified Extensible Firmware Interface (UEFI) disables a failing DIMM that is detected during POST, and the IMM2.1 lights the associated system error LED and the failing DIMM error LED.
- Environmental monitor with fan speed control for temperature, voltages, fan failure, power supply failure, and power backplane failure.
- Intelligent Platform Management Interface (IPMI) Specification V2.0 and Intelligent Platform Management Bus (IPMB) support.
- Invalid system configuration (CONFIG) LED support.
- Light path diagnostics LEDs indicators to report errors that occur with fans, power supplies, microprocessor, hard disk drives, and system errors.
- Local firmware code flash update
- Nonmaskable interrupt (NMI) detection and reporting.
- Operating-system failure blue screen capture.
- PCI configuration data.
- Power/reset control (power-on, hard and soft shutdown, hard and soft reset, schedule power control).
- Query power-supply input power.
- ROM-based IMM2.1 firmware flash updates.
- Serial over LAN (SOL).
- Serial port redirection over telnet or ssh.
- SMI handling
- System event log (SEL) - user readable event log.

The IMM2.1 also provides the following remote server management capabilities through the ipmitool, a management utility program:

- **Command-line interface (IPMI Shell)**

  The command-line interface provides direct access to server management functions through the IPMI 2.0 protocol. Use the command-line interface to issue commands to control the server power, view system information, and identify the server. You can also save one or more commands as a text file and run the file as a script.

- **Serial over LAN**

  Establish a Serial over LAN (SOL) connection to manage servers from a remote location. You can remotely view and change the UEFI settings, restart the server, identify the server, and perform other management functions. Any standard Telnet client application can access the SOL connection.

For more information about IMM2.1, see the *Integrated Management Module II User's Guide* at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=migr-5086346.

Using the remote presence and blue-screen capture features

The remote presence and blue-screen capture features are integrated functions of the Integrated Management Module II (IMM2).

The remote presence feature provides the following functions:

- Remotely viewing video with graphics resolutions up to 1600 x 1200 at 75 Hz, regardless of the system state
- Remotely accessing the server, using the keyboard and mouse from a remote client
- Mapping the CD or DVD drive, diskette drive, and USB flash drive on a remote client, and mapping ISO and diskette image files as virtual drives that are available for use by the server
- Uploading a diskette image to the IMM2.1 memory and mapping it to the server as a virtual drive

The blue-screen capture feature captures the video display contents before the IMM2.1 restarts the server when the IMM2.1 detects an operating-system hang condition. A system administrator can use the blue-screen capture to assist in determining the cause of the hang condition.

Obtaining the IMM2.1 host name

Use this information to obtain the IMM2.1 host name.

If you are logging on to the IMM2.1 for the first time after installation, the IMM2.1 defaults to DHCP. If a DHCP server is not available, the IMM2.1 uses a static IP address of 192.168.70.125. The default IPv4 host name is "IMM-" (plus the last 12 characters on the IMM2.1 MAC address). The default host name also comes on the IMM2.1 network access tag that comes attached to the power supply on the rear of the server. The IMM2.1 network access tag provides the default host name of the IMM2.1 and does not require you to start the server.

The IPv6 link-local address (LLA) is derived from the IMM2.1 default host name. The IMM2.1 LLA is on the IMM2.1 network access tag is on the power supply on the rear of the server. To derive the link-local address, complete the following steps:

Step 1. Take the last 12 characters on the IMM2.1 MAC address (for example, 5CF3FC5EAAD0).

Step 2. Separate the number into pairs of hexadecimal characters (for example, 5C:F3:FC:5E:AA:D0).

Step 3. Separate the first six and last six hexadecimal characters.

Step 4. Add "FF" and "FE" in the middle of the 12 characters (for example, 5C F3 FC FF FE 5E AA D0).

Step 5. Convert the first pair of hexadecimal characters to binary (for example, 5=0101, C=1100, which results in 01011100 F3 FC FF FE 5E AA D0).

Step 6. Flip the 7th binary character from left (0 to 1 or 1 to 0), which results in 01011110 F3 FF FE 5E AA D0.

Step 7. Convert the binary back to hexadecimal (for example, 5E F3FCFFFE5EAAD0).

Obtaining the IP address for the IMM2.1

Use this information to obtain the IP address for the IMM2.1.

To access the web interface to use the remote presence feature, you need the IP address or host name of the IMM2.1. You can obtain the IMM2.1 IP address through the Setup utility and you can obtain the IMM2.1 host name from the IMM2.1 network access tag. The server comes with a default IP address for the IMM2.1 of 192.168.70.125.

To obtain the IP address, complete the following steps:

Step 1. Turn off the server.

Note: Approximately 5 to 10 seconds after the server is connected to power, the power-control button becomes active.

Step 2. When the prompt `<F1> Setup` is displayed, press `F1`. (This prompt is displayed on the screen for only a few seconds. You must press `F1` quickly.) If you have set both a power-on password and an administrator password, you must type the administrator password to access the full Setup utility menu.

Step 3. From the Setup utility main menu, select **System Settings**.

Step 4. On the next screen, select **Integrated Management Module**.

Step 5. On the next screen, select **Network Configuration**.

Step 6. Find the IP address and write it down.

Step 7. Exit from the Setup utility.

Logging on to the web interface

Use this information to log on to the web interface.

To log on to the IMM2.1 web interface, complete the following steps:

Step 1. On a system that is connected to the server, open a web browser. In the **Address** or **URL** field, type the IP address or host name of the IMM2.1 to which you want to connect.

Note: If you are logging on to the IMM2.1 for the first time after installation, the IMM2.1 defaults to DHCP. If a DHCP host is not available, the IMM2.1 assigns a static IP address of 192.168.70.125. The IMM2.1 network access tag provides the default host name of the IMM2.1 and does not require you to start the server.

Step 2. On the Login page, type the user name and password. If you are using the IMM2.1 for the first time, you can obtain the user name and password from your system administrator. All login attempts are documented in the system-event log.

Note: The IMM2.1 is set initially with a user name of USERID and password of PASSW0RD (with a zero, not a the letter O). You have read/write access. You must change the default password the first time you log on.

Step 3. Click **Log in** to start the session. The System Status and Health page provides a quick view of the system status.

Note: If you boot to the operating system while in the IMM2.1 GUI and the message "Booting OS or in unsupported OS" is displayed under **System Status ➔ System State**, disable Windows 2008 or 2012 firewall or type the following command in the Windows 2008 or 2012 console. This might also affect blue-screen capture features.

```
netsh firewall set icmpsetting type=8 mode=ENABLE
```

By default, the icmp packet is blocked by Windows firewall. The IMM2.1 GUI will then change to "OS booted" status after you change the setting as indicated above in both the Web and CLI interfaces.

Using the embedded hypervisor

The VMware ESXi embedded hypervisor software is available on the optional Lenovo USB flash device with embedded hypervisor.

The USB flash device can be installed in USB connectors on the system board (see "Internal cable routing and connectors" on page 34 for the location of the connectors). Hypervisor is virtualization software that enables multiple operating systems to run on a host system at the same time. The USB flash device is required to activate the hypervisor functions.

To start using the embedded hypervisor functions, you must add the USB flash device to the startup sequence in the Setup utility.

To add the USB flash device to the startup sequence, complete the following steps:

Step 1. Turn on the server.

> **Note:** Approximately 5 to 10 seconds after the server is connected to power, the power-control button becomes active.

Step 2. When the prompt `<F1> Setup` is displayed, press `F1`.

Step 3. From the Setup utility main menu, select **Boot Manager**.

Step 4. Select **Add Boot Option**; then, select **Generic Boot Option → Embedded Hypervisor**. Press Enter, and then select Esc.

Step 5. Select **Change Boot Order → Change the order**. Use the Up arrow and Down Arrow keys to select **Embedded Hypervisor** and use the plus (+) and minus (-) keys to move Embedded Hypervisor in the boot order. When **Embedded Hypervisor** is in the correct location in the boot order, press Enter. Select **Commit Changes** and press Enter.

Step 6. Select **Save Settings** and then select **Exit Setup**.

If the embedded hypervisor flash device image becomes corrupt, you can download the image from http://www.ibm.com/systems/x/os/vmware/esxi/.

For additional information and instructions, see VMware vSphere 4.1 Documentation at http://www.vmware.com/support/ pubs/vs_pages/vsp_pubs_esxi41_e_vc41.html or the *VMware vSphere Installation and Setup Guide* at http://pubs.vmware.com/vsphere-50/topic/ com.vmware.ICbase/PDF/vsphere-esxi-vcenter-server-50-installation-setup-guide.pdf.

Configuring the Ethernet controller

Use this information to configure the Ethernet controller.

The Ethernet controllers are integrated on the system board. They provide an interface for connecting to a 10 Mbps, 100 Mbps, or 1 Gbps network and provide full-duplex (FDX) capability, which enables simultaneous transmission and reception of data on the network. If the Ethernet ports in the server support auto-negotiation, the controllers detect the data-transfer rate (10BASE-T, 100BASE-TX, or 1000BASE-T) and duplex mode (full-duplex or half-duplex) of the network and automatically operate at that rate and mode.

You do not have to set any jumpers or configure the controllers. However, you must install a device driver to enable the operating system to address the controllers.

To find device drivers and information about configuring the Ethernet controllers, go to http://www.lenovo.com/support.

Enabling Features on Demand Ethernet software

Use this information to enable Features on Demand Ethernet software.

You can activate the Features on Demand (FoD) software upgrade key for Fibre Channel over Ethernet (FCoE) and iSCSI storage protocols that is integrated in the Integrated Management Module II (IMM2). For more information and instructions for activating the Features on Demand Ethernet software key, see the *Features on Demand User's Guide*. To download the document, go to http://www.ibm.com/systems/x/fod/, log in, and click **Help**.

Enabling Features on Demand RAID software

Use this information to enable Features on Demand RAID software.

You can activate the Features on Demand (FoD) software upgrade key for RAID that is integrated in the integrated management module. For more information and instructions for activating the Features on Demand RAID software key, see the *Features on Demand User's Guide*. To download the document, go to http://www.ibm.com/systems/x/fod/, log in, and click **Help**.

Configuring RAID arrays

Use the Setup utility to configure the RAID arrays.

The specific procedure for configuring arrays depends on the RAID controller that you are using. For details, see the documentation for your RAID controller. To access the utility for your RAID controller, complete the following steps:

Step 1.   Turn on the server.

        Note: Approximately 10 seconds after the server is connected to power, the power-control button becomes active.

Step 2.   When prompted, `<F1 Setup>` is displayed, press F1. If you have set an administrator password, you must type the administrator password to access the full Setup utility menu. If you do not type the administrator password, a limited Setup utility menu is available.

Step 3.   Select **System Settings ➙ Storage**.

Step 4.   Press Enter to refresh the list of device drivers.

Step 5.   Select the device driver for your RAID controller and press Enter.

Step 6.   Follow the instructions in the documentation for your RAID controller.

Advanced Settings Utility program

The Advanced Settings Utility (ASU) program is an alternative to the Setup utility for modifying UEFI settings.

Use the ASU program online or out of band to modify UEFI settings from the command line without the need to restart the system to access the Setup utility.

You can also use the ASU program to configure the optional remote presence features or other IMM2.1 settings. The remote presence features provide enhanced systems-management capabilities.

In addition, the ASU program provides IMM2.1 LAN over USB interface configuration through the command-line interface.

Use the command-line interface to issue setup commands. You can save any of the settings as a file and run the file as a script. The ASU program supports scripting environments through a batch-processing mode.

For more information and to download the ASU program, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-ASU.

Updating Systems Director

Use this information to update the Systems Director.

If you plan to use Systems Director to manage the server, you must check for the latest applicable Systems Director updates and interim fixes.

Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

Installing a newer version

To locate and install a newer version of Systems Director, complete the following steps:

Step 1. Check for the latest version of Systems Director:

    a. Go to http://www.ibm.com/systems/software/director/resources.html.

    b. If a newer version of Systems Director than what comes with the server is shown in the drop-down list, follow the instructions on the web page to download the latest version.

Step 2. Install the Systems Director program.

Installing updates with your management server is connected to the Internet

If your management server is connected to the Internet, to locate and install updates and interim fixes, complete the following steps:

Step 1. Make sure that you have run the Discovery and Inventory collection tasks.

Step 2. On the Welcome page of the Systems Director web interface, click **View updates**.

Step 3. Click **Check for updates**. The available updates are displayed in a table.

Step 4. Select the updates that you want to install, and click Install to start the installation wizard.

Installing updates with your management server is not connected to the Internet

If your management server is not connected to the Internet, to locate and install updates and interim fixes, complete the following steps:

Step 1. Make sure that you have run the Discovery and Inventory collection tasks.

Step 2. On a system that is connected to the Internet, go to http://www.ibm.com/support/fixcentral.

Step 3. From the **Product family** list, select **Systems Director**.

Step 4. From the **Product** list, select **Systems Director**.

Step 5. From the **Installed version** list, select the latest version, and click**Continue**.

Step 6. Download the available updates.

Step 7. Copy the downloaded files to the management server.

Step 8. On the management server, on the Welcome page of the Systems Director web interface, click the **Manage** tab, and click **Update Manager**.

Step 9. Click **Import updates** and specify the location of the downloaded files that you copied to the management server.

Step 10. Return to the Welcome page of the Web interface, and click **View updates**.

Step 11. Select the updates that you want to install, and click **Install** to start the installation wizard.

Updating the Universal Unique Identifier (UUID)

The Universal Unique Identifier (UUID) must be updated when the system board is replaced. Use the Advanced Settings Utility to update the UUID in the UEFI-based server.

The ASU is an online tool that supports several operating systems. Make sure that you download the version for your operating system. You can download the ASU from the Web site. To download the ASU and update the UUID, complete the following steps.

Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

Step 1. Download the Advanced Settings Utility (ASU):

   a. Go to http://www.lenovo.com/support.

   b. Click on the **Downloads** tab at the top of the panel.

   c. Under **ToolsCenter**, select **View ToolsCenter downloads**.

   d. Select **Advanced Settings Utility (ASU)**.

   e. Scroll down and click on the link and download the ASU version for your operating system.

Step 2. ASU sets the UUID in the Integrated Management Module II (IMM2). Select one of the following methods to access the Integrated Management Module II (IMM2) to set the UUID:

   • Online from the target system (LAN or keyboard console style (KCS) access)

   • Remote access to the target system (LAN based)

   • Bootable media containing ASU (LAN or KCS, depending upon the bootable media)

Step 3. Copy and unpack the ASU package, which also includes other required files, to the server. Make sure that you unpack the ASU and the required files to the same directory. In addition to the application executable (asu or asu64), the following files are required:

   • For Windows based operating systems:

      – *IBM_rndis_server_os.inf*

      – *device.cat*

   • For Linux based operating systems:

      – *cdc_interface.sh*

Step 4. After you install ASU, use the following command syntax to set the UUID:

```
asu set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value> [access_method]
```

Where:

<uuid_value>
      Up to 16-byte hexadecimal value assigned by you.

[access_method]
      The access method that you selected to use from the following methods:

   • Online authenticated LAN access, type the command:

      ```
      [host <imm_internal_ip>] [user <imm_user_id>][password <imm_password>]
      ```

Where:

imm_internal_ip
The IMM2.1 internal LAN/USB IP address. The default value is 169.254.95.118.

imm_user_id
The IMM2.1`account` (1 of 12 accounts). The default value is USERID.

imm_password
The IMM2.1 account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).

Note: If you do not specify any of these parameters, ASU will use the default values. When the default values are used and ASU is unable to access the IMM2.1 using the online authenticated LAN access method, ASU will automatically use the unauthenticated KCS access method.

The following commands are examples of using the userid and password default values and not using the default values:

Example that does not use the userid and password default values:
```
asu set SYSTEM_PROD_DATA.SYsInfoUUID <uuid_value> –user <user_id>
–password <password>
```

Example that does use the userid and password default values:
```
asu set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value>
```

- Online KCS access (unauthenticated and user restricted):

  You do not need to specify a value for *access_method* when you use this access method.

  Example:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value>
  ```

  The KCS access method uses the IPMI/KCS interface. This method requires that the IPMI driver be installed. Some operating systems have the IPMI driver installed by default. ASU provides the corresponding mapping layer. See the *Advanced Settings Utility Users Guide* for more details. You can access the ASU Users Guide from the website.

  Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

  1. Go to http://www.lenovo.com/support.
  2. Click on the **Downloads** tab at the top of the panel.
  3. Under **ToolsCenter**, select **View ToolsCenter downloads**.
  4. Select **Advanced Settings Utility (ASU)**.
  5. Scroll down and click on the link and download the ASU version for your operating system. Scroll down and look under **Online Help** to download the *Advanced Settings Utility Users Guide*.

- Remote LAN access, type the command:

  Note: When using the remote LAN access method to access IMM2.1 using the LAN from a client, the *host* and the *imm_external_ip* address are required parameters.

  ```
  host <imm_external_ip> [user <imm_user_id>][password <imm_password>]
  ```
  Where:

imm_external_ip
The external IMM2.1 LAN IP address. There is no default value. This parameter is required.

imm_user_id
The IMM2.1`account` (1 of 12 accounts). The default value is USERID.

imm_password
> The IMM2.1 account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).

The following commands are examples of using the userid and password default values and not using the default values:

Example that does not use the userid and password default values:
```
asu set SYSTEM_PROD_DATA.SYsInfoUUID <uuid_value> -host <imm_ip>
-user <user_id> -password <password>
```

Example that does use the userid and password default values:
```
asu set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value> -host <imm_ip>
```

- Bootable media:

  You can also build a bootable media using the applications available through the ToolsCenter website at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-CENTER. From the **ToolsCenter** page, scroll down for the available tools.

Step 5. Restart the server.

Updating the DMI/SMBIOS data

Use this information to update the DMI/SMBIOS data.

The Desktop Management Interface (DMI) must be updated when the system board is replaced. Use the Advanced Settings Utility to update the DMI in the UEFI-based server. The ASU is an online tool that supports several operating systems. Make sure that you download the version for your operating system. You can download the ASU from the website. To download the ASU and update the DMI, complete the following steps.

Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

Step 1. Download the Advanced Settings Utility (ASU):

   a. Go to http://www.lenovo.com/support.

   b. Click **Downloads** tab at the top of the panel.

   c. Under **ToolsCenter**, select **View ToolsCenter downloads**.

   d. Select **Advanced Settings Utility (ASU)**.

   e. Scroll down and click on the link and download the ASU version for your operating system.

Step 2. ASU sets the DMI in the Integrated Management Module II (IMM2). Select one of the following methods to access the Integrated Management Module II (IMM2) to set the DMI:

   - Online from the target system (LAN or keyboard console style (KCS) access)

   - Remote access to the target system (LAN based)

   - Bootable media containing ASU (LAN or KCS, depending upon the bootable media)

Step 3. Copy and unpack the ASU package, which also includes other required files, to the server. Make sure that you unpack the ASU and the required files to the same directory. In addition to the application executable (asu or asu64), the following files are required:

   - For Windows based operating systems:

     – *IBM_rndis_server_os.inf*

     – *device.cat*

   - For Linux based operating systems:

– *cdc_interface.sh*

Step 4. After you install ASU, Type the following commands to set the DMI:

```
asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model> [access_method]
asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> [access_method]
asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag> [access_method]
```

Where:

<m/t_model>
   The server machine type and model number. Type `mtm xxxxyyy`, where *xxxx* is the machine type and *yyy* is the server model number.

<s/n>
   The serial number on the server. Type `sn zzzzzzz`, where *zzzzzzz* is the serial number.

<asset_method>
   The server asset tag number. Type `asset aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa`, where *aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa* is the asset tag number.

[access_method]
   The access method that you select to use from the following methods:

- Online authenticated LAN access, type the command:

  `[host <imm_internal_ip>] [user <imm_user_id>][password <imm_password>]`

  Where:

  imm_internal_ip
     The IMM2.1 internal LAN/USB IP address. The default value is 169.254.95.118.

  imm_user_id
     The IMM2.1 `account` (1 of 12 accounts). The default value is USERID.

  imm_password
     The IMM2.1 account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).

  Note: If you do not specify any of these parameters, ASU will use the default values. When the default values are used and ASU is unable to access the IMM2.1 using the online authenticated LAN access method, ASU will automatically use the unauthenticated KCS access method.

  The following commands are examples of using the userid and password default values and not using the default values:

  Examples that do not use the userid and password default values:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model>
  –user <imm_user_id> –password <imm_password>
  asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> –user <imm_user_id>
  –password <imm_password>
  asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag>
  –user <imm_user_id> –password <imm_password>
  ```

  Examples that do use the userid and password default values:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model>
  asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n>
  asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag>
  ```

- Online KCS access (unauthenticated and user restricted):

  You do not need to specify a value for *access_method* when you use this access method.

The KCS access method uses the IPMI/KCS interface. This method requires that the IPMI driver be installed. Some operating systems have the IPMI driver installed by default. ASU provides the corresponding mapping layer. To download the *Advanced Settings Utility Users Guide*, complete the following steps:

Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

1. Go to http://www.lenovo.com/support.
2. Click **Downloads** tab at the top of the panel.
3. Under **ToolsCenter**, select **View ToolsCenter downloads**.
4. Select **Advanced Settings Utility (ASU)**.
5. Scroll down and click on the link and download the ASU version for your operating system. Scroll down and look under **Online Help** to download the *Advanced Settings Utility Users Guide*.

- The following commands are examples of using the userid and password default values and not using the default values:

  Examples that do not use the userid and password default values:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model>
  asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n>
  asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag>
  ```

- Remote LAN access, type the command:

  Note: When using the remote LAN access method to access IMM2.1 using the LAN from a client, the *host* and the *imm_external_ip* address are required parameters.

  ```
  host <imm_external_ip> [user <imm_user_id>][password <imm_password>]
  ```

  Where:

  imm_external_ip
  > The external IMM2.1 LAN IP address. There is no default value. This parameter is required.

  imm_user_id
  > The IMM2.1 `account` (1 of 12 accounts). The default value is USERID.

  imm_password
  > The IMM2.1 account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).

  The following commands are examples of using the userid and password default values and not using the default values:

  Examples that do not use the userid and password default values:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model> -host <imm_ip>
  -user <imm_user_id> -password <imm_password>
  asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> -host <imm_ip>
  -user <imm_user_id> -password <imm_password>
  asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag> -host <imm_ip>
  -user <imm_user_id> -password <imm_password>
  ```

  Examples that do use the userid and password default values:
  ```
  asu set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model> -host <imm_ip>
  asu set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> -host <imm_ip>
  asu set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag> -host <imm_ip>
  ```

- Bootable media:

You can also build a bootable media using the applications available through the ToolsCenter website at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-CENTER. From the **ToolsCenter** page, scroll down for the available tools.

Step 5. Restart the server.

Chapter 4. Troubleshooting

This chapter describes the diagnostic tools and troubleshooting information that are available to help you solve problems that might occur in the server.

If you cannot diagnose and correct a problem by using the information in this chapter, see Appendix D "Getting help and technical assistance" on page 1265 for more information.

Start here

You can solve many problems without outside assistance by following the troubleshooting procedures in this documentation and on the World Wide Web.

This document describes the diagnostic tests that you can perform, troubleshooting procedures, and explanations of error messages and error codes. The documentation that comes with your operating system and software also contains troubleshooting information.

Diagnosing a problem

Before you contact IBM or an approved warranty service provider, follow these procedures in the order in which they are presented to diagnose a problem with your server.

Step 1. **Return the server to the condition it was in before the problem occurred.**

If any hardware, software, or firmware was changed before the problem occurred, if possible, reverse those changes. This might include any of the following items:

- Hardware components
- Device drivers and firmware
- System software
- UEFI firmware
- System input power or network connections

Step 2. **View the light path diagnostics LEDs and event logs.**

The server is designed for ease of diagnosis of hardware and software problems.

- **Light path diagnostics LEDs:** See "Light path diagnostics LEDs" on page 129 for information about using light path diagnostics LEDs.
- **Event logs:** See "Event logs" on page 134 for information about notification events and diagnosis.
- **Software or operating-system error codes:** See the documentation for the software or operating system for information about a specific error code. See the manufacturer's website for documentation.

Step 3. **Run Dynamic System Analysis (DSA) and collect system data.**

Run Dynamic System Analysis (DSA) to collect information about the hardware, firmware, software, and operating system. Have this information available when you contact IBM or an approved warranty service provider. For instructions for running DSA, see the *Dynamic System Analysis Installation and User's Guide*.

To download the latest version of DSA code and the *Dynamic System Analysis Installation and User's Guide*, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-DSA.

Step 4. **Check for and apply code updates.**

Fixes or workarounds for many problems might be available in updated UEFI firmware, device firmware, or device drivers. To display a list of available updates for the server, go to http://www.ibm.com/support/fixcentral.

Attention: Installing the wrong firmware or device-driver update might cause the server to malfunction. Before you install a firmware or device-driver update, read any readme and change history files that are provided with the downloaded update. These files contain important information about the update and the procedure for installing the update, including any special procedure for updating from an early firmware or device-driver version to the latest version.

Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

a. **Install UpdateXpress system updates.**

You can install code updates that are packaged as an UpdateXpress System Pack or UpdateXpress CD image. An UpdateXpress System Pack contains an integration-tested bundle of online firmware and device-driver updates for your server. In addition, you can use ToolsCenter Bootable Media Creator to create bootable media that is suitable for applying firmware updates and running preboot diagnostics. For more information about UpdateXpress System Packs, see http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-XPRESS and "Updating the firmware" on page 97. For more information about the Bootable Media Creator, see http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-BOMC.

Be sure to separately install any listed critical updates that have release dates that are later than the release date of the UpdateXpress System Pack or UpdateXpress image (see b. on page 122).

b. **Install manual system updates.**

1. **Determine the existing code levels.**

In DSA, click **Firmware/VPD** to view system firmware levels, or click **Software** to view operating-system levels.

2. **Download and install updates of code that is not at the latest level.**

To display a list of available updates for the server, go to http://www.ibm.com/support/fixcentral.

When you click an update, an information page is displayed, including a list of the problems that the update fixes. Review this list for your specific problem; however, even if your problem is not listed, installing the update might solve the problem.

Step 5. **Check for and correct an incorrect configuration.**

If the server is incorrectly configured, a system function can fail to work when you enable it; if you make an incorrect change to the server configuration, a system function that has been enabled can stop working.

a. **Make sure that all installed hardware and software are supported.**

See http://www.lenovo.com/us/en/ serverproven/ to verify that the server supports the installed operating system, optional devices, and software levels. If any hardware or software component is not supported, uninstall it to determine whether it is causing the problem.

You must remove nonsupported hardware before you contact IBM or an approved warranty service provider for support.

b. **Make sure that the server, operating system, and software are installed and configured correctly.**

Many configuration problems are caused by loose power or signal cables or incorrectly seated adapters. You might be able to solve the problem by turning off the server, reconnecting cables, reseating adapters, and turning the server back on. For information about performing the checkout procedure, see "About the checkout procedure" on page 124. For information about configuring the server, see Chapter 3 "Configuration information and instructions" on page 97.

Step 6. **See controller and management software documentation.**

If the problem is associated with a specific function (for example, if a RAID hard disk drive is marked offline in the RAID array), see the documentation for the associated controller and management or controlling software to verify that the controller is correctly configured.

Problem determination information is available for many devices such as RAID and network adapters.

For problems with operating systems or software or devices, go to http://www.lenovo.com/support.

Step 7. **Check for troubleshooting procedures and RETAIN tips.**Troubleshooting procedures and RETAIN tips document known problems and suggested solutions. To search for troubleshooting procedures and RETAIN tips, go to http://www.lenovo.com/support.

Step 8. **Use the troubleshooting tables.**

See "Troubleshooting by symptom" on page 140 to find a solution to a problem that has identifiable symptoms.

A single problem might cause multiple symptoms. Follow the troubleshooting procedure for the most obvious symptom. If that procedure does not diagnose the problem, use the procedure for another symptom, if possible.

If the problem remains, contact IBM or an approved warranty service provider for assistance with additional problem determination and possible hardware replacement. To open an online service request, go to http://www.ibm.com/support/entry/portal/Open_service_request. Be prepared to provide information about any error codes and collected data.

Undocumented problems

If you have completed the diagnostic procedure and the problem remains, the problem might not have been previously identified by IBM. After you have verified that all code is at the latest level, all hardware and software configurations are valid, and no light path diagnostics LEDs or log entries indicate a hardware component failure, contact IBM or an approved warranty service provider for assistance.

To open an online service request, go to http://www.ibm.com/support/entry/portal/Open_service_request. Be prepared to provide information about any error codes and collected data and the problem determination procedures that you have used.

Service bulletins

Lenovo continually updates the support website with the latest tips and techniques that you can use to solve problem that you might have with the Lenovo System x3500 M5 server.

To find service bulletins that are available for the Lenovo System x3500 M5 server, go to
http://www.lenovo.com/support and search for 7383, and retain.

Checkout procedure

The checkout procedure is the sequence of tasks that you should follow to diagnose a problem in the server.

About the checkout procedure

Before you perform the checkout procedure for diagnosing hardware problems, review the following information.

- Read the safety information that begins on page "Safety" on page v.
- Dynamic System Analysis (DSA) provides the primary methods of testing the major components of the server, such as the system board, Ethernet controller, keyboard, mouse (pointing device), serial ports, and hard disk drives. You can also use them to test some external devices. If you are not sure whether a problem is caused by the hardware or by the software, you can use the diagnostic programs to confirm that the hardware is working correctly.
- When you run DSA, a single problem might cause more than one error message. When this happens, correct the cause of the first error message. The other error messages usually will not occur the next time you run DSA.

    Important: If multiple error codes or light path diagnostics LEDs indicate a microprocessor error, the error might be in the microprocessor or in the microprocessor socket. See "Microprocessor problems" on page 145 for information about diagnosing microprocessor problems.

- Before you run DSA, you must determine whether the failing server is part of a shared hard disk drive cluster (two or more servers sharing external storage devices). If it is part of a cluster, you can run all diagnostic programs except the ones that test the storage unit (that is, a hard disk drive in the storage unit) or the storage adapter that is attached to the storage unit. The failing server might be part of a cluster if any of the following conditions is true:
    - You have identified the failing server as part of a cluster (two or more servers sharing external storage devices).
    - One or more external storage units are attached to the failing server and at least one of the attached storage units is also attached to another server or unidentifiable device.
    - One or more servers are located near the failing server.

    Important: If the server is part of a shared hard disk drive cluster, run one test at a time. Do not run any suite of tests, such as "quick" or "normal" tests, because this might enable the hard disk drive diagnostic tests.

- If the server is halted and a POST error code is displayed, see Appendix B "UEFI (POST) error codes" on page 1083. If the server is halted and no error message is displayed, see "Troubleshooting by symptom" on page 140 and "Solving undetermined problems" on page 153.
- For information about power-supply problems, see "Solving power problems" on page 152, "Power problems" on page 148, and "Power-supply LEDs" on page 132.
- For intermittent problems, check the event log; see "Event logs" on page 134 and Appendix C "DSA diagnostic test results" on page 1107.

Performing the checkout procedure

Use this information to perform the checkout procedure.

To perform the checkout procedure, complete the following steps:

Step 1.   Is the server part of a cluster?

- **No:** Go to Step 2 on page 125.
- **Yes:** Shut down all failing servers that are related to the cluster. Go to Step 2 on page 125.

Step 2.   Complete the following steps:

a.   Check the power supply LEDs (see "Power-supply LEDs" on page 132).

b.   Turn off the server and all external devices.

c.   Check all internal and external devices for compatibility at http://www.lenovo.com/us/en/serverproven/.

d.   Check all cables and power cords.

e.   Set all display controls to the middle positions.

f.   Turn on all external devices.

g.   Turn on the server. If the server does not start, see "Troubleshooting by symptom" on page 140.

h.   Check the system-error LED on the operator information panel. If it is lit, check the light path diagnostics LEDs (see "Light path diagnostics" on page 127).

i.   Check for the following results:

- Successful completion of POST (see "POST" on page 137 for more information).
- Successful completion of startup, which is indicated by a readable display of the operating-system desktop.

Step 3.   Is there a readable image on the monitor screen?

- **No:** Find the failure symptom in "Troubleshooting by symptom" on page 140; if necessary, see "Solving undetermined problems" on page 153.
- **Yes:** Run DSA (see "Running DSA Preboot diagnostic programs" on page 138).
  - If DSA reports an error, follow the instructions in Appendix C "DSA diagnostic test results" on page 1107.
  - If DSA does not report an error but you still suspect a problem, see "Solving undetermined problems" on page 153.

Diagnostic tools

The following tools are available to help you diagnose and solve hardware-related problems.

- **Light path diagnostics**

  Use light path diagnostics to diagnose system errors quickly. See "Light path diagnostics" on page 127 for more information.

- **Event logs**

  The event logs list the error codes and messages that are generated when an error is detected for the subsystems IMM2.1, POST, DSA, and the server baseboard management controller. See "Event logs" on page 134 for more information.

- **Integrated Management Module II (IMM2)**

  The Integrated Management Module II (IMM2) combines service processor functions, video controller, and remote presence and blue-screen capture features in a single chip. The IMM2.1 provides advanced service-processor control, monitoring, and alerting function. If an environmental condition exceeds a threshold or if a system component fails, the IMM2.1 lights LEDs to help you diagnose the problem, records the error in the IMM2.1 event log, and alerts you to the problem. Optionally, the IMM2.1 also provides a virtual presence capability for remote server management capabilities. The IMM2.1 provides remote server management through the following industry-standard interfaces:

- Intelligent Platform Management Protocol (IPMI) version 2.0

- Simple Network Management Protocol (SNMP) version 3

- Common Information Model (CIM)

- Web browser

For more information about the Integrated Management Module II (IMM2), see "Using the Integrated Management Module II (IMM2)" on page 108, Appendix A "Integrated Management Module II (IMM2) error messages" on page 285, and the *Integrated Management Module II User's Guide* at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=migr-5086346.

- **Dynamic System Analysis**

  Two editions of Dynamic System Analysis (DSA) are available for diagnosing problems, DSA Portable and DSA Preboot:

  - DSA Portable

    DSA Portable collects and analyzes system information to aid in diagnosing server problems. DSA Portable runs on the server operating system and collects the following information about the server:

    - Drive health information

    - Event logs for ServeRAID controllers and service processors

    - IMM2.1 configuration information

    - IMM2.1 environmental information

    -

    - Installed hardware, including PCI and USB information

    - Installed applications and hot fixes

    - Kernel modules

    - Light path diagnostics status

    - Microprocessor, input/out hub, and UEFI error logs

    - Network interfaces and settings

    - Option card driver and firmware information

    - RAID controller configuration

    - Service processor (Integrated Management Module II (IMM2)) status and configuration

    - System configuration

    - Vital product data, firmware, and UEFI configuration

    DSA Portable creates a DSA log, which is a chronologically ordered merge of the system-event log (as the IPMI event log), the Integrated Management Module II (IMM2) event log (as the ASM event log), and the operating-system event logs. You can send the DSA log as a file to Lenovo Support (when requested by Lenovo Support) or view the information as a text file or HTML file.

    Note: Use the latest available version of DSA to make sure you are using the most recent configuration data. For documentation and download information for DSA, see http://shop.lenovo.com/us/en/systems/solutions/.

    For additional information, see " Dynamic System Analysis" on page 137 and Appendix C "DSA diagnostic test results" on page 1107.

  - DSA Preboot

    DSA Preboot diagnostic program is stored in the integrated USB memory on the server. DSA Preboot collects and analyzes system information to aid in diagnosing server problems, as well as offering a rich set of diagnostic tests of the major components of the server. DSA Preboot collects the following information about the server:

- Drive health information

- Event logs for ServeRAID controllers and service processors

- IMM2.1 configuration information

- IMM2.1 environmental information

- Installed hardware, including PCI and USB information

- Light path diagnostics status

- Microprocessor, input/output hub, and UEFI error logs

- Network interfaces and settings

- Option card driver and firmware information

- RAID controller configuration

- Service processor (Integrated Management Module II (IMM2)) status and configuration

- System configuration

- Vital product data, firmware, and UEFI configuration

DSA Preboot also provides diagnostics for the following system components (when they are installed):

1. Emulex network adapter

2. IMM2.1 I2C bus

3. Light path diagnostics panel

4. Memory modules

5. Microprocessors

6. Optical devices (CD or DVD)

7. SAS or SATA drives

8. LSI controller

9. Broadcom network adapter

10. FusionIO storage

11. Intel GPU

12. Nvidia GPU

See "Running DSA Preboot diagnostic programs" on page 138 for more information on running the DSA Preboot program on the server.

- **Troubleshooting by symptom**

These tables list problem symptoms and actions to correct the problems. See "Troubleshooting by symptom" on page 140 for more information.

Light path diagnostics

Light path diagnostics is a system of LEDs on various external and internal components of the server that leads you to the failed component. When an error occurs, LEDs are lit along the path of the front panel, the light path diagnostics panel, then on the failed component. By viewing the LEDs in a particular order, you can often identify the source of the error.

When LEDs are lit to indicate an error, they remain lit when the server is turned off, provided that the server is still connected to power and the power supply is operating correctly.

Before you work inside the server to view light path diagnostics LEDs, read the safety information "Safety" on page v and "Handling static-sensitive devices" on page 32.

If an error occurs, view the light path diagnostics LEDs in the following order:

1. Look at the operator information panel on the front of the server.

   - If the check log LED is lit, it indicates that an error or multiple errors have occurred. The sources of the errors cannot be isolated or concluded by observing the light path diagnostics LEDs directly. A further investigation into IMM2.1 system-event log or system-error log might be required.

   - If the system-error LED is lit, it indicates that an error has occurred; go to step 2.

   The following illustration shows the operator information panel.
Figure 87. Operator information panel

The following table describes the LEDs on the operator information panel and suggested actions to correct the detected problems.

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 10. The suggested actions to correct the detected problem for each LED light

LED	Description	Action
System locator (blue)	Use this LED to visually located the server among other servers. You can use Systems Director or IMM2.1 to light this LED remotely.	
Check log (yellow)	An error has occurred and cannot be isolated without performing certain procedures.	a. Check the IMM2.1 system event log and the system-error log for information about the error. b. Save the log if necessary and clear the log afterwards.
System-error (yellow)	An error has occurred.	a. Check the light path diagnostics LEDs and follow the instructions. b. Check the IMM2.1 system event log and the system-error log for information about the error. c. Save the log if necessary and clear the log afterwards.

2. Look at the light path diagnostics panel on the front of the server. Lit LEDs on the light path diagnostics panel indicate the type of error that has occurred. The light path diagnostics panel LEDs are visible through the bezel. See "Light path diagnostics LEDs" on page 129. Look at the system service label on the top of the server, which gives an overview of internal components that correspond to the LEDs on the light path diagnostics panel. This information can often provide enough information to diagnose the error.

Light path diagnostics LEDs

The following table describes the LEDs on the light path diagnostics panel and suggested actions to correct the detected problems.

Look at the light path diagnostics panel on the front of the server. Lit LEDs on the light path diagnostics panel indicate the type of error that has occurred. The light path diagnostics panel LEDs are visible through the bezel.

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 11. Light path diagnostics panel LEDs
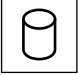

LED	Description	Action

Hard disk drive/ RAID	A hard disk drive has failed or is missing. A SAS controller or a ServeRAID controller error has occurred.	1. Check the LEDs on the hard disk drives for the drive with a lit status LED and reseat the hard disk drive.
		2. Reseat the hard disk drive backplane.
		3. Check the LEDs near SAS controllers or ServeRAID controllers and reseat the corresponding controllers.
		4. For more information, see the .
		5. If the error remains, replace the following components one at a time, in the order listed, restarting the server after each:
		   a. Replace the hard disk drive.
		   b. Replace the hard disk drive backplane.
		   c. Replace the SAS controller.
		   d. Replace the ServeRAID controller.
		6. If the problem remains, go to http://www.lenovo.com/support.

Fan	A fan has failed, is operating too slowly, or has been removed. The TEMP LED might also be lit.	1. Open the fan cage cover to reseat the failing fan (with lit LED). 2. Replace the failing fan (see "Installing a hot-swap fan" on page 216).
Temperature	The system temperature has exceeded a threshold level. A failing fan can cause the Temperature LED to be lit.	1. Make sure that the heat sink is seated correctly. 2. Determine whether a fan has failed. If it has failed, replace the failing fan. 3. Make sure that the room temperature is not too high. See "Server features and specifications" on page 5 for the server temperature information. 4. Make sure that the air vents are not blocked. 5. Make sure that the fan on the adapter and the network adapter is seated correctly. If it has failed, replace the failing component. 6. If the failure remains, go to http://www.lenovo.com/support.

Table 11. Light path diagnostics panel LEDs (continued)

LED	Description	Action
Microprocessor	When only the Microprocessor LED is lit, a microprocessor has failed.	If the Configuration LED is not lit, a microprocessor failure occurs, complete the following steps: 1. (Trained technician only) Make sure that the failing microprocessor and its heat sink, which are indicated by a lit LED on the system board, are installed correctly. See "Installing a microprocessor and heat sink" on page 265 for information about installation and requirements. 2. (Trained technician only) Replace the failing microprocessor (see "Installing a microprocessor and heat sink" on page 265). 3. If the failure remains, go to http://www.lenovo.com/support.
	Microprocessor + Configuration When both the Microprocessor and Configuration LEDs are lit, the microprocessor configuration is invalid.	If the Configuration LED and the Microprocessor LED are lit, the system issues an invalid microprocessor configuration error. Complete the following steps to correct the problem: 1. Check the microprocessors that were just installed to make sure that they are compatible with each other (see "Installing a microprocessor and heat sink" on page 265 for additional information about microprocessor requirements) and use the Setup utility and select System Information ® System Summary ® Processor Details to verify the microprocessors information. 2. (Trained technician only) Replace the incompatible microprocessor. 3. Check the system-error logs for information about the error. Replace any component that is identified in the error log.
Configuration	Configuration + Microprocessor A hardware configuration error has occurred.	If the Configuration LED and the Microprocessor LED are lit, complete the following steps to correct the problem: 1. Check the microprocessors that were just installed to make sure that they are compatible with each other (see "Installing a microprocessor and heat sink" on page 265 for additional information about microprocessor requirements). 2. (Trained technician only) Replace the incompatible microprocessor. 3. Check the system-event logs for information about the error (see "Event logs" on page 134). Replace any component that is identified in the error log.
	Configuration + Memory A hardware configuration error has occurred.	If the Configuration LED and the Memory LED are lit, check the system-event logs for information about the error (see "Event logs" on page 134).
	Configuration + Power supply A hardware configuration error has occurred.	If the Configuration LED and the Power supply LED are lit, the system issues an invalid power configuration error. Make sure that both power supplies installed in the server are of the same rating or wattage.

Table 11. Light path diagnostics panel LEDs (continued)

LED	Description	Action
Memory MEM	When only the Memory LED is lit, a memory error has occurred.	**Note:** Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server. If the Configuration LED is not lit, the system might detect a memory error. Complete the following steps to correct the problem: 1. Reseat or swap the DIMMs with lit LEDs. 2. Check the system-event logs for information about the error (see "Event logs" on page 134). 3. Update the server firmware to the latest level (see "Updating the firmware" on page 97 for more information). 4. Replace the failing DIMM (see "Installing a DIMM" on page 247).
	Memory + Configuration When both the Memory and Configuration LEDs are lit, the memory configuration is invalid.	If the Memory LED and the Configuration LED are lit, check the system-event logs for information about the error (see "Event logs" on page 134).
Power supply ⊿	When only the Power supply LED is lit, a power supply has failed.	If the CONFIG LED is not lit, the system might detect a power supply error. Complete the following steps to correct the problem: 1. Check the power-supply with an lit yellow LED (see "Power-supply LEDs" on page 132). 2. Make sure that the power supplies are seated correctly and plugged in a good AC outlet. 3. Remove one of the power supplies to isolate the failed power supply. 4. Make sure that both power supplies installed in the server are of the same voltage. 5. Replace the failed power supply (see "Removing a hot-swap power supply" on page 233).
	Power supply + Configuration When both the Power supply and Configuration LEDs are lit, the power supply configuration is invalid.	If the PS LED and the CONFIG LED are lit, the system issues an invalid power configuration error. Make sure that both power supplies installed in the server are of the same rating or wattage.
Over spec OVER SPEC	The power supplies are using more power than their maximum rating.	If the Over spec LED on the light path diagnostics panel is lit, complete the following steps in order until the problem is solved: 1. Add a second power supply. 2. Replace the failed power supply. 3. Remove the optional devices.

Table 11. Light path diagnostics panel LEDs (continued)

LED	Description	Action
PCI	An error has occurred on a PCI card or a PCI bus.	1. Check if any PCI slot error LED is lit to identify the component that caused the error. 2. Check the system-error log for information about the error (see "Event logs" on page 134). 3. If you cannot isolate the failing component by using the LEDs and the information in the system-event logs, remove one component at a time; and restart the server after each component is removed. 4. If the failure remains, go to http://www.lenovo.com/support.
NMI	A nonmaskable interrupt has occurred, or the NMI button was pressed.	1. Check the system-event logs for information about the error (see "Event logs" on page 134). 2. Restart the server.
System board	An error has occurred on the system battery, the microprocessor 2 expansion board, the power paddle card, or the system board.	1. Check the LEDs on the system board to identify the component that caused the error. The System board LED can be lit due to any of the following reasons: • Battery (see "Removing the system battery" on page 217 and "Installing the system battery" on page 218). • Power paddle card (see "Removing the power paddle card" on page 255 and "Installing the power paddle card" on page 257). • (Trained technician only) System board (see "Removing the system board" on page 277 and "Installing the system board" on page 280). 2. Check the system-event logs for information about the error. 3. Replace the failing component: • Battery • Microprocessor 2 expansion board • Power paddle card • (Trained technician only) System board

Look at the system service label on the top of the server, which gives an overview of internal components that correspond to the LEDs on the light path diagnostics panel. This information can often provide enough information to diagnose the error.

Power-supply LEDs

This section describes the power-supply LEDs on the rear of the server and the suggested actions to correct the detected problems.

The following illustration shows the power-supply LEDs on the rear of the server.

Figure 88. Power-supply LEDs on the rear of the server

Error
(Amber)   DC power   AC power
          (Green)   (Green)

Ethernet link LED

Ethernet activity LED
The following table describes the problems that are indicated by various combinations of the power-supply LEDs and the system power LED on the operator information panel and suggested actions to correct the detected problems.

Table 12. Power-supply LEDs

AC Power-supply LEDs					
AC	DC	Error	Description	Action	Notes
On	On	Off	Normal operation		
Off	Off	Off	No ac power to the server or a problem with the ac power source.	1. Check the ac power to the server. 2. Make sure that the power cord is connected to a functioning power source. 3. Restart the server. If the error remains, check the power supply LEDs. 4. If the problem remains, replace the power supply.	This is a normal condition when no ac power is present.
Off	Off	On	Faulty power-supply.	1. Make sure that the power cord is connected to a functioning power source. 2. Replace the power supply.	This happens only when a second power supply is providing power to the server.
Off	On	Off	Faulty power supply	Replace the power supply.	
Off	On	On	Faulty power supply	Replace the power supply.	

Table 12. Power-supply LEDs (continued)

AC Power-supply LEDs			Description	Action	Notes
AC	DC	Error			
On	Off	Off	Power supply not fully seated, faulty system board, or faulty power supply	1. Reseat the power supply. 2. If the system board error LED is not lit, replace the power supply. 3. (Trained technician only) If the system board error LED is lit, replace the system board.	Typically indicates that a power supply is not fully seated.
On	Off or Flashing	On	Faulty power supply	Replace the power supply.	
On	On	On	Power supply is faulty but still operational	Replace the power supply.	

System pulse LEDs

This section describes the system pulse LEDs on the system board that monitors the system power-on and power-off and boot progress.

The following LEDs are on the system board and monitor the system power-on and power-off sequencing and boot progress (see "System-board LEDs and controls" on page 29 for the location of these LEDs).

Table 13. System pulse LEDs

LED	Description	Action
IMM2.1 heartbeat	IMM2.1 heartbeat boot process.	The following steps describe the different stages of the IMM2.1 heartbeat sequencing process. 1. When this LED is blinking fast (approximately 4Hz), this indicates, that the IMM2.1 code is in the loading process. 2. When this LED goes off momentarily, this indicates that the IMM2.1 code has loaded completely. 3. When this LED goes off momentarily and then starts blinking slowing (approximately 1Hz), this indicates that IMM2.1 is fully operational. You can now press the power-control button to power-on the server. 4. If this LED does not blink within 30 seconds of connecting a power source to the server, (trained technician only) replace the system board.

Event logs

Error codes and messages are displayed in POST event log, system-event log, Integrated Management Module II (IMM2) event log, and DSA event log.

- **POST event log:** This log contains the most recent error codes and messages that were generated during POST. You can view the contents of the POST event log from the Setup utility (see "Starting the Setup

utility" on page 101). For more information about POST error codes, see Appendix B "UEFI (POST) error codes" on page 1083.

- **System-event log:** This log contains POST and system management interrupt (SMI) events and all events that are generated by the baseboard management controller that is embedded in the Integrated Management Module II (IMM2). You can view the contents of the system-event log through the Setup utility and through the Dynamic System Analysis (DSA) program (as IPMI event log).The system-event log is limited in size. When it is full, new entries will not overwrite existing entries; therefore, you must periodically clear the system-event log through the Setup utility. When you are troubleshooting an error, you might have to save and then clear the system-event log to make the most recent events available for analysis. For more information about the system-event log, see Appendix A "Integrated Management Module II (IMM2) error messages" on page 285.

  Messages are listed on the left side of the screen, and details about the selected message are displayed on the right side of the screen. To move from one entry to the next, use the Up Arrow (-) and Down Arrow (̄) keys.

  Some IMM2.1 sensors cause assertion events to be logged when their setpoints are reached. When a setpoint condition no longer exists, a corresponding deassertion event is logged. However, not all events are assertion-type events.

- **Integrated Management Module II (IMM2) event log:** This log contains a filtered subset of all IMM2.1, POST, and system management interrupt (SMI) events. You can view the IMM2.1 event log through the IMM2.1 web interface. For more information, see "Logging on to the web interface" on page 110. You can also view the IMM2.1 event log through the Dynamic System Analysis (DSA) program (as the ASM event log). For more information about IMM2.1 error messages, see Appendix A "Integrated Management Module II (IMM2) error messages" on page 285.

- **DSA event log:** This log is generated by the Dynamic System Analysis (DSA) program, and it is a chronologically ordered merge of the system-event log (as the IPMI event log), the IMM2.1 chassis-event log (as the ASM event log), and the operating-system event logs. You can view the DSA event log through the DSA program (see "Viewing event logs without restarting the server" on page 135). For more information about DSA and DSA messages, see " Dynamic System Analysis" on page 137 and Appendix C "DSA diagnostic test results" on page 1107.

Viewing event logs through the Setup utility

Use this information to view the event logs through the Setup utility.

To view the POST event log or system-event log, complete the following steps:

Step 1. Turn on the server.

Step 2. When the prompt **<F1> Setup** is displayed, press F1. If you have set both a power-on password and an administrator password, you must type the administrator password to view the event logs.

Step 3. Select **System Event Logs** and use one of the following procedures:

- To view the POST event log, select **POST Event Viewers**.
- To view the system-event log, select **System Event Log**.

Viewing event logs without restarting the server

Use this information to view the event logs without restarting the server.

If the server is not hung and the IMM2.1 is connected to a network, methods are available for you to view one or more event logs without having to restart the server.

If you have installed Dynamic System Analysis (DSA) Portable, you can use it to view the system-event log (as the IPMI event log), or the IMM2.1 event log (as the ASM event log), the operating-system event logs, or the merged DSA log. You can also use DSA Preboot to view these logs, although you must restart the server

to use DSA Preboot. To install DSA Portable or check for and download a later version of DSA Preboot CD image, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-DSA.

If IPMItool is installed in the server, you can use it to view the system-event log. Most recent versions of the Linux operating system come with a current version of IPMItool. For an overview of IPMI, go to http://www.ibm.com/developerworks/linux/blueprints/ and click **Using Intelligent Platform Management Interface (IPMI) on Linux platforms**.

You can view the IMM2.1 event log through the **Event Log** link in the Integrated Management Module II (IMM2) web interface. For more information, see "Logging on to the web interface" on page 110.

The following table describes the methods that you can use to view the event logs, depending on the condition of the server. The first three conditions generally do not require that you restart the server.

Table 14. Methods for viewing event logs

Condition	Action
The server is not hung and is connected to a network (using an operating system controlled network ports).	Use any of the following methods: • Run DSA Portable to view the diagnostic event log (requires IPMI driver) or create an output file that you can send to service and support (using ftp or local copy). • Use IPMItool to view the system-event log (requires IPMI driver). • Use the web browser interface to the IMM2.1 to view the system-event log locally (requires RNDIS USB LAN driver).
The server is not hung and is not connected to a network (using an operating system controlled network ports).	• Run DSA Portable to view the diagnostic event log (requires IPMI driver) or create an output file that you can send to service and support (using ftp or local copy). • Use IPMItool to view the system-event log (requires IPMI driver). • Use the web browser interface to the IMM2.1 to view the system-event log locally (requires RNDIS USB LAN driver).
The server is not hung and the Integrated Management Module II (IMM2) is connected to a network.	In a web browser, type the IP address for the IMM2.1 and go to the **Event Log** page. For more information, see "Obtaining the IMM2.1 host name" on page 109 and "Logging on to the web interface" on page 110.
The server is hung, and no communication can be made with the IMM2.1.	• If DSA Preboot is installed, restart the server and press F2 to start DSA Preboot and view the event logs (see "Running DSA Preboot diagnostic programs" on page 138 for more information). • Alternatively, you can restart the server and press F1 to start the Setup utility and view the POST event log or system-event log. For more information, see "Viewing event logs through the Setup utility" on page 135.

Clearing the event logs

Use this information to clear the event logs.

To clear the event logs, complete the following steps.

Note: The POST error log is automatically cleared each time the server is restarted.

Step 1. Turn on the server.

Step 2. When the prompt **<F1> Setup** is displayed, press `F1`. If you have set both a power-on password and an administrator password, you must type the administrator password to view the event logs.

Step 3. To clear the IMM2.1 system-event log, select **System Event Logs** ➙ **Clear System Event Log**, then, press `Enter` twice.

POST

When you turn on the server, it performs a series of tests to check the operation of the server components and some optional devices in the server. This series of tests is called the power-on self-test, or POST.

Note: This server does not use beep codes for server status.

If a power-on password is set, you must type the password and press **Enter** (when you are prompted), for POST to run.

If POST detects a problem, an error message is displayed. See Appendix B "UEFI (POST) error codes" on page 1083 for more information.

If POST detects a problem, an error message is sent to the POST event log, see "Event logs" on page 134 for more information.

Dynamic System Analysis

Dynamic System Analysis (DSA) collects and analyzes system information to aid in diagnosing server problems.

DSA collects the following information about the server:

- Drive health information
- Event logs for ServeRAID controllers and service processors
- Hardware inventory, including PCI and USB information
- Installed applications and hot fixes (available in DSA Portable only)
- Kernel modules (available in DSA Portable only)
- Light path diagnostics status
- Network interfaces and settings
- Performance data and details about processes that are running
- RAID controller configuration
- Service processor (Integrated Management Module II (IMM2)) status and configuration
- System configuration
- Vital product data and firmware information

For system-specific information about the action that you should take as a result of a message that DSA generates, see Appendix C "DSA diagnostic test results" on page 1107.

If you cannot find a problem by using DSA, see "Solving undetermined problems" on page 153 for information about testing the server.

Note: DSA Preboot might appear to be unresponsive when you start the program. This is normal operation while the program loads.

Make sure that the server has the latest version of the DSA code. To obtain
DSA code and the *Dynamic System Analysis Installation and User's Guide*, go to
http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-DSA.

DSA editions

Two editions of Dynamic System Analysis are available.

- **DSA Portable**

  DSA Portable Edition runs within the operating system; you do not have to restart the server to run it. It is
  packaged as a self-extracting file that you download from the web. When you run the file, it self-extracts
  to a temporary folder and performs comprehensive collection of hardware and operating-system
  information. After it runs, it automatically deletes the temporary files and folder and leaves the results of
  the data collection and diagnostics on the server.

  If you are unable to restart the server, use DSA Portable.

- **DSA Preboot**

  DSA Preboot runs outside of the operating system; you must restart the server to run it. It is provided
  in the flash memory on the server, or you can create a bootable media such as a CD, DVD, ISO, USB,
  or PXE using the ToolsCenter Bootable Media Creator (BoMC). For more details, see the BoMC *User
  Guide* at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=LNVO-BOMC. In addition to
  the capabilities of the other editions of DSA, DSA Preboot includes diagnostic routines that would be
  disruptive to run within the operating-system environment (such as resetting devices and causing loss of
  network connectivity). It has a graphical user interface that you can use to specify which diagnostics to
  run and to view the diagnostic and data collection results.

  DSA Preboot provides diagnostics for the following system components, if they are installed:

  - Emulex network adapter
  - Optical devices (CD or DVD)
  - Tape drives (SCSI, SAS, or SATA)
  - Memory
  - Microprocessor
  - Checkpoint panel
  - I2C bus
  - SAS and SATA drives

  If you are able to restart the server or if you need comprehensive diagnostics, use DSA Preboot.

For more information and to download the utilities, go to
http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-DSA.

Running DSA Preboot diagnostic programs

Use this information to run the DSA Preboot diagnostic programs.

Note: The DSA memory test might take up to 30 minutes to run. If the problem is not a memory problem,
skip the memory test.

To run the DSA Preboot diagnostic programs, complete the following steps:

Step 1.   If the server is running, turn off the server and all attached devices.

Step 2.   Turn on all attached devices; then, turn on the server.

Step 3.   When the prompt **<F2> Diagnostics** is displayed, press F2.

Note: The DSA Preboot diagnostic program might appear to be unresponsive for an unusual length of time when you start the program. This is normal operation while the program loads. The loading process may take up to 10 minutes.

Step 4.   Optionally, select **Quit to DSA** to exit from the stand-alone memory diagnostic program.

Note: After you exit from the stand-alone memory diagnostic environment, you must restart the server to access the stand-alone memory diagnostic environment again.

Step 5.   Type **gui** to display the graphical user interface, or type **cmd** to display the DSA interactive menu.

Step 6.   Follow the instructions on the screen to select the diagnostic test to run.

If the diagnostic programs do not detect any hardware errors but the problem remains during normal server operation, a software error might be the cause. If you suspect a software problem, see the information that comes with your software.

A single problem might cause more than one error message. When this happens, correct the cause of the first error message. The other error messages usually will not occur the next time you run the diagnostic programs.

If the server stops during testing and you cannot continue, restart the server and try running the DSA Preboot diagnostic programs again. If the problem remains, replace the component that was being tested when the server stopped.

Diagnostic text messages

Diagnostic text messages are displayed while the tests are running.

A diagnostic text message contains one of the following results:

Passed: The test was completed without any errors.

Failed: The test detected an error.

Aborted: The test could not proceed because of the server configuration

Additional information concerning test failures is available in the extended diagnostic results for each test.

Viewing the test log results and transferring the DSA collection

Use this information to view the test log results and transferring the DSA collection.

To view the test log for the results when the tests are completed, click the **Success** link in the Status column, if you are running the DSA graphical user interface, or type :x to exit the Execute Tests menu, if you are running the DSA interactive menu, or select **Diagnostic Event Log** in the graphical user interface. To transfer DSA Preboot collections to an external USB device, type the `copy` command in the DSA interactive menu.

- If you are running the DSA graphical user interface (GUI), click the **Success** link in the Status column.
- If you are running the DSA interactive menu (CLI), type :x to exit the Execute Tests menu; then, select **completed tests** to view the results.

You can also send the DSA error log to Lenovo support to aid in diagnosing the server problems.

Automated service request (call home)

Lenovo provides tools that can automatically collect and send data or call Lenovo Support when an error is detected.

These tools can help Lenovo Support speed up the process of diagnosing problems. The following sections provide information about the call home tools.

Electronic Service Agent

Electronic Service Agent monitors, tracks, and captures system hardware errors and hardware and software inventory information, and reports serviceable problems directly to Lenovo Support.

You can also choose to collect data manually. It uses minimal system resources, and can be downloaded from the website. For more information and to download Electronic Service Agent, go to http://www.ibm.com/support/esa/.

Error messages

This section provides the list of error codes and messages for UEFI/POST, IMM2.1, and DSA that are generated when a problem is detected.

See Appendix B "UEFI (POST) error codes" on page 1083, Appendix A "Integrated Management Module II (IMM2) error messages" on page 285, and Appendix C "DSA diagnostic test results" on page 1107 for more information.

Troubleshooting by symptom

Use the troubleshooting tables to find solutions to problems that have identifiable symptoms.

If you cannot find a solution to the problem in these tables, see Appendix C "DSA diagnostic test results" on page 1107 for information about testing the server and "Running DSA Preboot diagnostic programs" on page 138 for additional information about running DSA Preboot program. For additional information to help you solve problems, see "Start here" on page 121.

If you have just added new software or a new optional device and the server is not working, complete the following steps before you use the troubleshooting tables:

Step 1. Check the system-error LED on the operator information panel; if it is lit, check the light path diagnostics LEDs (see "Light path diagnostics" on page 127).

Step 2. Remove the software or device that you just added.

Step 3. Run Dynamic System Analysis (DSA) to determine whether the server is running correctly (for information about using DSA, see Appendix C "DSA diagnostic test results" on page 1107).

Step 4. Reinstall the new software or new device.

CD/DVD drive problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 15. CD/DVD drive's symptoms and actions

Symptom	Action

The optional DVD drive is not recognized.	1. Make sure that:
	
	  • The SATA connector to which the DVD drive is attached (primary or secondary) is enabled in the Setup utility.
	
	  • All cables and jumpers are installed correctly.
	
	  • The correct device driver is installed for the DVD drive.
	
	2. Run the DVD drive diagnostic programs.
	
	3. Reseat the following components:
	
	  a. DVD drive
	
	  b. DVD drive cable
	
	4. Replace the components listed in step 3 one at a time, in the order shown, restarting the server each time.
	
	5. (Trained technician only) Replace the system board.

A CD or DVD is not working correctly.	1. Clean the CD or DVD. 2. Replace the CD or DVD with new CD or DVD media. 3. Run the DVD drive diagnostic programs. 4. Reseat the DVD drive. 5. Replace the DVD drive.
The DVD drive tray is not working.	1. Make sure that the server is turned on. 2. Insert the end of a straightened paper clip into the manual tray-release opening. 3. Reseat the DVD drive. 4. Replace the DVD drive.

General problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 16. General symptoms and actions

Symptom	Action
A cover latch is broken, an LED is not working, or a similar problem has occurred.	If the part is a CRU, replace it. If the part is a microprocessor or the system board, the part must be replaced by a trained technician.
The server is hung while the screen is on. Cannot start the Setup utility by pressing F1.	1. See "Nx-boot failure" on page 157 for more information. 2. See "Recovering the server firmware (UEFI update failure)" on page 155 for more information.

GPU/VGA adapter problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 17. GPU/VGA adapter symptoms and actions

Symptom	Action
Seeing the **Yellow Band** or the **SLOT ERR LED** is lit up in the slot during the installation of 2x nVIDA K20c.	1. Enable PCI 64 bit resource. 2. Change the option ROM execution order (**slot 5 ➜ slot 7 ➜ slot 2**) if you operate in **Legacy mode only OS**.
The system hanged or seeing **Yellow Band** in slot 7 or no video output during the installation of nVIDA Q series or K series.	Disable PCI 64 bit resource (except for nVIDA K20c).

Hard disk drive problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 18. Hard disk drive symptoms and actions

Symptom	Action
Not all drives are recognized by the hard disk drive diagnostic tests.	Remove the drive that is indicated by the diagnostic tests; then, run the hard disk drive diagnostic tests again. If the remaining drives are recognized, replace the drive that you removed with a new one.
The server stops responding during the hard disk drive diagnostic test.	Remove the hard disk drive that was being tested when the server stopped responding, and run the diagnostic test again. If the hard disk drive diagnostic test runs successfully, replace the drive that you removed with a new one.
A hard disk drive was not detected while the operating system was being started.	Reseat all hard disk drives and cables; then, run the hard disk drive diagnostic tests again.
A hard disk drive passes the diagnostic Fixed Disk Test, but the problem remains.	Run the diagnostic SCSI Fixed Disk Test (see "Running DSA Preboot diagnostic programs" on page 138). **Note:** This test is not available on servers that have RAID arrays or servers that have SATA hard disk drives.

Hypervisor problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 19. Hypervisor's symptoms and actions

Symptom	Action
If an optional embedded hypervisor flash device is not listed in the expected boot order, does not appear in the list of boot devices, or a similar problem has occurred.	1. Make sure that the optional embedded hypervisor flash device is selected on the boot manager ‹F12› `Select Boot Device` at startup. 2. Make sure that the embedded hypervisor flash device is seated in the connector correctly (see "Removing a USB embedded hypervisor flash device" on page 249 and "Installing a USB embedded hypervisor flash device" on page 250). 3. See the documentation that comes with the optional embedded hypervisor flash device for setup and configuration information. 4. Make sure that other software works on the server.

Intermittent problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 20. Intermittent problems and actions

Symptom	Action
A problem occurs only occasionally and is difficult to diagnose.	1. Make sure that: • All cables and cords are connected securely to the rear of the server and attached devices. • When the server is turned on, air is flowing from the fan grille. If there is no airflow, the fan is not working. This can cause the server to overheat and shut down. 2. Check the system-error log or IMM2.1 event logs (see "Event logs" on page 134).

Keyboard, mouse, or USB-device problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 21. Keyboard, mouse, or USB-device's symptoms and actions

Symptom	Action
All or some keys on the keyboard do not work.	1. Make sure that: • The keyboard cable is securely connected. • The server and the monitor are turned on. 2. If you are using a USB keyboard, run the Setup utility and enable keyboardless operation. 3. If you are using a USB keyboard and it is connected to a USB hub, disconnect the keyboard from the hub and connect it directly to the server.

Symptom	Action
	4. Replace the keyboard.

The mouse or USB-device does not work.	1. Make sure that:
	
	   • The mouse or USB device cable is securely connected to the server.
	
	   • The mouse or USB device drivers are installed correctly.
	
	   • The server and the monitor are turned on.
	
	   • The mouse option is enabled in the Setup utility.
	
	2. If you are using a USB mouse or USB device and it is connected to a USB hub, disconnect the mouse or USB device from the hub and connect it directly to the server.
	
	3. Replace the mouse or USB-device.

Memory problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 22. Memory problems and actions

Symptom	Action

The amount of system memory that is displayed is less than the amount of installed physical memory.	**Note:** Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.
	
	1. Make sure that:
	
	   • No error LEDs are lit on the operator information panel.
	
	   • No DIMM error LEDs are lit on the system board.
	
	   • Memory mirrored channel does not account for the discrepancy.
	
	   • The memory modules are seated correctly.
	
	   • You have installed the correct type of memory.
	
	   • If you changed the memory, you updated the memory configuration in the Setup utility.
	
	   • All banks of memory are enabled. The server might have automatically disabled a memory bank when it detected a problem, or a memory bank might have been manually disabled.
	
	   • There is no memory mismatch when the server is at the minimum memory configuration.
	
	2. Reseat the DIMMs, and then restart the server.
	
	3. Check the POST error log:
	
	   • If a DIMM was disabled by a systems-management interrupt (SMI), replace the DIMM.
	
	   • If a DIMM was disabled by the user or by POST, reseat the DIMM; then, run the Setup utility and enable the DIMM.
	
	4. Check that all DIMMs are initialized in the Setup utility; then, run memory diagnostics (see "Running DSA Preboot diagnostic programs" on page 138).

Table 22. Memory problems and actions (continued)

Symptom	Action
	5. Reverse the DIMMs between the channels (of the same microprocessor), and then restart the server. If the problem is related to a DIMM, replace the failing DIMM.
	6. Re-enable all DIMMs using the Setup utility, and then restart the server.
	7. (Trained technician only) Install the failing DIMM into a DIMM connector for microprocessor 2 (if installed) to verify that the problem is not the microprocessor or the DIMM connector.
	8. (Trained technician only) Replace the system board.
Multiple DIMMs in a channel are identified as failing.	**Note:** Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server. 1. Reseat the DIMMs; then, restart the server. 2. Remove the highest-numbered DIMM of those that are identified and replace it with an identical known good DIMM; then, restart the server. Repeat as necessary. If the failures continue after all identified DIMMs are replaced, go to step 4. 3. Return the removed DIMMs, one at a time, to their original connectors, restarting the server after each DIMM, until a DIMM fails. Replace each failing DIMM with an identical known good DIMM, restarting the server after each DIMM replacement. Repeat step 3 until you have tested all removed DIMMs. 4. Replace the highest-numbered DIMM of those identified; then, restart the server. Repeat as necessary. 5. Reverse the DIMMs between the channels (of the same microprocessor), and then restart the server. If the problem is related to a DIMM, replace the failing DIMM. 6. (Trained technician only) Install the failing DIMM into a DIMM connector for microprocessor 2 (if installed) to verify that the problem is not the microprocessor or the DIMM connector. 7. (Trained technician only) Replace the system board.

Microprocessor problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 23. Microprocessor's symptoms and actions

Symptom	Action
The server goes directly to the POST Event Viewer when it is turned on.	1. Correct any errors that are indicated by the light path diagnostics LEDs (see "Light path diagnostics" on page 127). 2. Make sure that the server supports all the microprocessors and that the microprocessors match in speed and cache size. To view the microprocessor information, run the Setup utility and select **System Information → System Summary → Processor Details**. 3. (Trained technician only) Reseat microprocessor 1 4. (Trained technician only) If there is no indication of which microprocessor has failed, isolate the error by testing with one microprocessor at a time.

Table 23. Microprocessor's symptoms and actions (continued)

Symptom	Action
	5. Replace the following components one at a time, in the order shown, restarting the server each time: a. (Trained technician only) Microprocessor 2 b. (Trained technician only) System board 6. (Trained technician only) If multiple error codes or light path diagnostics LEDs indicate a microprocessor error, reverse the locations of two microprocessors to determine whether the error is associated with a microprocessor or with a microprocessor socket. • If the error is associated with a microprocessor, replace the microprocessor. • If the error is associated with a microprocessor socket, replace the system board.

Monitor problems

Some monitors have their own self-tests. If you suspect a problem with your monitor, see the documentation that comes with the monitor for instructions for testing and adjusting the monitor. If you cannot diagnose the problem, call for service.

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 24. Monitor and video's symptoms and actions

Symptom	Action
Testing the monitor.	1. Make sure that the monitor cables are firmly connected. 2. Try using a different monitor on the server, or try using the monitor that is being tested on a different server. 3. Run the diagnostic programs. If the monitor passes the diagnostic programs, the problem might be a video device driver. 4. (Trained technician only) Replace the system board.
The screen is blank.	1. If the server is attached to a KVM switch, bypass the KVM switch to eliminate it as a possible cause of the problem: connect the monitor cable directly to the correct connector on the rear of the server. 2. Make sure that: • The server is turned on. If there is no power to the server, see "Power problems" on page 148. • The monitor cables are connected correctly. • The monitor is turned on and the brightness and contrast controls are adjusted correctly. • No POST errors are generated when the server is turned on. 3. Make sure that the correct server is controlling the monitor, if applicable. 4. See "Solving undetermined problems" on page 153.

Table 24. Monitor and video's symptoms and actions (continued)

Symptom	Action
The monitor works when you turn on the server, but the screen goes blank when you start some application programs.	1. Make sure that: • The application program is not setting a display mode that is higher than the capability of the monitor. • You installed the necessary device drivers for the application. 2. Run video diagnostics (see "Running DSA Preboot diagnostic programs" on page 138). • If the server passes the video diagnostics, the video is good; see "Solving undetermined problems" on page 153. • (Trained technician only) If the server fails the video diagnostics, replace the system board.
The monitor has screen jitter, or the screen image is wavy, unreadable, rolling, or distorted.	1. If the monitor self-tests show that the monitor is working correctly, consider the location of the monitor. Magnetic fields around other devices (such as transformers, appliances, fluorescents, and other monitors) can cause screen jitter or wavy, unreadable, rolling, or distorted screen images. If this happens, turn off the monitor. **Attention:** Moving a color monitor while it is turned on might cause screen discoloration. Move the device and the monitor at least 305 mm (12 in.) apart, and turn on the monitor. **Notes:** a. To prevent diskette drive read/write errors, make sure that the distance between the monitor and any external diskette drive is at least 76 mm (3 in.). b. Non-Lenovo monitor cables might cause unpredictable problems. 2. Reseat the monitor and cable. 3. Replace the following components one at a time, in the order shown, restarting the server each time: a. Monitor b. (Trained technician only) System board
Wrong characters appear on the screen.	1. If the wrong language is displayed, update the server firmware to the latest level (see "Updating the firmware" on page 97) with the correct language. 2. Reseat the monitor and cable. 3. Replace the following components one at a time, in the order shown, restarting the server each time: a. Monitor b. (Trained technician only) System board

Network connection problems

• Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.

• If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

• Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 25. Network connection problems and actions

Symptom	Action
Log in failed by using LDAP account with SSL enabled.	1. Make sure the license key is valid.
	2. Generate a new license key and log in again.

Optional-device problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 26. Optional-device problems and actions

Symptom	Action
An Lenovo optional device that was just installed does not work.	1. Make sure that: • The device is designed for the server (see http://www.lenovo.com/us/en/serverproven/). • You followed the installation instructions that came with the device and the device is installed correctly. • You have not loosened any other installed devices or cables. • You updated the configuration information in the Setup utility. Whenever memory or any other device is changed, you must update the configuration.
	2. Reseat the device that you just installed.
	3. Replace the device that you just installed.
An Lenovo optional device that worked previously does not work now.	1. Make sure that all of the cable connections for the device are secure.
	2. If the device comes with test instructions, use those instructions to test the device.
	3. If the failing device is a SCSI device, make sure that: • The cables for all external SCSI devices are connected correctly. • The last device in each SCSI chain, or the end of the SCSI cable, is terminated correctly. • Any external SCSI device is turned on. You must turn on an external SCSI device before you turn on the server.
	4. Reseat the failing device.
	5. Replace the failing device.

Power problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 27. Power problems and actions

Symptom	Action

The power-control button does not work, and the reset button does not work (the server does not start).
Note: The power-control button will not function until approximately 5 to 10 seconds after the server has been connected to power.
	1. Make sure that the power-control button is working correctly:
	  a. Disconnect the server power cords.
	  b. Reconnect the power cords.
	  c. (Trained technician only) Reseat the operator information panel cable, and then repeat steps 1a and 1b.
	    • (Trained technician only) If the server starts, reseat the operator information panel. If the problem remains, replace the operator information panel.
	    • If the server does not start, bypass the power-control button by using the force power-on jumper (see "System-board switches and jumpers" on page 28). If the server starts, reseat the operator information panel. If the problem remains, replace the operator information panel.
	2. Make sure that :
	  a. The power cords are correctly connected to the server and to a working electrical outlet.
	  b. The type of memory that is installed is correct.
	  c. The DIMM is fully seated.
	  d. The LEDs on the power supply do not indicate a problem.
	  e. The microprocessors are installed in the correct sequence.
	3. Reseat the following components:
	  a. DIMMs
	  b. (Trained technician only) Power switch connector
	  c. (Trained technician only) Power backplane
	4. Replace the following components one at a time, in the order shown, restarting the server each time:
	  a. DIMMs
	  b. (Trained technician only) Power switch connector
	  c. (Trained technician only) Power backplane
	  d. (Trained technician only) System board
	5. If you just installed an optional device, remove it, and restart the server. If the server now starts, you might have installed more devices than the power supply supports.
	6. See "Power-supply LEDs" on page 132.
	7. See "Solving undetermined problems" on page 153.

The server does not turn off.	1. Determine whether you are using an Advanced Configuration and Power Interface (ACPI) or a non-ACPI operating system. If you are using a non-ACPI operating system, complete the following steps:
	  a. Press Ctrl+Alt+Delete.
	  b. Turn off the server by pressing the power-control button for 5 seconds.
	  c. Restart the server.
	  d. If the server fails POST and the power-control button does not work, disconnect the power cord for 5 seconds; then, reconnect the power cord and restart the server.
	2. If the problem remains or if you are using an ACPI-aware operating system, suspect the system board.

The server unexpectedly shuts down, and the LEDs on the	See "Solving undetermined problems" on page 153.

Table 27. Power problems and actions (continued)

Symptom	Action
operator information panel are not lit.	

Serial port problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 28. Serial port problems and actions

Symptom	Action

The number of serial ports that are identified by the operating system is less than the number of installed serial ports.	1. Make sure that:
	  • Each port is assigned a unique address in the Setup utility and none of the serial ports is disabled.
	  • The serial-port adapter (if one is present) is seated correctly.
	2. Reseat the serial port adapter.
	3. Replace the serial port adapter.

A serial device does not work.	1. Make sure that:
	  • The device is compatible with the server.
	  • The serial port is enabled and is assigned a unique address.
	  • The device is connected to the correct connector.
	2. Reseat the following components:
	  a. Failing serial device
	  b. Serial cable
	3. Replace the following components one at a time, in the order shown, restarting the server each time:
	  a. Failing serial device
	  b. Serial cable
	  c. (Trained technician only) System board

The serial port might print out some messages for debugging purposes during the uEFI and pDSA configuration stages. Some external devices when attached on the serial port can cause specific device-related behaviors.	1. In the uEFI console redirection page, disable the serial port setting to stop messages from being printed out via the serial port.

ServerGuide problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.

- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 29. ServerGuide problems and actions

Symptom	Action
The *ServerGuide Setup and Installation* CD will not start.	1. Make sure that the server supports the ServerGuide program and has a startable (bootable) DVD drive. 2. If the startup (boot) sequence settings have been changed, make sure that the DVD drive is first in the startup sequence. 3. If more than one DVD drive is installed, make sure that only one drive is set as the primary drive. Start the CD from the primary drive.
The ServeRAID Manager program cannot view all installed drives, or the operating system cannot be installed.	1. Make sure that the hard disk drive is connected correctly. 2. Make sure that the SAS hard disk drive cables are securely connected.
The operating-system installation program continuously loops.	Make more space available on the hard disk.
The ServerGuide program will not start the operating-system CD.	Make sure that the operating-system CD is supported by the ServerGuide program. For a list of supported operating-system versions, go to http://www.ibm.com/support/entry/portal/docdisplay?lndocid=SERV-GUIDE, click the link for your ServerGuide version, and scroll down to the list of supported Microsoft Windows operating systems.
The operating system cannot be installed; the option is not available.	Make sure that the server supports the operating system. If it does, either no logical drive is defined (SCSI RAID servers), or the ServerGuide System Partition is not present. Run the ServerGuide program and make sure that setup is complete.

Software problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 30. Software problems and actions

Symptom	Action

You suspect a software problem.	1. To determine whether the problem is caused by the software, make sure that:
	  • The server has the minimum memory that is needed to use the software. For memory requirements, see the information that comes with the software. If you have just installed an adapter or memory, the server might have a memory-address conflict.
	  • The software is designed to operate on the server.
	  • Other software works on the server.
	  • The software works on another server.
	2. If you received any error messages when using the software, see the information that comes with the software for a description of the messages and suggested solutions to the problem.
	3. Contact the software vendor.

Universal Serial Bus (USB) port problems

- Follow the suggested actions in the order in which they are listed in the Action column until the problem is solved.
- If an action step is preceded by '(Trained technician only)', that step must be performed only by a Trained technician.
- Go to the IBM support website at http://www.lenovo.com/support to check for technical information, hints, tips, and new device drivers or to submit a request for information.

Table 31. Universal Serial Bus (USB) port problems and actions

Symptom	Action
A USB device does not work.	1. Make sure that: • The correct USB device driver is installed. • The operating system supports USB devices. 2. Make sure that the USB configuration options are set correctly in the Setup utility (see "Using the Setup utility" on page 101 for more information). 3. If you are using a USB hub, disconnect the USB device from the hub and connect it directly to the server.

Solving power problems

Use this information to solve power problems.

Power problems can be difficult to solve. For example, a short circuit can exist anywhere on any of the power distribution buses. Usually, a short circuit will cause the power subsystem to shut down because of an overcurrent condition. To diagnose a power problem, use the following general procedure:

Step 1. Turn off the server and disconnect all power cords.

Step 2. Check for loose cables in the power subsystem. Also check for short circuits, for example, if a loose screw is causing a short circuit on a circuit board.

Step 3. Check the lit LEDs on the light path diagnostics panel (see "Light path diagnostics LEDs" on page 129).

Step 4. Remove the adapters and disconnect the cables and power cords to all internal and external devices until the server is at the minimum configuration that is required for the server to start (see "Solving undetermined problems" on page 153).

Step 5. Reconnect all ac power cords and turn on the server. If the server starts successfully, reseat the adapters and devices one at a time until the problem is isolated.

If the server does not start from the minimum configuration, see "Power-supply LEDs" on page 132 to replace the components in the minimum configuration one at a time until the problem is isolated.

Solving Ethernet controller problems

Use this information to solve the Ethernet controller problems.

The method that you use to test the Ethernet controller depends on which operating system you are using. See the operating-system documentation for information about Ethernet controllers, and see the Ethernet controller device-driver readme file.

Try the following procedures:

Step 1. Make sure that the correct device drivers, which come with the server are installed and that they are at the latest level.

Step 2. Make sure that the Ethernet cable is installed correctly.

- The cable must be securely attached at all connections. If the cable is attached but the problem remains, try a different cable.

- If you set the Ethernet controller to operate at 100 Mbps, you must use Category 5 cabling.

- If you directly connect two servers (without a hub), or if you are not using a hub with X ports, use a crossover cable. To determine whether a hub has an X port, check the port label. If the label contains an X, the hub has an X port.

Step 3. Determine whether the hub supports auto-negotiation. If it does not, try configuring the integrated Ethernet controller manually to match the speed and duplex mode of the hub.

Step 4. Check the Ethernet controller LEDs on the rear panel of the server. These LEDs indicate whether there is a problem with the connector, cable, or hub.

- The Ethernet link status LED is lit when the Ethernet controller receives a link pulse from the hub. If the LED is off, there might be a defective connector or cable or a problem with the hub.

- The Ethernet transmit/receive activity LED is lit when the Ethernet controller sends or receives data over the Ethernet network. If the Ethernet transmit/receive activity is off, make sure that the hub and network are operating and that the correct device drivers are installed.

Step 5. Check the LAN activity LED on the rear of the server. The LAN activity LED is lit when data is active on the Ethernet network. If the LAN activity LED is off, make sure that the hub and network are operating and that the correct device drivers are installed.

Step 6. Check for operating-system-specific causes of the problem.

Step 7. Make sure that the device drivers on the client and server are using the same protocol.

If the Ethernet controller still cannot connect to the network but the hardware appears to be working, the network administrator must investigate other possible causes of the error.

Solving undetermined problems

If Dynamic System Analysis (DSA) cannot diagnose the failure or if the server is inoperative, use the information in this section to solve the undetermined problems.

If you suspect that a software problem is causing failures (continuous or intermittent), see "Software problems" on page 151.

Corrupted data in CMOS memory or corrupted UEFI firmware can cause undetermined problems. To reset the CMOS data, use the CMOS clear jumper (JP1) to clear the CMOS memory and override the power-on password; see "System-board internal connectors" on page 27 for more information. If you suspect that the UEFI firmware is corrupted, see "Recovering the server firmware (UEFI update failure)" on page 155.

If the power supplies are working correctly, complete the following steps:

Step 1. Turn off the server.

Step 2. Make sure that the server is cabled correctly.

Step 3. Remove or disconnect the following devices, one at a time, until you find the failure. Turn on the server and reconfigure it each time.
- Any external devices.
- Surge-suppressor device (on the server).
- Printer, mouse, and non-Lenovo devices.
- Each adapter.

- Hard disk drives.

   Note: The minimum configuration required for the server to start is one microprocessor and one 2 GB DIMM.

Step 4.   Turn on the server. If the problem remains, suspect the following components in the following order:

1. Power supply
2. Memory
3. Microprocessor
4. System board

If the problem is solved when you remove an adapter from the server but the problem recurs when you reinstall the same adapter, suspect the adapter; if the problem recurs when you replace the adapter with a different one, suspect the riser card.

If you suspect a networking problem and the server passes all the system tests, suspect a network cabling problem that is external to the server.

Problem determination tips

Because of the variety of hardware and software combinations that can encounter, use the following information to assist you in problem determination. If possible, have this information available when requesting assistance from Lenovo.

- Machine type and model
- Microprocessor or hard disk drive upgrades
- Failure symptom
   - Does the server fail the diagnostic tests?
   - What occurs? When? Where?
   - Does the failure occur on a single server or on multiple servers?
   - Is the failure repeatable?
   - Has this configuration ever worked?
   - What changes, if any, were made before the configuration failed?
   - Is this the original reported failure?
- Diagnostic program type and version level
- Hardware configuration (print screen of the system summary)
- UEFI firmware level
- IMM firmware level
- Operating system software

You can solve some problems by comparing the configuration and software setups between working and nonworking servers. When you compare servers to each other for diagnostic purposes, consider them identical only if all the following factors are exactly the same in all the servers:

- Machine type and model
- UEFI firmware level
- IMM firmware level
- Adapters and attachments, in the same locations

- Address jumpers, terminators, and cabling
- Software versions and levels
- Diagnostic program type and version level
- Configuration option settings
- Operating-system control-file setup

See Appendix D "Getting help and technical assistance" on page 1265 for information about calling Lenovo for service.

Recovering the server firmware (UEFI update failure)

Use this information to recover the server firmware.

Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

If the server firmware has become corrupted, such as from a power failure during an update, you can recover the server firmware in the following way:

- **In-band method:** Recover server firmware, using either the boot block jumper (Automated Boot Recovery) and a server Firmware Update Package Service Pack.
- **Out-of-band method:** Use the IMM2.1 web interface to update the firmware, using the latest server firmware update package.

Notes: You can obtain a server update package from one of the following sources:

- Download the server firmware update from the World Wide Web.
- Contact your Lenovo service representative.

To download the server firmware update package from the World Wide Web, go to http://www.lenovo.com/support.

The flash memory of the server consists of a primary bank and a backup bank. You must maintain a bootable UEFI firmware image in the backup bank. If the server firmware in the primary bank becomes corrupted, you can either manually boot the backup bank with the UEFI boot backup jumper (JP2), or in the case of image corruption, this will occur automatically with the Automated Boot Recovery function.

In-band manual recovery method

This section details the in-band manual recovery method.

To recover the server firmware and restore the server operation to the primary bank, complete the following steps:

Step 1. Read the safety information that begins on "Safety" on page v and "Installation guidelines" on page 30.

Step 2. Turn off the server, and disconnect all power cords and external cables.

Step 3. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 4. Locate SW4 on the system board.

Step 5. Change the position of the UEFI boot backup switch (change switch 1 of the SW4 to the on position) to enable the UEFI recovery mode.

Step 6. Reinstall the server cover; then, reconnect all power cords.

Step 7. Restart the server. The system begins the power-on self-test (POST).

Step 8. Boot the server to an operating system that is supported by the firmware update package that you downloaded.

Step 9. Perform the firmware update by following the instructions that are in the firmware update package readme file.

Step 10. Turn off the server and disconnect all power cords and external cables, and then remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 11. Change the position of the UEFI boot backup switch back (change switch 1 of the SW4 to the off position).

Step 12. Reinstall the left-side cover (see "Installing the left-side cover" on page 176).

Step 13. Reconnect the power cord and any cables that you removed.

Step 14. Restart the server. The system begins the power-on self-test (POST). If this does not recover the primary bank, continue with the following steps.

Step 15. Remove the left-side cover (see "Removing the left-side cover" on page 48).

Step 16. Reset the CMOS by removing the system battery (see "Removing the system battery" on page 217).

Step 17. Leave the system battery out of the server for approximately 5 to 15 minutes.

Step 18. Reinstall the system battery (see "Installing the system battery" on page 218).

Step 19. Reinstall the left-side cover (see "Installing the left-side cover" on page 176).

Step 20. Reconnect the power cord and any cables that you removed.

Step 21. Restart the server. The system begins the power-on self-test (POST).

Step 22. If these recovery efforts fail, contact your Lenovo service representative for support.

In-band automated boot recovery method

This section details the in-band automated boot recovery method.

Note: Use this method if the System board LED on the light path diagnostics panel is lit and there is a log entry or `Booting Backup Image` is displayed on the firmware splash screen; otherwise, use the in-band manual recovery method.

Step 1. Boot the server to an operating system that is supported by the firmware update package that you downloaded.

Step 2. Perform the firmware update by following the instructions that are in the firmware update package readme file.

Step 3. Restart the server.

Step 4. At the firmware splash screen, press F3 when prompted to restore to the primary bank. The server boots from the primary bank.

Out-of-band method

See the IMM2.1 documentation (*Integrated Management Module II User's Guide*) at http://www.ibm.com/support/entry/portal/docdisplay?Indocid=migr-5086346.

Automated boot recovery (ABR)

Use this information for Automated boot recovery (ABR).

While the server is starting, if the integrated management module II detects problems with the server firmware in the primary bank, the server automatically switches to the backup firmware bank and gives you the opportunity to recover the firmware in the primary bank. For instructions for recovering the UEFI firmware, see "Recovering the server firmware (UEFI update failure)" on page 155. After you have recovered the firmware in the primary bank, complete the following steps:

Step 1. Restart the server.

Step 2. When the prompt **Press F3 to restore to primary** is displayed, press F3 to start the server from the primary bank.

Nx-boot failure

Use this information for Nx-boot failure.

Configuration changes, such as added devices or adapter firmware updates, and firmware or application code problems can cause the server to fail POST (the power-on self-test). If this occurs, the server responds in either of the following ways:

- The server restarts automatically and attempts POST again.
- The server hangs, and you must manually restart the server for the server to attempt POST again.

After a specified number of consecutive attempts (automatic or manual), the Nx-boot failure feature causes the server to revert to the default UEFI configuration and start the Setup utility so that you can make the necessary corrections to the configuration and restart the server. If the server is unable to successfully complete POST with the default configuration, there might be a problem with the system board.

To specify the number of consecutive restart attempts that will trigger the Nx-boot failure feature, in the Setup utility, click **System Settings ➙ Recovery ➙ POST Attempts ➙ POST Attempts Limit**. The available options are 3, 6, 9, and 255 (disable Nx-boot failure).

Chapter 5. Parts listing, Lenovo System x3500 M5 Type 5464

The parts listing of Lenovo System x3500 M5 Type 5464.

The following replaceable components are available for the Lenovo System x3500 M5 Type 5464 server, except as specified otherwise in "Replaceable server components" on page 159. For an updated parts listing, go to http://www.lenovo.com/support.

Replaceable server components

The replaceable server components for Lenovo System x3500 M5 Type 5464.

Replaceable components consist of structural parts, and field replaceable units (FRUs):

- **Structural parts:** Purchase and replacement of structural parts (components, such as chassis assembly, top cover, and bezel) is your responsibility. If Lenovo acquires or installs a structural component at your request, you will be charged for the service. See Structural parts for the list of structural parts.
- **Tier 1 customer replaceable unit (CRU):** Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request, you will be charged for the installation.
- **Tier 2 customer replaceable unit:** You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for your server.

For information about the terms of the warranty and getting service and assistance, see the *Warranty Information* document that comes with the server. For more information about getting service and assistance, see Getting help and technical assistance.

Visit http://www.lenovo.com/us/en/ serverproven/ for the latest options supporting plan.

The following illustration shows the major components in the server. The illustrations in this document might differ slightly from your hardware. For a list of structural parts, see "Structural parts" on page 169.
Figure 89. Server components

The following table lists the part numbers for the server replaceable components.

Index	Description	CRU part number (Tier 1)	CRU part number (Tier 2)
1	System x3500 M5 Lightpath Upgrade Kit	81Y7098	
2	Operator information panel assembly	81Y7083	
3	Front USB assembly cable	94Y6367	
7	Half High SATA DVD-ROM	43W8466

To order a structural part, complete the following steps:

Note: Changes are made periodically to the website. The actual procedure might vary slightly from what is described in this document.

1. Go to http://www.ibm.com.
2. From the **Products** menu, select **Upgrades, accessories & parts**.
3. Click **Obtain maintenance parts**; then, follow the instructions to order the part from the retail store.

If you need help with your order, call the toll-free number that is listed on the retail parts page, or contact your local Lenovo representative for assistance.

Power cords

For your safety, a power cord with a grounded attachment plug is provided to use with this product. To avoid electrical shock, always use the power cord and plug with a properly grounded outlet.

Lenovo power cords used in the United States and Canada are listed by Underwriter's Laboratories (UL) and certified by the Canadian Standards Association (CSA).

For units intended to be operated at 115 volts: Use a UL-listed and CSA-certified cord set consisting of a minimum 18 AWG, Type SVT or SJT, three-conductor cord, a maximum of 15 feet in length and a parallel blade, grounding-type attachment plug rated 15 amperes, 125 volts.

For units intended to be operated at 230 volts (U.S. use): Use a UL-listed and CSA-certified cord set consisting of a minimum 18 AWG, Type SVT or SJT, three-conductor cord, a maximum of 15 feet in length and a tandem blade, grounding-type attachment plug rated 15 amperes, 250 volts.

For units intended to be operated at 230 volts (outside the U.S.): Use a cord set with a grounding-type attachment plug. The cord set should have the appropriate safety approvals for the country in which the equipment will be installed.

Power cords for a specific country or region are usually available only in that country or region.

Power cord part number	Used in these countries and regions

Chapter 6. Removing and replacing components

Use this information to remove and replace the server components.

The types of replaceable components are:

- **Structural parts:** Purchase and replacement of structural parts (components, such as chassis assembly, top cover, and bezel) is your responsibility. If Lenovo acquires or installs a structural component at your request, you will be charged for the service.
- **Tier 1 customer replaceable unit (CRU):** Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request, you will be charged for the installation.
- **Tier 2 customer replaceable unit:** You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for your server.

See Chapter 5 "Parts listing, Lenovo System x3500 M5 Type 5464" on page 159 to determine whether a component is a structural part, Tier 1 CRU, or Tier 2 CRU.

For information about the terms of the warranty and getting service and assistance, see the *Warranty Information* document that comes with the server.

For more information about getting service and assistance, see Appendix D "Getting help and technical assistance" on page 1265.

Returning a device or component

If you are instructed to return a device or component, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Opening the bezel door

Use this information to unlock the left-side cover to open or remove the bezel.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To open the bezel doorfollow the steps below.

Step 1.   Unlock the left-side cover.

> **Note:** You must unlock the left-side cover to open or remove the bezel door. When you lock the left-side cover, it locks both the cover and the bezel door.

Step 2.   From the left-top section of the bezel door, use the key to turn the tab up to unlock the left-side cover and the bezel door

Figure 90. Unlock bezel door

Step 3.   Open the bezel door by pressing the button on the left edge of the bezel door, and rotate the left side of the bezel door away from the server.

Release button
Figure 91. Open the bezel door

Closing the bezel door

Use this information to close the bezel media door.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To close the bezel door, complete the following steps.

Step 1. Swing the bezel door to close it.

Step 2. From the left-top section of the bezel door, use the key to turn the tab down to lock the left-side cover and the bezel door
Figure 92. Lock the bezel door

Step 3. The bezel should be locked firmly.

Removing and replacing server components

This section provides information for removing and replacing server components in the server.

Removing and replacing structural parts

This section provides information for removing and replacing structural parts in the server.

Replacement of structural parts is your responsibility. If Lenovo installs a structural part at your request, you will be charged for the installation.

The illustrations in this document might differ slightly from your hardware.

Removing the left-side cover

Use this information to unlock and remove the left-side cover by using the key that comes with the server.

Important: Before you install optional hardware devices, make sure that the server is working correctly. Start the server and make sure that the operating system starts, if an operating system is installed, or that a 19990305 error code is displayed, indicating that an operating system was not found but the server is otherwise working correctly. If the server is not working correctly, see "Running DSA Preboot diagnostic programs" on page 138 for information about how to run diagnostics.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the left-side cover, complete the following steps.

Step 1. From the left-top section of the bezel door, use the key to turn the tab up to unlock the left-side cover and the bezel door

Figure 93. Unlock the left-side cover

Step 2. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Step 3. Press the cover-release latch down while you rotate the top edge of the cover away from the server; then, lift the cover off the server.
Figure 94. Left-side cover removal

Installing the left-side cover

Use this information to install the left-side cover.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the left-side server cover, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover-side facing up.

Step 2. Set the bottom edge of the left-side cover on the bottom ledge of the server.

Step 3. Rotate the top edge of the cover toward the server and press the cover release latch down until it clicks into place.
Figure 95. Set the bottom edge of the left-side cover

Step 4. Lock the cover, using the key that comes with the server.

Removing the bezel

Use this information to remove the bezel.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the bezel, complete the following steps.

Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 1. Unlock the left-side cover.

Step 2. From the top section of the bezel door, turn the tab up to unlock the bezel door
Figure 96. Unlock bezel door

Step 3. Open the bezel door by pressing the button on the left edge of the bezel door, and rotate the left side of the bezel door away from the server.
Figure 97. Open the bezel

Step 4. Pull the hinge assemblies hardly to release the bezel out of the server chassis.

Note: The bezel hinge needs to remove at a specific angle around sixty degree. Without doing so, the hinge or even the bezel will get damaged. You may find a white line on hinge as an indicator. To remove bezel needs to align the white line first.

Figure 98. Release the bezel

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the bezel

Use this information to install the bezel.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the bezel, complete the following steps.

Step 1.   Unlock the left-side cover, using the key that comes with the server.

   Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2.   Align the hinge assemblies with the hinge trough on the chassis.

Step 3.   Push the hinges into the troughs on the chassis until they snap into place.
Figure 99. Bezel installation

Step 4. Swing the bezel to close it.

Step 5. Lock the left-side cover and the bezel door

Replacing the stabilizing feet

Use this information to turn the stabilizing feet.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To replace the stabilizing feet, complete the following steps.

Step 1. Turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Step 2. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 3. Carefully position the server on a flat surface, with the feet hanging over the edge of the flat surface to ease removal.

Step 4. Press in on the tab that hold the feet in place; then, swing the feet away to be released one by one from the server.

Step 5. To reinstall the feet in the location, push the tab of the feet into the right place of the server.

Removing the air baffle

Use this information to remove the air baffle from the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Attention: The server automatically powers off when the air baffle is removed.

To remove the air baffle, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Press the release latches on both sides of the air baffle, and pull the air baffle up from the server and set it aside.
Figure 100. Air baffle removal

> **Attention:** For proper cooling and airflow, place the air baffle before you turn on the server.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Replacing the air baffle

Use this information to install the air baffle.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Attention: The server automatically powers off when the air baffle is removed.

To replace the air baffle, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the existing air baffle (see "Removing the air baffle" on page 181).

Step 4. Align the guide pins and place the air baffle into the server by press the release latches.
Figure 101. Air baffle installation

Step 5.   Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a RAID adapter battery or flash power module holder
Use this information to remove a RAID adapter battery or flash power module holder.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a RAID adapter battery or flash power module holder, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the remotely installed RAID adapter battery or flash power module (see "Removing a remotely installed RAID adapter battery or flash power module" on page 210).

Step 5.   Press the blue touch point slightly and pull the battery or flash power module holder out.
Figure 102. Battery or flash power module holder removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a RAID adapter battery or flash power module holder

Use this information to install a RAID adapter battery or flash power module holder.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a RAID adapter battery or flash power module holder, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Align the battery or flash power module holder with the location of the server to install the battery or flash power module holder.
Figure 103. Battery or flash power module holder installation

Step 5. Make sure that the battery or flash power module holder is secured firmly.

Step 6. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 7. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing and replacing Tier 1 CRUs

Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request, you will be charged for the installation.

The illustrations in this document might differ slightly from your hardware.

Removing and installing drives

Use this information to remove and install drives.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Depending on the server model, the server might come with a SATA attached DVD-ROM drive in bay 1.

The following illustrations show the location of the drive bays in the server. Your hardware might differ, depending on the model.

Note: If the server is configured for RAID operation using a ServeRAID adapter, you might have to reconfigure your disk arrays after you install drives. See the ServeRAID adapter documentation for additional information about RAID operation and complete instructions for using the ServeRAID adapter.

The following illustrations show the location of the drive bays in the 2.5-inch hot-swap SAS or hot-swap SATA hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 104. Server with eight 2.5-inch hard disk drives

SATA/SAS hard disk drive bays
Figure 105. Server with sixteen 2.5-inch hard disk drives

SATA/SAS hard disk drive bays
Figure 106. Server with twenty-four 2.5-inch hard disk drives

SATA/SAS hard disk drive bays
Figure 107. Server with thirty-two 2.5-inch hard disk drives

The following illustrations show the location of the drive bays in the 3.5-inch hot-swap SAS or hot-swap SATA hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 108. Server with six 3.5-inch hard disk drives

SATA/SAS hard disk drive bays
Figure 109. Server with twelve 3.5-inch hard disk drives

The following illustrations show the location of the drive bays with both 2.5-inch and 3.5-inch hot-swap SAS or hot-swap SATA hard disk drive server models.

SATA/SAS hard disk drive bays
Figure 110. Server with eight 2.5-inch hard disk drives and six 3.5-inch hard disk drives

SATA/SAS hard disk drive bays   SATA/SAS hard disk drive bays
Figure 111. Server with sixteen 2.5-inch hard disk drives and six 3.5-inch hard disk drives

The following notes describe the types of drives that the server supports and other information that you must consider when installing a drive:

- Make sure that you have all the cables and other equipment that is specified in the documentation that comes with the drive.

- Check the instructions that come with the drive to see whether you have to set any switches or jumpers on the drive. If you are installing a SAS or SATA device, be sure to set the SAS or SATA ID for that device.

- Optional external tape drives and DVD-ROM drives are examples of removable-media drives. You can install removable-media drives only in bays 1 and 2 on models with six 3.5-inch, eight, sixteen, twenty-four, and thirty-two 2.5-inch hard disk drives.

- The electromagnetic interference (EMI) integrity and cooling of the server are protected by having all bays and PCI slots covered or occupied. When you install a drive or PCI adapter, save the EMC shield and filler panel from the bay or the PCI adapter slot cover in the event that you later remove the drive or adapter.

- For a complete list of supported options for the server, see http://www.lenovo.com/us/en/ serverproven/.

Removing a 2.5-inch hot-swap hard disk drive
Use this information to remove a 2.5-inch hot-swap hard disk drive.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a 2.5-inch hot-swap hard disk drive, complete the following steps.

Step 1.   Unlock the left-side cover.

> **Note:** You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2.   Open the bezel (see "Removing the bezel" on page 177).

Step 3.   Press down on the release latch to open the drive handle; then, rotate the handle to pull the drive out of the drive bay.
Figure 112. Hot-swap hard disk drive removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a 2.5-inch hot-swap hard disk drive
Use this information to install a 2.5-inch hot-swap hard disk drive.

The following notes describe the types of hard disk drives that the server supports and other information that you must consider when you install a hard disk drive:

- Depending on the model, the server supports up to eight or up to thirty-two 2.5-inch SAS/SATA hot-swap hard disk drives in the hot-swap bays.
- For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.
- Inspect the drive and drive bay for signs of damage.
- Make sure that the drive is correctly installed in the drive bay.
- See the documentation for the ServeRAID adapter for instructions for installing a hard disk drive.

- All hot-swap drives in the server must have the same throughput speed rating; using drives with different speed ratings might cause all drives to operate at the speed of the slowest drive.
- You do not have to turn off the server to install hot-swap drives in the hot-swap drive bays. However, you must turn off the server when you perform any steps that involve installing or removing cables.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 2.5-inch hot-swap hard disk drive, complete the following steps.

Step 1. Unlock the left-side cover.

Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2. Open the bezel (see "Removing the bezel" on page 177).

Step 3. Remove the 2.5-inch filler panel, if one is present.

Step 4. Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package.

Step 5. Make sure that the drive handle is opened by press the latch; then, install the hard disk drive into the drive bay.

Step 6. Rotate the drive handle until the drive is seated in the drive bay and the release latch clicks into place.

2.5-inch hot-swap
hard disk drive

Handle

Latch

2.5-inch fill panel

Figure 113. Hot-swap hard disk drive installation

Notes:

1. After you install the hard disk drive, check the disk drive status LEDs to verify that the hard disk drive is operating correctly. If the yellow hard disk drive status LED is lit continuously, that drive is faulty and must be replaced. If the green hard disk drive activity LED is flashing, the drive is being accessed.

2. If the server is configured for RAID operation through an optional ServeRAID adapter, you might have to reconfigure your disk arrays after you install hard disk drives. See the ServeRAID documentation on the *ServeRAID Support* CD for additional information about RAID operation and complete instructions for using ServeRAID manager.

Step 7. Close the bezel (see "Installing the bezel" on page 179).

Step 8. Lock the left-side cover.

Removing a 3.5-inch hot-swap hard disk drive

Use this information to remove a 3.5-inch hot-swap SAS/SATA hard disk drive.

Attention: To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a 3.5-inch hot-swap SAS/SATA hard disk drive, complete the following steps.

Step 1. Unlock the left-side cover.

Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2. Open the bezel (see "Removing the bezel" on page 177).

Step 3. Press the latch to open the drive handle. Then, rotate the drive handle to the open position.

Step 4. Grasp the handle and pull the drive out of the drive bay.
Figure 114. Pull out the drive

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a 3.5-inch hot-swap hard disk drive
Use this information to install a 3.5-inch hot-swap SAS/SATA hard disk drive.

Before installing a 3.5-inch hot-swap hard disk drive, read the following information:

• Inspect the drive tray for signs of damage.

• To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.

• You do not have to turn off the server to install hot-swap drives in the hot-swap drive bays.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 3.5-inch hot-swap SAS/SATA hard disk drive, complete the following steps.

Step 1. Unlock the left-side cover.

Note: You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 2. Open the bezel (see "Removing the bezel" on page 177).

Step 3. Remove the filler panel, if one is present.

Step 4. Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package and place it on a static-protective surface.

Step 5. Make sure that the drive handle is opened by pressing the latch.

Step 6. Carefully slide the drive assembly into the drive bay until the drive snaps into place.
Figure 115. Hot-swap hard disk drive installation

Step 7. Rotate the drive handle to the closed position.

Step 8. Check the hard disk drive status indicator to make sure that the hard disk drive is operating correctly. After you replace a failed hard disk drive, the green activity LED flashes as the disk spins up. The yellow LED turns off after approximately 1 minute. If the new drive starts to rebuild, the yellow LED flashes slowly, and the green activity LED remains lit during the rebuild process. If the yellow LED remains lit, see the "Hard disk drive problems" on page 142 for more information.

Note: You might have to reconfigure the disk arrays after you install hard disk drives. See the RAID documentation on the Lenovo website at http://www.lenovo.com/support for information about RAID adapters.

Step 9. Close the bezel (see "Closing the bezel door" on page 174).

Step 10. Lock the left-side cover.

Removing a 3.5-inch simple-swap hard disk drive
Use this information to remove a 3.5-inch simple-swap hard disk drive.

Attention: To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a 3.5-inch simple-swap hard disk drive, complete the following steps.

Step 1.   Turn off the server and peripheral devices and disconnect all power cords.

Step 2.   Unlock the left-side cover.

> **Note:** You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 3.   Open the bezel (see "Removing the bezel" on page 177).

Step 4.   Press the release latch to open the drive handle. Then, to grasp the drive handle and pull the hard disk drive out of the drive bay.
Figure 116. Simple-swap hard disk drive removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a 3.5-inch simple-swap hard disk drive
Use this information to install a 3.5-inch simple-swap hard disk drive.

Before installing a 3.5-inch simple-swap hard disk drive, read the following information:

- Inspect the drive tray for signs of damage.
- To maintain proper system cooling, do not operate the server for more than 10 minutes without either a drive or a filler panel installed in each drive bay.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 3.5-inch simple-swap hard disk drive, complete the following steps.

Step 1. Turn off the server and peripheral devices and disconnect all power cords.

Step 2. Unlock the left-side cover.

> **Note:** You must unlock the left-side cover to open or remove the bezel. When you lock the left-side cover, it locks both the cover and the bezel.

Step 3. Open the bezel (see "Removing the bezel" on page 177).

Step 4. Remove the filler panel, if one is present.

Step 5. Touch the static-protective package that contains the disk drive to any unpainted metal surface on the server; then, remove the disk drive from the package and place it on a static-protective surface.

Step 6. Grasp the black drive handle and slide the blue release latch to the right and align the drive assembly with the guide rails in the bay.
Figure 117. Simple-swap hard disk drive installation

Step 7. Gently push the drive into the bay until the drive stops.

Step 8. Close the bezel (see "Installing the bezel" on page 179).

Step 9. Lock the left-side cover.

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a DVD drive
Use this information to remove a DVD drive.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the DVD drive, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Open the bezel (see "Removing the bezel" on page 177).

Step 3.   Disconnect the DVD drive cables from the back of the DVD drive. (see "Internal cable routing and connectors" on page 34)

Step 4.   Grasp each side of the DVD drive to pull the drive out of the server.
Figure 118. Pull the DVD drive out

Step 5.   Remove the optical drive retainer clip from the DVD drive and save them for future use.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a DVD drive
Use this information to install a DVD drive.

If you are replacing a drive, make sure that:

• You have all the cables and other equipment that are specified in the documentation that comes with the new drive.

• You have checked the instructions that come with the new drive to determine whether you must set any switches or jumpers in the drive.

• You have removed the blue optical drive rails from the side of the old drive and have them available for installation on the new drive.

Note: If you are installing a drive that contains a laser, observe the following safety precautions.

Statement 3

CAUTION:
When laser products (such as CD-ROMs, DVD drives, fiber optic devices, or transmitters) are installed, note the following:

- **Do not remove the covers. Removing the covers of the laser product could result in exposure to hazardous laser radiation. There are no serviceable parts inside the device.**

- **Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.**

DANGER

Some laser products contain an embedded Class 3A or Class 3B laser diode.

Note the following. Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.

Class 1 Laser Product
Laser Klasse 1
Laser Klass 1
Luokan 1 Laserlaite
Appareil À Laser de Classe 1

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the DVD drive, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Open the bezel (see "Removing the bezel" on page 177).

Step 3.   Touch the static-protective package that contains the DVD drive to any unpainted metal surface on the server; then, remove the DVD drive from the package.

Step 4.   Slide out the 1st Drive retainer clip from the chassis for use. (Or use the 2nd Drive retainer clip if the 1st Drive retainer clip has been used.)
Figure 119. The location of Drive retainer clips

Step 5. Install the drive retainer clip to the DVD drive, using the holes nearest the center of the drive.

Step 6. Follow the instructions that come with the drive to set jumpers or switches, if there is any.

Note: You might find it easier to install the new drive from the front and then attach the cables.

Step 7. Align the DVD drive to the drive bay; then, slide the DVD drive into the drive bay until it clicks into place.
Figure 120. Slide the DVD drive into the drive bay

Step 8. Connect power and signal cables to the drive and the connectors on the system board .(see "Internal cable routing and connectors" on page 34 for more information).

Step 9. Close the bezel (see "Installing the bezel" on page 179).

Step 10. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing an optional tape drive

Use this information to remove an optional tape drive.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove an optional full-height tape drive, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Open the bezel (see "Removing the bezel" on page 177).

Step 3.   Disconnect the power and signal cables from the back of the tape drive. (see "Internal cable routing and connectors" on page 34)

Step 4.   Grasp both sides of the tape drive to pull the drive out of the drive bay from the server.
Figure 121. Slide the tape drive out of the drive bay

Step 5.   Note the location of the drive retainer clip on the tape drive; then, remove the drive retainer clip and save them for future use.

Step 6.   Gently pull the tape drive out of the server.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing an optional tape drive

Use this information to install an optional tape drive.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install an optional full-height tape drive, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2. Open the bezel (see "Removing the bezel" on page 177).

Step 3. Remove the EMC shields from the drive bay, if installed.

Step 4. Touch the static-protective package that contains the tape drive to any unpainted metal surface on the server; then, remove the tape drive from the package.

Step 5. Slide out the 1st Drive retainer clip from the chassis for use. (Or use the 2nd Drive retainer clip if the 1st Drive retainer clip has been used.)
Figure 122. The location of Drive retainer clips

Step 6. Install the optical drive retainer clip on the tape drive.

Step 7. Follow the instructions that come with the drive to set jumpers or switches, if there is any.

Note: You might find it easier to install the new drive from the front and then attach the cables.

Step 8. Align the tape drive with the drive bay; then, slide the tape drive into the drive bay until it clicks into place.
Figure 123. Slide the tape drive into the drive bay

Step 9. Connect the power and signal cables to the drive and the connectors on the system board (see "Internal cable routing and connectors" on page 34 for more information).

Step 10. Close the bezel (see "Installing the bezel" on page 179).

Step 11. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing an adapter

Use this information to remove an adapter.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove an adapter, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Disconnect the cables from the adapter (see "Internal cable routing and connectors" on page 34).

Step 5. Press down the adapter-retention brackets to the open position.
Figure 124. Press down the adapter-retention brackets to the open position

Step 6. Pull the adapter out of the adapter connector; then, lift the adapter out of the server.

   Note: If you have installed the optional ServeRAID adapter memory module, remove it and keep it in future use (see "Removing an optional ServeRAID adapter memory module" on page 213).

Step 7. Install the PCI slot filler.
Step 8. Rotate the adapter-retention brackets to the close position.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing an adapter

Use this information to install an adapter.

The following notes describe the types of adapters that the server supports and other information that you must consider when you install an adapter:

- To confirm that the server supports the adapter that you are installing, see http://www.lenovo.com/us/en/serverproven/.
- Locate the documentation that comes with the adapter and follow those instructions in addition to the instructions in this section.
- Do not set the maximum digital video adapter resolution above 1600 x 1200 at 75 Hz for an LCD monitor. This is the highest resolution that is supported for any add-on video adapter that you install in the server.
- Avoid touching the components and gold-edge connectors on the adapter.
- The server uses a rotational interrupt technique to configure PCI adapters so that you can install PCI adapters that do not support sharing of PCI interrupts.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to stop, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when working inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.
To install an adapter, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.
Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).
Step 3. See the documentation that comes with the adapter for any cabling instructions and information about jumper or switch settings. (It might be easier for you to route cables before you install the adapter.)
Step 4. Touch the static-protective package that contains the adapter to any unpainted metal surface on the server; then, remove the adapter from the package.
Step 5. Remove the air baffle (see "Removing the air baffle" on page 181).
Step 6. Determine the PCI slot into which you will install the adapter.
Step 7. Press down the adapter-retention brackets to the open position.
Figure 125. Rotate the adapter-retention brackets to the open position

Step 8. Remove the expansion slot cover, if installed. Keep the slot cover in a safe place for potential future use.

Step 9. Press the adapter *firmly* into the expansion slot.

Attention: Incomplete insertion might cause damage to the system board or the adapter.

Step 10. Close the adapter-retention bracket.

Step 11. Connect the adapter cables (see "Internal cable routing and connectors" on page 34).

Step 12. Perform any configuration tasks that are required for the adapter.

Step 13. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 14. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Note: If the server is configured for RAID operation through an optional ServeRAID adapter, you might have to reconfigure your disk arrays after you install an adapter. See the ServeRAID documentation on the *Lenovo ServeRAID Support* CD for additional information about RAID operation and complete instructions for using ServeRAID Manager.

Removing the SD adapter
Use this information to remove the SD adapter.

The following notes describe the types of adapters that the server supports and other information that you must consider when you install an adapter:

• To confirm that the server supports the adapter that you are installing, see http://www.lenovo.com/us/en/serverproven/.

- Locate the documentation that comes with the adapter and follow those instructions in addition to the instructions in this section.
- Do not set the maximum digital video adapter resolution above 1600 x 1200 at 75 Hz for an LCD monitor. This is the highest resolution that is supported for any add-on video adapter that you install in the server.
- Avoid touching the components and gold-edge connectors on the adapter.
- The server uses a rotational interrupt technique to configure PCI adapters so that you can install PCI adapters that do not support sharing of PCI interrupts.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to stop, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when working inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the SD adapter, complete the following steps:

Step 1. Turn off the server and peripheral devices and disconnect all power cords.
Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).
Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).
Step 4. If necessary, remove the adapter closed to the SD adapter (see "Removing an adapter" on page 205).
Step 5. Loosen the two screws.
Step 6. Lift the SD adapter out of the server.
Step 7. Remove the SD cards.
Figure 126. SD adapter removal

If you are instructed to return the SD adapter, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Replacing the SD adapter

Use this information to replace a SD adapter.

The following notes describe the types of adapters that the server supports and other information that you must consider when you install an adapter:

- To confirm that the server supports the adapter that you are installing, see http://www.lenovo.com/us/en/serverproven/.
- Locate the documentation that comes with the adapter and follow those instructions in addition to the instructions in this section.
- Do not set the maximum digital video adapter resolution above 1600 x 1200 at 75 Hz for an LCD monitor. This is the highest resolution that is supported for any add-on video adapter that you install in the server.
- Avoid touching the components and gold-edge connectors on the adapter.
- The server uses a rotational interrupt technique to configure PCI adapters so that you can install PCI adapters that do not support sharing of PCI interrupts.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to stop, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when working inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the SD adapter, complete the following steps:

Step 1.   Turn off the server, and disconnect all power cords and external cables.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the adapter closed to the SD adapter (see "Removing an adapter" on page 205).

Step 5.   Insert the SD cards into the SD adapter.

Step 6.   Align the SD adapter with the alignment pins and connector; then, push downwards until it is firmly seated.

Step 7.   Fasten the two screws.
Figure 127. SD adapter installation

Step 8.   Reconnect the power cords and any cables have been removed.

Step 9.   Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 10. Reinstall the left-side cover (see "Installing the left-side cover" on page 176).

Step 11. Slide the server into the rack.

Step 12. See the http://www.ibm.com/support/entry/portal/docdisplay?lndocid=MIGR-5096845, that comes with the option, for information about how to configure the SD adapter.

Step 13. Turn on the peripheral devices and the server.

Removing a remotely installed RAID adapter battery or flash power module

Use this information to remove a RAID adapter battery or flash power module remotely in the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

If a ServeRAID adapter battery or flash power module is installed and you need to replace it, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

          Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Pull the release tab outward and unlock the battery/flash power module retention clip.

Battery / flash power module

Battery holder

Retention clip
Figure 128. Pull the release tab

Step 5. Disconnect the battery/flash power module cable from the battery/flash power module cable connector on the battery/flash power module (see "Internal cable routing and connectors" on page 34).

Step 6. Lift the battery/flash power module up to remove the battery/flash power module from the battery/flash power module holder.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a RAID adapter battery or flash power module remotely in the server

Use this information to install a RAID adapter battery or flash power module remotely in the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Note: When you install any RAID adapter that comes with batteries, it is sometimes necessary to install the batteries in another location in the server to prevent the batteries from overheating.

To install a RAID adapter battery or flash power module remotely in the server, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Install the ServeRAID adapter on the system board (see "Installing an adapter" on page 206).

Step 5. Connect one end of the battery/flash power module cable to the battery/flash power module connector.

Step 6. Route the remote battery/flash power module cable as shown in the following illustration.

Battery / flash power module

ServeRAID adapter

RAID adapter battery / flash
power module cable
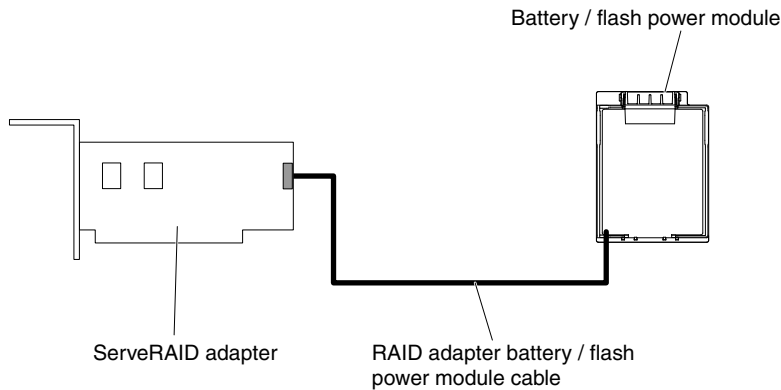

Figure 129. Route the battery/flash power module

Attention: Make sure that the cable is not connected and does not cover any connectors or obstruct any components on the system board.

Step 7. Install the battery/flash power module:

a. Align the battery/flash power module cable to slot of the battery holder. Place the battery/flash power module into the battery holder and make sure that the battery holder engages the battery/flash power module securely.

Battery / flash power module

Battery holder
Retention clip

Figure 130. Align the battery/flash power module cable

Note: The positioning of the remote battery/flash power module depends on the type of the remote batteries/flash power module that you install.

b. Lower and press down on the retention clip until it snaps in place to hold the battery/flash power module firmly in place.

Step 8. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 9. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Note: You must wait approximately 3 minutes after you connect the server power cord to an electrical outlet before the power-control button becomes active.

Removing an optional ServeRAID adapter memory module

Use this information to remove an optional ServeRAID adapter memory module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove an optional ServeRAID adapter memory module, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the adapter (see "Removing an adapter" on page 205).

Step 5.   Grasp the memory module and lift to remove it from the connector on the ServeRAID adapter.
Figure 131. Memory card removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing an optional ServeRAID adapter memory module

Use this information to install an optional ServeRAID adapter memory module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install an optional ServeRAID adapter memory module, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the ServeRAID adapter if necessary (see "Removing an adapter" on page 205).

Step 5. Touch the static-protective package that contains the memory card to any unpainted metal surface on the server; then, remove the memory card from the package.

Step 6. Align the memory module with the connector on the ServeRAID adapter and push it into the connector until it is firmly seated.
Figure 132. Align the memory module

Step 7. Reinstall the ServeRAID adapter (see "Installing an adapter" on page 206).

Step 8. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 9. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a hot-swap fan

Use this information to remove a hot-swap fan in the server.

Attention: To avoid unexpected system shutdown, ensure that you lay the server on its side with the cover facing up before you start.

The server comes with two 92 mm x 38 mm hot-swap fans in the fan cage assembly. The following instructions can be used to install any hot-swap fan in the server.

Notes:

1.
Figure 133. The available fan sockets in the server

2. You can order the two additional fans for redundant cooling.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a hot-swap fan, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Open the fan locking and pull it up from the fan cage assembly.
Figure 134. Open the fan-locking handle

Step 4. If you are instructed to return the hot-swap fan, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a hot-swap fan

Use this information to install a hot-swap fan in the server.

Attention: To avoid unexpected system shutdown, ensure that you lay the server on its side with the cover facing up before you start.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a hot-swap fan, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Step 2. Touch the static-protective package that contains the hot-swap fan to any unpainted metal surface on the server; then, remove the fan from the package.

Step 3. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 4. Open the fan-locking handle of the replacement fan.

Step 5. Insert the fan into the socket and close the handle to the locked position.
Figure 135. Insert fan into the socket

Step 6. Install and lock the left-side cover (see "Replacing the left-side cover" on page 93).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the system battery

Use this information to remove the system battery.

The following illustration shows the location of the system battery.
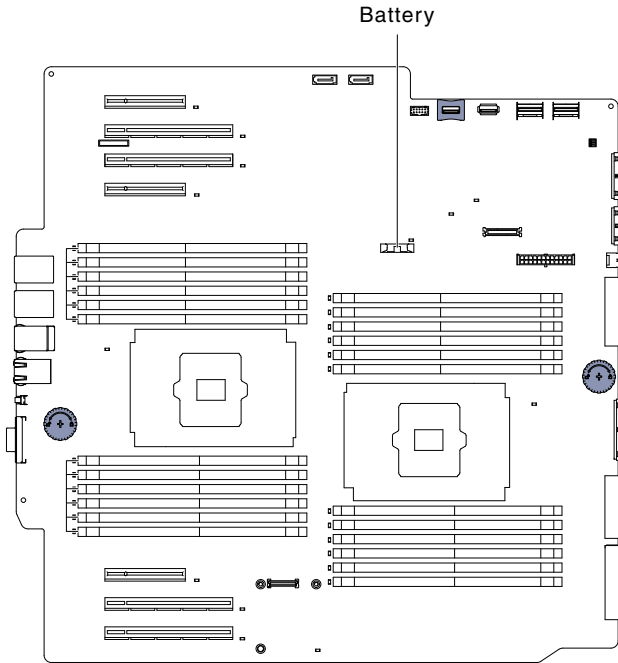

Figure 136. System battery

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the battery, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the system battery:

   a. If there is a rubber cover on the battery holder, use your fingers to lift the battery cover from the battery connector.

   b. Use one finger to tilt the battery horizontally out of its socket, pushing it away from the socket.

   Attention: Neither tilt nor push the battery by using excessive force.

   c. Use your thumb and index finger to lift the battery from the socket.
Figure 137. System battery removal

> **Attention:** Do not lift the battery by using excessive force. Failing to remove the battery properly may damage the socket on the system board. Any damage to the socket may require replacing the system board.

Step 5. Dispose of the battery as required by local ordinances or regulations (see the *Environmental Notices and User Guide* for more information).

Installing the system battery

Use this information to install the system battery.

The following notes describe information that you must consider when you replace the battery in the server:
Figure 138. System battery

- You must replace the battery with a lithium battery of the same type from the same manufacturer.
- To order replacement batteries, call 1-800-426-7378 within the United States, and 1-800-465-7999 or 1-800-465-6666 within Canada. Outside the U.S. and Canada, call your Lenovo sales representative or Lenovo reseller.
- After you replace the battery, you must reconfigure the server and reset the system date and time.
- To avoid possible danger, read and follow the following safety statement.

Statement 2

CAUTION:
When replacing the lithium battery, use only Lenovo Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:

- **Throw or immerse into water**
- **Heat to more than 100°C (212°F)**
- **Repair or disassemble**

Positive (+) side
To install the replacement battery, complete the following steps.

Step 1. Follow any special handling and installation instructions that come with the replacement battery.

Step 2. Insert the new battery:

    a. Tilt the battery so that you can insert it into the socket on the side opposite the battery clip.

Figure 139. Tilt the battery

    b. Press the battery down into the socket until it clicks into place. Make sure that the battery clip holds the battery securely.

    c. If you removed a rubber cover from the battery holder, use your fingers to install the battery cover on top of the battery connector.

Step 3. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 4. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

Step 5. Reconnect the external cables and power cords; then, turn on the attached devices and turn on the server.

Note: You must wait approximately 3 minutes after you connect the server power cord to an electrical outlet before the power-control button becomes active.

Step 6. Start the Setup utility and reset the configuration:

    a. Set the system date and time.

    b. Set the power-on password.

    c. Reconfigure the server.

    See "Starting the Setup utility" on page 101 for details.

Removing the light path diagnostics assembly

Use the information to remove the light path diagnostics assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the light path diagnostics assembly from the server, complete the following steps.

Step 1. Carefully lay the server down on its side.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 5. Disconnect the light path diagnostics cable from the system board (see "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34).

Step 6. Pull the release latch and push backward the light path diagnostics assembly to the rear of the server to release it.

Release latch

Light path diagnostics assembly
Figure 140. Remove the light path diagnostics assembly

Step 7. Stand the server back up in its vertical position.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the light path diagnostics assembly

Use the information to install the light path diagnostics assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the light path diagnostics assembly, complete the following steps.

Step 1. Carefully lay the server down on its side.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 5. Touch the static-protective package that contains the light path diagnostics assembly to any unpainted metal surface on the server; then, remove the assembly from the package.

Step 6. Install the light path diagnostics assembly into the place.
Figure 141. Light path diagnostics assembly installation

Step 7. Connect the light path diagnostics cable to the system board. See "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34 to locate the light path diagnostics connectors on the system board.

Step 8. Install the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 9. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 10. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

Step 11. Stand the server back up in its vertical position.

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the USB assembly

Use the information to remove the USB assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the USB assembly from the server, complete the following steps.

Step 1. Carefully lay the server down on its side.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Disconnect the USB assembly cable from the system board (see "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34).

Step 5. Stand the server back up in its vertical position.

Step 6. Open the bezel door (see "Opening the bezel door" on page 173).

Step 7. Press down on the release latch of the USB assembly; then, rotate it to be released away from the server.

Figure 142. The USB assembly removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the USB cable assembly

Use the information to install the USB cable assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the USB cable assembly, complete the following steps.

Step 1. Carefully lay the server down on its side.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 5. Stand the server back up in its vertical position.

Step 6. Remove the USB cable assembly.

Step 7. Touch the static-protective package that contains the USB cable assembly to any unpainted metal surface on the server; then, remove the assembly from the package.

Step 8.   Angel one side (without the release latch) of the USB assembly to the server chassis.

Front USB assembly

Release latch
Figure 143. The USB assembly installation

Step 9.   Rotate and insert the USB cable assembly into the mounting bracket.

Step 10.   Connect the USB cable to the system board (see "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34).

Step 11.   Close the bezel (see "Installing the bezel" on page 179).

Step 12.   Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 13.   Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the 2.5-inch hard disk drive backplane

Use this information to remove the 2.5-inch hard disk drive backplane.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a 2.5-inch hard disk drive backplane, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Open the bezel door (see "Opening the bezel door" on page 173).

Release button
Figure 144. Open bezel

Step 3. Remove the 2.5-inch hot-swap hard disk drives (see "Removing a 2.5-inch hot-swap hard disk drive" on page 192).

Step 4. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 5. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 6. Note where the power, signal, and configuration cables are connected to the 2.5-inch hard disk drive backplane; then, disconnect them (see "Internal cable routing and connectors" on page 34).

Step 7. The illustrator shows the location of 2.5-inch HDD hot-swap backplanes.

install backplane for drive day 16~23

install backplane for drive day 0~7

install backplane for drive day 24~31

install backplane for drive day 8~15

2.5-inch HDD
hot-swap backplane (expander)

2.5-inch HDD
hot-swap backplane
Figure 145. The location of 2.5-inch HDD hot-swap backplanes

Step 8. Lift the release latches that hold the backplane in place; then, rotate the top edge of the backplane toward the rear of the server and remove it from the server.
Figure 146. 2.5-inch HDD hot-swap backplane removal

Step 9.   If you are removing another SAS backplane, repeat steps 6 to 8 for removing the remaining backplanes.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the 2.5-inch hard disk drive backplane

Use this information to install the 2.5-inch hard disk drive backplane.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 2.5-inch hard disk drive backplane, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3.   Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 4.   Touch the static-protective package that contains the hard disk drive backplane to any unpainted metal surface on the server; then, remove the backplane from the package.

Step 5.   Position the bottom of 2.5-inch hard disk drive backplane in the tabs of the server chassis; then, rotate the top of the backplane toward the front of the server until the latches click into place.

Align pin

2.5-inch HDD backplane
Figure 147. 2.5-inch HDD backplane installation

Step 6. Connect the power, signal, and configuration cables to the 2.5-inch hard disk drive backplane (see "Hard disk drive backplane connectors" on page 33 and "Internal cable routing and connectors" on page 34).

Step 7. If you are replacing another 2.5-inch hard disk drive backplane, repeat steps 5 to 6 for installing the additional backplane.

Step 8. Install the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 9. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 10. Open the bezel door (see "Opening the bezel door" on page 173).

Release button
Figure 148. Open bezel

Step 11. Install the 2.5-inch hot-swap hard disk drives (see "Installing a 2.5-inch hot-swap hard disk drive" on page 193).

Step 12. Close the bezel (see "Installing the bezel" on page 179).

Step 13. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the 3.5-inch hard disk drive backplane

Use this information to remove the 3.5-inch hard disk drive backplane.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a 3.5-inch hard disk drive backplane, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2. Open the bezel door (see "Opening the bezel door" on page 173).

Release button
Figure 149. Open bezel

Step 3. Remove the 3.5-inch hot-swap hard disk drives (see "Removing a 3.5-inch hot-swap hard disk drive" on page 195).

Step 4. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 5. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 6. Note where the power, signal, and configuration cables are connected to the 3.5-inch hard disk drive backplane; then, disconnect them (see "Internal cable routing and connectors" on page 34).

Step 7. Press the release latches, then, rotate and release the 3.5-inch HDD backplane away from the server chassis.

Release latch

3.5-inch HDD backplane
Figure 150. 3.5-inch HDD backplane removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the 3.5-inch hard disk drive backplane

Use this information to install the 3.5-inch hard disk drive backplane.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a 3.5-inch hard disk drive backplane, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Open the bezel door (see "Opening the bezel door" on page 173).

Release button
Figure 151. Open bezel

Step 3.   Remove the 3.5-inch hot-swap hard disk drives (see "Removing a 3.5-inch hot-swap hard disk drive" on page 195).

Step 4.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 5.   Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 6.   Insert the bottom of the 3.5-inch hard disk drive backplane onto the lower lip of the server chassis.

Align pin

3.5-inch HDD backplane
Figure 152. 3.5-inch HDD backplane installation

Step 7.   Rotate the backplane toward the server chassis until the backplane clicks into the place securely.

Step 8.   Reconnect the power, configuration, and signal cables to the 3.5-inch hard disk drive backplane (see "Internal cable routing and connectors" on page 34).

Step 9.   Install the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 10. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 11. Install the 3.5-inch hot-swap hard disk drives that were removed from the hard disk drive cage (see "Installing a 3.5-inch hot-swap hard disk drive" on page 196).

Step 12. Close the bezel.

Step 13. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a hot-swap power supply

Use this information to remove a hot-swap power supply.

When you remove or install a hot-swap power supply, observe the following precautions.

Statement 5

CAUTION:
The power control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

Statement 8

CAUTION:
Never remove the cover on a power supply or any part that has the following label attached.

Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

To remove a hot-swap power supply, complete the following steps.

Notes:

1. If only one hot-swap power supply is installed in the server, you must turn off the server before removing the power supply.

2. You must install the fan cage assembly before removing or installing the power supply.

Step 1. Disconnect the power cord from the connector on the back of the power supply that you are removing.

Step 2. Press down the release latch of the hot-swap power supply and pull it out from the rear side of the server.
Figure 153. Hot-swap power supply removal

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a hot-swap power supply

Use this information to install a hot-swap power supply.

The following notes describe the type of ac power supply that the server supports and other information that you must consider when you install a power supply:

- Make sure that the devices that you are installing are supported. For a list of supported optional devices for the server, see http://www.lenovo.com/us/en/ serverproven/.

- Before you install an additional power supply or replace a power supply with one of a different wattage, you may use the Power Configurator utility to determine current system power consumption. For more information and to download the utility, go to http://www.ibm.com/systems/bladecenter/resources/powerconfig.html.

- The server comes with one hot-swap 12-volt output power supply that connects to power supply bay 1. The input voltage is 110 V ac or 220 V ac auto-sensing.

- Power supplies in the server must be with the same power rating or wattage to ensure that the server will operate correctly.

- Power supply 1 is the default/primary power supply. If power supply 1 fails, you must replace the power supply with the same wattage immediately.

- You can order an optional power supply for redundancy.

- These power supplies are designed for parallel operation. In the event of a power-supply failure, the redundant power supply continues to power the system. The server supports a maximum of two power supplies.

Statement 5

CAUTION:
The power control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

Statement 8

CAUTION:
Never remove the cover on a power supply or any part that has the following label attached.

Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

Attention: Static electricity that is released to internal server components when the server is powered-on might cause the server to halt, which might result in the loss of data. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding system when you work inside the server with the power on.

To install a hot-swap power supply, complete the following steps.

Step 1.   Touch the static-protective package that contains the hot-swap power supply to any unpainted metal surface on the server; then, remove the power supply from the package and place it on a static-protective surface.

Step 2. Remove the power-supply filler panel from the power bay, if one is installed.

Figure 154. Power-supply filler panel removal

Step 3. Install the power supply and push it in until it locks into place.

Notes:

1. If only one hot-swap power supply is installed in the server, a power-supply filler must be installed in the empty power bay.

2. Do not mix power supplies with different wattage in the server.

Step 4. Route the power cord through the handle and cable tie if any, so that it does not accidentally become unplugged.

Step 5. Connect one end of the power cord for the new power supply into the connector on the back of the power supply; then, connect the other end of the power cord to a properly grounded electrical outlet.

Note: If the server has been turned off, you must wait approximately 3 minutes after you connect the server power cord to an electrical outlet before the power-control button becomes active.

Step 6. Make sure that the ac power LED and the dc power LED on the ac power supply are lit, indicating that the power supply is operating correctly. The two green LEDs are to the right of the power-cord connector.

Step 7. When power supply is configured as zero-output mode, it keeps 12Vaux on, and sleep the 12V output to minimize its power consumption. At the same time, Power supply will keep DC_GOOD signal be asserted, and its fan rotating, the DC GOOD green LED should blink at a 1Hz rate.

Step 8. If you are replacing a power supply with one of a different wattage, apply the power information label provided with the new power supply over the existing power information label on the server.

Figure 155. Power supply replacement

Removing the operator information panel assembly

Use this information to remove the operator information panel assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the operator information panel assembly, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3.   Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 4.   Disconnect the operator information panel assembly cable from the system board (see "System-board internal connectors" on page 27).

Step 5.   Locate the operator information panel assembly release latch just above the DVD drive.
Figure 156. Operator information panel removal

Step 6. Pull out and rotate the release latch of the operator information panel assembly to release it from the server.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the operator information panel assembly

Use this information to install the operator information panel assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the operator information panel assembly, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2. Open the bezel (see "Removing the bezel" on page 177).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 5. Touch the static-protective package that contains the operator information panel assembly to any unpainted metal surface on the server; then, remove the assembly from the package.

Step 6. Angle the operator information panel assembly, so, its edge can fit into the guide slot.

Operator information
panel assembly

Release latch
Figure 157. Operator information panel installation

Step 7. Rotate the operator information panel assembly to the server chassis until clicks into place.

Step 8. Connect the operator information panel assembly cable to the system board (see "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34).

Step 9. Reinstall the DVD drive (see "Installing a DVD drive" on page 200 and "Installing an optional tape drive" on page 203) which you removed before in drive bay 1.

Step 10. Connect the drive cables to the back of the drive bay 1.

Step 11. Reinstall the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 12. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 13. Close the bezel (see "Replacing the air baffle" on page 182).

Step 14. Close and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a memory module

Use this information to remove a memory module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a dual inline memory module (DIMM), complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Locate the DIMM connectors on the system board (see "System-board internal connectors" on page 27).

> **Attention:** To avoid breaking the retaining clips or damaging the DIMM connectors, handle the clips gently.

Step 5. Move the DIMM retaining clips on the side of the DIMM connector to the open position by pressing the retaining clips away from the center of the DIMM connector.
Figure 158. Memory module removal

Step 6. Using your fingers, lift the DIMM out of the DIMM connector.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Memory module installation

The following notes describe the types of DIMMs that the server supports and other information that you must consider when you install DIMMs.

- When you install or remove DIMMs, the server configuration information changes. When you restart the server, the system displays a message that indicates that the memory configuration has changed.

- The server supports only industry-standard double-data-rate 4 (DDR4), 1600, 1866, or 2133 MHz, PC4-12800, PC4-14900, or PC4-17000 registered or load deduction, synchronous dynamic random-access memory (SDRAM) dual inline memory modules (DIMMs) with error correcting code (ECC). See http://www.lenovo.com/us/en/ serverproven/ for a list of supported memory modules for the server.

  – The specifications of a DDR4 DIMM are on a label on the DIMM, in the following format.

    gggggeRxff PC4*v-wwwwwm-aa-bb-ccd*

    where:

    – *ggggg* is the total capacity of the DIMM (for example, 1GB, 2GB, or 4GB)

- *eR* is the number of ranks

    1R = single-rank

    2R = dual-rank

    4R = quad-rank

- *xff* is the device organization (bit width)

    x4 = x4 organization (4 DQ lines per SDRAM)

    x8 = x8 organization

    x16 = x16 organization

- *v* is the SDRAM and support component supply voltage (VDD)

    • Blank = 1.2 V specified

- *wwwww* is the DIMM bandwidth, in MBps

    12800 = 12.80 GBps (DDR4-1600 SDRAMs, 8-byte primary data bus)

    14900 = 14.93 GBps (DDR4-1866 SDRAMs, 8-byte primary data bus)

    17000 = 17.00 GBps (DDR4-2133 SDRAMs, 8-byte primary data bus)

- *m* is the DIMM type

    L = Load Reduction DIMM (LRDIMM)

    R = Registered DIMM (RDIMM)

- *aa* is the CAS latency, in clocks at maximum operating frequency
- *bb* is the JEDEC SPD Revision Encoding and Additions level
- *cc* is the reference design file for the design of the DIMM
- *d* is the revision number of the reference design of the DIMM

Note: To determine the type of a DIMM, see the label on the DIMM. The information on the label is in the format xxxxx nRxxx PC4v-xxxxxx-xx-xx-xxx. The numeral in the sixth numerical position indicates whether the DIMM is single-rank (n=1), dual-rank (n=2), or quad-rank (n=4).

- The following rules apply to DDR4 RDIMM speed as it relates to the number of RDIMMs in a channel:

    - When you install 1 RDIMM per channel, the memory runs at 2133 MHz

    - When you install 2 RDIMMs per channel, the memory runs at 1866 MHz

    - When you install 3 RDIMMs per channel, the memory runs at 1600 MHz

    - All channels in a server run at the fastest common frequency

    - Do not install registered and load reduction DIMMs in the same server

- The following rules apply to DDR4 RDIMM speed as it relates to the number of LRDIMMs in a channel:

    - When you install 1 LRDIMM per channel, the memory runs at 2133MHz

    - When you install 2 LRDIMMs per channel, the memory runs at 2133 MHz

    - When you install 3 LRDIMMs per channel, the memory runs at 1600 MHz

- The maximum memory speed is determined by the combination of the microprocessor, DIMM speed, DIMM type, Operating Modes in UEFI settings, and the number of DIMMs installed in each channel.

- The server supports a maximum of 24 single-rank, dual-rank RDIMMs or 24 quad-rank LRIMMs.

- The following table shows an example of the maximum amount of memory that you can install using ranked DIMMs:

Table 33. Maximum memory installation using ranked DIMMs

Number of DIMMs	DIMM type	DIMM size	Total memory
24	Single-rank RDIMMs	4 GB	96 GB
24	Dual-rank RDIMMs	8 GB	192 GB
24	Dual-rank RDIMMs	16 GB	384 GB
24	Quad-rank LRDIMMs	32 GB	768 GB
24	Quad-rank LRDIMMs	64 GB	1536 GB

- The RDIMM options that are available for the server are 4 GB, 8 GB, and 16 GB. The server supports a minimum of 4 GB and a maximum of 384 GB of system memory using RDIMMs.

- The LRDIMM option that is available for the server is 32 GB and 64 GB. The server supports a minimum of 32 GB and a maximum of 1536 GB of system memory using LRDIMMs.

  Note: The amount of usable memory is reduced depending on the system configuration. A certain amount of memory must be reserved for system resources. To view the total amount of installed memory and the amount of configured memory, run the Setup utility. For additional information, see "Configuring the server" on page 98.

- A minimum of one DIMM must be installed for each microprocessor. For example, you must install a minimum of two DIMMs if the server has two microprocessors installed. However, to improve system performance, install a minimum of four DIMMs for each microprocessor.

- DIMMs in the server must be the same type (RDIMM or LRDIMM) to ensure that the server will operate correctly.

Note: You can install DIMMs for microprocessor 2 as soon as you install microprocessor 2; you do not have to wait until all of the DIMM slots for microprocessor 1 are filled.

The following illustration shows the location of the DIMM connectors on they system board.

Figure 159. The location of the DIMM connectors on the system board

DIMM installation sequence

Depending on the server model, the server may come with a minimum of one 8 GB or 16 GB DIMM installed in slot 1. When you install additional DIMMs, install them in the order shown in the following table to optimize system performance.

In general, all four channels on the memory interface for each microprocessor can be populated in any order and have no matching requirements.

Table 34. Independent mode DIMM installation sequence

Number of installed microprocessor	DIMM connector population sequence
One microprocessor installed	1, 4, 9, 12, 2, 5, 8, 11, 3, 6, 7, 10
Two microprocessors installed	1, 13, 4, 16, 9, 21, 12, 24, 2, 14, 5, 17, 8, 20, 11, 23, 3, 15, 6, 18, 7, 19, 10, 22

For optimal performance:

Make sure all four memory channels of each microprocessor are populated. Each memory channels should be populated with the same type and amount of memory per channel. Each microprocessor socket should be populated with the same type and amount of memory per socket. 1DPC (one DIMM per channel) or 2DPC (two DIMM per channel) memory configuration are recommended. Unless there is a need for memory capacity over memory frequency, 3DPC (three DIMMs per channel) configuration is not recommended since 3DPC configuration forces the memory subsystem to run at a lower frequency (1600 MHz).

Please refer to the Understanding and Optimizing Memory Performance for Intel Xeon Processor E5-2600 v3 Series in IBM Flex System, System x, and BladeCenter Platforms white paper for the detail.

Memory mirrored channel

Memory mirrored channel mode replicates and stores data on two pairs of DIMMs within two channels simultaneously. If a failure occurs, the memory controller switches from the primary pair of memory DIMMs to the backup pair of DIMMs.

If a failure occurs, the memory controller switches from the primary pair of memory DIMMs to the backup pair of DIMMs. To enable memory mirrored channel through the Setup utility, select **System Settings ➙ Memory**. For more information, see "Using the Setup utility" on page 101. When you use the memory mirrored channel feature, consider the following information:

• When you use memory mirrored channel, you must install a pair of DIMMs at a time. The two DIMMs in each pair must be identical in size, type, and rank (single, dual, or quad), and organization, but not in speed. The channels run at the speed of the slowest DIMM in any of the channels.

• The maximum available memory is reduced to half of the installed memory when memory mirrored channel is enabled. For example, if you install 64 GB of memory using RDIMMs, only 32 GB of addressable memory is available when you use memory mirrored channel.

The following diagram lists the DIMM connectors on each memory channel.

Figure 160. Connectors on each memory channel

Note: You can install DIMMs for microprocessor 2 as soon as you install microprocessor 2; you do not have to wait until all of the DIMM connectors for microprocessor 1 are filled.

The following table shows the installation sequence for memory mirrored mode:

Table 35. Memory mirrored channel mode DIMM population sequence

Number of DIMMs	Number of installed microprocessor	DIMM connector
First pair of DIMMs	1	1, 4
Second pair of DIMMs	1	9, 12
Third pair of DIMMs	1	2, 5
Fourth pair of DIMMs	1	8, 11
Fifth pair of DIMMs	1	7, 10
Sixth pair of DIMMs	1	3, 6
First pair of DIMMs	2	1, 4
Second pair of DIMMs	2	13, 16
Third pair of DIMMs	2	9, 12
Fourth pair of DIMMs	2	21, 24
Fifth pair of DIMMs	2	2, 5
Sixth pair of DIMMs	2	14, 17
Seventh pair of DIMMs	2	8, 11
Eighth pair of DIMMs	2	20, 23

Table 35. Memory mirrored channel mode DIMM population sequence (continued)

Number of DIMMs	Number of installed microprocessor	DIMM connector
Ninth pair of DIMMs	2	19, 22
Tenth pair of DIMMs	2	7, 10
Eleventh pair of DIMMs	2	15, 18
Twelfth pair of DIMMs	2	3, 6

When you install or remove DIMMs, the server configuration information changes. When you restart the server, the system displays a message that indicates that the memory configuration has changed.

Memory rank sparing

Sparing enables a failing rank to be replaced by ranks installed in an unoccupied space. An unused spare rank on the channel can be used to copy the contents of a failing rank on that channel.

You can enable rank sparing memory in the Setup utility (see "Starting the Setup utility" on page 101).

The following diagram lists the DIMM connectors on each memory channel.

Figure 161. Connectors on each memory channel

Note: You can install DIMMs for the microprocessor 2 once the microprocessor 2 is installed. You do not need to wait until all of the DIMM connectors for microprocessor 1 are filled.

The following table shows the installation sequence for memory rank sparing mode:

Table 36. Memory rank sparing mode DIMM population sequence

Number of DIMMs	Number of installed microprocessor	DIMM connector
First pair of DIMMs	1	1, 2
Second pair of DIMMs	1	4, 5
Third pair of DIMMs	1	8, 9
Fourth pair of DIMMs	1	11, 12
Fifth pair of DIMMs	1	7, 10
Sixth pair of DIMMs	1	3, 6
First pair of DIMMs	2	1, 2
Second pair of DIMMs	2	13, 14
Third pair of DIMMs	2	4, 5
Fourth pair of DIMMs	2	16, 17
Fifth pair of DIMMs	2	8, 9
Sixth pair of DIMMs	2	20, 21
Seventh pair of DIMMs	2	11, 12
Eighth pair of DIMMs	2	23, 24
Ninth pair of DIMMs	2	7, 10
Tenth pair of DIMMs	2	19, 22
Eleventh pair of DIMMs	2	3, 6
Twelfth pair of DIMMs	2	15, 18
Note: Rank Sparing is only supported when there is more than 1DPC or if a single QRDIMM is installed		

Installing a DIMM

Use this information to install a DIMM.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a DIMM, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

> **Attention:** Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle if installed (see "Removing the air baffle" on page 181).

Step 4. Locate the DIMM connectors on the system board (see "System-board internal connectors" on page 27). Determine the connectors into which you will install the DIMMs.

Step 5. Open the retaining clip on each end of the DIMM connector.

> **Attention:** To avoid breaking the retaining clips or damaging the DIMM connectors, open and close the clips gently.
Figure 162. DIMM installation

Step 6. Touch the static-protective package that contains the DIMM to any unpainted metal surface on the outside of the server. Then, remove the DIMM from the package.

Step 7. Turn the DIMM so that the alignment slot align correctly with the alignment tab.

Step 8. Insert the DIMM into the connector by aligning the edges of the DIMM with the slots at the ends of the DIMM connector (see "System-board internal connectors" on page 27) for the locations of the DIMM connectors).
Figure 163. Insert DIMM into connector

Step 9. Firmly press the DIMM straight down into the connector by applying pressure on both ends of the DIMM simultaneously. The retaining clips snap into the locked position when the DIMM is firmly seated in the connector.

> **Note:** If there is a gap between the DIMM and the retaining clips, the DIMM has not been correctly inserted; open the retaining clips, remove the DIMM, and then reinsert it.

Step 10. Reinstall the air baffle if it was removed before (see "Replacing the air baffle" on page 182).

Step 11. Reinstall and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a USB embedded hypervisor flash device

Use this information to remove a USB embedded hypervisor flash device.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a hypervisor flash device, complete the following steps.

Step 1. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3. Unlock the retention latch by pushing it down toward the system board.
Figure 164. Unlock retention latch

Step 4. Grasp the flash device and pull to remove it from the connector.

Step 5. Return the retention latch to the locked position by pulling it away from the system board.
Figure 165. Return retention latch to locked position

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a USB embedded hypervisor flash device

Use this information to install a USB embedded hypervisor flash device.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a hypervisor flash device, complete the following steps.

Step 1.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 2.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 3.   Unlock the retention latch by pushing it down toward the system board.

Figure 166. Unlock retention latch

Step 4.   Align the flash device with the USB connector on the system board and push it into the USB connector until it is firmly seated.

Step 5.   Return the retention latch to the locked position by pulling it away from the system board.
Figure 167. Return retention latch to locked position

Step 6.   Reconnect the power cord and any cables that you removed.

Step 7.   Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 8.   Reinstall the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the fan cage assembly

Use this information to remove the fan cage assembly from the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the fan cage assembly, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Disconnect the fan cage power cable from the system board (see "Internal cable routing and connectors" on page 34).

Step 5.   Rotate the fan cage release latch to the open position.
Figure 168. Fan cage removal

Step 6.   Grasp the fan cage assembly and lift it out of the server.
If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the fan cage assembly

Use this information to install the fan cage assembly from the server.

Attention: Make sure that all wires and cables inside the server are routed correctly before you install the fan cage assembly. Wiring that is not properly routed might be damaged or might prevent the fan cage assembly from seating properly in the server.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the fan cage assembly, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Align the guides on the fan cage with the release latch to the open position.

Step 5.   Put the fan cage assembly down into the server.

   Note: Make sure that the fan cage is fully seated.

Step 6.   Rotate the fan cage release latch to the close position. The fan cage will be fully seated when it is secured.
Figure 169. Fan cage installation

Step 7.   Connect the fan cage assembly power cable to the system board (see "Internal cable routing and connectors" on page 34).

Step 8.   Install the air baffle (see "Replacing the air baffle" on page 182).

Step 9.   Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the left-side cover/power cut-off switch assembly

Use this information to remove the left-side cover/power cut-off switch assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the left-side cover/power cut-off switch assembly, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the cables from the system board (see "Internal cable routing and connectors" on page 34).

Step 5.   Remove the screw of the power cut-off switch assembly from the chassis wall.

Power cut-off switch assembly
Screw

Figure 170. Remove screw that secures the power cut-off switch assembly

Step 6.   Grasp the switch assembly toward the front of the server to release it from the server.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the left-side cover/power cut-off switch assembly

Use this information to install the left-side cover/power cut-off switch assembly.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the left-side cover/power cut-off switch assembly, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Touch the static-protective package that contains the power cut-off switch assembly to any unpainted metal surface on the server; then, remove the power cut-off switch assembly from the package.

Step 5.   Align the power cut-off switch assembly on the chassis wall and push the assembly toward the rear of the server.
Figure 171. The power cut-off switch assembly installation

Step 6.   Install the screw to secure the power cut-off switch assembly on the chassis wall.

Step 7.   Connect the cable along the chassis to the system board (see "Internal cable routing and connectors" on page 34).

Step 8.   Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 9.   Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing and replacing Tier 2 CRUs

You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for your server.

The illustrations in this document might differ slightly from your hardware.

Removing the power paddle card

Use this information to remove the power paddle card.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove the power paddle card, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove all PCIe cards from the system board.

Step 5.   Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251),

Step 6. Disconnect all connected cables from the system board (see "Internal cable routing and connectors" on page 34).

Step 7. Remove the power supplies (see "Removing a hot-swap power supply" on page 233).

Step 8. Remove the system board (see "Removing the system board" on page 277),

Step 9. Grasp on the plunger of paddle card cage assembly and pull it toward the front of the server firstly, then, lift it out of the server.

Figure 172. Power paddle card cage assembly removal

Step 10. Disconnect the cables from the power paddle card (see "Internal cable routing and connectors" on page 34).

Step 11. Loosen the 4 screws to release the fixed power paddle card.
Figure 173. Loosen screw to release the fixed power paddle card

Step 12. Or loosen the 6 screws to release the redundant power paddle card.
Figure 174. Loosen screws to release the redundant power paddle card

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing the power paddle card

Use this information to install the power paddle card.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the power paddle card, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove all PCIe cards from the system board.

Step 5. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251),

Step 6. Disconnect all connected cables from the system board and disconnect the cables from the power paddle card after removing the cover (see "Internal cable routing and connectors" on page 34).

Step 7. Remove the power supplies (see "Removing a hot-swap power supply" on page 233).

Step 8. Remove the system board (see "Removing the system board" on page 277),

Step 9. Grasp on the plunger of paddle card cage assembly and pull it toward the front of the server firstly, then, lift it out of the server.
Figure 175. Power paddle card cage assembly removal

Step 10. Disconnect the cables from the power paddle card (see "Internal cable routing and connectors" on page 34).

Step 11. Remove the existing power paddle card (see "Removing the power paddle card" on page 255)

Step 12. Align the fixed power paddle card to the server chassis . Then, fasten the 4 screws to secure the fixed power paddle card.
Figure 176. The fixed power paddle card installation

Step 13. Align the redundant power paddle card to the server chassis . Then, fasten the 6 screws to secure the redundant power paddle card.
Figure 177. The redundant power paddle card installation

Step 14. Reconnect the cables to the power paddle card (see "Internal cable routing and connectors" on page 34).

Step 15. Pull up the plunger of the power paddle card cover and gently put it down. Then, push it backward to the rear of the chassis until it clicks into place.

Power paddle card cover

Plunger
Figure 178. Power paddle card cover installation

Step 16. Reinstall the system board (see "Installing the system board" on page 280),

Step 17. Reconnect all connected cables to the system board and reconnect the cables to the power paddle card before replace the power paddle card cover (see "Internal cable routing and connectors" on page 34).

Step 18. Reinstall the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 19. Reinstall all PCIe cards from the system board.

Step 20. Reinstall the air baffle (see "Replacing the air baffle" on page 182).

Step 21. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

Step 22. Stand the server back up in its vertical position.

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing a microprocessor and heat sink

Use this information to remove a microprocessor and heat sink.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

The following notes describe the type of microprocessor that the server supports and other information that you must consider when you install a microprocessor and heat sink:

• Microprocessors are to be installed only by trained technicians.

   Important: Always use the microprocessor installation tool to install a microprocessor. Failing to use the microprocessor installation tool may damage the microprocessor sockets on the system board. Any damage to the microprocessor sockets may require replacing the system board.

- Do not allow the thermal grease on the microprocessor and heat sink to come in contact with anything. Contact with any surface can compromise the thermal grease and the microprocessor socket.
- Dropping the microprocessor during installation or removal can damage the contacts.
- Do not touch the microprocessor contacts; handle the microprocessor by the edges only. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.
- Do not remove the first microprocessor from the system board to install the second microprocessor.
- To order an additional optional microprocessor, contact your Lenovo sales representative or Lenovo reseller.

Note: Be sure to use the installation tool that comes with your microprocessor installation tool assembly. The tools are similar in function and design, however Tool A has one setting for installing one size of microprocessor, and supports the following families of microprocessors: E5-26xx, E5-46xx. Installation Tool B has two settings for installing two different sizes of microprocessors. The settings that are marked on Tool B are "L" for smaller low core microprocessors, and "H" for larger high core microprocessors. Installation Tool B supports the following families of microprocessors: E5-26xx, E5-46xx, E5-26xx v2, E5-46xx v2.

Microprocessor Installation Tools A and B are shown in the following illustration.

Microprocessor Installation Tool A   **Microprocessor Installation Tool B**
Figure 179. Microprocessor installation tools

To remove a microprocessor and heat sink, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

      Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Remove the heat sink:

Attention: Do not touch the thermal material on the bottom of the heat sink. Touching the thermal material will contaminate it. If the thermal material on the microprocessor or heat sink becomes contaminated, you must wipe off the contaminated thermal material on the microprocessor or heat sink with the alcohol wipes and reapply clean thermal grease to the heat sink.

a. Rotate the heat sink release lever to the fully open position.
Figure 180. Rotate the heat sink release lever to the open position

b. Remove the heat sink out of the server. After removal, place the heat sink (with the thermal grease side up) on a clean, flat surface.
Figure 181. Remove the heat sink out of the server

Step 5. Open the microprocessor socket release levers and retainer:
Figure 182. Open CPU socket

    a.   Identify which release lever is labeled as the first release lever to open and open it.

    b.   Open the second release lever on the microprocessor socket.

    c.   Open the microprocessor retainer.

       Attention: Do not touch the microprocessor contacts. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.

Step 6.   Install the microprocessor on the microprocessor installation tool:

       Note: If you are replacing a microprocessor, use the empty installation tool that comes with the new microprocessor to remove the microprocessor.

    a.   Select the empty installation tool and ensure that the handle is in the open position. If the installation tool handle is not in the open position, use the following instructions for your installation tool:

       • If using Installation Tool A, twist the microprocessor installation tool handle counterclockwise to the open position.
Figure 183. Installation tool A handle adjustment

- If using Installation Tool B, **1** lift the interlock latch and hold it up while you **2** twist the microprocessor installation tool handle counterclockwise to the open position, and then release the interlock latch. The following illustration of the installation tool shows the location of the interlock latch and counterclockwise rotation of the handle before loading the microprocessor.
Figure 184. Installation tool B handle adjustment

b. Align the installation tool with the alignment pins on the microprocessor socket and carefully lower down the tool on the microprocessor. The installation tool rests on the socket only if aligned correctly.
Figure 185. Align the installation tool

c. Twist the handle on the installation tool clockwise.
Figure 186. Twist the handle clockwise

    d. Lift the microprocessor out of the socket.
Figure 187. Lift microprocessor out of the socket

Step 7. If you do not intend to install a microprocessor on the socket, install the socket cover that you removed before on the microprocessor socket.

> **Attention:** The pins on the socket are fragile. Any damage to the pins may require replacing the system board.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a microprocessor and heat sink

Use this information to install a microprocessor and heat sink.

The following notes describe the type of microprocessor that the server supports and other information that you must consider when you install a microprocessor and heat sink:

- Microprocessors are to be installed only by trained technicians.

  Important: Always use the microprocessor installation tool to install a microprocessor. Failing to use the microprocessor installation tool may damage the microprocessor sockets on the system board. Any damage to the microprocessor sockets may require replacing the system board.

- The server supports certain Intel Xeon scalable multi-core microprocessors, which are designed for the LGA 2011 socket. These microprocessors are 64-bit dual-core or quad-core microprocessors with an integrated memory controller, quick-path interconnect, and shared last cache. See http://www.lenovo.com/us/en/ serverproven/ for a list of supported microprocessors.

- Do not mix microprocessors with different cores in the same server.

- The server supports up to two microprocessors when the microprocessor 2 expansion board is installed.

  Note: Microprocessor 2 expansion board is supported when the second microprocessor is installed.

- When two microprocessors are installed, the air baffle and fan 2 must be installed to provide proper system cooling.

- When you install the second microprocessor, you must also install additional memory, the air baffle, and fan 2. See "Memory module installation" on page 241 for details about the installation sequence.

- To ensure proper server operation when you install an additional microprocessor, use microprocessors that have the same QuickPath Interconnect (QPI) link speed, integrated memory controller frequency, core frequency, power segment, internal cache size, and type.

- Mixing microprocessors of different stepping levels within the same server model is supported.

- When mixing microprocessors with different stepping levels within the same server model, you do not have to install the microprocessor with lowest stepping level and features in microprocessor socket 1.

- Read the documentation that comes with the microprocessor to determine whether you have to update the server firmware. To download the latest level of server firmware and other code updates for the server, go to http://www.ibm.com/support/fixcentral.

- The microprocessor speeds are automatically set for this server; therefore, you do not have to set any microprocessor frequency-selection jumpers or switches.

- If the thermal-grease protective cover (for example, a plastic cap or tape liner) is removed from the heat sink, do not touch the thermal grease on the bottom of the heat sink or set down the heat sink. For more information about applying or working with thermal grease, see "Thermal grease" on page 86.

  Note: Removing the heat sink from the microprocessor destroys the even distribution of the thermal grease and requires replacing the thermal grease.

- Do not remove the first microprocessor from the system board to install the second microprocessor.

- To order an additional optional microprocessor, contact your Lenovo sales representative or Lenovo reseller.

There are two types of microprocessor installation tools. The tools are similar in function and design, however Tool A has one setting for installing one size of microprocessor, and supports the following families of microprocessors: E5-26xx, E5-46xx. Installation Tool B has two settings for installing two different sizes of microprocessors. The settings that are marked on Tool B are "L" for smaller low core microprocessors, and "H" for larger high core microprocessors. Installation Tool B supports the following families of microprocessors: E5-26xx, E5-46xx, E5-26xx v2, E5-46xx v2.

Microprocessor Installation Tools A and B are shown in the following illustration.

Microprocessor Installation Tool A　　**Microprocessor Installation Tool B**
Figure 188. Microprocessor installation tools

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a microprocessor and heat sink, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Rotate the heat sink retention module release lever to the open position.

Figure 189. Rotate heat sink

Step 5. Open the microprocessor socket release levers and retainer:
Figure 190. Open the microprocessor socket release lever

    a. Identify which release lever is labeled as the first release lever to open and open it.

    b. Open the second release lever on the microprocessor socket.

    c. Open the microprocessor retainer.

    Attention: Do not touch the connectors on the microprocessor and the microprocessor socket.

Step 6. Install the microprocessor on the microprocessor socket:

    a. Touch the static-protective package that contains the new microprocessor to any unpainted on the chassis or any unpainted metal surface on any other grounded rack component; then, carefully remove the microprocessor from the package.

    b. Release the sides of the cover and remove the cover from the installation tool. The microprocessor is preinstalled on the installation tool.
Figure 191. Release the sides of the cover to remove microprocessor

Note: Do not touch the microprocessor contacts. Contaminants on the microprocessor contacts, such as oil from your skin, can cause connection failures between the contacts and the socket.

c. Align the installation tool with the microprocessor socket. The installation tool rests flush on the socket only if properly aligned.
Figure 192. Align the installation tool with the microprocessor socket

d. Install the microprocessor using the following instructions for your installation tool.

- If using Installation Tool A, twist the handle on the microprocessor tool assembly counterclockwise to the open position to insert the microprocessor into the socket, and lift the installation tool out of the socket.
- If using Installation Tool B, twist the handle of the installation tool assembly counterclockwise until the microprocessor is inserted into the socket, and lift the installation tool out of the socket. The following illustration shows the tool handle in the open position.
Figure 193. Installation Tool B
Figure 194. Installation tool handle adjustment

Attention:

- Do not press the microprocessor into the socket.

- Make sure that the microprocessor is oriented and aligned correctly in the socket before you try to close the microprocessor retainer.

- Do not touch the thermal material on the bottom of the heat sink or on top of the microprocessor. Touching the thermal material will contaminate it.

Step 7. Remove the microprocessor socket dust cover, tape, or label from the surface of the microprocessor socket, if one is present. Store the socket cover in a safe place.
Figure 195. Remove the microprocessor socket cover

Attention: When you handle static-sensitive devices, take precautions to avoid damage from static electricity. For details about handling these devices, see ("Handling static-sensitive devices" on page 32).

Step 8. Close the microprocessor socket release levers and retainer:

    a.   Close the microprocessor retainer on the microprocessor socket.

    b.   Identify which release lever is labeled as the first release lever to close and close it.

    c.   Close the second release lever on the microprocessor socket.
Figure 196. Close the release lever

Step 9. Install the heat sink:

    Attention:

- Do not set down the heat sink after you remove the plastic cover.
- Do not touch the thermal grease on the bottom of the heat sink after you remove the plastic cover. Touching the thermal grease will contaminate it. See "Thermal grease" on page 86 for more information.
Figure 197. Thermal grease in heat sink

1. Remove the plastic protective cover from the bottom of the heat sink.
2. Position the heat sink over the microprocessor. The heat sink is keyed to assist with proper alignment.
3. Align the heat sink to the retainer bracket tabs and place the heat sink on top of the microprocessor, thermal material side down.
Figure 198. Install the heat sink

4. Press firmly on the heat sink.
5. Rotate the heat sink release lever to the closed position and hook it underneath the lock tab.
Figure 199. Rotate the heat sink release lever to the closed position

Step 10. If you installed the second microprocessor, install the air baffle (see "Replacing the air baffle" on page 92).

Step 11. Install and lock the left-side cover ("Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Thermal grease

The thermal grease must be replaced whenever the heat sink has been removed from the top of the microprocessor and is going to be reused or when debris is found in the grease. Use this information to replace damaged or contaminated thermal grease on the microprocessor and heat sink.

When you are installing the heat sink on the same microprocessor that it was removed from, make sure that the following requirements are met:

• The thermal grease on the heat sink and microprocessor is not contaminated.

• Additional thermal grease is not added to the existing thermal grease on the heat sink and microprocessor.

Notes:

• Read the safety information in "Safety" on page v.

• Read the "Installation guidelines" on page 30.

• Read "Handling static-sensitive devices" on page 32.

To replace damaged or contaminated thermal grease on the microprocessor and heat sink, complete the following steps.

Step 1. Place the heat sink on a clean work surface.

Step 2. Remove the cleaning pad from its package and unfold it completely.

Step 3. Use the cleaning pad to wipe the thermal grease from the bottom of the heat sink.

   Note: Make sure that all of the thermal grease is removed.

Step 4.   Use a clean area of the cleaning pad to wipe the thermal grease from the microprocessor; then, dispose of the cleaning pad after all of the thermal grease is removed.

Figure 200. 9 uniformly spaced dots on the top of the microprocessor

Step 5.   Use the thermal-grease syringe to place 9 uniformly spaced dots of 0.02 mL each on the top of the microprocessor. The outermost dots must be within approximately 5 mm of the edge of the microprocessor. This is to ensure uniform distribution of the grease.
Figure 201. Thermal-grease syringe

Note: 0.01 mL is one tick mark on the syringe. If the grease is properly applied, approximately half (0.22 mL) of the grease will remain in the syringe.

Step 6.   Install the heat sink onto the microprocessor as described in "Installing a microprocessor and heat sink" on page 265.

Removing a heat sink

Use this information to remove a heat sink retention module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To remove a heat sink retention module, complete the following steps.

Step 1.   Carefully turn the server on its side so that it is lying flat, with the cover facing up.

Attention: Do not allow the server to fall over.

Step 2.   Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3.   Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4.   Rotate the heat sink release lever to the fully open position.

Figure 202. Rotate the heat sink release lever to the open position

Step 5. Remove the heat sink out of the server. After removal, place the heat sink (with the thermal grease side up) on a clean, flat surface.
Figure 203. Remove the heat sink out of the server

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Installing a heat sink

Use this information to install a heat sink retention module.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install a heat sink retention module, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

> **Attention:** Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Position the heat sink over the microprocessor. The heat sink is keyed to assist with proper alignment.

Step 5. Align the heat sink to the retainer bracket tabs and place the heat sink on top of the microprocessor, thermal material side down.
Figure 204. Install the heat sink

> **Attention:** Make sure that you install each heat sink with its paired microprocessor.

Step 6. Press firmly on the heat sink.

Step 7. Rotate the heat sink release lever to the closed position and hook it underneath the lock tab
Figure 205. Rotate the heat sink release lever to the closed position

Step 8. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 9. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Removing the system board

Use this information to remove the system board.

Notes:

1. Before you replace the system board, make sure that you backup any features on demand (FoD) keys that were enabled. Reactivate any Features on Demand features after replacing the system board. Instructions for automating the activation of features and installing activation keys is in the *Lenovo Features on Demand User's Guide*. To download the document, go to http://www.ibm.com/systems/x/fod/, log in, and click **Help**.

2. When you replace the system board, you must either update the server with the latest firmware or restore the pre-existing firmware that the customer provides on a diskette or CD image. Make sure that you have the latest firmware or a copy of the pre-existing firmware before you proceed.

3. When you replace the system board, make sure that you remove the Integrated Management Module II (IMM2) Advanced Upgrade and place it on the new system board. For information about the Advanced Upgrade, see "Using the remote presence and blue-screen capture features" on page 109

   Note: You have to reactivate the Features on Demand (FoD) after replacing the system board.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

Note: When you replace the system board, you must either update the server with the latest firmware or restore the pre-existing firmware that the customer provides on a diskette or CD image. Make sure that you have the latest firmware or a copy of the pre-existing firmware before you proceed

To remove the system board, complete the following steps.

Step 1. Carefully turn the server on its side so that it is lying flat, with the cover facing up.

   Attention: Do not allow the server to fall over.

Step 2. Unlock and remove the left-side cover (see "Removing the left-side cover" on page 175).

Step 3. Remove the air baffle (see "Removing the air baffle" on page 181).

Step 4. Remove the fan cage assembly (see "Removing the fan cage assembly" on page 251).

Step 5. Note where the cables are connected to the system board; then, disconnect them.

   Attention: Disengage all latches, release tabs or locks on cable connectors when you disconnect all cables from the system board (see "Internal cable routing and connectors" on page 34). Failing to release them before removing the cables will damage the cable sockets on the system board. The cable sockets on the system board are fragile. Any damage to the cable sockets may require replacing the system board.

Step 6. Remove any of the following components that are installed on the system board and put them in a safe, static-protective place:

   - Adapters (see "Removing an adapter" on page 205)
   - DIMMs (see "Removing a memory module" on page 240)
   - Microprocessors and heat sinks (see "Removing a microprocessor and heat sink" on page 260)

   Notes:

   1. Remove the socket covers from the microprocessor sockets on the new system board and place them on the microprocessor sockets of the system board you are removing.
   2. Do not allow the thermal grease to come in contact with anything, and keep each heat sink paired with its microprocessor for reinstallation. Contact with any surface can compromise the thermal grease and the microprocessor socket. A mismatch between the microprocessor and its original heat sink can require the installation of a new heat sink.

   - Battery (see "Removing the system battery" on page 217)
   - Hypervisor ("Removing a USB embedded hypervisor flash device" on page 249)

Step 7. Lose the thumb screws on the system board.
Thumb screw / handle

Figure 206. Lose the thumb screws

Step 8. Slide the system board toward the front of the server; then, grasp the thumbs screws as the handles to carefully lift the system board out of the server.
System board

Figure 207. System board removal

Step 9. Remove the dust covers from the microprocessor sockets of the new system board and place them on the microprocessor sockets of the old system board that you just removed.

If you are instructed to return the server component or optional device, follow all packaging instructions, and use any packaging materials for shipping that are supplied to you.

Attention: Make sure to place the socket cover for the microprocessor socket on the system board before returning the system board.

Installing the system board

Use this information to install the system board.

Notes:

1. When you reassemble the components in the server, be sure to route all cables carefully so that they are not exposed to excessive pressure.

2. When you replace the system board, you must either update the server with the latest firmware or restore the pre-existing firmware from a diskette or CD image. Make sure that you have the latest firmware or a copy of the pre-existing firmware before you proceed. See "Updating the firmware" on page 97, "Updating the Universal Unique Identifier (UUID)" on page 114, and "Updating the DMI/SMBIOS data" on page 116.

3. When you replace the system board, make sure that you remove the Integrated Management Module II (IMM2) Advanced Upgrade and place it on the new system board. For information about the Advanced Upgrade, see "Using the remote presence and blue-screen capture features" on page 109

4. Reactivate any Features on Demand features after replacing the system board. Instructions for automating the activation of features and installing activation keys is in the *Lenovo Features on Demand User's Guide*. To download the document, go to http://www.ibm.com/systems/x/fod/, log in, and click **Help**.

Read the safety information in "Safety" on page v and "Installation guidelines" on page 30.

If you are replacing a server component in the server, you need to turn off the server and peripheral devices, and disconnect the power cords and all external cables.

To install the system board, complete the following steps.

Step 1. Touch the static-protective package that contains the system board to any unpainted metal surface on the server; then, remove the system board from the package.

Step 2. Align the guide pins and the alignment pins on the chassis with the holes on the system board.

Alignment pin

Guide pins
Alignment pins

Figure 208. Align guide pins and alignment pins on the server chassis

Step 3. Gently insert the system board and slide the system board toward the rear of the server.

System board

Alignment pin

Guide pin
Figure 209. Insert system board into the server chassis

Note: Make sure that none of the server cables are caught under the system board.

Step 4. fasten the thumb screw/handle

Step 5. Install any of the following components that you removed from the system board:

- Microprocessor and heat sink (see "Installing a microprocessor and heat sink" on page 265)
- DIMMs (see "Installing a DIMM" on page 247)
- Adapters (see "Installing an adapter" on page 206)
- System battery (see "Installing the system battery" on page 218)
- Hypervisor (see "Installing a USB embedded hypervisor flash device" on page 250)

Step 6. Reconnect any cables to the system board that you disconnected during removal (see "System-board internal connectors" on page 27 and "Internal cable routing and connectors" on page 34).

Step 7. Install the fan cage assembly (see "Installing the fan cage assembly" on page 252).

Step 8. Install the air baffle (see "Replacing the air baffle" on page 182).

Step 9. Install and lock the left-side cover (see "Installing the left-side cover" on page 176).

Step 10. Reconnect the external cables and power cords; then, turn on the attached devices and turn on the server.

Step 11. Start the Setup utility and reset the configuration.

a. Set the system date and time.

b. Set the power-on password.

c. Reconfigure the server.

See "Using the Setup utility" on page 101 for details.

Step 12. Either update the server with the latest RAID firmware or restore the pre-existing firmware from a diskette or CD image.

Step 13. Update the UUID (see "Updating the Universal Unique Identifier (UUID)" on page 114).

Step 14. Update the DMI/SMBIOS (see "Updating the DMI/SMBIOS data" on page 116).

Step 15. Reactivate any Features on Demand features.

If you have replaced a server component or installed an optional device in the server, you need to reconnect the power cords and all external cables, and turn on the server and peripheral devices.

Appendix A. Integrated Management Module II (IMM2) error messages

This section details the Integrated Management Module II (IMM2) error messages.

When a hardware event is detected by the IMM2.1 on the server, the IMM2.1 logs that event in the system-event log in the server.

For each event code, the following fields are displayed:

Event identifier
A hexadecimal identifier that uniquely identifies an event or class of events. In this documentation, the event identifiers are prefixed with 0x and followed by eight characters.

Event description
The logged message string that appears for an event. When the event string is displayed in the event log, information such as a specific component is displayed. In this documentation, that additional information appears as variables, such as [arg1] or [arg2].

Explanation
Provides additional information to explain why the event occurred.

Severity
An indication of the level of concern for the condition. In the system-event log, severity is abbreviated to the first character. The following severities can be displayed.

Info:
The event was recorded for audit purposes, usually a user action or a change of states that is normal behavior.

Warning:
The event is not as severe as an error, but if possible, the condition should be corrected before it becomes an error. It might also be a condition that requires additional monitoring or maintenance.

Error:
The event is a failure or critical condition that impairs service or an expected function.

Alert Category
Similar events are grouped together in categories. The alert category is in the following format:

severity - device

severity is one of the following severity levels:

- **Critical:** A key component in the server is no longer functioning.
- **Warning:** The event might progress to a critical level.
- **System:** The event is the result of a system error or a configuration change.

device is the specific device in the server that caused the event to be generated.

Serviceable
Specifies whether user action is required to correct the problem.

CIM Information

Provides the prefix of the message ID and the sequence number that is used by the CIM message registry.

SNMP Trap ID
The SNMP trap ID that is found in the SNMP alert management information base (MIB).

Automatically contact Service
If this field is set to **Yes**, and you have enabled Electronic Service Agent (ESA), Support will be notified automatically if the event is generated.

While you wait for Support to call, you can perform the recommended actions for the event.

User response
Indicates what actions you should perform to solve the event.

Perform the steps listed in this section in the order shown until the problem is solved. After you perform all of the actions that are described in this field, if you cannot solve the problem, contact Support.

Note: This list includes error codes and messages that might not apply to this machine type and model.

The following is the list of IMM2.1 error messages and suggested actions to correct the detected server problems. For more information about IMM2.1, see the *Integrated Management Module II User's Guide* at http://www.ibm.com/support/entry/portal/docdisplay?lndocid=migr-5086346.

List of IMM events

This section lists all messages that can be sent from the IMM.

- **40000001-00000000 : Management Controller [arg1] Network Initialization Complete. ()**

  This message is for the use case where a Management Controller network has completed initialization.

  May also be shown as 4000000100000000 or 0x4000000100000000

User Response
Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.

1. Refer to TIP H212293 for minimum code level.

2. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.

3. Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.

4. If the problem follows the DIMM, replace the failing DIMM.

5. (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.

6. (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.

7. (Trained technician only) Replace the affected microprocessor.

8. Manually re-enable all affected DIMMs if the server firmware version is older than UEFI v1.10. If the server firmware version is UEFI v1.10 or newer, disconnect and reconnect the server to the power source and restart the server.

9. (Trained Service technician only) Replace the affected microprocessor.

- **806f010c-2006ffff : Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 6)**

    Prefix: PLAT ID: 0138

    User Response
    Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.

    1. Refer to TIP H212293 for minimum code level.

    2. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.

    3. Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.

    4. If the problem follows the DIMM, replace the failing DIMM.

    5. (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.

    6. (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.

    7. (Trained technician only) Replace the affected microprocessor.

    8. Manually re-enable all affected DIMMs if the server firmware version is older than UEFI v1.10. If the server firmware version is UEFI v1.10 or newer, disconnect and reconnect the server to the power source and restart the server.

9. (Trained Service technician only) Replace the affected microprocessor.

- **806f010c-2017ffff : Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 23)**

  This message is for the use case when an implementation has detected a Memory uncorrectable error.

User Response
Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.

1. Refer to TIP H212293 for minimum code level.

2. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.

3. Manually re-enable all affected DIMMs.

4. Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.

5. If the problem follows the DIMM, replace the failing DIMM.

6. (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.

7. (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.

8. (Trained technician only) Replace the affected microprocessor.

- **806f030c-2002ffff : Scrub Failure for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 2)**

User Response
Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.

1. Refer to TIP H212293 for minimum code level.

2. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.

3. Manually re-enable all affected DIMMs.

4. Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.

5. If the problem follows the DIMM, replace the failing DIMM.

6. (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.

7. (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.

8. (Trained technician only) Replace the affected microprocessor.

- **806f030c-2014ffff : Scrub Failure for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 20)**

This message is for the use case when an implementation has detected a Memory Scrub failure.

   Prefix: PLAT **ID:** 0131

User Response

1. Make sure the DIMM is installed correctly.
2. If the DIMM was disabled because of a memory fault (memory uncorrectable error or memory logging limit reached), follow the suggested actions for that error event and restart the server.
3. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory event. If no memory fault is recorded in the logs and no DIMM connector error LED is lit, you can re-enable the DIMM through the Setup utility or the Advanced Settings Utility (ASU).

One of the DIMMs :

- **806f0413-2582ffff : A PCI PERR has occurred on system [ComputerSystemElementName]. (PCIs)**

   This message is for the use case when an implementation has detected a PCI PERR.

   May also be shown as 806f04132582ffff or 0x806f04132582ffff

User Response

1. Check the PCI LED.
2. Reseat the affected adapters and riser cards.
3. Update the server firmware (UEFI and IMM) and adapter firmware. Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.
4. Remove both adapters.
5. Replace the PCIe adapters.
6. Replace the riser card.

- **806f0507-0301ffff : [ProcessorElementName] has a Configuration Mismatch. (CPU 1)**

This message is for the use case when an implementation has detected a Processor Configuration Mismatch has occurred.

User Response
    Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.

1.   Refer to TIP H212293 for minimum code level.

2.   Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.

3.   Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.

4.   If the problem follows the DIMM, replace the failing DIMM.

5.   (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.

6.   (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.

7.   (Trained technician only) Replace the affected microprocessor.

8.   Manually re-enable all affected DIMMs if the server firmware version is older than UEFI v1.10. If the server firmware version is UEFI v1.10 or newer, disconnect and reconnect the server to the power source and restart the server.

9.   (Trained Service technician only) Replace the affected microprocessor.

  1. Refer to TIP H212293 for minimum code level.
  2. Check the IBM support website for an applicable retain tip or firmware update that applies to this memory error.
  3. Swap the affected DIMMs (as indicated by the error LEDs on the system board or the event logs) to a different memory channel or microprocessor.
  4. If the problem follows the DIMM, replace the failing DIMM.
  5. (Trained technician only) If the problem occurs on the same DIMM connector, check the DIMM connector. If the connector contains any foreign material or is damaged, replace the system board.
  6. (Trained technician only) Remove the affected microprocessor and check the microprocessor socket pins for any damaged pins. If a damage is found, replace the system board.
  7. (Trained technician only) Replace the affected microprocessor.
  8. Manually re-enable all affected DIMMs if the server firmware version is older than UEFI v1.10. If the server firmware version is UEFI v1.10 or newer, disconnect and reconnect the server to the power source and restart the server.
  9. (Trained Service technician only) Replace the affected microprocessor.

Alert Category
    Critical - Hard Disk drive

SNMP Trap ID
    5

CIM Information
    Prefix: PLAT **ID:** 0174

User Response

1. Make sure that the RAID adapter firmware and hard disk drive firmware are at the latest level.

2. Make sure that the SAS cable is connected correctly.

3. Replace the SAS cable.

4. Check backplane cable connection.

5. Replace the RAID adapter.

6. Replace the hard disk drive that is indicated by a lit status LED.

- **806f050d-042bffff : Array [ComputerSystemElementName] is in critical condition. (SDRAID Drive 12)**

This message is for the use case when an implementation has detected that an Array is Critical.

May also be shown as 806f050d042bffff or 0x806f050d042bffff

CIM Information
Prefix: PLAT **ID:** 0234

User Response

1. Check the PCI LED.

2. Reseat the affected adapters and riser card.

3. Update the server firmware (UEFI and IMM) and adapter firmware. Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

4. Make sure that the adapter is supported. For a list of supported optional devices, see http://www.ibm.com/systems/info/x86servers/serverproven/compat/us/.

5. Remove both adapters.

6. Replace the PCIe adapters.

7. Replace the riser card.

- **806f052b-2101ffff : Invalid or Unsupported firmware or software was detected on system [ComputerSystemElementName]. (IMM2 FW Failover)**

This message is for the use case when an implementation has detected an Invalid/Unsupported Firmware/Software Version.

User Response

1. (Trained technician only) Replace microprocessor n (see Removing a microprocessor and heat sink and Replacing a microprocessor and heat sink).

2. If the problem persists and there is no other CPU with the same error indication, replace the system board.

3. (Trained technician only) Replace the system board (see Removing the system board and Replacing the system board). (n = microprocessor number)

*   **816f0125-0c01ffff : [ManagedElementName] detected as present. (Front Panel)**

This message is for the use case when an implementation has detected a Managed Element is now Present.

2. If the problem persists and there is no other CPU with the same error indication, replace the system board.

3. (Trained technician only) Replace the system board (see Removing the system board and Replacing the system board). (n = microprocessor number)

IMM Events that automatically notify Support

You can configure the IBM Flex System Manager or the CMM to automatically notify Support (also known as *call home*) if certain types of errors are encountered. If you have configured this function, see the table for a list of events that automatically notify Support.

Table 37. Events that automatically notify Support

Event ID	Message String	Automatically Notify Support
40000086-00000000	Test Call Home Generated by user [arg1]. ()	Yes
40000087-00000000	Manual Call Home by user [arg1]: [arg2]. ()	Yes
80010202-0701ffff	Numeric sensor [NumericSensorElementName] going low (lower critical) has asserted. (CMOS Battery)	Yes
80010902-0701ffff	Numeric sensor [NumericSensorElementName] going high (upper critical) has asserted. (SysBrd 12V)	Yes
806f0021-2201ffff	Fault in slot [PhysicalConnectorSystemElementName] on system [ComputerSystemElementName]. (No Op ROM Space)	Yes
806f0021-2582ffff	Fault in slot [PhysicalConnectorSystemElementName] on system [ComputerSystemElementName]. (All PCI Error)	Yes
806f0021-3001ffff	Fault in slot [PhysicalConnectorSystemElementName] on system [ComputerSystemElementName]. (PCI 1)	Yes
806f0108-0a01ffff	[PowerSupplyElementName] has Failed. (Power Supply 1)	Yes
806f0108-0a02ffff	[PowerSupplyElementName] has Failed. (Power Supply 2)	Yes
806f010c-2001ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 1)	Yes
806f010c-2002ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 2)	Yes
806f010c-2003ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 3)	Yes
806f010c-2004ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 4)	Yes
806f010c-2005ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 5)	Yes
806f010c-2006ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 6)	Yes
806f010c-2007ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 7)	Yes
806f010c-2008ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 8)	Yes
806f010c-2009ffff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 9)	Yes
806f010c-200affff	Uncorrectable error detected for [PhysicalMemoryElementName] on Subsystem [MemoryElementName]. (DIMM 10)	Yes

Table 37. Events that automatically notify Support (continued)

Event ID	Message String	Automatically Notify Support

Appendix B. UEFI (POST) error codes

This section details the UEFI (POST) error codes.

UEFI (POST) diagnostic error codes can be generated when the server starts up or while the server is running. UEFI (POST) codes are logged in the IMM2.1 event log in the server.

For each event code, the following fields are displayed:

Event identifier
    An identifier that uniquely identifies an event.

Event description
    The logged message string that appears for an event.

Explanation
    Additional information to explain why the event occurred.

Severity
    An indication of the level of concern for the condition. The severity is abbreviated in the event log to the first character. The following severities can be displayed:

Table 38. Event severity levels

Severity	Description
Informational	An informational message is something that was recorded for audit purposes, usually a user action or a change of states that is normal behavior.
Warning	A warning is not as severe as an error, but if possible, the condition should be corrected before it becomes an error. It might also be a condition that requires additional monitoring or maintenance.
Error	An error typically indicates a failure or critical condition that impairs service or an expected function.

User response
    Indicate the actions that you should take to resolve the event.

    Perform the steps listed in this section in the order shown until the problem is solved. After you perform all of the actions that are described in this field, if you cannot solve the problem, contact Lenovo support.

The following is the list of the UEFI (POST) error codes and suggested actions to correct the detected problems.

List of UEFI events

This section lists all messages that can be sent from UEFI.

- **I.11002 [I.11002]**

  Explanation: A processor mismatch has been detected between one or more processors in the system. One or More Mismatched Processors Detected

  Severity

Error

User Response
Complete the following steps:

1. This message could occur with messages about other Processor configuration problems. Resolve those messages first.

2. If the problem persists, ensure that matching processors are installed (i.e., matching option part numbers, etc)

3. Verify that the Processor's are installed in the correct sockets according to the service information for this product. If not, correct that problem.

4. Check IBM support site for an applicable service bulletin or UEFI firmware update that applies to this processor error.

5. (Trained Service technician only) Replace mismatching processor. Inspect Processor socket and replace the system board first if socket is damaged.

- **I.1800A [I.1800A]**

    Explanation: A mismatch has been detected between the speed at which a QPI link has trained between two or more processor packages. Processors have mismatched Bus Speed

    Severity
    Error

    User Response
    Complete the following steps:

    1. Verify that the processor is a valid option that is listed as a Server Proven device for this system. If not, remove the Processor and install one listed on the Server Proven website.

    2. Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

    3. Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.

    4. (Trained Service technician only) Replace the Processor. Inspect Processor socket and replace the system board first if socket is damaged

- **I.1800C [I.1800C]**

    Explanation: A cache type mismatch has been detected for one or more processor packages. Processors have one or more cache levels with mismatched type

    Severity
    Error

    User Response
    Complete the following steps:

    1. Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

    2. Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.

    3. (Trained technician only)Replace the system board

- **I.1800D [I.1800D]**

    Explanation: A cache associativity mismatch has been detected for one or more processor packages. Processors have one or more cache levels with mismatched associativity

    Severity
    Error

    User Response
    Complete the following steps:

    1. Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

    2. Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.

    3. (Trained technician only)Replace the system board

- **I.1800E [I.1800E]**

    Explanation: A processor model mismatch has been detected for one or more processor packages. Processors have mismatched Model Number

    Severity
    Error

    User Response
    Complete the following steps:

    1. Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

    2. Check the IBM support site for an applicable service bulletin or firmware update that applies to this Processor error.

    3. (Trained technician only)Replace the system board

- **I.1800F [I.1800F]**

    Explanation: A processor family mismatch has been detected for one or more processor packages. Processors have mismatched Family

    Severity
    Error

    User Response
    Complete the following steps:

    1. Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

    2. Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.

    3. (Trained technician only)Replace the system board

- **I.18010 [I.18010]**

Explanation: A processor stepping mismatch has been detected for one or more processor packages. Processors of the same model have mismatched Stepping ID

Severity
>   Error

User Response
>   Complete the following steps:

>   1.   Verify that matching processors are installed in the correct processor sockets. Correct any mismatch found.

>   2.   Check the IBM support site for an applicable service bulletin or firmware update that applies to this processor error.

>   3.   (Trained technician only)Replace the system board

- **I.2018002 [I.2018002]**

    Explanation: The device found at Bus % Device % Function % could not be configured due to resource constraints. The Vendor ID for the device is % and the Device ID is %. OUT_OF_RESOURCES (PCI Option ROM)

    Severity
    >   Info

    User Response
    >   Complete the following steps:

    >   1.   If this PCIe device and/or any attached cables were recently installed, moved, serviced or upgraded, reseat the adapter and any attached cables.

    >   2.   Check IBM support site for any applicable service bulletin or UEFI or adapter firmware update that applies to this error. NOTE: It may be necessary to disable unused option ROMs from UEFI F1 setup or ASU or using adapter manufacturer utilities so that adapter firmware can be updated.

    >   3.   Move the adapter to a different slot. If a slot is not available or error recurs, replace the adapter.

    >   4.   If the adapter was moved to a different slot and the error did not recur, verify that this is not a system limitation. Then replace the system board. Also, if this is not the initial installation and the error persists after adapter replacement, replace the system board.

- **I.2018003 [I.2018003]**

    Explanation: A bad option ROM checksum was detected for the device found at Bus % Device % Function %. The Vendor ID for the device is % and the Device ID is %. ROM CHECKSUM ERROR

    Severity
    >   Error

    User Response
    >   Complete the following steps:

    >   1.   If this PCIe device and/or any attached cables were recently installed, moved, serviced or upgraded, reseat the adapter and any attached cables.

    >   2.   Move the adapter to a different system slot, if available.

    >   3.   Check IBM support site for any applicable service bulletin or UEFI or adapter firmware update that applies to this error. NOTE: It may be necessary to configure slot to Gen1 or to use special utility software so that adapter firmware can be upgraded. Gen1/Gen2 settings can be

configured via F1 Setup -> System Settings -> Devices and I/O Ports -> PCIe Gen1/Gen2/Gen3 Speed Selection, or the ASU Utility.

4. Replace the adapter.

- **I.3808004 [I.3808004]**

  Explanation: The IMM System Event log (SEL) is full. IPMI System Event Log is Full

  Severity
  Info

  User Response
  Complete the following steps:

  1. Use the IMM Web Interface to clear the event log.

  2. If IMM communication is unavailable, use F1 Setup to access System Event Logs Menu and Choose Clear IMM System Event Log and Restart Server.

- **I.3818001 [I.3818001]**

  Explanation: The firmware image capsule signature for the currently booted flash bank is invalid. Current Bank CRTM Capsule Update Signature Invalid

  Severity
  Info

  User Response
  Complete the following steps:

  1. Reboot the system. Will come up on backup UEFI image. Update the primary UEFI image.

  2. If error does not persist no additional recovery action is required.

  3. If error persists, or boot is unsuccessful, (Trained service technician only) Replace the system board.

- **I.3818002 [I.3818002]**

  Explanation: The firmware image capsule signature for the non-booted flash bank is invalid. Opposite Bank CRTM Capsule Update Signature Invalid

  Severity
  Info

  User Response
  Complete the following steps:

  1. Update the backup UEFI image.

  2. If error does not persist no additional recovery action is required.

  3. If error persists, or boot is unsuccessful, (Trained service technician only) Replace the system board.

- **I.3818003 [I.3818003]**

Explanation: The CRTM flash driver could not lock the secure flash region. CRTM Could not lock secure flash region

Severity
> Info

User Response
> Complete the following steps:

> 1. If system failed to boot successfully, DC cycle the system.

> 2. If system boots to F1 setup, update the UEFI image and reset bank to primary (if required). If the system boots without error, recovery is complete and no additional action is required.

> 3. If system fails to boot, or if the firmware update attempt fails, (trained service technician only) replace the system board.

- **I.3818009 [I.3818009]**

  Explanation: The TPM could not be properly initialized. TPMINIT: Fail to initialize TPM chip.

  Severity
  > Info

  User Response
  > Complete the following steps:

  > 1. Check the IBM support site for an applicable service bulletin or firmware update that applies to this error.

  > 2. Reboot the system.

  > 3. If the error continues, replace the system-board assembly (see Removing the system-board assembly and Installing the system-board assembly).

- **I.3868000 [I.3868000]**

  Explanation: IFM: System reset performed to reset adapters. IFM: System reset performed to reset adapters

  Severity
  > Info

  User Response
  > Complete the following steps:

  > 1. Information only; no action is required.

- **I.3868003 [I.3868003]**

  Explanation: IFM: Configuration to large for compatibility mode. IFM: Configuration too large for compatibility mode

  Severity
  > Info

  User Response
  > Complete the following steps:

1. Information only; no action is required.

- **I.5100B [I.5100B]**

   Explanation: An unqualified DIMM serial number has been detected: serial number % found in slot % of memory card %. Unqualified DIMM Serial Number Detected

   Severity
   Info

   User Response
   Complete the following steps:
   1. If this information event is logged in the IMM event log, the server does not have qualified memory installed.
   2. The memory installed may not be covered under warranty.
   3. Without qualified memory, speeds supported above industry standards will not be enabled.
   4. Please contact your Local Sales Representative or Authorized Business Partner to order qualified memory to replace the unqualified DIMM(s).
   5. After you intall qualified memory and power up the server, check to make sure this informational event is not logged again.

- **I.58015 [I.58015]**

   Explanation: Memory spare copy initiated. Spare Copy Started

   Severity
   Info

   User Response
   Complete the following steps:
   1. Information only; no action is required.

- **I.580A4 [I.580A4]**

   Explanation: Memory population change detected. DIMM Population Change Detected

   Severity
   Info

   User Response
   Complete the following steps:
   1. If you have added or removed DIMMs to the system, and no additional errors were detected, then please ignore this message.
   2. Check system event log for uncorrected DIMM failures and replace those DIMMs.

- **I.580A5 [I.580A5]**

   Explanation: Mirror Fail-over complete. DIMM number % has failed over to to the mirrored copy. DIMM Mirror Fail-over Detected

Severity
    Info

User Response
    Complete the following steps:

      1.   Check the system-event log for uncorrected DIMM failures and replace those DIMMs.

- **I.580A6 [I.580A6]**

  Explanation: Memory spare copy has completed successfully. Spare Copy Complete

  Severity
      Info

  User Response
      Complete the following steps:

        1.   If you have added or removed DIMMs to the system, and no additional errors were detected, then please ignore this message.
        2.   Check system event log for uncorrected DIMM failures and replace those DIMMs.

User Response
Complete the following steps:

1. Clean the tape drive using the appropriate cleaning media and install new media.

2. Run the test again.

3. Make sure that the drive firmware is at the latest level.

4. Rerun the test after upgrading to the latest firmware level.

5. Make sure that the DSA Diagnostic code is at the latest level.

6. Run the test again.

7. Check the system firmware level and upgrade if necessary.

8. Run the test again.

9. If the failure remains, refer to "Troubleshooting by symptom" in the system "Installation and Service Guide" for the next corrective action.

Appendix D. Getting help and technical assistance

If you need help, service, or technical assistance or just want more information about Lenovo products, you will find a wide variety of sources available from Lenovo to assist you.

Use this information to obtain additional information about Lenovo and Lenovo products, and determine what to do if you experience a problem with your Lenovo system or optional device.

Note: This section includes references to IBM web sites and information about obtaining service. IBM is Lenovo's preferred service provider for the System x, Flex System, and NeXtScale System products.

Before you call

Before you call, make sure that you have taken these steps to try to solve the problem yourself.

If you believe that you require warranty service for your Lenovo product, the service technicians will be able to assist you more efficiently if you prepare before you call.

- Check all cables to make sure that they are connected.
- Check the power switches to make sure that the system and any optional devices are turned on.
- Check for updated software, firmware, and operating-system device drivers for your Lenovo product. The Lenovo Warranty terms and conditions state that you, the owner of the Lenovo product, are responsible for maintaining and updating all software and firmware for the product (unless it is covered by an additional maintenance contract). Your service technician will request that you upgrade your software and firmware if the problem has a documented solution within a software upgrade.
- If you have installed new hardware or software in your environment, check http://www.lenovo.com/us/en/serverproven/ to make sure that the hardware and software is supported by your product.
- Go to http://www.lenovo.com/support to check for information to help you solve the problem.
- Gather the following information to provide to the service technician. This data will help the service technician quickly provide a solution to your problem and ensure that you receive the level of service for which you might have contracted.
  - Hardware and Software Maintenance agreement contract numbers, if applicable
  - Machine type number (Lenovo 4-digit machine identifier)
  - Model number
  - Serial number
  - Current system UEFI and firmware levels
  - Other pertinent information such as error messages and logs
- Go to http://www.ibm.com/support/entry/portal/Open_service_request to submit an Electronic Service Request. Submitting an Electronic Service Request will start the process of determining a solution to your problem by making the pertinent information available to the service technicians. The IBM service technicians can start working on your solution as soon as you have completed and submitted an Electronic Service Request.

You can solve many problems without outside assistance by following the troubleshooting procedures that Lenovo provides in the online help or in the Lenovo product documentation. The Lenovo product documentation also describes the diagnostic tests that you can perform. The documentation for most systems, operating systems, and programs contains troubleshooting procedures and explanations of error messages and error codes. If you suspect a software problem, see the documentation for the operating system or program.

Using the documentation

Information about your Lenovo system and preinstalled software, if any, or optional device is available in the product documentation. That documentation can include printed documents, online documents, readme files, and help files.

See the troubleshooting information in your system documentation for instructions for using the diagnostic programs. The troubleshooting information or the diagnostic programs might tell you that you need additional or updated device drivers or other software. Lenovo maintains pages on the World Wide Web where you can get the latest technical information and download device drivers and updates. To access these pages, go to http://www.lenovo.com/support.

Getting help and information from the World Wide Web

Up-to-date information about Lenovo products and support is available on the World Wide Web.

On the World Wide Web, up-to-date information about Lenovo systems, optional devices, services, and support is available at http://www.lenovo.com/support. The most current version of the product documentation is available in the following product-specific Information Centers:

- **Flex System products:**

    http://pic.dhe.ibm.com/infocenter/flexsys/information/index.jsp
- **System x products:**

    http://shop.lenovo.com/us/en/systems/
- **NeXtScale System products:**

    http://pic.dhe.ibm.com/infocenter/nxtscale/documentation/index.jsp

How to send DSA data

You can use the Enhanced Customer Data Repository to send diagnostic data to IBM.

Before you send diagnostic data to IBM, read the terms of use at http://www.ibm.com/de/support/ecurep/terms.html.

You can use any of the following methods to send diagnostic data:

- **Standard upload**:

    http://www.ibm.com/de/support/ecurep/send_http.html
- **Standard upload with the system serial number**:

    http://www.ecurep.ibm.com/app/upload_hw
- **Secure upload**:

    http://www.ibm.com/de/support/ecurep/send_http.html#secure
- **Secure upload with the system serial number**:

    https://www.ecurep.ibm.com/app/upload_hw

Creating a personalized support web page

You can create a personalized support web page by identifying Lenovo products that are of interest to you.

To create a personalized support web page, go to http://www.ibm.com/support/mynotifications. From this personalized page, you can subscribe to weekly email notifications about new technical documents, search for information and downloads, and access various administrative services.

Software service and support

Through IBM Support Line, you can get telephone assistance, for a fee, with usage, configuration, and software problems with your Lenovo products.

For more information about Support Line and other IBM services, see http://www.ibm.com/services or see http://www.ibm.com/planetwide for support telephone numbers. In the U.S. and Canada, call 1-800-IBM-SERV (1-800-426-7378).

Hardware service and support

IBM is Lenovo's preferred service provider for the System x, Flex System and NeXtScale System products.

You can receive hardware service through your Lenovo reseller or from IBM. To locate a reseller authorized by Lenovo to provide warranty service, go to http://www.ibm.com/partnerworld and click **Business Partner Locator**. For IBM support telephone numbers, see http://www.ibm.com/planetwide. In the U.S. and Canada, call 1-800-IBM-SERV (1-800-426-7378).

In the U.S. and Canada, hardware service and support is available 24 hours a day, 7 days a week. In the U.K., these services are available Monday through Friday, from 9 a.m. to 6 p.m.

Taiwan product service

Use this information to contact IBM Taiwan product service.

台灣 IBM 產品服務聯絡方式：
台灣國際商業機器股份有限公司
台北市松仁路 7 號 3 樓
電話：0800-016-888

IBM Taiwan product service contact information:

IBM Taiwan Corporation

Taipei, Taiwan
Telephone: 0800-016-888

Appendix E. Notices

Lenovo may not offer the products, services, or features discussed in this document in all countries. Consult your local Lenovo representative for information on the products and services currently available in your area.

Any reference to a Lenovo product, program, or service is not intended to state or imply that only that Lenovo product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any Lenovo intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any other product, program, or service.

Lenovo may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

Lenovo (United States), Inc.
1009 Think Place - Building One
Morrisville, NC 27560
U.S.A.
Attention: Lenovo Director of Licensing

LENOVO PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. Lenovo may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

The products described in this document are not intended for use in implantation or other life support applications where malfunction may result in injury or death to persons. The information contained in this document does not affect or change Lenovo product specifications or warranties. Nothing in this document shall operate as an express or implied license or indemnity under the intellectual property rights of Lenovo or third parties. All information contained in this document was obtained in specific environments and is presented as an illustration. The result obtained in other operating environments may vary.

Lenovo may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Any references in this publication to non-Lenovo Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this Lenovo product, and use of those Web sites is at your own risk.

Any performance data contained herein was determined in a controlled environment. Therefore, the result obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Trademarks

Lenovo, the Lenovo logo, Flex System, System x, NeXtScale System, and x Architecture are trademarks of Lenovo in the United States, other countries, or both.

Intel and Intel Xeon are trademarks of Intel Corporation in the United States, other countries, or both.

Internet Explorer, Microsoft, and Windows are trademarks of the Microsoft group of companies.

Linux is a registered trademark of Linus Torvalds.

Other company, product, or service names may be trademarks or service marks of others.

Important notes

Processor speed indicates the internal clock speed of the microprocessor; other factors also affect application performance.

CD or DVD drive speed is the variable read rate. Actual speeds vary and are often less than the possible maximum.

When referring to processor storage, real and virtual storage, or channel volume, KB stands for 1 024 bytes, MB stands for 1 048 576 bytes, and GB stands for 1 073 741 824 bytes.

When referring to hard disk drive capacity or communications volume, MB stands for 1 000 000 bytes, and GB stands for 1 000 000 000 bytes. Total user-accessible capacity can vary depending on operating environments.

Maximum internal hard disk drive capacities assume the replacement of any standard hard disk drives and population of all hard-disk-drive bays with the largest currently supported drives that are available from Lenovo.

Maximum memory might require replacement of the standard memory with an optional memory module.

Each solid-state memory cell has an intrinsic, finite number of write cycles that the cell can incur. Therefore, a solid-state device has a maximum number of write cycles that it can be subjected to, expressed as `total bytes written` (TBW). A device that has exceeded this limit might fail to respond to system-generated commands or might be incapable of being written to. Lenovo is not responsible for replacement of a device that has exceeded its maximum guaranteed number of program/erase cycles, as documented in the Official Published Specifications for the device.

Lenovo makes no representations or warranties with respect to non-Lenovo products. Support (if any) for the non-Lenovo products is provided by the third party, not Lenovo.

Some software might differ from its retail version (if available) and might not include user manuals or all program functionality.

Recycling information

Lenovo encourages owners of information technology (IT) equipment to responsibly recycle their equipment when it is no longer needed. Lenovo offers a variety of programs and services to assist equipment owners in recycling their IT products. For information on recycling Lenovo products, go to:http://www.lenovo.com/recycling.

Particulate contamination

Attention: Airborne particulates (including metal flakes or particles) and reactive gases acting alone or in combination with other environmental factors such as humidity or temperature might pose a risk to the device that is described in this document.

Risks that are posed by the presence of excessive particulate levels or concentrations of harmful gases include damage that might cause the device to malfunction or cease functioning altogether. This specification sets forth limits for particulates and gases that are intended to avoid such damage. The limits must not be viewed or used as definitive limits, because numerous other factors, such as temperature or moisture content of the air, can influence the impact of particulates or environmental corrosives and gaseous contaminant transfer. In the absence of specific limits that are set forth in this document, you must implement practices that maintain particulate and gas levels that are consistent with the protection of human health and safety. If Lenovo determines that the levels of particulates or gases in your environment have caused damage to the device, Lenovo may condition provision of repair or replacement of devices or parts on implementation of appropriate remedial measures to mitigate such environmental contamination. Implementation of such remedial measures is a customer responsibility.

Table 39. Limits for particulates and gases

Contaminant	Limits
Particulate	• The room air must be continuously filtered with 40% atmospheric dust spot efficiency (MERV 9) according to ASHRAE Standard 52.2[1]. • Air that enters a data center must be filtered to 99.97% efficiency or greater, using high-efficiency particulate air (HEPA) filters that meet MIL-STD-282. • The deliquescent relative humidity of the particulate contamination must be more than 60%[2]. • The room must be free of conductive contamination such as zinc whiskers.
Gaseous	• Copper: Class G1 as per ANSI/ISA 71.04-1985[3] • Silver: Corrosion rate of less than 300 Å in 30 days
[1] ASHRAE 52.2-2008 - *Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size*. Atlanta: American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc.	
[2] The deliquescent relative humidity of particulate contamination is the relative humidity at which the dust absorbs enough water to become wet and promote ionic conduction.	
[3] ANSI/ISA-71.04-1985. *Environmental conditions for process measurement and control systems: Airborne contaminants*. Instrument Society of America, Research Triangle Park, North Carolina, U.S.A.	

Telecommunication regulatory statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact a Lenovo representative or reseller for any questions.

Electronic emission notices

When you attach a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices that are supplied with the monitor.

Federal Communications Commission (FCC) statement

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment

generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user will be required to correct the interference at his own expense.

Properly shielded and grounded cables and connectors must be used in order to meet FCC emission limits. Lenovo is not responsible for any radio or television interference caused by using other than recommended cables and connectors or by unauthorized changes or modifications to this equipment. Unauthorized changes or modifications could void the user's authority to operate the equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that might cause undesired operation.

Industry Canada Class A emission compliance statement

This Class A digital apparatus complies with Canadian ICES-003.

Avis de conformité à la réglementation d'Industrie Canada

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

Australia and New Zealand Class A statement

Attention: This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

European Union EMC Directive conformance statement

This product is in conformity with the protection requirements of EU Council Directive 2004/108/EC on the approximation of the laws of the Member States relating to electromagnetic compatibility. Lenovo cannot accept responsibility for any failure to satisfy the protection requirements resulting from a non-recommended modification of the product, including the installation of option cards from other manufacturers.

This product has been tested and found to comply with the limits for Class A Information Technology Equipment according to European Standard EN 55022. The limits for Class A equipment were derived for commercial and industrial environments to provide reasonable protection against interference with licensed communication equipment.

Lenovo, Einsteinova 21, 851 01 Bratislava, Slovakia

Germany Class A statement

Deutschsprachiger EU Hinweis: Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit

Deutschsprachiger EU Hinweis:Hinweis für Geräte der Klasse A EU-Richtlinie zur Elektromagnetischen Verträglichkeit Dieses Produkt entspricht den Schutzanforderungen der EU-Richtlinie 2004/108/EG (früher 89/336/EWG) zur Angleichung der Rechtsvorschriften über die elektromagnetische Verträglichkeit in den EU-Mitgliedsstaaten und hält die Grenzwerte der EN 55022 Klasse A ein.

Um dieses sicherzustellen, sind die Geräte wie in den Handbüchern beschrieben zu installieren und zu betreiben. Des Weiteren dürfen auch nur von der Lenovo empfohlene Kabel angeschlossen werden. Lenovo übernimmt keine Verantwortung für die Einhaltung der Schutzanforderungen, wenn das Produkt ohne Zustimmung der Lenovo verändert bzw. wenn Erweiterungskomponenten von Fremdherstellern ohne Empfehlung der Lenovo gesteckt/eingebaut werden.

Deutschland:

Einhaltung des Gesetzes über die elektromagnetische Verträglichkeit von Betriebsmittein Dieses Produkt entspricht dem „Gesetz über die elektromagnetische Verträglichkeit von Betriebsmitteln" EMVG (früher „Gesetz über die elektromagnetische Verträglichkeit von Geräten"). Dies ist die Umsetzung der EU-Richtlinie 2004/108/EG (früher 89/336/EWG) in der Bundesrepublik Deutschland.

Zulassungsbescheinigung laut dem Deutschen Gesetz über die elektromagnetische Verträglichkeit von Betriebsmitteln, EMVG vom 20. Juli 2007 (früher Gesetz über die elektromagnetische Verträglichkeit von Geräten), bzw. der EMV EG Richtlinie 2004/108/EC (früher 89/336/EWG), für Geräte der Klasse A.

Dieses Gerät ist berechtigt, in Übereinstimmung mit dem Deutschen EMVG das EG-Konformitätszeichen - CE - zu führen. Verantwortlich für die Konformitätserklärung nach Paragraf 5 des EMVG ist die Lenovo (Deutschland) GmbH, Gropiusplatz 10, D-70563 Stuttgart.

Informationen in Hinsicht EMVG Paragraf 4 Abs. (1) 4:**Das Gerät erfüllt die Schutzanforderungen nach EN 55024 und EN 55022 Klasse A.**

Nach der EN 55022: „Dies ist eine Einrichtung der Klasse A. Diese Einrichtung kann im Wohnbereich Funkstörungen verursachen; in diesem Fall kann vom Betreiber verlangt werden, angemessene Maßnahmen durchzuführen und dafür aufzukommen."

Nach dem EMVG: „Geräte dürfen an Orten, für die sie nicht ausreichend entstört sind, nur mit besonderer Genehmigung des Bundesministers für Post und Telekommunikation oder des Bundesamtes für Post und Telekommunikation betrieben werden. Die Genehmigung wird erteilt, wenn keine elektromagnetischen Störungen zu erwarten sind." (Auszug aus dem EMVG, Paragraph 3, Abs. 4). Dieses Genehmigungsverfahren ist nach Paragraph 9 EMVG in Verbindung mit der entsprechenden Kostenverordnung (Amtsblatt 14/93) kostenpflichtig.

Anmerkung: Um die Einhaltung des EMVG sicherzustellen sind die Geräte, wie in den Handbüchern angegeben, zu installieren und zu betreiben.

Japan VCCI Class A statement

この装置は、クラス A 情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。　　　　　　VCCI–A

This is a Class A product based on the standard of the Voluntary Control Council for Interference (VCCI). If this equipment is used in a domestic environment, radio interference may occur, in which case the user may be required to take corrective actions.
