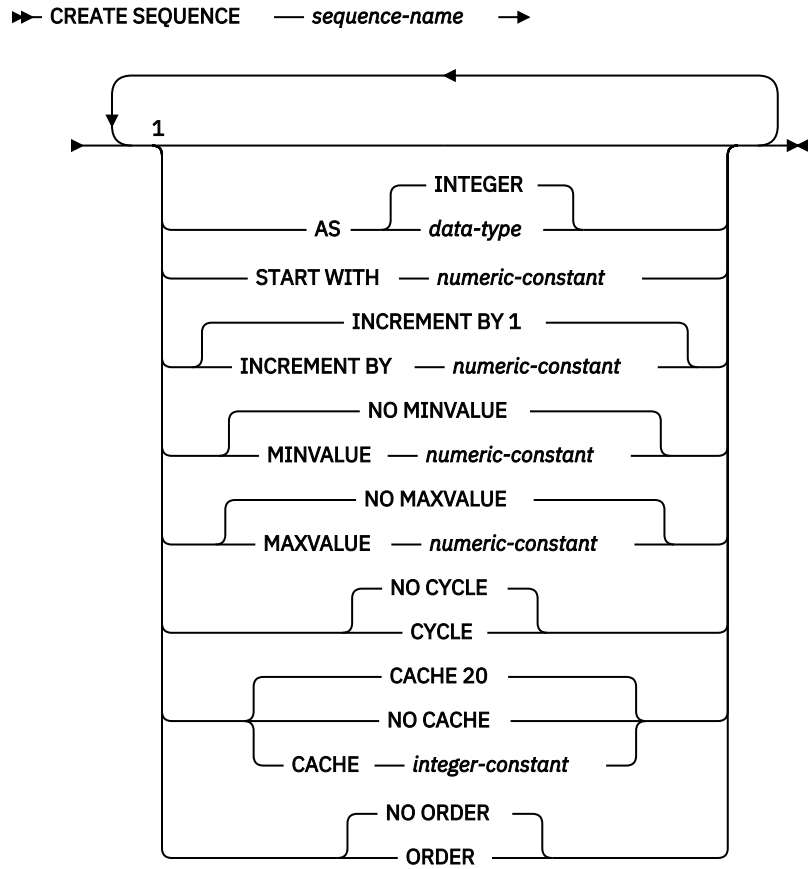
This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

- The CREATEIN privilege on the schema
- SYSADM or SYSCTRL authority
- System DBADM

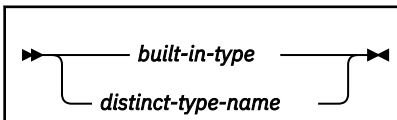


The authorization ID that matches the schema name implicitly has the CREATEIN privilege on the schema.

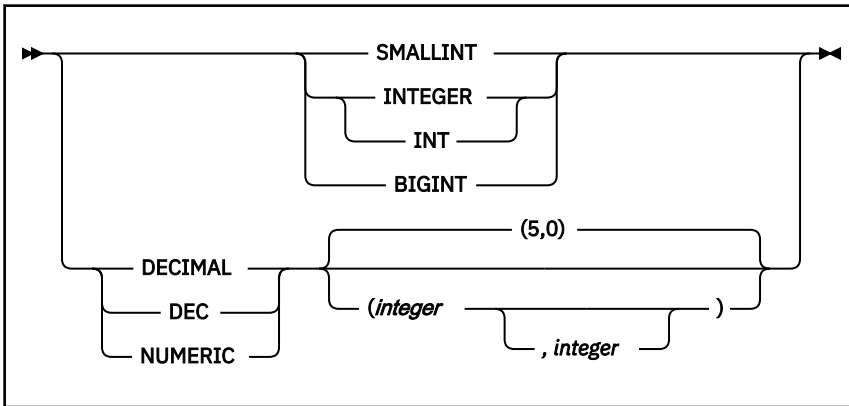
Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the of the owner of the plan or package. If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified, a role is the owner. Otherwise, an authorization ID is the owner.

If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER clause is specified. In that case, the privileges set is the privileges that are held by the role that is associated with the primary authorization ID of the process.

If the data type of the sequence is a distinct type, the privilege set must include the USAGE privilege on the distinct type.



Syntax



Notes:

[1] The same clause must not be specified more than once. Separator commas can be specified between sequence attributes when a sequence is defined.

data-type:

built-in-type:

Description

sequence-name
Names the sequence. The name, including the implicit or explicit qualifiers, must not identify an existing sequence at the current server, including the sequence names that are generated by Db2.

The schema name must not begin with 'SYS' unless the schema name is 'SYSADM'.

AS *data-type*
Specifies the data type to be used for the sequence value. The data type can be any exact numeric data type (SMALLINT, INTEGER, BIGINT, or DECIMAL with a scale of zero), or a user-defined distinct type for which the source type is an exact numeric data type with a scale of zero. The default, when AS is not specified, is INTEGER. If DECIMAL is specified, the default is DECIMAL(5,0).

START WITH *numeric-constant*
Specifies the first value for the sequence. The value can be any positive or negative value that could be assigned to the a column of the data type that is associated with the sequence without non-zero digits existing to the right of the decimal point.

If the START WITH clause is not explicitly specified with a value, the default is the MINVALUE for ascending sequences and MAXVALUE for descending sequences.

This value is not necessarily the value that a sequence would cycle to after reaching the maximum or minimum value of the sequence. The START WITH clause can be used to start a sequence outside the range that is used for cycles. The range used for cycles is defined by MINVALUE and MAXVALUE.

INCREMENT BY *numeric-constant*
Specifies the interval between consecutive values of the sequence. The value can be any positive or negative value (including 0) that could be assigned to a column of the data type that is associated with the sequence without any non-zero digits existing to the right of the decimal point. The default is 1.

If INCREMENT BY is positive, the sequence ascends. If INCREMENT BY is negative, the sequence descends. If INCREMENT is 0, the sequence is treated as an ascending sequence.

The absolute value of INCREMENT BY can be greater than the difference between MAXVALUE and MINVALUE.

MINVALUE or NO MINVALUE
Specifies the minimum value at which a descending sequence either cycles or stops generating values or an ascending sequence cycles to after reaching the maximum value. The default is NO MINVALUE.

MINVALUE *numeric-constant*
Specifies the minimum end of the range of values for the sequence. The last value that is generated for a cycle of a descending sequence will be equal to or greater than this value. MINVALUE is the value to which an ascending sequence cycles to after reaching the maximum value.

The value can be any positive or negative value that could be assigned to the a column of the data type that is associated with the sequence without non-zero digits existing to the right of the decimal point. The value must be less than or equal to the maximum value.

For the effects of defining MINVALUE and MAXVALUE with the same value, see Defining a constant sequence.

NO MINVALUE
Specifies that the minimum end point of the range of values for the sequence has not been specified explicitly. In such a case, the default value for MINVALUE becomes one of the following:

- For an ascending sequence, the value is the START WITH value or 1 if START WITH is not specified.
- For a descending sequence, the value is the minimum value of the data type that is associated with the sequence.

MAXVALUE or NO MAXVALUE
Specifies the maximum value at which an ascending sequence either cycles or stops generating values or an descending sequence cycles to after reaching the minimum value. The default is NO MAXVALUE.

MAXVALUE *numeric-constant*
Specifies the maximum end of the range of values for the sequence. The last value that is generated for a cycle of an ascending sequence will be less than or equal to this value. MAXVALUE is the value to which a descending sequence cycles to after reaching the minimum value.

The value can be any positive or negative value that could be assigned to the a column of the data type that is associated with the sequence without non-zero digits existing to the right of the decimal point. The value must be greater than or equal to the minimum value.

For the effects of defining MAXVALUE and MINVALUE with the same value, see Defining a constant sequence.

NO MAXVALUE
Specifies the maximum end point of the range of values for the sequence has not been specified explicitly. In such a case, the default value for MAXVALUE becomes one of the following:

- For an ascending sequence, the value is the maximum value of the data type that is associated with the sequence.
- For a descending sequence, the value is the START WITH value or -1 if START WITH is not specified.

To find the maximum possible value for a given data type, see "Limits in Db2 for z/OS" on page 2039.

CYCLE or NO CYCLE
Specifies whether or not the sequence should continue to generate values after reaching either its maximum or minimum value. The boundary of the sequence can be reached either with the next value landing exactly on the boundary condition or by overshooting it. The default is NO CYCLE.

CYCLE
Specifies that the sequence continue to generate values after either the maximum or minimum value has been reached. If this option is used, after an ascending sequence reaches its maximum value, it generates its minimum value. After a descending sequence reaches its minimum value, it generates its maximum value. The maximum and minimum values for the sequence defined by the MINVALUE and MAXVALUE options determine the range that is used for cycling.

When CYCLE is in effect, duplicate values can be generated by the sequence. When a sequence is defined with CYCLE, any application conversion tools for converting applications from other vendor platforms to Db2 should also explicitly specify MINVALUE, MAXVALUE, and START WITH values.

NO CYCLE
Specifies that the sequence cannot generate more values once the maximum or minimum value for the sequence has been reached. The NO CYCLE option (the default) can be altered to CYCLE at any time during the life of the sequence.

When the next value is being generated for a sequence if the maximum value (for an ascending sequence) or the minimum value (for a descending sequence) of the logical range of the sequence is exceeded and the NO CYCLE option is in effect, an error occurs.

CACHE or NO CACHE
Specifies whether or not to keep some preallocated values in memory for faster access. This is a performance and tuning option.

CACHE *integer-constant*
Specifies the maximum number of values of the sequence that Db2 can preallocate and keep in memory. Preallocating values in the cache reduces synchronous I/O when values are generated for the sequence. The actual number of values that Db2 caches is always the lesser of the number in effect for the CACHE option and the number of remaining values within the logical range. Thus, the CACHE value is essentially an upper limit for the size of the cache.

In the event the system is shut down (either normally or through a system failure), all cached sequence values that have not been used in committed statements are lost (that is, they will never be used). The value specified for the CACHE option is the maximum number of sequence values that could be lost when the system is shut down.

The minimum value is 2. The default is CACHE 20.

In a data sharing environment, you can use the CACHE and NO ORDER options to allow multiple Db2 members to cache sequence values simultaneously.

NO CACHE
Specifies that values of the sequence are not to be preallocated. This option ensures that there is not a loss of values in the case of a system failure. When NO CACHE is specified, the values of the sequence are not stored in the cache. In this case, every request for a new value for the sequence results in synchronous I/O to the log.

ORDER or NO ORDER
Specifies whether the sequence numbers must be generated in order of request. The default is NO ORDER.

ORDER
Specifies that the sequence numbers are generated in order of request. Specifying ORDER might disable the caching of values. There is no guarantee that values are assigned in order across the entire server unless NO CACHE is also specified. ORDER applies only to a single-application process.

NO ORDER
Specifies that the sequence numbers do not need to be generated in order of request.

In a data sharing environment, if the CACHE and NO ORDER options are in effect, multiple caches can be active simultaneously, and the requests for next value assignments from different Db2 members might not result in the assignment of values in strict numeric order. For example, if members DB2A and DB2B are using the same sequence, and DB2A gets the cache values 1 to 20 and DB2B gets the cache values 21 to 40, the actual order of values assigned would be 1,21,2 if DB2A requested for next value first, then DB2B requested, and then DB2A again requested. Therefore, to guarantee that sequence numbers are generated in strict numeric order among multiple Db2 members using the same sequence concurrently, specify the ORDER option.

Notes

Owner privileges: The owner is authorized to change (ALTER privilege) or use (USAGE privilege) the sequence and grant others these privileges. See "GRANT (sequence privileges)" on page 1793. For more information about ownership of the object see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

Relationship of MINVALUE and MAXVALUE: MINVALUE must not be greater than MAXVALUE. Although MINVALUE is typically less than MAXVALUE, MINVALUE can equal MAXVALUE. If START WITH were the same value as MINVALUE and MAXVALUE, the sequence would be constant. The request for the next value in a constant sequence appears to have no effect because all of the values that are generated by the sequence are in fact the same value.

Defining sequences that cycle: When you define a sequence, you can choose to have it cycle automatically or not when the maximum or minimum value for the sequence has been reached.

- Implicitly or explicitly defining a sequence with NO CYCLE causes the sequence to not cycle automatically after the boundary is reached. However, you can use the ALTER SEQUENCE statement to cycle the sequence manually. ALTER SEQUENCE allows you to restart or extend the sequence, which causes sequence values to continue to be generated.
- Explicitly defining a sequence with CYCLE causes the sequence to cycle automatically after the boundary is reached. Sequence values continue to be generated after the sequence cycles.

  When a sequence is defined to cycle automatically, the maximum or minimum value that is generated for a sequence might not be the actual MAXVALUE or MINVALUE value that is specified if the increment

is a value other than 1 or -1. For example, the sequence defined with START WITH=1, INCREMENT=2, MAXVALUE=10 will generate a maximum value of 9, and will not generate the value 10.

When a sequence is defined with CYCLE, any application conversion tools (for converting applications from other vendor platforms to Db2) should also explicitly specify MINVALUE, MAXVALUE, and START WITH.

Defining a constant sequence: You can define a sequence such that it always returns the same (or a constant) value. To create a constant sequence, use either of these techniques when defining the sequence:

- Specify an INCREMENT value of zero and a START WITH value that does not exceed MAXVALUE.
- Specify the same value for START WITH, MINVALUE, and MAXVALUE, and specify CYCLE.

A constant sequence can be used as a numeric global variable. You can use ALTER SEQUENCE to adjust the values that are generated for a constant sequence.

Consumed values of a sequence: After Db2 generates a value for a sequence, that value can be said to be "consumed" regardless of whether or not that value is used by the application or not. The value is not reused within the current cycle. A consumed value might not be used when the statement that caused the value to be generated fails for some reason or is rolled back after the value was generated. Generated but unused values can constitute gaps in a sequence.

Gaps in a sequence: Consecutive values in a sequence differ by the constant INCREMENT BY value specified for the sequence. However, gaps can occur in the values that are assigned to a sequence object by Db2.

The following situations are some examples of how gaps can be introduced in the sequence values:

- A transaction has advanced the sequence and then rolls back.
- The SQL statement leading to the generation of the next value fails after the value was generated.
- The NEXT VALUE expression is used in the SELECT statement of a cursor in a DRDA environment where the client uses block-fetch and not all retrieved rows are fetched by the application.
- The sequence is altered and then the alteration is rolled back.
- The sequence (or an identity column table) is dropped and then the drop is rolled back.
- The SYSIBM.SYSSEQ table space is stopped or closed for any reason (including when DSMAX is reached)
- The Db2 subsystem is stopped or goes down

Values of such gaps are not available for the current cycle, unless the sequence is altered and restarted in a specific way to make them available.

A sequence is incremented independently of a transaction. Thus, a given transaction increments the sequence two times might see a gap in the two numbers that it receives if other transactions concurrently increment the same sequence. Most applications can tolerate these instances as these are not really gaps.

Duplicate sequence values: It is possible the duplicate values can be generated for a sequence. Duplicate values are most likely to occur when a sequence is defined with the CYCLE option, is defined as a constant sequence, or is altered. For example, the following situations could cause duplicate sequence values:

- A sequence is defined with the attributes START WITH=2, INCREMENT BY 2, MINVALUE=2, MAXVALUE=10, and CYCLE.
- The ALTER SEQUENCE statement is used to restart the sequence with a value that has already been generated.
- The ALTER SEQUENCE statement is used to reverse the ascending direction of a sequence by changing the INCREMENT BY value from a positive to a negative.

Using sequences: A sequence can be referenced using a *sequence-reference*. A sequence reference can appear in most places that an expression can appear. A sequence reference can specify whether the

value to be returned is a newly generated value or the previously generated value. A NEXT VALUE sequence expression is used to generate a new value. A PREVIOUS VALUE sequence expression is used to obtain the last assigned value of a sequence. For more information, see “Sequence reference” on page 268.

Alternative syntax and synonyms: To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following keywords:

- NOMINVALUE (single key word) as a synonym for NO MINVALUE
- NOMAXVALUE (single key word) as a synonym for NO MAXVALUE
- NOCYCLE (single key word) as a synonym for NO CYCLE
- NOCACHE (single key word) as a synonym for NO CACHE
- NOORDER (single key word) as a synonym for NO ORDER

Examples

Example 1: Create a sequence names "org_seq" that starts at 1 increments by 1, does not cycle, and caches 24 values at a time:

```
CREATE SEQUENCE ORDER_SEQ
   START WITH 1
   INCREMENT BY 1
   NO MAXVALUE
   NO CYCLE
   CACHE 24;
```

INCREMENT 1, NO MAXVALUE, and NO CYCLE are defaults and do not need to be specified.

Example 2: The following example shows how to create and use a sequence named "order_seq" in a table named "orders":

```
CREATE SEQUENCE ORDER_SEQ
   START WITH 1
   INCREMENT BY 1
   NO MAXVALUE
   NO CYCLE
   CACHE 20;
  INSERT INTO ORDERS (ORDERNO, CUSTNO)
    VALUES (NEXT VALUE FOR ORDER_SEQ, 123456);
```

or to update the orders:

```
UPDATE ORDERS
   SET ORDERNO = NEXT VALUE FOR ORDER_SEQ
   WHERE CUSTNO = 123456;
```

Example 3: The following example shows how to use the same sequence number as a unique key value in two separate tables by referencing the sequence number with a NEXT VALUE expression for the first row to generate the sequence value and with a PREVIOUS VALUE expression for the other rows to refer to the sequence value most recently generated.

```
INSERT INTO ORDERS (ORDERNO, CUSTNO)
   VALUES (NEXT VALUE FOR ORDER_SEQ, 123456);
   INSERT INTO LINE_ITEMS (ORDERNO, PARTNO, QUANTITY)
     VALUES (PREVIOUS VALUE FOR ORDER_SEQ, 987654, 100);
```

If NEXT VALUE is invoked in the same statement as the PREVIOUS VALUE, then regardless of their order in the statement, PREVIOUS VALUE returns the previous (unincremented) value and NEXT VALUE returns the next value.

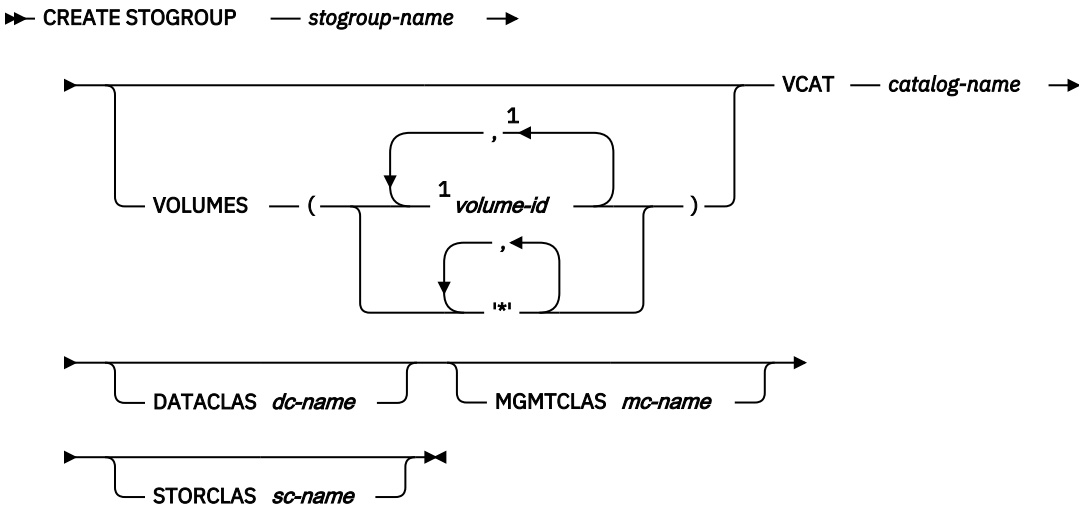
CREATE STOGROUP

The CREATE STOGROUP statement creates a storage group at the current server. Storage from the identified volumes can later be allocated for table spaces and index spaces.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization



The privilege set that is defined below must include at least one of the following:

- The CREATESG privilege
- SYSADM or SYSCTRL authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the of the owner of the plan or package. If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified, a role is the owner. Otherwise, an authorization ID is the owner.

If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER clause is specified. In that case, the privileges set is the privileges that are held by the role that is associated with the primary authorization ID of the process.

Syntax

Notes:

[1] The same *volume-id* must not be specified more than once.

Description

stogroup-name

Names the storage group. The name must not identify a storage group that exists at the current server.

VOLUMES(*volume-id,...*) or VOLUMES(*'*',...*)
Defines the volumes of the storage group. Each *volume-id* is a volume serial number of a storage volume. The volume serial number can have a maximum of six characters and is specified as an identifier or a string constant.

If the data set that is associated with the storage group is not managed by Storage Management Subsystem (SMS), VOLUMES must be specified. Asterisks are recognized only by SMS. SMS usage is recommended, rather than using Db2 to allocate data to specific volumes. Having Db2 select the volume requires non-SMS usage or assigning an SMS Storage Class with guaranteed space. However, because guaranteed space reduces the benefits of SMS allocation, it is not recommended. If one or more of the DATACLAS, MGMTCLAS, or STORCLAS clauses are specified, VOLUMES can be omitted. If the VOLUMES clause is omitted, the volume selection is controlled by SMS.

If you do choose to use specific volume assignments, additional manual space management must be performed. Free space must be managed for each individual volume to prevent failures during the initial allocation and extension. This process generally requires more time for space management and results in more space shortages. Guaranteed space should be used only where the space needs are relatively small and do not change.

VCAT *catalog-name*
Identifies the integrated catalog facility catalog for the storage group. The designated catalog is the one in which entries are placed for the data sets created by Db2 with the aid of the storage group, for associated table or index spaces or for their partitions. For each such space or partition, association is made through a USING clause in a CREATE TABLESPACE, CREATE INDEX, ALTER TABLESPACE, or ALTER INDEX statement. For more on the association, see the descriptions of those statements.

The data sets are linear VSAM data sets cataloged in the integrated catalog facility catalog that *catalog-name* identifies. For more information about *catalog-name* values, see “Naming conventions” on page 77.

More than one Db2 subsystem can share the integrated catalog facility catalogs with the current server. To avoid the chance of those subsystems attempting to assign the same name to different data sets, specify a *catalog-name* value that is not used by the other Db2 subsystems.

DATACLAS *dc-name*
Identifies the name of the SMS data class to associate with the Db2 storage group. The SMS data class name must be from 1-8 characters in length. The SMS storage administrator defines the data class that can be used. DATACLAS must not be specified more than one time.

MGMTCLAS *mc-name*
Identifies the name of the SMS management class to associate with the Db2 storage group. The SMS management class name must be from 1-8 characters in length. The SMS storage administrator defines the management class that can be used. MGMTCLAS must not be specified more than one time.

STORCLAS *sc-name*
Identifies the name of the SMS storage class to associate with the Db2 storage group. The SMS storage class name must be from 1-8 characters in length. The SMS storage administrator defines the storage class that can be used. STORCLAS must not be specified more than one time.

Notes

Device types:
When the storage group is used at run time, an error can occur if the volumes in the storage group are of different device types, or if a volume is not available to z/OS for dynamic allocation of data sets.

When a storage group is used to extend a data set, all volumes in the storage group must be of the same device type as the volumes used when the data set was defined. Otherwise, an extend failure occurs if an attempt is made to extend the data set.

Number of volumes
There is no specific limit on the number of volumes that can be defined for a storage group. However, the maximum number of volumes that can be managed for a storage group is 133.

z/OS imposes a limit on the number of volumes that can be allocated per data set (currently, 59 volumes). For the latest information on that restriction, see *z/OS DFSMS Access Method Services for Catalogs*.

Storage group owner:
If the statement is embedded in an application program, the owner of the plan or package is the owner of the storage group. If the statement is dynamically prepared, the SQL authorization ID of the process is the owner of the storage group. The owner has the privilege of altering and dropping the storage group.

Specifying volume IDs:
A new storage group must have either specific volume IDs or non-specific volume IDs. You cannot create a storage group that contains a mixture of specific and non-specific volume IDs.

Verifying the existence of volumes and classes: When processing the VOLUMES, DATACLAS, MGMTCLAS, or STORCLAS clauses, Db2 does not check the existence of the volumes or classes or determine the types of devices that are identified or if SMS is active. Later, when the storage group allocates data sets, the list of volumes is passed to Data Facilities (DFSMSdfp) in the physical order of the rows in the SYSIBM.SYSVOLUMES catalog table.

Related information:

Implementing Db2 storage groups (Db2 Administration Guide)

Examples

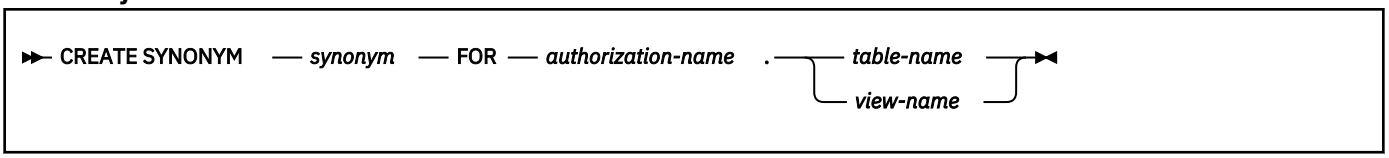
Example 1: Create storage group, DSN8G110, of volumes ABC005 and DEF008. DSNCAT is the integrated catalog facility catalog name.

```
CREATE STOGROUP DSN8G110
  VOLUMES (ABC005,DEF008)
  VCAT DSNCAT;
```

CREATE SYNONYM (deprecated)

The CREATE SYNONYM statement defines a synonym for a table or view at the current server.

Deprecated function: Synonyms are deprecated. In Db2 12, packages bound with APPLCOMPAT(V12R1M504 or higher cannot issue CREATE synonym statements. Use aliases instead.Synonyms are similar to aliases but are supported only for compatibility with previous releases Aliases behave the same for all Db2 family products. For more about aliases, see Aliases (Introduction to Db2 for z/OS) and “CREATE ALIAS” on page 1291. Existing synonyms remain supported, but support might be removed in the future.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified. The statement cannot be processed in a trusted context that is defined with a role as the object owner.

Authorization

None required.

Syntax

Description

synonym
Names the synonym. The name must not identify a synonym, table, view, or alias that exists at the current server and that is owned by the owner of the synonym that is being created and must not identify a table that exists in the SYSIBM.SYSPENDINGOBJECTS catalog table. The unqualified name must not be the same as an existing synonym.

FOR *authorization-name.table-name* or *authorization-name.view-name*
Identifies the object to which the synonym applies. The name must consist of two parts and must identify a table, view, or alias that exists at the current server. If a table is identified, it must not be an auxiliary table or a declared temporary table. If an alias is identified, it must be an alias for a table or view at the current server and the synonym is defined for that table or view. The name must not identify a table that was implicitly created for an XML column, or an accelerator-only table.

Notes

Owner privileges: There are no specific privileges on a synonym.

The owner of the synonym is determined as follows:

- If the CURRENT SCHEMA special register contains a value that is not the same as the CURRENT SQLID special register, the owner of the synonym is the value of the CURRENT SCHEMA special register.
- Otherwise, the owner of the schema is the value of the CURRENT SQLID special register.

For more information about ownership of an object, see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

If an alias is used to denote the table or view, the name of that table or view, not the alias, is recorded in the catalog as the definition of the synonym. That severs the connection between the synonym and alias, and even if the alias is dropped and redefined, the synonym is still in effect and names the original table or view.

Example

Define DEPT as a synonym for the table DSN8B10.DEPT.

```
CREATE SYNONYM DEPT
  FOR DSN8B10.DEPT;
```

CREATE TABLE

The CREATE TABLE statement defines a table. The definition must include its name and the names and attributes of its columns. The definition can include other attributes of the table, such as its primary key and its table space.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

- The CREATETAB privilege for the database explicitly specified by the IN clause.

  If the IN clause is not specified, the CREATETAB privilege on database DSNDB04 is required.
- DBADM, DBCTRL, or DBMAINT authority for the database explicitly specified by the IN clause. If the IN clause is not specified, DBADM, DBCTRL, or DBMAINT authority for database DSNDB04 is required.
- SYSADM or SYSCTRL authority
- System DBADM

If the table space is created implicitly, the privilege set that is defined below must include at least one of the following:

- The CREATETS privilege for the database explicitly specified by the IN clause.

  If the IN clause is not specified, the CREATETS privilege on database DSNDB04 is required.
- DBADM, DBCTRL, or DBMAINT authority for the database explicitly specified by the IN clause. If the IN clause is not specified, DBADM, DBCTRL, or DBMAINT authority for database DSNDB04 is required.
- SYSADM or SYSCTRL authority

The privilege set must also have the USE privilege for the following objects:

- For the table space if one is specified in the IN clause
- For the default buffer pool and default storage group of the database if a database is specified in the IN clause

If you specify a table space name, you must also have the SYSADM or SYSCTRL authority or the DBADM authority for the database.

For tables that are created in an implicit database, the database authority must be held on DSNDB04.

Additional privileges might be required in the following conditions:

- The clause IN, LIKE or FOREIGN KEY is specified.
- The data type of a column is a distinct type.
- The table space is implicitly created.
- A *fullselect* is specified.
- A column is defined as a security label column.

See the description of the appropriate clauses for details about these privileges.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the package.

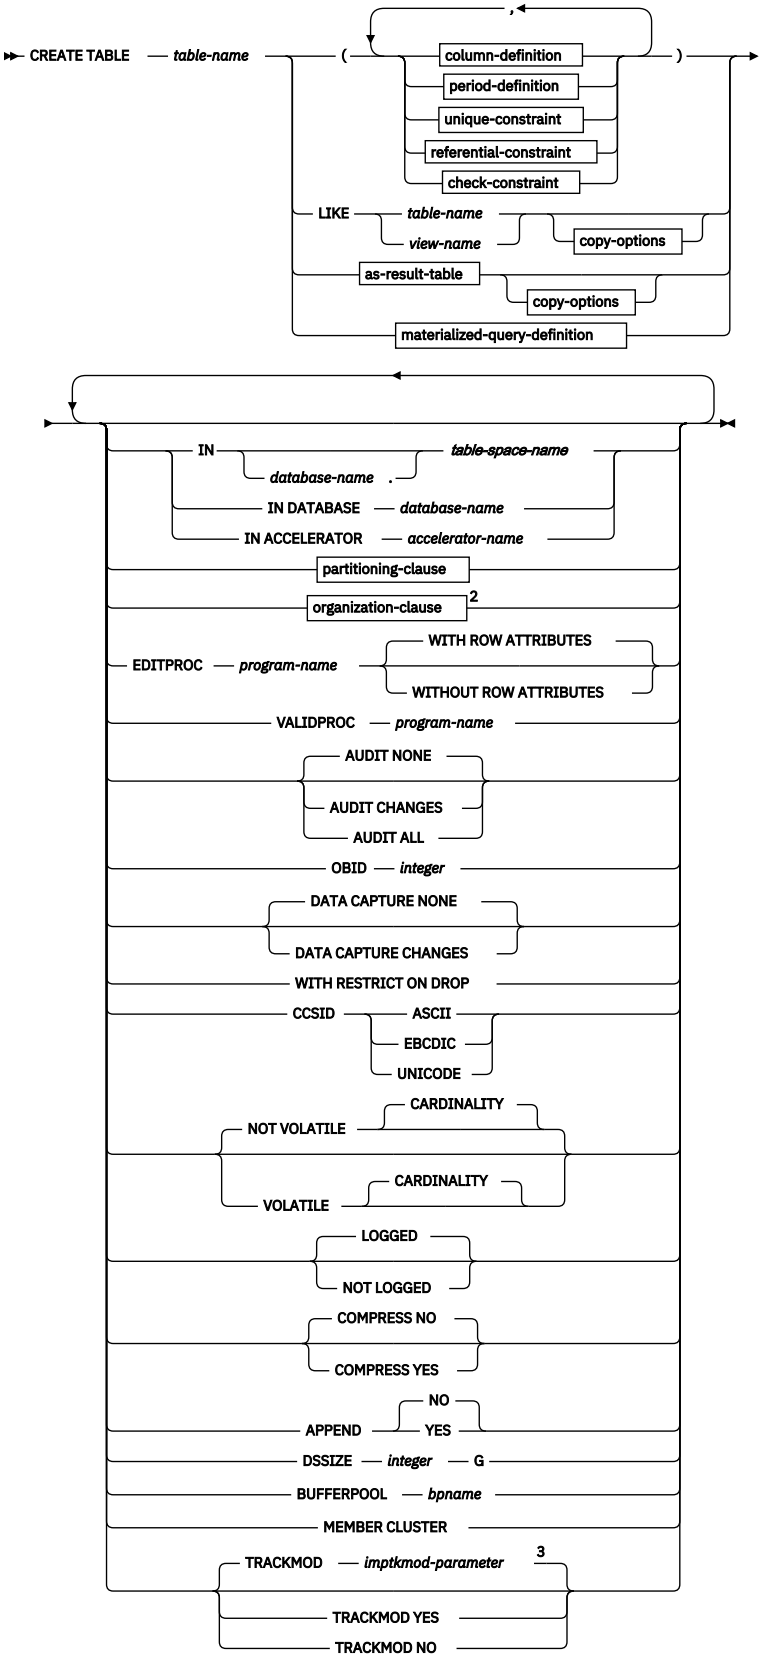
If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified:

- A role is the owner of the table that is being created
- The privilege set is the set of privileges that are held by that role
- The schema qualifier (implicit or explicit) must be the same as the role, unless the role has the CREATEIN privilege on the schema, or SYSADM, SYSCTRL, or system DBADM authority

Otherwise, an authorization ID is the owner of the package, and the following rules apply:

- If the privilege set lacks the CREATEIN privilege on the schema, SYSADM authority, SYSCTRL authority, and System DBADM authority, the schema qualifier (implicit or explicit) must be the same as the authorization ID of the owner of the package.
- If the privilege set lacks SYSADM authority, SYSCTRL authority, and System DBADM authority, and the table is explicitly qualified, the authorization ID that is the same as the schema name must have all the necessary privileges to create the table, and that authorization ID is the owner of the table. Otherwise,

the authorization ID of the owner of the package must have all the necessary privileges to create the table, and that authorization ID is the owner of the table.



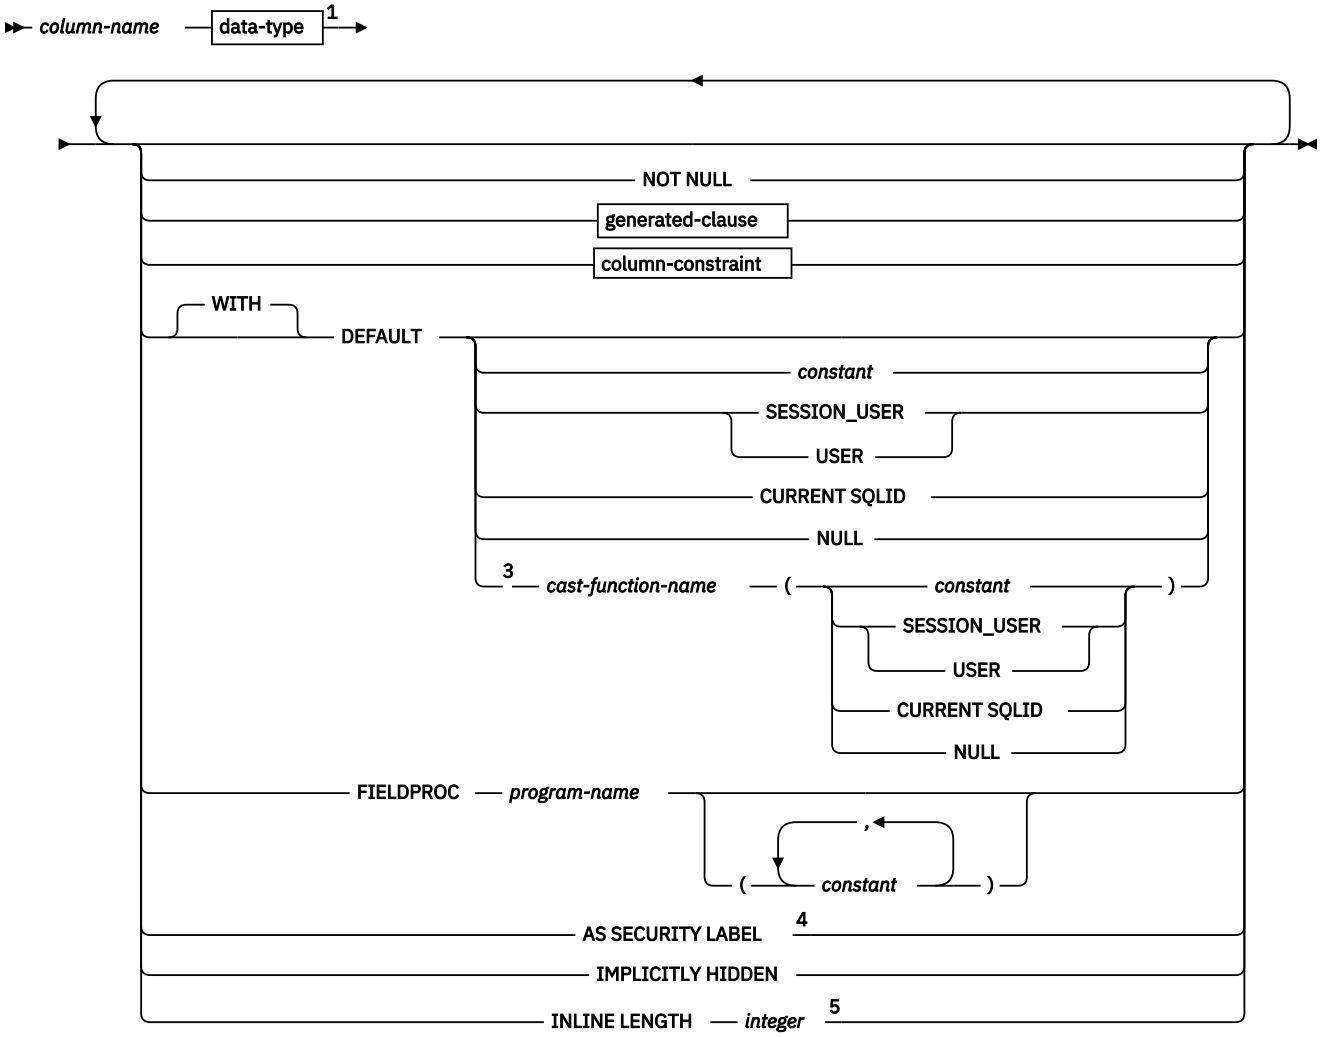
- If the privilege set includes SYSADM authority, SYSCTRL authority, or system DBADM authority, the schema qualifier (implicit or explicit) can be any schema name. However, if the table is explicitly qualified, the authorization ID that is the same as the schema name is the owner of the table. Otherwise, the authorization ID of the owner of the package is the owner of the table.
- If the privilege set includes DBADM authority and DBCTRL authority for the database, the schema qualifier (implicit or explicit) can be any schema name. However, if the table is explicitly qualified, the authorization ID that is the same as the schema name is the owner of the table. Otherwise, the authorization ID of the owner of the package is the owner of the table.

If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER clause is in effect. When ROLE AS OBJECT OWNER is in effect, the privileges set is the privileges that are held by the role that is associated with the primary authorization ID of the process, and the owner of the table is that role. The schema qualifier (implicit or explicit) must be the same as that role, unless the role has CREATEIN privilege on the schema, or SYSADM authority, SYSCTRL authority, or System DBADM authority.

For the case where the SQL authorization ID of the process holds the privileges, the following rules apply:

- If the privilege set lacks CREATEIN privilege on the schema, SYSADM authority, SYSCTRL authority, and System DBADM authority, the schema qualifier must be the same as one of the authorization IDs of the process.
- If the privilege set lacks SYSADM authority, SYSCTRL authority, and System DBADM authority, and the table is explicitly qualified, then the authorization ID that is the same as the schema name must have all the necessary privileges to create the table, and that authorization ID is the owner of the table. Otherwise, the SQL authorization ID of the process must include all privileges that are needed to create the table, and that authorization ID is the owner of the table.
- If the privilege set includes SYSADM authority, SYSCTRL authority, or System DBADM authority, the schema qualifier can be any schema name. However, if the table is explicitly qualified, then the authorization ID that is the same as the schema name is the owner of the table. Otherwise, the SQL authorization ID of the process is the owner of the table.

Syntax



Notes:

[1] The same clause must not be specified more than once.

[2] Hash-organized tables are deprecated. Beginning in Db2 12, packages bound with APPLCOMPAT(V12R1M504) or higher cannot create hash-organized tables or alter existing tables to use hash-organization. Existing hash organized tables remain supported, but they are likely to be unsupported in the future.

[3] The IMPTKMOD subsystem parameter specifies the default value.

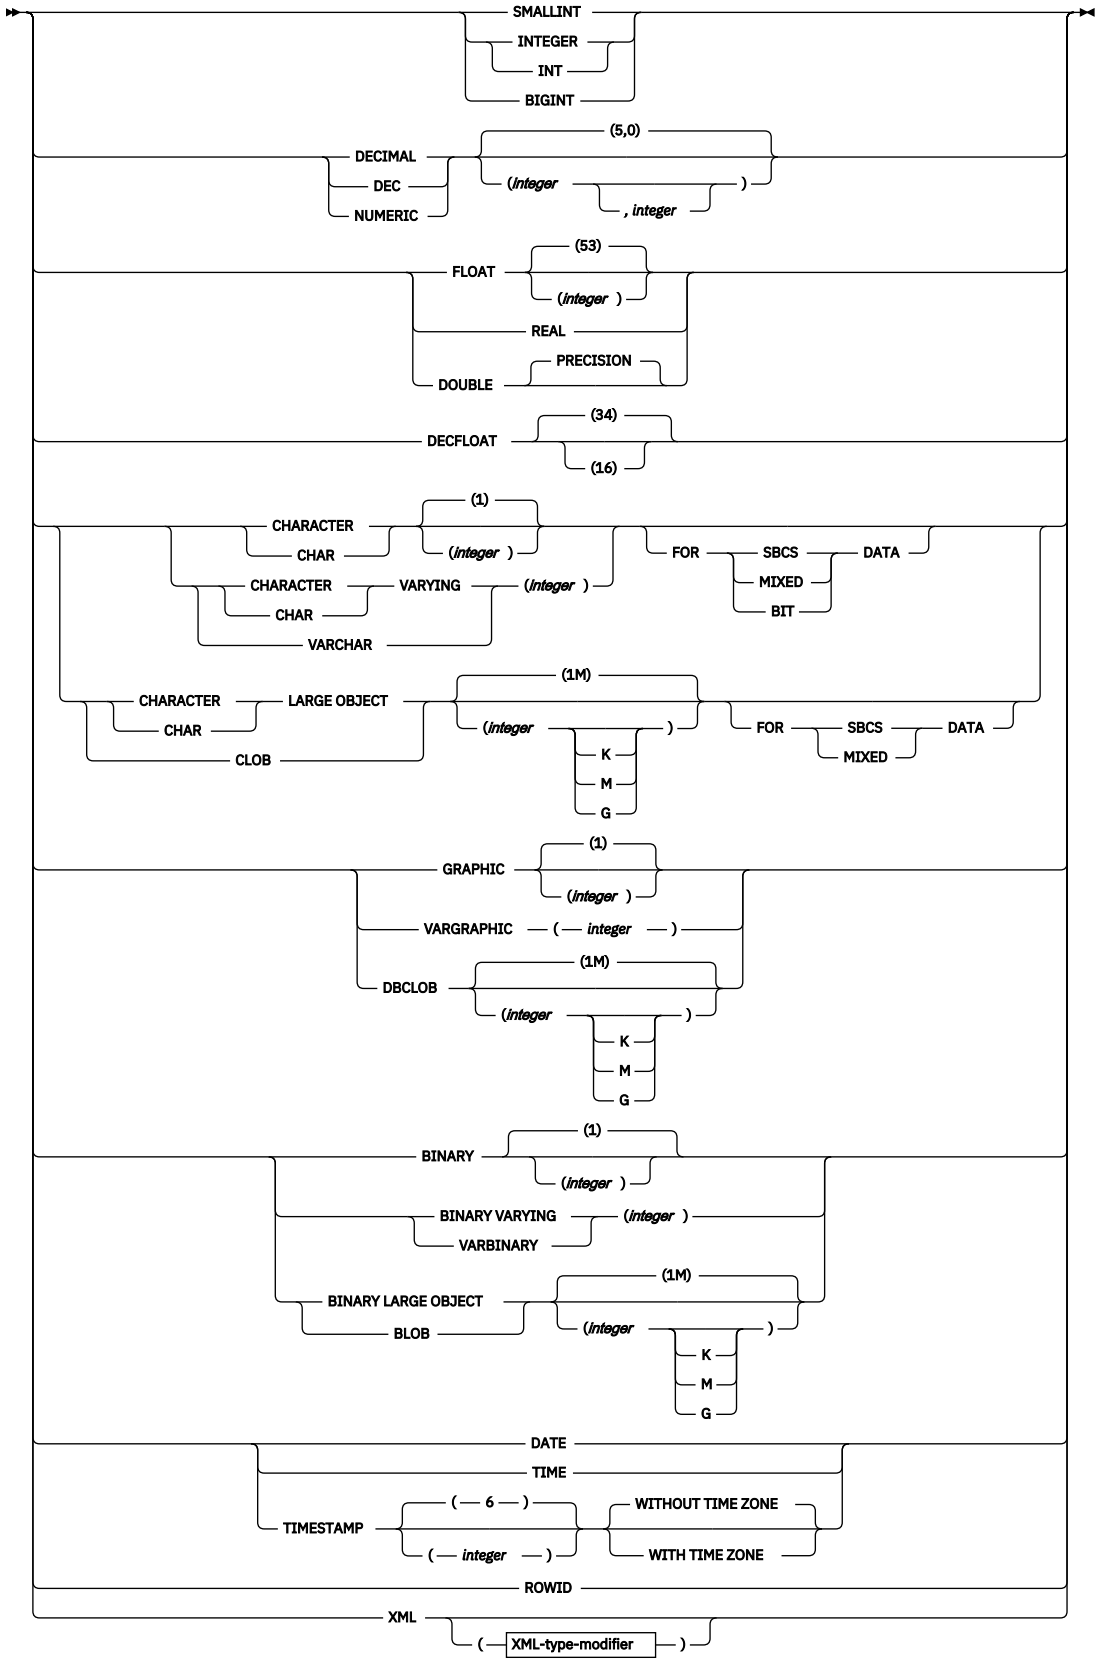
column-definition:

Notes:

[1] Data type is optional if *as-row-change-timestamp-clause* is specified

[2] The same clause must not be specified more than one time.

[3] The *cast-function-name* form of the DEFAULT value can only be used with a column that is defined as a distinct type.



[4] AS SECURITY LABEL can be specified only for a CHAR(8) data type and requires that the NOT NULL and WITH DEFAULT clauses be specified.

[5] INLINE LENGTH only applies to a column with a LOB data type or a distinct type that is based on a LOB data type.

Notes:

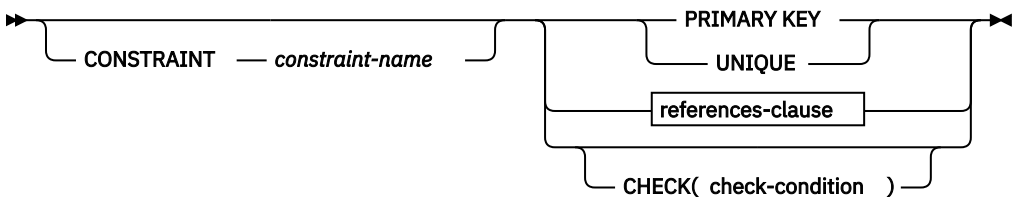
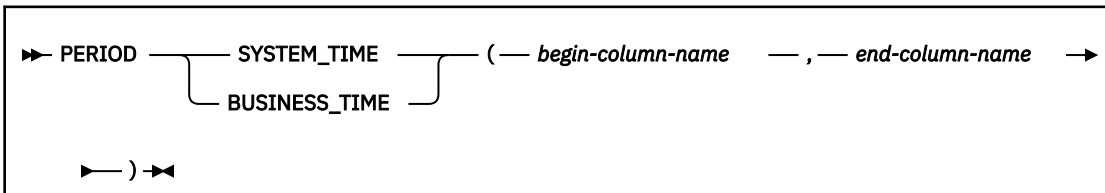
[1] This definition of special register is specific to this context, as part of *non-deterministic-expression*.

[2] USER can be specified as a synonym for SESSION_USER.

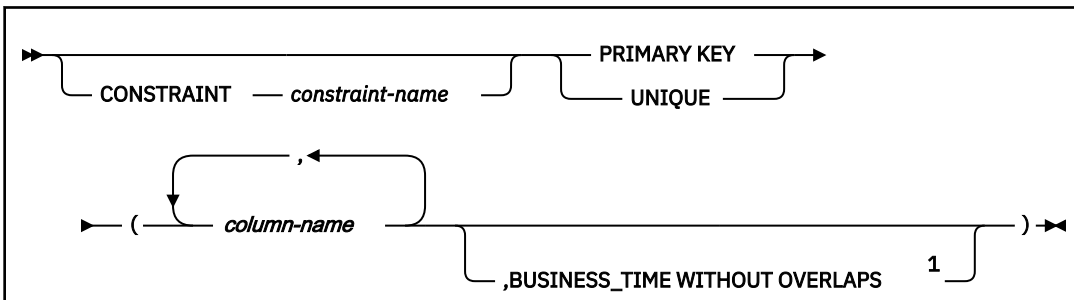


session-variable:



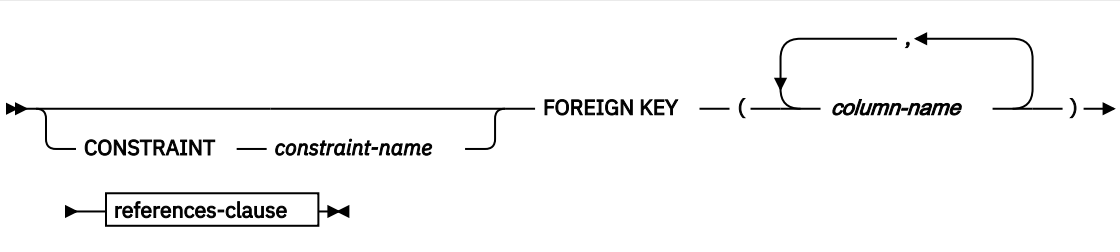
Notes:

[1] This definition of session variable is specific to this context, as part of *non-deterministic-expression*.

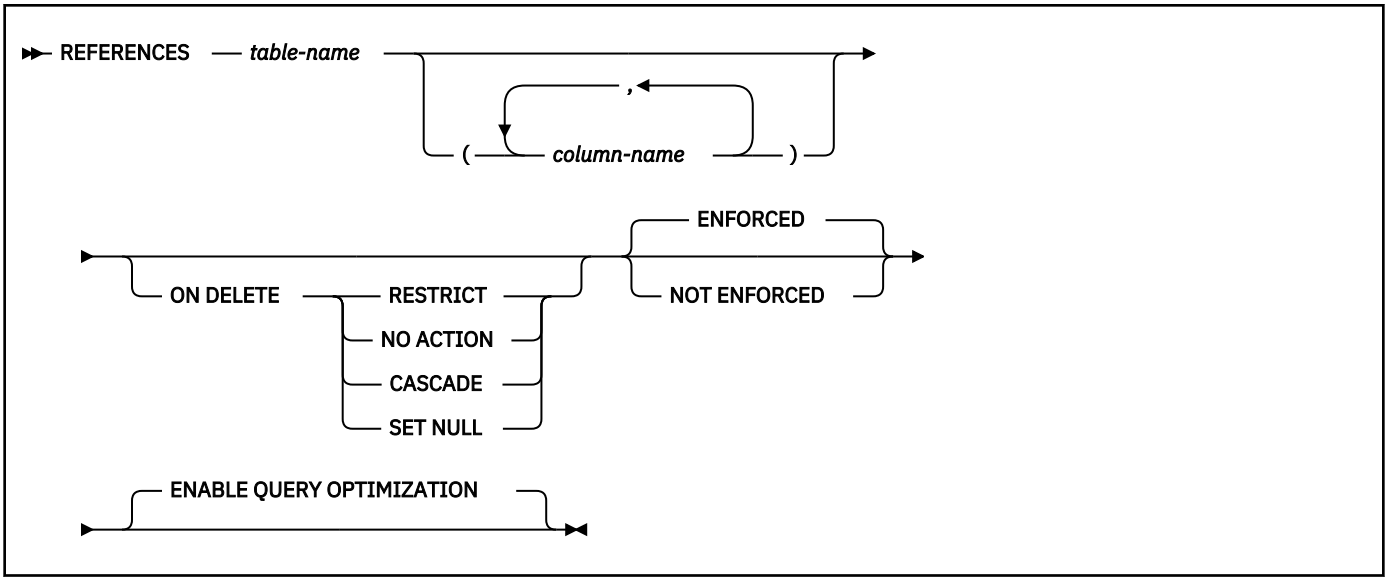


column-constraint:

period-definition:

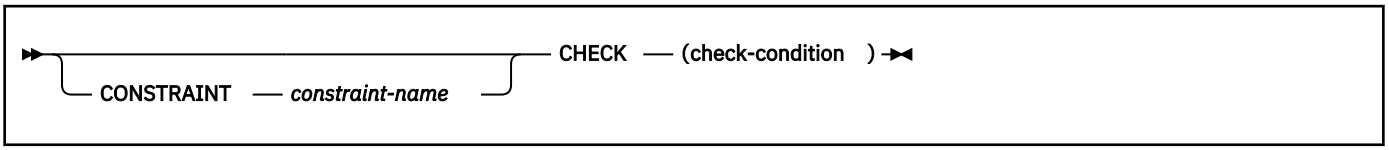


unique-constraint:

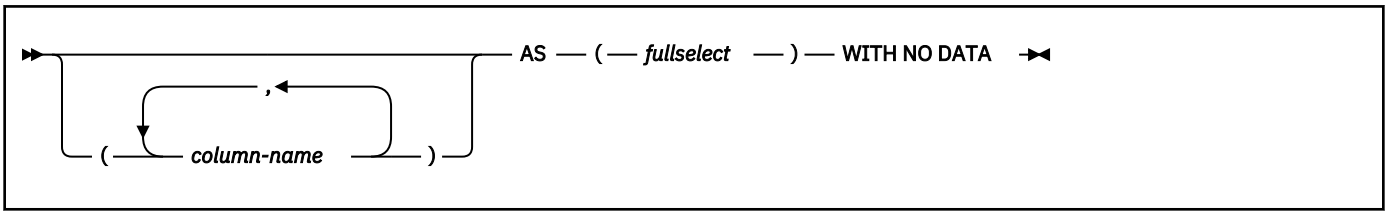


Notes:

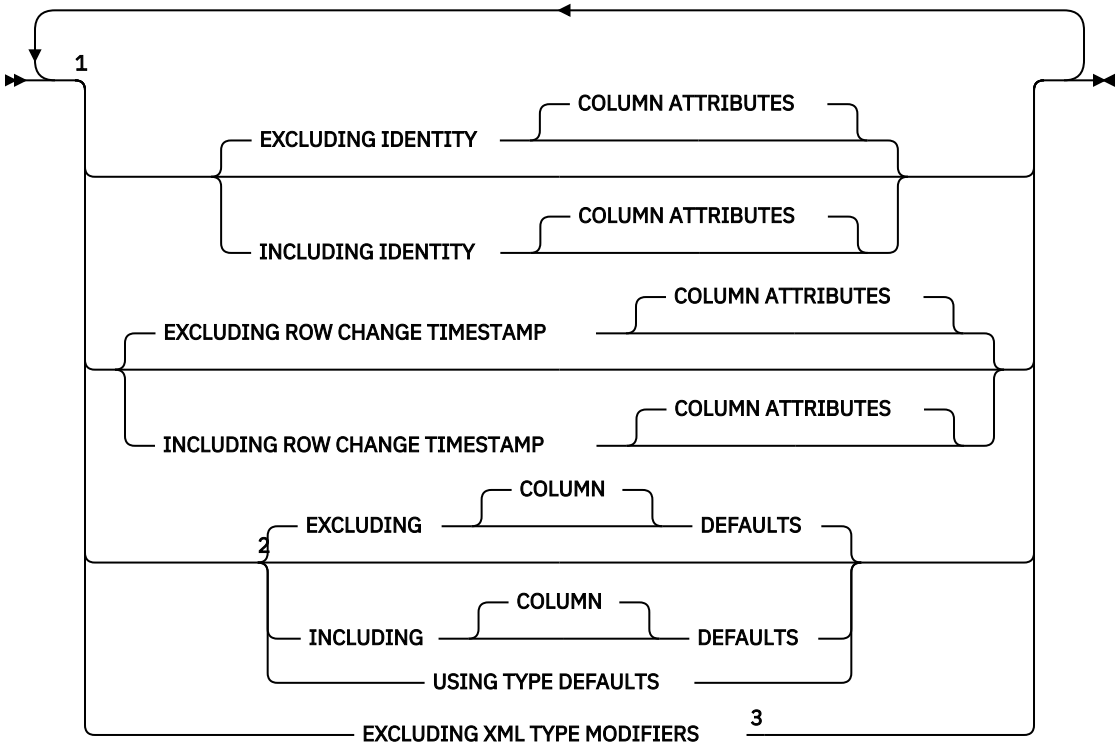
[1] If `BUSINESS_TIME WITHOUT OVERLAPS` is specified, the BUSINESS_TIME period will not overlap in time periods for the same *column-name* values.



referential-constraint:



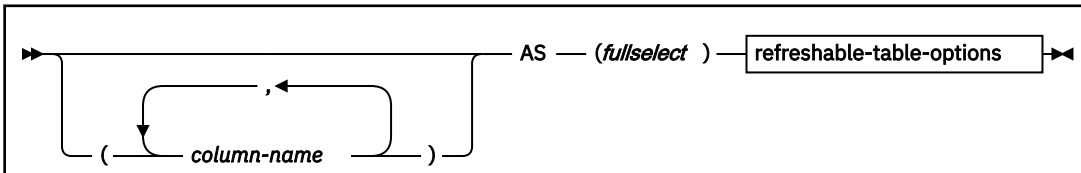
references-clause:



check-constraint:

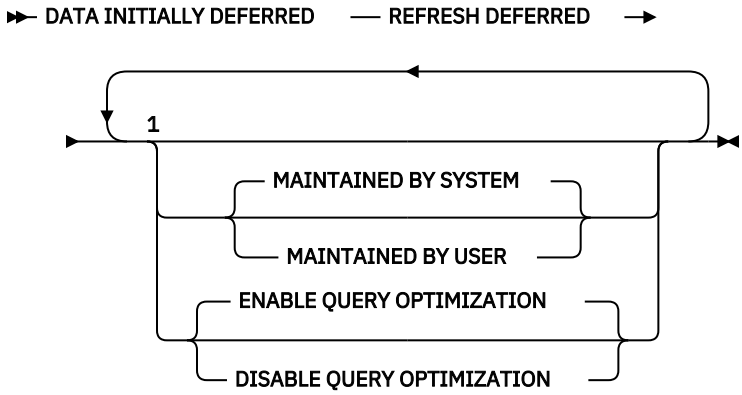
as-result-table:

copy-options:



Notes:

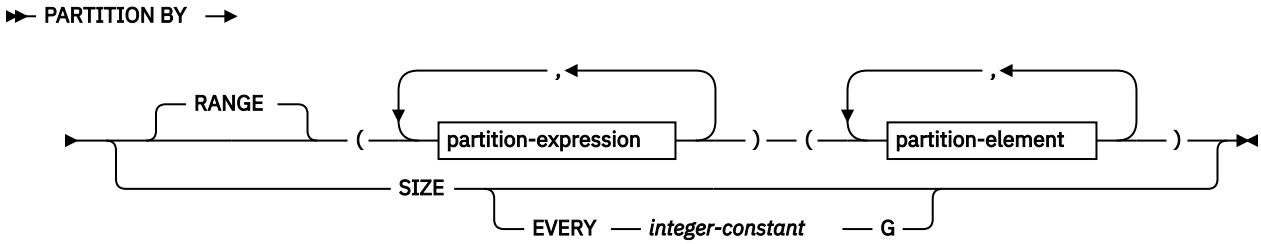
[1] These clauses can be specified in any order and must not be specified more than one time.



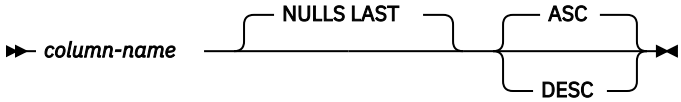
[2] EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, and USING TYPE DEFAULTS must not be specified with the LIKE clause.

[3] EXCLUDING XML TYPE MODIFIERS must be specified with the LIKE clause if the identified table has an XML type modifier and none of the XML columns of the new table has an XML type modifier. EXCLUDING XML TYPE MODIFIERS is not supported when a view is identified in a LIKE clause and the view contains XML columns.

materialized-query-definition

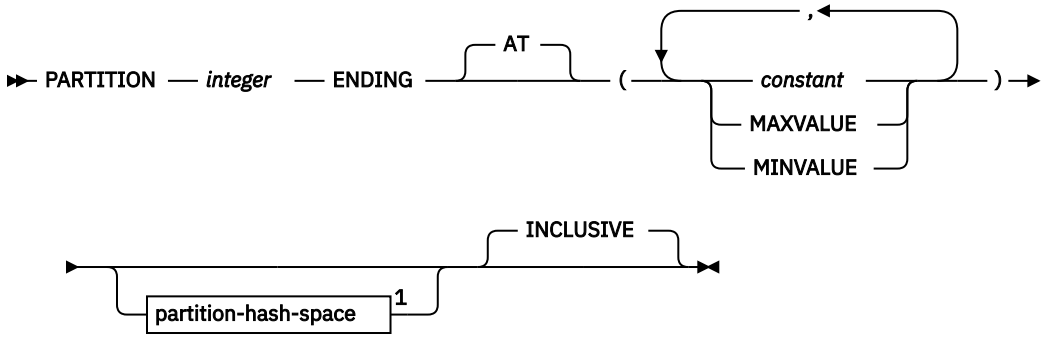


refreshable-table-options:



Notes:

[1] The same clause must not be specified more than one time.



partitioning-clause:

partition-expression:

partition-element:

Notes:

[1] Hash-organized tables are deprecated. Beginning in Db2 12, packages bound with APPLCOMPAT(V12R1M504) or higher cannot create hash-organized tables or alter existing tables to use hash-organization. Existing hash organized tables remain supported, but they are likely to be unsupported in the future.

Description

table-name
Names the table. The name, including the implicit or explicit qualifier, must not identify a table, view, alias, or synonym that exists at the current server or a table that exists in the SYSIBM.SYSPENDINGOBJECTS catalog table. The unqualified name must not be the same as an existing synonym.

If the name is qualified, the name can be a two-part or three-part name. If a three-part name is used, the first part must match the value of field Db2LOCATION NAME on installation panel DSNTIPR at the current server. (If the current server is not the local Db2, this name is not necessarily the name in the CURRENT SERVER special register.)

column-definition

column-name
Names a column of the table. For a dependent table, up to 749 columns can be named. For a table that is not a dependent, this number is 750. Do not qualify *column-name* and do not use the same name for more than one column of the table.

built-in-type
Specifies the data type of the column as one of the following built-in data types, and for character string data types, specifies the subtype. For more information about defining a table with a LOB column (CLOB, BLOB, or DBCLOB), see Creating a table with LOB columns.

If IN ACCELERATOR is specified, not all data types are supported. For example, DECFLOAT, LOB, ROWID, TIMESTAMP WITH TIME ZONE, and XML are not supported. The *IBM Db2 Analytics Accelerator for z/OS: Stored Procedures Reference* has a complete list of supported data types.

SMALLINT
For a small integer.

INTEGER or INT
For a large integer.

BIGINT
For a big integer.

DECIMAL(*integer*,*integer*) or DEC(*integer*,*integer*)
DECIMAL(*integer*) or DEC(*integer*)
DECIMAL or DEC
For a decimal number. The first integer is the precision of the number. That is, the total number of digits, which can range from 1 to 31. The second integer is the scale of the number. That is, the number of digits to the right of the decimal point, which can range from 0 to the precision of the number.

You can use DECIMAL(*p*) for DECIMAL(*p*,0) and DECIMAL for DECIMAL(5,0).

You can also use the word NUMERIC instead of DECIMAL. For example, NUMERIC(8) is equivalent to DECIMAL(8). Unlike DECIMAL, NUMERIC has no allowable abbreviation.

DECFLOAT(*integer*)
For a decimal floating-point number. The value of *integer* must be either 16 or 34 and represents the number of significant digits that can be stored. If *integer* is omitted, the DECFLOAT column will be capable of representing 34 significant digits.

FLOAT(*integer*)
FLOAT
For a floating-point number. If *integer* is between 1 and 21 inclusive, the format is single precision floating-point. If the integer is between 22 and 53 inclusive, the format is double precision floating-point.

You can use DOUBLE PRECISION or FLOAT for FLOAT(53).

REAL
For single precision floating-point.

DOUBLE or DOUBLE PRECISION
For double precision floating-point

CHARACTER(*integer*) or CHAR(*integer*)
CHARACTER or CHAR
For a fixed-length character string of length *integer*, which can range 1 - 255. If the length specification is omitted, a length of 1 character is assumed.

VARCHAR(*integer*), CHAR VARYING(*integer*), or CHARACTER VARYING(*integer*)
For a varying-length character string of maximum length *integer*, which can range from 1 to the maximum record size minus 10 bytes. See Table 193 on page 1564 to determine the maximum record size.

CCSID 1208
Specifies that the column is a Unicode column encoded in UTF-8. This clause must not be specified for an ASCII or Unicode table.

FOR *subtype* DATA
Specifies a subtype for a character string column, which is a column with a data type of CHAR, VARCHAR, or CLOB. Do not use the FOR *subtype* DATA clause with columns of any other data type (including any distinct type). *subtype* can be one of the following:

SBCS
Column holds single-byte data.

MIXED
Column holds mixed data. Do not specify MIXED if the value of field MIXED DATA on installation panel DSNTIPF is NO unless the CCSID UNICODE clause is also specified, or the table is being created in a Unicode table space or database.

BIT
Column holds BIT data. Do not specify BIT for a CLOB column.

Only character strings are valid when subtype is BIT.

If you do not specify the FOR clause, the column is defined with a default subtype. For ASCII or EBCDIC data:

- The default is SBCS when the value of field MIXED DATA on installation panel DSNTIPF is NO.
- The default is MIXED when the value is YES.

For Unicode data, the default subtype is MIXED.

A security label column is always considered SBCS data, regardless of the encoding scheme of the table.

CLOB(*integer* [K|M|G]), CHAR LARGE OBJECT(*integer* [K|M|G]), or CHARACTER LARGE OBJECT(*integer* [K|M|G])
CLOB, CHAR LARGE OBJECT, or CHARACTER LARGE OBJECT
For a character large object (CLOB) string of the specified maximum length in bytes. The maximum length must be in the range of 1 - 2147483647. A CLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see “Restrictions using LOBs” on page 112.

When *integer* is not specified, the default length is 1M. The maximum value that can be specified for *integer* depends on whether a units indicator is also specified as shown in the following list.

integer
The maximum value for *integer* is 2147483647. The maximum length of the string is *integer*.

***integer* K**
The maximum value for *integer* is 2097152. The maximum length is 1024 times *integer*.

***integer* M**
The maximum value for *integer* is 2048. The maximum length is 1,048,576 times *integer*.

***integer* G**
The maximum value for *integer* is 2. The maximum length is 1,073,741,824 times *integer*.

If you specify a value that evaluates to 2 gigabytes (2,147,483,648), Db2 uses a value that is one byte less, or 2147483647.

GRAPHIC(*integer*)
GRAPHIC
For a fixed-length graphic string of length *integer*, which can range 1 - 127. If the length specification is omitted, a length of 1 character is assumed.

VARGRAPHIC(*integer*)
For a varying-length graphic string of maximum length *integer*, which must range from 1 to *n*/2, where *n* is the maximum row size minus 2 bytes.

CCSID 1200
Specifies that the column is a Unicode column encoded in UTF-16. This clause must not be specified for an ASCII or Unicode table.

DBCLOB(*integer* [K|M|G])
DBCLOB
For a double-byte character large object (DBCLOB) string of the specified maximum length in double-byte characters. The maximum length must be in the range of 1 - 1,073,741,823. A DBCLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see "Restrictions using LOBs" on page 112.

When *integer* is not specified, the default length is 1M. The meaning of *integer* K|M|G is similar to CLOB. The difference is that the number specified is the number of double-byte characters.

CCSID 1200
Specifies that the column is a Unicode column encoded in UTF-16. This clause must not be specified for an ASCII or Unicode table.

BINARY(*integer*)
A fixed-length binary string of length *integer*. The *integer* can range from 1 through 255. If the length specification is omitted, a length of 1 byte is assumed.

BINARY VARYING(*integer*) or VARBINARY(*integer*)
A varying-length binary string of maximum length *integer*, which can range from 1 through 32704. The length is limited by the page size of the table space.

BLOB (*integer* [K|M|G] or BINARY LARGE OBJECT(*integer* [K|M|G])
BLOB or BINARY LARGE OBJECT
For a binary large object (BLOB) string of the specified maximum length in bytes. The maximum length must be in the range of 1 through 2147483647. A BLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see "Restrictions using LOBs" on page 112.

When *integer* is not specified, the default length is 1M. The meaning of *integer* K|M|G is the same as for CLOB.

DATE
For a date.

TIME
For a time.

TIMESTAMP(*integer*) WITHOUT TIME ZONE
For a timestamp. *integer* specifies the optional timestamp precision attribute and must be in the range from 0 to 12. The timestamp precision denotes the number of fractional second digits that are included in the timestamp. The default is 6.

TIMESTAMP(*integer*) WITH TIME ZONE
For a timestamp with time zone. *integer* specifies the optional timestamp precision attribute and must be in the range from 0 to 12. The timestamp precision denotes the number of fractional second digits that are included in the timestamp. The default is 6.

ROWID
For a row ID type.

A table can contain at most two ROWID columns. If it contains two, one column is implicitly generated by Db2 and the other column is explicitly defined as a ROWID without the IMPLICITLY HIDDEN attribute. The values in a ROWID column are unique for every row in the table and cannot be updated. You must specify NOT NULL with ROWID.

XML
For an XML document. Only well-formed XML documents can be inserted into an XML column.

If the XML column is the first XML column that you create for the table, a BIGINT DOCID column is implicitly created and is used to store a unique document identifier for the XML columns of a row.

XMLSCHEMA
Specifies one or more XML schemas that are used to validate the XML value. The same XML schema can not be specified more than one time.

If the XML value has already been validated, for example, the XML value is the result of the DSN_XMLVALIDATE function or from an XML column with a type modifier, and the XML schema against which the XML value is validated is one of the schemas specified in the *XML-type-modifier*, Db2 accepts the XML value without revalidation.

XML-schema-specification
Specifies one XML schema. The XML schema can be identified by using either the registered XML-schema-name or the schema's target namespace followed by an optional schema location. Any XML schema that is referenced in this clause must be registered in the XML schema repository prior to use.

ID *registered-XML-schema-name*
Identifies an XML schema by using its *registered-XML-schema-name*. The name must uniquely identify an existing XML schema in the XML schema repository at the current server. If no XML schema by this name exists, an error is returned.

The schema qualifier must be SYSXSR.

URI *target-namespace*
Specifies the target namespace URI of the XML schema. The value for the target-namespace URI is a character string constant which is not empty. The URI must be the target namespace of a registered XML schema and, if no LOCATION clause is specified, it must uniquely identify the registered XML schema.

NO NAMESPACE
Specifies that the XML schema has no target namespace. There must be a registered XML schema that has no target namespace. If no LOCATION clause is specified, there must be only one such registered XML schema.

LOCATION *schema-location*
Specifies the XML schema location URI of the XML schema. The value of *schema-location* is a character string constant that is not empty. The schema location URI, combined with the target namespace URI, must identify a registered XML schema.

ELEMENT *element-name*
Specifies the name of the global element declaration. *element-name* must match the local name of the root element node in the instance XML document. The namespace name of the root element node must be the same as the target namespace URI.

distinct-type-name
Specifies the data type of the column is a distinct type (a user-defined data type). The length, precision, and scale of the column are respectively the length, precision, and scale of the source type of the distinct type. The privilege set must implicitly or explicitly include the USAGE privilege on the distinct type.

The encoding scheme of the distinct type must be the same as the encoding scheme of the table. The subtype for the distinct type, if it has the attribute, is the subtype with which the distinct type was created.

If the column is to be used in the definition of the foreign key of a referential constraint, the data type of the corresponding column of the parent key must have the same distinct type.

NOT NULL
Prevents the column from containing null values. Omission of NOT NULL implies that the column can contain null values.

column-constraint
The *column-constraint* of a *column-definition* provides a shorthand method of defining a constraint composed of a single column. Thus, if a *column-constraint* is specified in the definition of column C, the effect is the same as if that constraint were specified as a *unique-constraint*, *referential-constraint*, or *check-constraint* in which C is the only identified column.

CONSTRAINT *constraint-name*
Names the constraint. If a constraint name is not specified, a unique constraint name is generated. If the name is specified, it must be different from the names of any referential, check, primary key, or unique key constraints previously specified on the table.

PRIMARY KEY
Provides a shorthand method of defining a primary key composed of a single column. Thus, if PRIMARY KEY is specified in the definition of column C, the effect is the same as if the PRIMARY KEY(C) clause is specified as a separate clause.

The NOT NULL clause must be specified with this clause. PRIMARY KEY cannot be specified more than one time in a column definition, and must not be specified if the UNIQUE clause is specified in the definition. This clause must also not be specified if the definition is for one of the following types of columns:

- a LOB column
- a ROWID column
- a DECFLOAT column
- a distinct type column that is based on a LOB, ROWID, or DECFLOAT data type
- an XML column
- a row change timestamp column
- a column in an accelerator-only table
- a Unicode column in an EBCDIC table

The table is marked as unavailable until its primary index is explicitly created unless the CREATE TABLE statement is processed by the schema processor or the table space that contains the table is implicitly created. In that case, Db2 implicitly creates an index to enforce the uniqueness of the primary key and the table definition is considered complete. (For more information about implicitly created indexes, see Implicitly created indexes.)

UNIQUE
Provides a shorthand method of defining a unique key composed of a single column. Thus, if UNIQUE is specified in the definition of column C, the effect is the same as if the UNIQUE(C) clause is specified as a separate clause.

The NOT NULL clause must be specified with this clause. UNIQUE cannot be specified more than one time in a column definition and must not be specified if the PRIMARY KEY clause is specified in the column definition or if the definition is for one of the following types of columns:

- a LOB column
- a ROWID column
- a DECFLOAT column
- a distinct type column that is based on a LOB, ROWID, or DECFLOAT data type
- an XML column
- a row change timestamp column
- a column in an accelerator-only table

- a Unicode column in an EBCDIC table

The table is marked as unavailable until all the required indexes are explicitly created unless the CREATE TABLE statement is processed by the schema processor or the table space that contains the table is implicitly created. In that case, Db2 implicitly creates the indexes that are required for the unique keys and the table definition is considered complete. (For more information about implicitly created indexes, see Implicitly created indexes.)

references-clause

The *references-clause* of a *column-definition* provides a shorthand method of defining a foreign key composed of a single column. Thus, if *references-clause* is specified in the definition of column C, the effect is the same as if the *references-clause* were specified as part of a FOREIGN KEY clause in which C is the only identified column.

Do not specify *references-clause* in the definition of the following types of columns because these types of columns cannot be a foreign key:

- a LOB column
- a ROWID column
- a DECFLOAT column
- a distinct type column that is based on a LOB, ROWID, or DECFLOAT data type
- an XML column
- a row change timestamp column
- a security label column
- a Unicode column in an EBCDIC table

CHECK *(check-condition)*

CHECK *(check-condition)* provides a shorthand method of defining a check constraint that applies to a single column. For conformance with the SQL standard, if CHECK is specified in the column definition of column C, no columns other than C should be referenced in the check condition of the check constraint. The effect is the same as if the check condition were specified as a separate clause.

DEFAULT

Specifies the default value that is assigned to the column in the absence of a value specified on an insert or update operation or LOAD. DEFAULT must not be specified more than one time in the same *column-definition*. Do not specify DEFAULT for the following types of columns because Db2 generates default values:

- An identity column (a column that is defined AS IDENTITY)
- A ROWID column (or a distinct type that is based on a ROWID)
- A row change timestamp column
- A row-begin column
- A row-end column
- A *transaction-start-id* column
- An XML column

If IN ACCELERATOR is specified, do not specify DEFAULT for a column.

Do not specify a value after the DEFAULT keyword for a security label column. Db2 provides the default value for a security label column.

Do not specify a value after the DEFAULT keyword for a Unicode column in an EBCDIC table. Alternatively, DEFAULT NULL can be specified.

If a value is not specified after DEFAULT, the default value depends on the data type of the column, as follows:

Data Type
Default Value

Numeric
0

Big integer
0

Fixed-length character string
Blanks

Fixed-length graphic string
Blanks

Fixed-length binary string
Hexadecimal zeros

Varying-length string
A string of length 0

Inline BLOB
Hexadecimal zeros

Inline CLOB
Blanks

Inline DBCLOB
Blanks

Date
CURRENT DATE

Time
CURRENT TIME

TIMESTAMP(*integer*) WITHOUT TIME ZONE
CURRENT TIMESTAMP(*p*) WITHOUT TIME ZONE where *p* is the corresponding timestamp precision.

TIMESTAMP(*integer*) WITH TIME ZONE
CURRENT TIMESTAMP(*p*) WITH TIME ZONE where *p* is the corresponding timestamp precision.

If the column is defined as timestamp with time zone the default value must include a time zone.

Distinct type
The default of the source data type

A default value other than the one that is listed above can be specified in one of the following forms:

- WITH DEFAULT for a default value of an empty string
- DEFAULT NULL for a default value of null

Omission of NOT NULL and DEFAULT from a *column-definition*, for a column other than an identity column, is an implicit specification of DEFAULT NULL. For an identity column, it is an implicit specification of NOT NULL, and Db2 generates default values.

constant
Specifies a constant as the default value for the column. The value of the constant must conform to the rules for assigning that value to the column.

A character or graphic string constant must be short enough so that its UTF-8 representation requires no more than 1536. A hexadecimal graphic string constant (GX) cannot be specified.

In addition, the length of the constant value cannot be greater than the INLINE LENGTH attribute for LOB columns.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register at the time of an SQL data change statement or LOAD as the default value for the column. If SESSION_USER is specified, the

data type of the column must be a character string with a length attribute greater than or equal to 8 characters when the value is expressed in CCSID 37. If the data type of the column is an inline CLOB, the INLINE LENGTH attribute must be greater than or equal to 8 characters when the value is expressed as CCSID 37.

CURRENT SQLID
Specifies the value of the SQL authorization ID of the process at the time of an insert or update operation or LOAD as the default value for the column. If CURRENT SQLID is specified, the data type of the column must be a character string with a length attribute greater than or equal to the length attribute of the CURRENT SQLID special register. If the data type of the column is an inline CLOB, the INLINE LENGTH attribute must be greater than or equal to the length attribute of the CURRENT SQLID special register.

NULL
Specifies null as the default value for the column. If NOT NULL is specified, DEFAULT NULL must not be specified with the same *column-definition*.

cast-function-name
The name of the cast function that matches the name of the distinct type for the column. A cast function can only be specified if the data type of the column is a distinct type.

The schema name of the cast function, whether it is explicitly specified or implicitly resolved through function resolution, must be the same as the explicitly or implicitly specified schema name of the distinct type.

constant
Specifies a constant as the argument. The constant must conform to the rules of a constant for the source type of the distinct type. The length of the constant cannot be greater than the INLINE LENGTH attribute for LOB columns.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register at the time a row is inserted as the default for the column. The source type of the distinct type of the column must be a CHAR, VARCHAR, or inline CLOB with a length attribute (inline length attribute for CLOB) that is greater than or equal to the length attribute of the SESSION_USER special register.

CURRENT SQLID
Specifies the value of the CURRENT SQLID special register at the time a row is inserted as the default for the column. The source type of the distinct type of the column must be a CHAR, VARCHAR, or inline CLOB with a length attribute (or inline length attribute for CLOB) that is greater than or equal to the length attribute of the CURRENT SQLID special register.

NULL
Specifies the NULL value as the argument.

In a given column definition:

- DEFAULT and FIELDPROC cannot both be specified.
- NOT NULL and DEFAULT NULL cannot both be specified.

Table 189 on page 1530 summarizes the effect of specifying the various combinations of the NOT NULL and DEFAULT clauses on the CREATE TABLE statement *column-description* clause.

Table 189. Effect of specifying combinations of the NOT NULL and DEFAULT clauses

If NOT NULL is:	And DEFAULT is:	The effect is:
Specified[1]	Omitted	An error occurs if a value is not provided for the column on an insert or update operation or LOAD.
	Specified without an operand	The system defined nonnull default value is used.
	constant	The specified constant is used as the default value.
	SESSION_USER	The value of the SESSION_USER special register at the time of an insert or update operation or LOAD is used as the default value.
	CURRENT SQLID	The SQL authorization ID of the process at the time of an insert or update operation or LOAD is used as the default value.
	NULL	An error occurs during the execution of CREATE TABLE.
Omitted	Omitted	Equivalent to an implicit specification of DEFAULT NULL.
	Specified without an operand	The system defined nonnull default value is used.
	constant	The specified constant is used as the default value.
	SESSION_USER	The value of the SESSION_USER special register at execution time is used as the default value.
	CURRENT SQLID	The SQL authorization ID of the process is used as the default value.
	NULL	Null is used as the default value.

Note: The table does not apply to a column with a ROWID data type or to an identity column.

GENERATED

Specifies that Db2 generates values for the column. GENERATED must be specified if the column is to be considered one of the following types of columns:

- An identity column
- A row change timestamp column.
- A ROWID column
- A row-begin column
- A row-end column
- A *transaction-start-id* column
- A generated expression column

GENERATED must only be specified for these types of columns. GENERATED must not be specified with *default-clause* in a column definition.

GENERATED must not be specified if the column definition references global variables.

ALWAYS
Specifies that Db2 always generates a value for the column when a row is inserted or updated and a default value must be generated. ALWAYS is the default and recommended value.

BY DEFAULT
Specifies that Db2 will generate a value for the column when a row is inserted or updated and a default value must be generated, unless an explicit value is specified.

For a row change timestamp column, Db2 inserts or updates a specified value but does not verify that the value is unique for the column unless the row change timestamp column has a unique constraint or a unique index that specifies only the row change timestamp column.

For a ROWID column, Db2 uses a specified value only if it is a valid row ID value that was previously generated by Db2 and the column has a unique, single-column index. Until this index is created on the ROWID column, the SQL insert or update operation and the LOAD utility cannot be used to add rows to the table. If the table space is explicitly created and the value of the CURRENT RULES special register is 'STD' when the CREATE TABLE statement is processed, or if the table space is implicitly created, Db2 implicitly creates the index on the ROWID column. The name of this index is 'I' followed by the first ten characters of the column name followed by seven randomly generated characters. If the column name is less than ten characters, Db2 adds underscore characters to the end of the name until it has ten characters. The implicitly created index has the COPY NO attribute.

For an identity column, Db2 inserts a specified value but does not verify that it a unique value for the column unless the identity column has a unique, single-column index.

BY DEFAULT is the recommended value only when you are using data propagation.

FOR EACH ROW ON UPDATE AS ROW CHANGE TIMESTAMP
Specifies that the column is a timestamp column for the table. Db2 generates a value for the column for each row as the row is inserted, and for any row in which any column is updated. The value that is generated for a row change timestamp column is a timestamp that corresponds to the insert or update time of the row. If multiple rows are inserted or updated with a single statement, the value for the row change timestamp column might be different for each row.

A table can only have one row change timestamp column.

If *data-type* is specified, it must be TIMESTAMP WITHOUT TIME ZONE with a precision of 6.

A row change timestamp column cannot have a DEFAULT clause. NOT NULL must be specified for a row change timestamp column.

AS TRANSACTION START ID
Specifies that the value is assigned by Db2 whenever a row is inserted into the table or any column in the row is updated. Db2 assigns a unique timestamp value per transaction or the null value. The null value is assigned to the transaction-start-ID column if the column is nullable. Otherwise, the value is generated using the time-of-day clock during execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin column or transaction-start-ID column in the table, or when a row in a system-period temporal table is deleted. If multiple rows are inserted or updated within a single SQL transaction, the values for the transaction-start-ID column are the same for all the rows and are unique from the values that are generated for the column for another transaction.

A transaction-start-ID column is required for a system-period temporal table.

A table can have only one transaction-start-ID column. If a data type is not specified, the column is defined as TIMESTAMP(12) WITHOUT TIME ZONE. If a data type is specified, it must be TIMESTAMP(12) WITHOUT TIME ZONE or TIMESTAMP(12) WITH TIME ZONE. If the column is defined as TIMESTAMP WITH TIME ZONE, the values are stored in UTC, with a time zone of +00:00. A transaction-start-ID column cannot have a DEFAULT clause. A transaction-start-ID column is not updatable.

A value for a transaction-start-ID column is composed of a TIMESTAMP(9) value that is unique per transaction per data sharing member followed by 3 digits that indicate the data sharing member number.

AS ROW BEGIN
Specifies that the column contains timestamp data and that the values are generated by Db2. Db2 generates a value for the column for each row as the row is inserted, and for every row in which any column is updated. The generated value is a timestamp that corresponds to the start time that is associated with the most recent transaction. If multiple rows are inserted with a single SQL unit of work, the values for the transaction start timestamp column are the same.

A *row-begin* column is intended to be used for a system-period temporal table.

For a system-period temporal table, Db2 ensures the uniqueness of the generated values for a row-begin column across transactions. If multiple rows are inserted or updated within a single SQL transaction, the values for the row-begin column are the same for all the rows and are unique from the values that are generated for the column for another transaction. A row-begin column is required as the begin column of a SYSTEM_TIME period.

A table can have only one column defined as AS ROW BEGIN. If a data type is specified, it must be TIMESTAMP(12) WITHOUT TIME ZONE or TIMESTAMP(12) WITH TIME ZONE. If the column is defined as TIMESTAMP(12) WITH TIME ZONE, the values are stored in UTC, with a time zone of +00:00. If no data type is specified, the column is defined as TIMESTAMP(12) WITHOUT TIME ZONE. A column defined as a row-begin column cannot have a DEFAULT clause, and must be defined as NOT NULL.

A row-begin column is not updatable.

A value for a row-begin column is composed of a TIMESTAMP(9) value that is unique per transaction per data sharing member followed by 3 digits that indicate the data sharing member number.

AS ROW END
Specifies that a value for the data type of the column is assigned by Db2 whenever a row is inserted or any column in the row is updated. The value that is assigned for a TIMESTAMP WITHOUT TIME ZONE column is the TIMESTAMP value '9999-12-30-00.00.00.000000000000'. The value that is assigned for a TIMESTAMP WITH TIME ZONE column is the TIMESTAMP value '9999-12-30-00.00.00.000000000000 +00:00'.

A row-end column is required as the second column of a SYSTEM_TIME period.

A table can have only one row-end column. If a data type is not specified, the column is defined as TIMESTAMP(12) WITHOUT TIME ZONE. If a data type is specified, it must be TIMESTAMP(12) WITHOUT TIME ZONE or TIMESTAMP(12) WITH TIME ZONE. If the column is defined as TIMESTAMP WITH TIME ZONE, the values are stored in UTC, with a time zone of +00:00. A row-end column cannot have a DEFAULT clause and must be defined as NOT NULL. A row-end column is not updatable.

as-generated-expression-clause
Specifies that values for the column are generated by Db2. The generated value is assigned to the column whenever a row is inserted, or any column in the row is updated.

DATA CHANGE OPERATION
Specifies that the database manager generates one of the following values, depending on the specified expression:

I
Insert operation.

U
Update operation.

D
Delete operation.

A table can have only one DATA CHANGE OPERATION column. The column must be defined as CHAR(1). The column cannot have a DEFAULT clause and must not be defined as NOT NULL.

The column is a non-deterministic generated expression column.

Do not specify any of the following clauses for the column:

- CCSID 1200
- CCSID 1208
- FIELDPROC

special-register

Specifies the value of the special register. The column is to contain the value of the special register at the time of the data change statement that assigns the value to the column. If multiple rows are inserted or updated with a single SQL statement, the value for the column is the same for all of the rows.

special-register must be one of the following special registers, and the column must use the required data type.

Table 190. Possible special register values for non-deterministic generated expression columns

Special register	Data type for the column
CURRENT CLIENT_ACCTNG	VARCHAR(255)
CURRENT CLIENT_APPLNAME	VARCHAR(255)
CURRENT CLIENT_CORR_TOKEN	VARCHAR(255)
CURRENT CLIENT_USERID	VARCHAR(255)
CURRENT CLIENT_WRKSTNNAME	VARCHAR(255)
CURRENT SERVER	CHAR(16)
CURRENT SQLID	VARCHAR(*n*) where $n \geq 8$
SESSION_USER or USER	VARCHAR(128)

The column cannot have a DEFAULT clause and must not be defined as NOT NULL.

The column is a non-deterministic generated expression column.

Do not specify any of the following clauses for the column:

- CCSID 1200
- CCSID 1208
- FIELDPROC

Related information:

“Special registers” on page 167

session-variable

Specifies the value of a built-in session variable. The fully qualified name of the session variable must be specified. The value of the session variable is obtained from the GETVARIABLE function at the time of the data change operation that assigns the value to the column. If multiple rows are changed with a single SQL statement, the value for the column is the same for all of the rows.

session-variable must be one of the following session variables, and the column must use the required data type.

Table 191. Possible session variable values for non-deterministic generated expression columns

Session variable	Data type for the column
SYSIBM.PACKAGE_NAME	VARCHAR(128)
SYSIBM.PACKAGE_SCHEMA	VARCHAR(128)
SYSIBM.PACKAGE_VERSION	VARCHAR(122)

The column cannot have a DEFAULT clause and must not be defined as NOT NULL.

The column is a non-deterministic generated expression column.

Do not specify any of the following clauses for the column:

- CCSID 1200
- CCSID 1208
- FIELDPROC

Related information:

"Built-in session variables" on page 306

AS IDENTITY

Specifies that the column is an identity column for the table. A table can have only one identity column. AS IDENTITY can be specified only if the data type for the column is an exact numeric type with a scale of zero (SMALLINT, INTEGER, BIGINT, DECIMAL with a scale of zero, or a distinct type based on one of these types).

An identity column is implicitly NOT NULL. An identity column cannot have a WITH DEFAULT clause.

Defining a column AS IDENTITY does not necessarily ensure the uniqueness of the values. To ensure uniqueness of the values, define a unique, single-column index on the identity column.

If IN ACCELERATOR is specified, AS IDENTITY must not be specified.

START WITH *numeric-constant*

Specifies the first value that is generated for the identity column. The value can be any positive or negative value that could be assigned to the column without non-zero digits existing to the right of the decimal point.

If a value is not explicitly specified when the identity column is defined, the default is the MINVALUE for an ascending identity column and the MAXVALUE for a descending identity column. This value is not necessarily the value that would be cycled to after reaching the maximum or minimum value for the identity column. The range used for cycles is defined by MINVALUE and MAXVALUE. MAXVALUE and MINVALUE do not constrain the numeric-constant value. That is, the START WITH clause can be used to start the generation of values outside the range that is used for cycles. However, the next generated value after the specified START WITH value is MINVALUE for an ascending identity column or MAXVALUE for a descending identity column.

INCREMENT BY *numeric-constant*

Specifies the interval between consecutive values of the identity column. The value can be any positive or negative value (including 0) that does not exceed the value of a large integer constant, and could be assigned to the column without any non-zero digits existing to the right of the decimal point.

If this value is negative, the values for the identity column descend. If this value is 0 or positive, the values for the identity column ascend. The default is 1.

MINVALUE or NO MINVALUE
Specifies the minimum value at which a descending identity column either cycles or stops generating values or an ascending identity column cycles to after reaching the maximum value.

NO MINVALUE
Specifies that the minimum end point of the range of values for the identity column has not be set. In such a case, the default value for MINVALUE becomes one of the following:

- For an ascending identity column, the value is the START WITH value or 1 if START WITH is not specified.
- For a descending identity column, the value is the minimum value of the data type of the column.

The default is NO MINVALUE.

MINVALUE *numeric-constant*
Specifies the numeric constant that is the minimum value that is generated for this identity column. This value can be any positive or negative value that could be assigned to this column without non-zero digits existing to the right of the decimal point. The value must be less than or equal to the maximum value.

MAXVALUE or NO MAXVALUE
Specifies the maximum value at which an ascending identity column either cycles or stops generating values or a descending identity column cycles to after reaching the minimum value.

NO MAXVALUE
Specifies that the minimum end point of the range of values for the identity column has not be set. In such a case, the default value for MAXVALUE becomes one of the following:

- For an ascending identity column, the value is the maximum value of the data type associated with the column.
- For a descending identity column, the value is the START WITH value -1 if START WITH is not specified.

The default is NO MAXVALUE.

MAXVALUE *numeric-constant*
Specifies the numeric constant that is the maximum value that is generated for this identity column. This value can be any positive or negative value that could be assigned to this column without non-zero digits existing to the right of the decimal point. The value must be greater than or equal to the minimum value.

CYCLE or NO CYCLE
Specifies whether this identity column should continue to generate values after reaching either its maximum or minimum value. The default is NO CYCLE.

NO CYCLE
Specifies that values will not be generated for the identity column after the maximum or minimum value has been reached.

CYCLE
Specifies that values continue to be generated for the identity column after the maximum or minimum value has been reached. If this option is used, after an ascending identity column reaches the maximum value, it generates its minimum value. After a descending identity column reaches its minimum value, it generates its maximum value. The maximum and minimum values for the identity column determine the range that is used for cycling.

When CYCLE is in effect, duplicate values can be generated by Db2 for an identity column. However, if a unique index exists on the identity column and a non-unique value is generated for it, an error occurs.

CACHE *integer-constant* or NO CACHE
Specifies whether to keep some preallocated values in memory. Preallocating and storing values in the cache improves the performance of inserting rows into a table. The default is CACHE 20.

NO CACHE
Specifies that values for the identity column and sequences are not preallocated and stored in the cache, ensuring that values will not be lost in the case of a system failure. In this case, every request for a new value for the identity column or sequence results in synchronous I/O.

In a data sharing environment, use NO CACHE if you need to guarantee that the identity column and sequence values are generated in the order in which they are requested.

CACHE *integer-constant*
Specifies the maximum number of values of the identity column sequence that Db2 can preallocate and keep in memory.

During a Db2 shutdown, all cached identity column values and sequence values that are yet to be assigned will be lost and will not be used. Therefore, the value that is specified for CACHE also represents the maximum number of identity column values and sequence values that will be lost during a Db2 shutdown.

The minimum value is 2.

In a data sharing environment, you can use the CACHE and NO ORDER options to allow multiple Db2 members to cache sequence values simultaneously.

ORDER or NO ORDER
Specifies whether the identity column values must be generated in order of request. The default is NO ORDER.

NO ORDER
Specifies that the values do not need to be generated in order of request.

ORDER
Specifies that the values are generated in order of request. Specifying ORDER might disable the caching of values. ORDER applies only to a single-application process.

In a data sharing environment, if the CACHE and NO ORDER options are in effect, multiple caches can be active simultaneously, and the requests for identity values from different Db2 members might not result in the assignment of values in strict numeric order. For example, if members DB2A and DB2B are using the identity column, and DB2A gets the cache values 1 to 20 and DB2B gets the cache values 21 to 40, the actual order of values assigned would be 1,21,2 if DB2A requested a value first, then DB2B requested, and then DB2A again requested. Therefore, to guarantee that identity values are generated in strict numeric order among multiple Db2 members using the same identity column, specify the ORDER option.

FIELDPROC *program-name*
Designates *program-name* as the field procedure exit routine for the column. A field procedure can be specified only for a column with a length attribute that is not greater than 255 bytes. FIELDPROC can only be specified for columns that are a built-in character string or graphic string data types. The column must not be one of the following:

- a LOB column
- a security label column
- a row change timestamp column
- a column with the TIMESTAMP WITH TIME ZONE data type
- a Unicode column in an EBCDIC table
- a column in an accelerator-only table

The field procedure encodes and decodes column values: before a value is inserted in the column, it is passed to the field procedure for encoding. Before a value from the column is used by a program, it is

passed to the field procedure for decoding. A field procedure could be used, for example, to alter the sorting sequence of values entered in the column.

The field procedure is also invoked during the processing of the CREATE TABLE statement. When so invoked, the procedure provides Db2 with the column's *field description*. The field description defines the data characteristics of the encoded values. By contrast, the information you supply for the column in the CREATE TABLE statement defines the data characteristics of the decoded values.

Related information:

Field procedures (Db2 Administration Guide)
"Character and graphic string comparisons" on page 148

constant
Is a parameter that is passed to the field procedure when it is invoked. A parameter list is optional. The *n*th parameter specified in the FIELDPROC clause on CREATE TABLE corresponds to the *n*th parameter of the specified field procedure. The maximum length of the parameter list is 254 bytes, including commas but excluding insignificant blanks and the delimiting parentheses.

If you omit FIELDPROC, the column has no field procedure.

AS SECURITY LABEL
Specifies that the column will contain security label values. This also indicates that the table is defined with multilevel security with row level granularity. A table can have only one security label column. A security label column cannot be defined for an accelerator-only table. To define a table with a security label column, the primary authorization ID of the statement must have a valid security label, and the RACF SECLABEL class must be active. In addition, the following conditions are also required:

- The data type of the column must be CHAR(8).
- The subtype of the column must be SBCS.
- The column must be defined with the NOT NULL and WITH DEFAULT clauses.
- The column must be an EBCDIC column.
- The WITH DEFAULT clause must not specify a default value (Db2 determines the default value)
- No field procedures, check constraints, or referential constraints are defined on the column.
- No edit procedure for the table can be defined with row attribute sensitivity.

For information about using multilevel security, see *Db2 Administration Guide*.

IMPLICITLY HIDDEN
Specifies that the column is not visible in the result for SQL statements unless you explicitly refer to the column by name. For example, assuming that the table T1 includes a column that is defined with the IMPLICITLY HIDDEN clause, the result of a SELECT * would not include the implicitly hidden column. However, the result of a SELECT statement that explicitly refers to the name of the implicitly hidden column would include that column in the result table.

IMPLICITLY HIDDEN must not be specified for all columns of a table. If IN ACCELERATOR is specified, IMPLICITLY HIDDEN must not be specified.

INLINE LENGTH *integer*
Specifies the maximum length of the inline portion of a LOB column value. The inline portion is the portion that is stored in the base table space. INLINE LENGTH cannot be specified if the column is not a LOB column (or a distinct type that is based on a LOB), if the table is not in a universal table space, or if the table is an accelerator-only table.

For BLOB and CLOB columns, *integer* specifies the maximum number of bytes that are stored in the base table space for the column. *integer* must be between 0 and 32680 (inclusive) for a BLOB or CLOB column.

For a DBCLOB column, *integer* specifies the maximum number of double-byte characters that are stored in the table space for the column. *integer* must be between 0 and 16340 (inclusive) for a DBCLOB column.

If INLINE LENGTH is specified, the value of *integer* cannot be greater than the maximum length of the LOB column.

If the INLINE LENGTH clause is not specified, the maximum length of the LOB column depends on the following conditions:

- If a distinct type is not used or the distinct type that is used has been created without the INLINE LENGTH attribute, the LOB column will use the value of the LOB INLINE LENGTH parameter on installation panel DSNTIPD as the default inline length when the value of LOB INLINE LENGTH does not exceed the maximum length of the LOB column. If the value of LOB INLINE LENGTH exceeds the maximum length of the LOB column, the maximum length is the inline length of this LOB column.
- If a distinct type that has been created with the INLINE LENGTH attribute is used, the LOB column inherits the inline length from the distinct type.

Regardless of how the length is determined, the inline length of the LOB cannot be greater than its maximum length.

period-definition

PERIOD

Defines a period for the table. *begin-column-name* must not be the same as *end-column-name*. The data type, length, precision, and scale for *begin-column-name* must be the same as for *end-column-name*.

If IN ACCELERATOR is specified, PERIOD must not be specified.

SYSTEM_TIME (*begin-column-name*,*end-column-name*)

Defines a system period with the name SYSTEM_TIME. There must not be a column in the table with the name SYSTEM_TIME. A table can have only one SYSTEM_TIME period. *begin-column-name* must be defined as AS ROW BEGIN and *end-column-name* must be defined as AS ROW END.

BUSINESS_TIME (*begin-column-name*,*end-column-name*)

Defines an application period with the name BUSINESS_TIME. There must not be a column in the table with the name BUSINESS_TIME. A table can have only one BUSINESS_TIME period. *begin-column-name* and *end-column-name* must be defined as DATE or TIMESTAMP(6) WITHOUT TIME ZONE, and the columns must be defined as NOT NULL. *begin-column-name* and *end-column-name* must not identify a column that is defined with a GENERATED clause.

An implicit check constraint is generated to ensure that the value of *end-column-name* is greater than the value of *begin-column-name*. The name of the implicitly created check constraint is DB2_GENERATED_CHECK_CONSTRAINT_FOR_BUSINESS_TIME, and that name must not be defined as the name of an existing check constraint.

begin-column-name

Identifies the column that records the beginning of the period of time in which a row is valid. The name must identify a column that exists in the table and must not be the same as a column that is used in the definition of another period for the table. *begin-column-name* must not be the same as *end-column-name*. The data type and precision for *begin-column-name* must be the same as for *end-column-name*.

For a SYSTEM_TIME period, *begin-column-name* must be defined as AS ROW BEGIN.

For a BUSINESS_TIME period, the column must not be defined with a GENERATED clause.

end-column-name

Identifies the column that records the end of the period of time in which a row is valid. In the history table that is associated with a system-period temporal table, the history table column that corresponds to *end-column-name* in the system-period temporal table is set to reflect the deletion of the row. The name must identify a column that exists in the table and must not be the same as a column that is used in the definition of another period for the table.

For a SYSTEM_TIME period, *end-column-name* must be defined as AS ROW END.

For a BUSINESS_TIME period, the column must not be defined with a GENERATED clause.

unique-constraint

CONSTRAINT *constraint-name*
Names the constraint. If a constraint name is not specified, a unique constraint name is generated. If a name is specified, it must be different from the names of any referential, check, primary key, or unique key constraints previously specified on the table.

PRIMARY KEY(*column-name,...*)
Defines a primary key composed of the identified columns. The clause must not be specified more than one time and the same column must not be identified more than one time. The identified columns must be defined as NOT NULL. Each *column-name* must be an unqualified name that identifies a column of the table except for the following types of columns:

- a LOB column
- a ROWID column
- a DECFLOAT column
- a distinct type column that is based on a LOB, ROWID, or DECFLOAT data type
- an XML column
- a row change timestamp column
- a column in an accelerator-only table
- a Unicode column in an EBCDIC table

The number of identified columns must not exceed 64. In addition, the sum of the length attributes of the columns must not be greater than 2000 - 2*m*, where *m* is the number of varying-length columns in the key.

The table is marked as unavailable until its primary index is explicitly created unless the table space is explicitly created and the CREATE TABLE statement is processed by the schema processor, or the table space is implicitly created. In that case, Db2 implicitly creates an index to enforce the uniqueness of the primary key and the table definition is considered complete. (For more information about implicitly created indexes, see Implicitly created indexes.)

BUSINESS_TIME WITHOUT OVERLAPS can be specified as the last item in the list. If BUSINESS_TIME WITHOUT OVERLAPS is specified, the list must include at least one *column-name* or *key-expression*. When WITHOUT OVERLAPS is specified, the values for the rest of the specified keys are unique with respect to the time for the BUSINESS_TIME period. When BUSINESS_TIME WITHOUT OVERLAPS is specified, the columns of the BUSINESS_TIME period must not be specified as part of the constraint. The specification of BUSINESS_TIME WITHOUT OVERLAPS adds the following to the constraint:

- The end column of the BUSINESS_TIME period in ascending order
- The begin column of the BUSINESS_TIME period in ascending order

UNIQUE(*column-name,...*)
Defines a unique key composed of the identified columns. Each *column-name* must be an unqualified name that identifies a column of the table. Each identified column must be defined as NOT NULL. The same column must not be identified more than one time. The following types of columns cannot be identified:

- a LOB column
- a ROWID column
- a DECFLOAT column
- a distinct type column that is based on a LOB, ROWID, or DECFLOAT data type
- an XML column
- a row change timestamp column
- a column in an accelerator-only table

- a Unicode column in an EBCDIC table

The number of identified columns must not exceed 64. In addition, the sum of the length attributes of the columns must not be greater than 2000 - 2*m*, where *m* is the number of varying-length columns in the key.

A unique key is a duplicate if it is the same as the primary key or a previously defined unique key. The specification of a duplicate unique key is ignored with a warning.

The table is marked as unavailable until all the required indexes are explicitly created unless the table space is explicitly created and the CREATE TABLE statement is processed by the schema processor, or the table space is implicitly created. In these cases, Db2 implicitly creates the indexes that are required for the unique keys and the table definition is considered complete. (For more information about implicitly created indexes, see Implicitly created indexes.)

BUSINESS_TIME WITHOUT OVERLAPS can be specified as the last item in the list. If BUSINESS_TIME WITHOUT OVERLAPS is specified, the list must include at least one *column-name* or *key-expression*. When WITHOUT OVERLAPS is specified, the values for the rest of the specified keys are unique with respect to the time for the BUSINESS_TIME period. When BUSINESS_TIME WITHOUT OVERLAPS is specified, the columns of the BUSINESS_TIME period must not be specified as part of the constraint. The specification of BUSINESS_TIME WITHOUT OVERLAPS adds the following to the constraint:

- The end column of the BUSINESS_TIME period in ascending order
- The begin column of the BUSINESS_TIME period in ascending order

referential-constraint

CONSTRAINT *constraint-name*
Names the referential constraint. If a constraint name is not specified, a unique constraint name is generated. If a name is specified, it must be different from the names of any referential, check, primary key, or unique key constraints previously specified on the table.

FOREIGN KEY (*column-name,...*) references-clause
Each specification of the FOREIGN KEY clause defines a referential constraint. The table being created is the child table for the referential constraint.

The foreign key of the referential constraint is composed of the identified columns. Each *column-name* must be an unqualified name that identifies a column of the table. The same column must not be identified more than one time. The column cannot be any of the following types of columns:

- a LOB column
- a ROWID column
- a DECFLOAT column
- an XML column
- a row change timestamp column
- a security label column
- a column in an accelerator-only table
- a Unicode column in an EBCDIC table

The number of identified columns must not exceed 64. The sum of the column length attributes must not exceed 255 minus the number of columns that allow null values. The referential constraint is a duplicate if the FOREIGN KEY and parent table are the same as the FOREIGN KEY and parent table of a previously defined referential constraint. The specification of a duplicate referential constraint is ignored with a warning.

The foreign key of the referential constraint cannot reference a parent key that contains BUSINESS_TIME WITHOUT OVERLAPS.

REFERENCES *table-name (column-name,...)*
The table name that is specified after REFERENCES must identify a table that exists at the current server[35]. The table name must not identify one of the following tables:

- A catalog table
- A directory table
- A declared global temporary table
- A history table
- An archive table

In the following discussion, let T2 denote an identified table and let T1 denote the table that you are creating (T1 and T2 cannot be the same table[35]).

T2 must have a unique index. The privilege set must include the ALTER or REFERENCES privilege on the parent table, or the REFERENCES privilege on the columns of the nominated parent key.

The parent key of the referential constraint is composed of the identified columns. Each *column-name* must be an unqualified name that identifies a column of T2. The same column must not be identified more than one time. The identified column cannot be any of the following types of columns:

- a LOB column
- a ROWID column
- a DECFLOAT column
- an XML column
- a row change timestamp column
- a security label column
- a Unicode column in an EBCDIC table

The list of column names in the parent key must match the list of column names in a primary key or unique key in the parent table T2. The column names must be specified in the same order as in the primary key or unique key. If any of the referenced columns in T2 has a non-numeric data type, T2 and T1 must use the same encoding scheme.

If a list of column names is not specified, T2 must have a primary key. Omission of a list of column names is an implicit specification of the columns of the primary key for T2.

The specified foreign key must have the same number of columns as the parent key of T2 and, except for their names, default values, null attributes and check constraints, the description of the *n*th column of the foreign key must be identical to the description of the *n*th column of the nominated parent key. If the foreign key includes a column defined as a distinct type, the corresponding column of the nominated parent key must be the same distinct type. If a column of the foreign key has a field procedure, the corresponding column of the nominated parent key must have the same field procedure and an identical field description. A *field description* is a description of the encoded value as it is stored in the database for a column that has been defined to have an associated field procedure.

The table space that contains T1 must be available to Db2. If T1 is populated, its table space is placed in a check pending status. A table in a segmented table space is populated if the table is not empty. A table in a table space that is not segmented is considered populated if the table space has ever contained any records.

The referential constraint that is specified by a FOREIGN KEY clause defines a relationship in which T2 is the parent and T1 is the dependent. A description of the referential constraint is recorded in the catalog.

ON DELETE

The delete rule of the relationship is determined by the ON DELETE clause. For more on the concepts used here, see Referential constraints (Introduction to Db2 for z/OS).

SET NULL must not be specified unless some column of the foreign key allows null values. The default value for the rule depends on the value of the CURRENT RULES special register when the CREATE

[35] This restriction is relaxed when the statement is processed by the schema processor and the other table is created within the same CREATE SCHEMA.

TABLE statement is processed. If the value of the register is 'Db2', the delete rule defaults to RESTRICT; if the value is 'STD', the delete rule defaults to NO ACTION.

The delete rule applies when a row of T2 is the object of a DELETE or propagated delete operation and that row has dependents in T1. Let *p* denote such a row of T2. Then:

- If RESTRICT or NO ACTION is specified, an error occurs and no rows are deleted.
- If CASCADE is specified, the delete operation is propagated to the dependents of *p* in T1.
- If SET NULL is specified, each nullable column of the foreign key of each dependent of *p* in T1 is set to null.

Let T3 denote a table identified in another FOREIGN KEY clause (if any) of the CREATE TABLE statement. The delete rules of the relationships involving T2 and T3 must be the same and must not be SET NULL if:

- T2 and T3 are the same table.
- T2 is a descendent of T3 and the deletion of rows from T3 cascades to T2.
- T2 and T3 are both descendents of the same table and the deletion of rows from that table cascades to both T2 and T3.

ENFORCED or NOT ENFORCED
Indicates whether or not the referential constraint is enforced by Db2 during normal operations, such as insert, update, or delete.

ENFORCED
Specifies that the referential constraint is enforced by the Db2 during normal operations (such as insert, update, or delete) and that it is guaranteed to be correct. This is the default.

NOT ENFORCED
Specifies that the referential constraint is not enforced by Db2 during normal operations, such as insert, update, or delete. This option should only be used when the data that is stored in the table is verified to conform to the constraint by some other method than relying on the database manager.

ENABLE QUERY OPTIMIZATION
Specifies that the constraint can be used for query optimization. Db2 uses the information in query optimization using materialized query tables with the assumption that the constraint is correct. This is the default.

check-constraint

CONSTRAINT *constraint-name*
Names the check constraint. The constraint name must be different from the names of any referential, check, primary key, or unique key constraints previously specified on the table.

If *constraint-name* is not specified, a unique constraint name is derived from the name of the first column in the *check-condition* specified in the definition of the check constraint.

CHECK (*check-condition*)
Defines a check constraint. At any time, the *check-condition* must be true or unknown for every row of the table. A *check-condition* can evaluate to unknown if a column that is an operand of the predicate is null. A *check-condition* that evaluates to unknown does not violate the check constraint. A *check-condition* is a search condition, with the following restrictions:

- It can refer only to columns of table *table-name*.
- The columns cannot be the following types of columns:
  - LOB columns
  - ROWID columns
  - DECFLOAT columns
  - distinct type columns that are based on LOB, ROWID, and DECFLOAT data types

  - XML columns
  - security label columns
  - columns in an accelerator-only table
  - Unicode columns in an EBCDIC table
- It can be up to 3800 bytes long, not including redundant blanks.
- It must not contain any of the following:
  - Subselects
  - Built-in or user-defined functions
  - CAST specifications
  - Cast functions other than those created when the distinct type was created
  - Host variables
  - Parameter markers
  - Special registers
  - Global variables
  - Columns that include a field procedure
  - CASE expressions
  - ROW CHANGE expressions
  - Row expressions
  - DISTINCT predicates
  - GX constants (hexadecimal graphic string constants)
  - Sequence references
  - OLAP specifications
- If a *check-condition* refers to a LOB column (including a distinct type that is based on a LOB), the reference must occur within a LIKE predicate.
- The AND and OR logical operators can be used between predicates. The NOT logical operator cannot be used with the following predicates: NOT BETWEEN, NOT IN, NOT LIKE, or IS NOT NULL.
- The first operand of every predicate must be the column name of a column in the table.
- The second operand in the *check-condition* must be either a constant or the name of a column in the table.
  - If the second operand of a predicate is a constant, and if the constant is:
    - A floating-point number, then the column data type must be floating point.
    - A decimal number, then the column data type must be either floating point or decimal.
    - An integer number, then the column data type must not be a small integer.
    - A small integer number, then the column data type must be small integer.
    - A decimal constant, then its precision must not be larger than the precision of the column.
  - If the second operand of a predicate is a column, then both columns of the predicate must have:
    - The same data type.
    - Identical descriptions with the exception that the specification of the NOT NULL and DEFAULT clauses for the columns can be different, and that string columns with the same data type can have different length attributes.

LIKE

table-name* or *view-name
Specifies that the columns of the table have exactly the same name and description as the columns of the identified table or view.

The name that is specified after LIKE must identify a table or view that exists at the current server or a declared temporary table. A view cannot contain columns of length 0.

LIKE must not reference an accelerator-only table or be used with the IN ACCELERATOR clause.

table-name must not contain a Unicode column in an EBCDIC table.

The privilege set must implicitly or explicitly include the SELECT privilege on the identified table or view. If the identified table or view contains a column with a distinct type, the USAGE privilege on the distinct type is also needed. An identified table must not be an auxiliary table or a clone table. An identified view must not include a column that is an explicitly defined ROWID column (including a distinct type that is based on a ROWID), an identity column, or a row change timestamp column.

The use of LIKE is an implicit definition of *n* columns, where *n* is the number of columns in the identified table (including implicitly hidden columns) or view. A column of the new table that corresponds to an implicitly hidden column in the existing table will also be defined as implicitly hidden. The implicit definition includes all attributes of the *n* columns as they are described in SYSCOLUMNS with the following exceptions:

- When a table is identified in the LIKE clause and a column in the table has a field procedure, the corresponding column of the new table has the same field procedure and the field description. However, the field procedure is not invoked during the execution of the CREATE TABLE statement. When a view is identified in the LIKE clause, none of the columns of the new table will have a field procedure. This is true even in the case that a column of a base table underlying the view has a field procedure defined.
- When a table is identified in the LIKE clause and a column in the table is an identity column, the corresponding column of the new table inherits only the data type of the identity column; none of the identity attributes of the column are inherited unless the INCLUDING IDENTITY clause is specified.
- When a table is identified in the LIKE clause and a column in the table is a security label column, the corresponding column of the new table inherits only the data type of the security label column; none of the security label attributes of the column are inherited.
- When a table that contains a ROWID column is identified in the LIKE clause, the corresponding column of the new table inherits the ROWID column, regardless of whether the column has the IMPLICITLY HIDDEN attribute.
- When a table is identified in the LIKE clause and the table contains row change timestamp column, a transaction-start-ID column, a row-begin column, or a row-end column, the corresponding column of the new table inherits only the data type of the original column. The new column is not considered a generated column.
- When a table is identified in the LIKE clause and a column in the table is a generated expression column, the corresponding column of the new table inherits only the data type of the original column. The new column is not considered a generated column.
- When a table is identified in the LIKE clause and the table contains an inline LOB column, the corresponding columns of the new table will inherit the inline attribute if the table is in an universal table space. Otherwise, the inline attribute of the table identified in the LIKE clause is ignored.
- When a view is identified in the LIKE clause, the default value that is associated with the corresponding column of the new table depends on the column of the underlying base table for the view. If the column of the base table does not have a default, the new column does not have a default. If the column of the base table has a default, the default of the new column is:
  - Null if the column of the underlying base table allows nulls.
  - The default for the data type of the underlying base table if the underlying base table does not allow nulls.

  The above defaults are chosen regardless of the current default of the base table column. The existence of an INSTEAD OF trigger does not affect the inheritance of default values.

- When a table that uses table-controlled partitioning is identified in the LIKE clause, the new table does not inherit partitioning scheme of that table. You can add these partition boundaries by specifying ALTER TABLE with the ADD PARTITION BY RANGE clause.
- The CCSID of the column is determined by the implicit or explicit CCSID clause. For more information, see the CCSID clause.
- When a table is identified in the LIKE clause and the table includes a period, the new table does not inherit the period.
- When the table that is identified in the LIKE clause is a system-period temporal table, the new table is not a system-period temporal table.
- When the table that is identified in the LIKE clause has row access controls or column access controls activated, the new table does not inherit the row access controls or the column access controls.

The implicit definition does not include any other attributes of the identified table or view. For example, the new table does not have a primary key or foreign key. The table is created in the table space implicitly or explicitly specified by the IN clause, and the table has any other optional clause only if the optional clause is specified.

copy-options

copy-options

Specifies whether identity column attributes, row change timestamp attributes, and column defaults are inherited from the definition of the source of the result table.

EXCLUDING IDENTITY COLUMN ATTRIBUTES or INCLUDING IDENTITY COLUMN ATTRIBUTES

Specifies whether identity column attributes are inherited from the definition of the source of the result table.

EXCLUDING IDENTITY COLUMN ATTRIBUTES

Specifies that identity column attributes are not inherited from the definition of the source of the result table. This is the default.

INCLUDING IDENTITY COLUMN ATTRIBUTES

Specifies that, if available, identity column attributes (such as START WITH, INCREMENT BY, and CACHE values) are inherited from the definition of the source table. These attributes can be inherited if the element of the corresponding column in the table, view, or *fullselect* is the name of a column of a table or the name of a column of a view that directly or indirectly maps to the column name of a base table with the identity attribute. In other cases, the columns of the new temporary table do not inherit the identity attributes. The columns of the new table do not inherit the identity attributes in the following cases:

- The select list of the *fullselect* includes multiple instances of an identity column name (that is, selecting the same column more than one time).
- The select list of the *fullselect* includes multiple identity columns (that is, it involves a join).
- The identity column is included in an expression in the select list.
- The *fullselect* includes a set operation.

EXCLUDING ROW CHANGE TIMESTAMP COLUMN ATTRIBUTES or INCLUDING ROW CHANGE TIMESTAMP COLUMN ATTRIBUTES

Specifies whether row change timestamp column attributes are inherited from the definition of the source of the result table.

EXCLUDING ROW CHANGE TIMESTAMP COLUMN ATTRIBUTES

Specifies that row change timestamp column attributes are not inherited from the source result table definition. This is the default.

INCLUDING ROW CHANGE TIMESTAMP COLUMN ATTRIBUTES

Specifies that, if available, row change timestamp column attributes are inherited from the definition of the source table. These attributes can be inherited if the element of the corresponding column in the table, view, or *fullselect* is the name of a column of a table or the

name of a column of a view that directly or indirectly maps to the column name of a base table defined as a row change timestamp column. In other cases, the columns of the new temporary table do not inherit the row change timestamp column attributes. The columns of the new table do not inherit the row change timestamp attributes in the following cases:

- The select list of the *fullselect* includes multiple instances of a row change timestamp column name (that is, selecting the same column more than one time).
- The select list of the *fullselect* includes multiple row change timestamp column names (that is, it involves a join).
- The row change timestamp column is included in an expression in the select list.
- The *fullselect* includes a set operation (such as union).

EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, or USING TYPE DEFAULTS
Specifies whether column defaults are inherited from the source result table definition. EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, and USING TYPE DEFAULTS must not be specified if the LIKE clause is specified.

EXCLUDING COLUMN DEFAULTS
Specifies that the column defaults are not inherited from the definition of the source table. The default values of the column of the new table are either null or there are no default values. If the column can be null, the default is the null value. If the column cannot be null, there is no default value, and an error occurs if a value is not provided for a column on an insert or update operation, or LOAD for the new table.

INCLUDING COLUMN DEFAULTS
Specifies that column defaults for each updatable column of the definition of the source table are inherited. Columns that are not updatable do not have a default defined in the corresponding column of the created table. The existence of an INSTEAD OF trigger for a view does not affect the inheritance of default values.

USING TYPE DEFAULTS
Specifies that the default values for the table depend on data type of the columns that result from *fullselect*, as follows:

Data type	Default value
Numeric	0
Fixed-length character string	Blanks
Fixed-length graphic string	Blanks
Fixed-length binary string	Hexadecimal zeros
Varying-length string	A string of length 0
Fixed-length char or fixed-length graphic	A string of blanks
Fixed-length binary	Hexadecimal zeros
Date	CURRENT DATE
Time	CURRENT TIME
Timestamp(*integer*) without time zone	CURRENT TIMESTAMP(*p*) WITHOUT TIME ZONE where *p* is the corresponding timestamp precision.

Timestamp(*integer*) with time zone
CURRENT TIMESTAMP(*p*) WITH TIME ZONE where *p* is the corresponding timestamp precision.

as-result-table

as-result-table
Specifies that the column definitions of the table are based on the result of the *fullselect*.

column-name
Names the columns in the table. If a list of column names is specified, it must consist of as many names as there are columns in the result table of the *fullselect*. Each *column-name* must be unique and unqualified. If a list of column names is not specified, the columns of the table inherit the names of the columns of the result table of the *fullselect*.

A list of column names must be specified if the result table of the *fullselect* has duplicate column names or an unnamed column. An unnamed column is a column derived from a constant, function, expression, or set operation that is not named using the AS clause.

AS *(fullselect)*
Specifies that the table definition is based on the column definitions from the result of the *fullselect*. The use of AS *(fullselect)* is an implicit definition of *n* columns for the table, where *n* is the number of columns that would result from the *fullselect*. The columns of the new table are defined by the columns that result from the *fullselect*. Every select list element must have a unique name. The AS clause can be used in the *select-clause* to provide unique names.

The implicit definition includes the column name, data type, length, precision, scale, and nullability characteristic of each of the result columns of *fullselect*. The length of each column must not be 0. Other column attributes, such as DEFAULT and IDENTITY, are not inherited from the *fullselect*. A column of the new table that corresponds to an implicitly hidden column of a base table referenced in the *fullselect* is not considered hidden in the new table. The generated column attributes are not inherited from the *fullselect*. That is, a new column of the table is not considered as a generated column. A FIELDPROC is inherited for a column if the corresponding select item of the *fullselect* is a column that can be mapped to a column of a base table or a view. The new table contains a security label column if only one table in the *fullselect* contains a security label column and the primary authorization ID of the statement has a valid security label.

The implicit definition does not include any other attributes of the identified table or view. For example, the new table does not have a primary key or foreign key. The table is created in the table space implicitly or explicitly specified by the IN clause, and the table has any other optional clause only if the optional clause is specified.

If IN ACCELERATOR is specified, AS (*fullselect*) cannot be specified.

The owner of the table being created must have the SELECT privilege on the tables or views referenced in the fullselect, or the privilege set must include SYSADM or DBADM authority for the database in which the tables of the fullselect reside. Having SELECT privilege means that the owner has at least one of the following authorizations.

- Ownership of the tables or views referenced in the fullselect
- The SELECT privilege on the tables and views referenced in the fullselect
- SYSADM authority
- DBADM authority for the database in which the tables of the fullselect reside

Additional privileges might be necessary for accessing other objects that are referenced in the fullselect.

The fullselect must not:

- Result in a column having a ROWID, BLOB, CLOB, DBCLOB, or XML data type or a distinct type based on these data types.
- Include multiple security label columns.

- Include a PREVIOUS VALUE or a NEXT VALUE expression.
- Refer to host variables or include parameter markers.
- Include an SQL data change statement in the FROM clause.
- Include an outermost SELECT list that references data that is encoded with different CCSID sets.
- Result in a column that is an array.
- Reference a remote object.
- Reference an accelerator-only table.

WITH NO DATA
Specifies that the query is used only to define the attributes of the new table. The table is not populated using the results of the *fullselect* and the REFRESH TABLE statement cannot be used.

If the tables that are specified in the *fullselect* use row access controls or column access controls, the row access controls and the column access controls are not defined for the new table.

materialized-query-definition

materialized-query-definition
Specifies that the column definitions of the materialized query table are based on the result of a *fullselect*. If *materialized-query-table-options* are specified, the REFRESH TABLE statement can be used to populate the table with the results of the *fullselect*.

column-name
Names the columns in the table. If a list of column names is specified, it must consist of as many names as there are columns in the result table of the fullselect. Each *column-name* must be unique and unqualified. If a list of column names is not specified, the columns of the table inherit the names of the columns of the result table of the *fullselect*.

A list of column names must be specified if the result table of the *fullselect* has duplicate column names or an unnamed column. An unnamed column is a column derived from a constant, function, expression, or set operation that is not named using the AS clause of the select list.

AS *(fullselect)*
Specifies that the table definition is based on the column definitions from the result of the *fullselect*. The use of AS *(fullselect)* is an implicit definition of *n* columns for the table, where *n* is the number of columns that would result from the *fullselect*. The columns of the new table are defined by the columns that result from the *fullselect*. Every select list element must have a unique name. The AS clause can be used in the *select-clause* to provide unique names.

The implicit definition includes the column name, data type, length, precision, scale, and nullability characteristic of each of the result columns of *fullselect*. The length of each column must not be a 0. Other column attributes, such as DEFAULT, IDENTITY, and unique constraints, are not inherited from the *fullselect*. A column of the new table that corresponds to an implicitly hidden column of a base table referenced in the *fullselect* is not considered hidden in the new table. The generated column attributes are not inherited from the *fullselect*. That is, the new column of the materialized query table is not considered as a generated column. A FIELDPROC is inherited for a column if the corresponding select item of the *fullselect* is a column that can be directly mapped to a column of a base table or a view in the FROM clause of the *fullselect*. The materialized query table contains a security label column if only one table in the *fullselect* contains a security label column and the primary authorization ID of the statement has a valid security label.

Authorization for creating materialized query tables:
The owner of the table being created must have the SELECT privilege on the tables or views referenced in the fullselect, or the privilege set must include SYSADM or DBADM authority for the database in which the tables of the fullselect reside. Having SELECT privilege means that the owner has at least one of the following authorizations:

- Ownership of the tables or views referenced in the fullselect

- The SELECT privilege on the tables and views referenced in the fullselect
- SYSADM authority
- DBADM authority for the database in which the tables of the fullselect reside

Additional privileges might be necessary for accessing other objects that are referenced in the fullselect.

The rules for establishing the qualifiers for names used in the fullselect are the same as the rules used to establish the qualifiers for *table-name*.

The following restrictions apply when creating materialized query tables. When *fullselect* does not satisfy the restrictions, an error occurs:

- The length of each result column of the fullselect must not be 0.
- The fullselect cannot contain a column of a LOB or XML data type.
- No more than one table in the fullselect can contain a security label column.
- The fullselect must not contain a period specification.
- The outermost SELECT list must not reference data that is encoded with different CCSID sets.
- The object that is specified in the FROM clause of the fullselect cannot be a view with columns of length 0.
- The fullselect cannot contain a reference to a created global temporary table, a declared global temporary table, an accelerator-only table, a directory table, or another materialized query table.
- If IN ACCELERATOR is specified, *materialized-query-definition* cannot be specified.
- The fullselect cannot directly or indirectly reference a base table that has been activated for the row or column access control or a base table for which a row permission or a column mask has been defined.
- The fullselect must not refer to host variables or include parameter markers.
- The fullselect must not refer to global variables.

Additional restrictions when ENABLE QUERY OPTIMIZATION is in effect:

- The fullselect must be a subselect.
- The subselect cannot include the following:
  - A special register
  - A scalar fullselect
  - A row change timestamp column
  - A ROW CHANGE expression
  - An expression for which implicit time zone values apply (for example, cast a timestamp to a timestamp with time zone)
  - The RAND built-in function
  - The RID built-in function
  - A user-defined scalar or table function that is not deterministic or that has external actions
  - Any predicates that include a subquery
  - A row expression predicate
  - A join using the INNER JOIN syntax, or an outer join
  - A lateral correlation
  - A nested table expression or view that requires temporary materialization
  - A direct or indirect reference to a table that uses activated row or column access controls, or a table for which row or column access controls have been defined.
  - A FETCH FIRST clause

- A reference to a global variable
- A collection-derived table (UNNEST)
- A GROUPING SETS or *super-groups* clause

- If a table with a security label is referenced, the security label column must be referenced in the outer select list of the subselect.
- If the subselect references a view, the fullselect in the view definition must satisfy all other restrictions.

refreshable-table-options
Specifies the options for a refreshable materialized query table. The ORDER BY clause is allowed, but it is used only by REFRESH. The ORDER BY clause can improve the locality of reference of data in the materialized query table.

DATA INITIALLY DEFERRED
Specifies that the data is not inserted into the materialized query table when it is created. Use the REFRESH TABLE statement to populate the materialized query table, or use the INSERT statement to insert data into a user-maintained materialized query table.

REFRESH DEFERRED
Specifies that the data in the table can be refreshed at any time using the REFRESH TABLE statement. The data in the table only reflects the result of the query as a snapshot at the time when the REFRESH TABLE statement is processed or when it was last updated for a user-maintained materialized query table.

MAINTAINED BY SYSTEM or MAINTAINED BY USER
Specifies how the data in the materialized query table is maintained.

MAINTAINED BY SYSTEM
Specifies that the materialized query table is maintained by the system. Only the REFRESH statement is allowed on the table. This is the default.

MAINTAINED BY USER
Specifies that the materialized query table is maintained by the user, who can use the LOAD utility, an SQL data change statement, a SELECT from data change statement, or REFRESH TABLE SQL statements on the table.

ENABLE QUERY OPTIMIZATION or DISABLE QUERY OPTIMIZATION
Specifies whether this materialized query table can be used for optimization.

ENABLE QUERY OPTIMIZATION
Specifies that the materialized query table can be used for query optimization. If the fullselect specified does not satisfy the restrictions for query optimization, an error occurs.

ENABLE QUERY OPTIMIZATION is the default.

The fullselect must not contain a period specification.

DISABLE QUERY OPTIMIZATION
Specifies that the materialized query table cannot be used for query optimization. The table can still be queried directly.

IN

IN ***database-name.table-space-name*** **or** **IN DATABASE** ***database-name***
Identifies the database and table space in which the table is created. Both forms are optional.

If you specify both a database and a table space, the database must be described in the catalog on the current server. The database must not be DSNDB06 or a work file database. The table space must belong to the database that you specify.

If you specify a database but not a table space, a table space is implicitly created in *database-name*. The name of the table space is derived from the name of the table. The qualifier of the table space is the same as the qualifier of the table. The buffer pool that is used is the default buffer pool for user

data that is specified on installation panel DSNTIP1. If you specify a table space but not a database, the database that contains the table space is used.

If you specify neither a table space or a database, a database is implicitly created with the name DSN*xxxxx*, where *xxxxx* is a five-digit number. A table space is also implicitly created.

If you specify a table space, it cannot be one of the following table spaces:

- A table space that was created implicitly
- A partitioned table space that already contains a table
- A LOB table space
- An XML table space
- A table space that already contains a system-period temporal table, a history table, an archive-enabled table, or an archive table

If you specify a partitioned table space, you cannot load or use the table until its partitioned scheme is created.

You cannot specify a name in the format of an implicitly created database name, which is DSN*xxxxx*, where *xxxxx* is a five-digit number..

To create a table space implicitly, the privilege set must have: SYSADM or SYSCTRL authority; DBADM, DBCTRL, or DBMAINT authority for the database; or the CREATETS privilege for the database. You must also have the USE privilege for the default buffer pool in the database and default storage group.

For implicitly created table spaces, Db2 selects the buffer pool as described in Implicitly defined table spaces (Db2 Administration Guide).

IN ACCELERATOR *accelerator-name*
Specifies that the table is an accelerator-only table. *accelerator-name* identifies the accelerator in which the table will be defined.

You can specify an alias (logical name) for *accelerator-name*. For more information, see Using an alias for an accelerator (Db2 Performance).

If you specify an accelerator-only table, the table and the data of the table exists only in the accelerator, not in Db2. However, the table and column definition of the accelerator-only table are contained in Db2 catalog tables.

partitioning-clause block

PARTITION BY RANGE or PARTITION BY SIZE
Specifies the partitioning scheme for the table.

PARTITION BY RANGE
Specifies the range partitioning scheme for the table (the columns that are used to partition the data). When this clause is specified, the table space is complete, and it is not necessary to create a partitioned index on the table. If this clause is used, the ENDING AT clause cannot be used on a subsequent CREATE INDEX statement for this table.

If this clause is specified, the IN *database-name.table-space-name* clause is required. This clause applies only to tables in a partitioned table space. PARTITION BY RANGE must not be specified for a table that is created in a partition-by-growth table space. If IN ACCELERATOR is specified, PARTITION BY RANGE must not be specified.

partition-expression
Specifies the key data over which the range is defined to determine the target data partition of the data.

column-name
Specifies the columns of the key. Each *column-name* must identify a column of the table. Do not specify more than 64 columns or the same column more than one time. The sum of

length attributes of the columns must not be greater than 255 - *n*, where *n* is the number of columns that can contain null values. Do not specify a qualified column name.

A timestamp with time zone column (or a column with a distinct type that is based on the timestamp with time zone data type) can only be specified as the last column in a partitioning key.

Do not specify a column for *column-name* if the column is defined as follows:

- a LOB column (or a column with a distinct type that is based on a LOB data type)
- a BINARY column (or a column with a distinct type that is based on a BINARY data type)
- a VARBINARY column (or a column with a distinct type that is based on a VARBINARY data type)
- a DECFLOAT column (or a column with a distinct type that is based on a DECFLOAT data type)
- an XML column
- a Unicode column in an EBCDIC table

NULLS LAST
Specifies that null values are treated as positive infinity for purposes of comparison.

ASC
Puts the entries in ascending order by the column. ASC is the default.

DESC
Puts the entries in descending order by the column.

partition-element
Specifies ranges for a data partitioning key and the table space where rows of the table in the range will be stored.

PARTITION *integer*
integer is the physical number of a partition in the table space. A PARTITION clause must be specified for every partition of the table space. In this context, highest means highest in the sorting sequences of the columns. In a column defined as ascending (ASC), highest and lowest have their usual meanings. In a column defined as descending (DESC), the lowest actual value is highest in the sorting sequence.

ENDING AT (*constant*, MAXVALUE, or MINVALUE, ...)
Defines the limit key for a partition boundary. Specify at least one value (*constant*, MAXVALUE, or MINVALUE) after ENDING AT in each PARTITION clause. You can use as many values as there are columns in the key. The concatenation of all values is the highest value of the key for ascending and the lowest for descending.

constant
Specifies a constant value with a data type that must conform to the rules for assigning that value to the column. If a string constant is longer or shorter than required by the length attribute of its column, the constant is either truncated or padded on the right to the required length. If the column is ascending, the padding character is X'FF'. If the column is descending, the padding character is X'00'. The precision and scale of a decimal constant must not be greater than the precision and scale of its corresponding column. A hexadecimal string constant (GX) cannot be specified.

MAXVALUE
Specifies a value greater than the maximum value for the limit key of a partition boundary (that is, all X'FF' regardless of whether the column is ascending or descending). If all of the columns in the partitioning key are ascending, a constant or the MINVALUE clause cannot be specified following MAXVALUE. After MAXVALUE is specified, all subsequent columns must be MAXVALUE.

MINVALUE
Specifies a value that is smaller than the minimum value for the limit key of a partition boundary (that is, all X'00' regardless of whether the column is ascending or

descending). If all of the columns in the partitioning key are descending, a constant or the MAXVALUE clause cannot be specified following MINVALUE. After MINVALUE is specified, all subsequent columns must be MINVALUE.

The key values are subject to the following rules:

- The first value corresponds to the first column of the key, the second value to the second column, and so on. Using fewer values than there are columns in the key has the same effect as using the highest or lowest values for the omitted columns, depending on whether they are ascending or descending.
- The highest value of the key in any partition must be lower than the highest value of the key in the next partition for ascending cases.
- The values specified for the last partition are enforced. The value specified for the last partition is the highest value of the key that can be placed in the table. Any key values greater than the value specified for the last partition are out of range.
- If the concatenation of all the values exceeds 255 bytes, only the first 255 bytes are considered.
- If a key includes a ROWID column or a column with a distinct type that is based on a ROWID data type, 17 bytes of the constant that is specified for the corresponding ROWID column are considered.
- If a null value is specified for the partitioning key and the key is ascending, an error is returned unless MAXVALUE is specified. If the key is descending, an error is returned unless MINVALUE is specified.

partition-hash-space
See partition-hash-space.

INCLUSIVE
Specifies that the specified range values are included in the data partition.

PARTITION BY SIZE
Specifies that the table is created in a partition-by-growth table space. If the IN clause is also specified, the IN clause must identify a partition-by-growth table space.

If IN ACCELERATOR is specified, PARTITION BY SIZE must not be specified.

EVERY *integer* G
Specifies that the table is to be partitioned by growth, every *integer* G bytes. *integer* must not be greater than 256. If the IN clause identifies a table space, *integer* must be the same as the DSSIZE value that is in effect for the table space that will contain the table.

organization-clause

See organization-clause.

Other options

EDITPROC *program-name*
Identifies the user-written code that implements the edit procedure for the table. The edit procedure must exist at the current server. The procedure is invoked during the execution of an SQL data change statement or LOAD and all row retrieval operations on the table.

An edit routine receives an entire table row, and can transform that row in any way. Also, it receives a transformed row and must change the row back to its original form.

You must not specify an edit routine for a table with a LOB column, or for an EBCDIC table with a Unicode column.

For information on writing an EDITPROC exit routine, see Edit procedures (Db2 Administration Guide).

WITH ROW ATTRIBUTES
Specifies that the edit procedure parameter list contains an address for the description of a row. WITH ROW ATTRIBUTES must not be specified for a table with an identity, LOB, XML, ROWID, or SECURITY LABEL column. WITH ROW ATTRIBUTES is the default. When WITH ROW ATTRIBUTES is specified, the column names in the table must not be longer than 18 EBCDIC SBCS characters in length.

WITHOUT ROW ATTRIBUTES
Specifies that the description of the row is not provided to the edit procedure. On entry to the edit procedure, the address for the row description in the parameter list contains a value of zero.

VALIDPROC *program-name*
Designates *program-name* as the validation exit routine for the table. Writing a validation exit routine is described in Validation routines (Db2 Administration Guide).

The validation routine can inhibit a load, insert, update, or delete operation on any row of the table: before the operation takes place, the procedure is passed the row. The values that are represented by any LOB or XML columns in the table are not passed to the validation routine. On an insert or update operation, if the table has a security label column and the user does not have write-down privilege, the user's security label value is passed to the validation routine as the value of the column. After examining the row, the procedure returns a value that indicates whether the operation should proceed. A typical use is to impose restrictions on the values that can appear in various columns. If IN ACCELERATOR is specified, VALIDPROC must not be specified.

A table can have only one validation procedure at a time. In an ALTER TABLE statement, you can designate a replacement procedure or discontinue the use of a validation procedure.

If you omit VALIDPROC, the table has no validation routine.

You must not specify a validation routine for an EBCDIC table with a Unicode column.

AUDIT
Identifies the types of access to this table that causes auditing to be performed. For information about audit trace classes, see *Db2 Administration Guide*.

If a materialized query table is refreshed with the REFRESH TABLE statement, the auditing also occurs during the REFRESH TABLE operation. AUDIT works as usual for LOAD and SQL data change operations on a user-maintained materialized query table.

NONE
Specifies that no auditing is to be done when this table is accessed. This is the default.

CHANGES
Specifies that auditing is to be done when the table is accessed during the first insert, update, or delete operation. However, the auditing is done only if the appropriate audit trace class is active.

ALL
Specifies that auditing is to be done when the table is accessed during the first operation of any kind performed by a utility or application process. However, the auditing is done only if the appropriate audit trace class is active and the access is not performed with COPY, RECOVER, REPAIR, LOAD with a dummy input data set, or any stand-alone utility.

If the table is subsequently altered with an ALTER TABLE statement, the ALTER TABLE statement is audited for successful and failed attempts in the following cases, if the appropriate audit trace class is active:

- AUDIT attribute is changed to NONE, CHANGES, or ALL on an audited or non-audited table.
- AUDIT CHANGES or AUDIT ALL is in effect.

If IN ACCELERATOR is specified, AUDIT NONE, CHANGES, and ALL must not be specified.

OBID *integer*
Identifies the OBID to be used for this table. An OBID is the identifier for an object's internal descriptor. The integer must be greater than 1 and must not identify an existing or previously used OBID of the database. If you omit OBID, Db2 generates a value.

The following statement retrieves the value of OBID:

```
SELECT OBID
  FROM SYSIBM.SYSTABLES
  WHERE CREATOR = 'ccc' AND NAME = 'nnn';
```

Here, *nnn* is the table name and *ccc* is the creator of the table.

DATA CAPTURE
Specifies whether the logging of the following actions on the table is augmented by additional information:

- SQL data change operations
- Adding columns (using the ADD COLUMN clause of the ALTER TABLE statement)
- Changing columns (using the ALTER COLUMN clause of the ALTER TABLE statement)

For guidance on intended uses of the expanded log records, see:

- The description of data propagation to IMS in *IMS DataPropagator: An Introduction*
- The instructions for using Remote Recovery Data Facility (RRDF) in *Remote Recovery Data Facility Program Description and Operations*
- The instructions for reading log records in *Db2 Administration Guide*

If a materialized query table is refreshed with the REFRESH TABLE statement, the logging of the augmented information occurs during the REFRESH TABLE operation. DATA CAPTURE works as usual for insert, update, and delete operations on a user-maintained materialized query table.

A table with data that is stored only in an accelerator-only table cannot be defined with this attribute.

NONE
Do not record additional information to the log. This is the default.

CHANGES
Write additional data about SQL updates to the log. Information about the values that are represented by any LOB or XML columns is not available. Do not specify DATA CAPTURE CHANGES for tables that reside in table spaces that specify NOT LOGGED.

WITH RESTRICT ON DROP
Indicates that the table can be dropped only by using REPAIR DBD DROP. In addition, the database and table space that contain the table can be dropped only by using REPAIR DBD DROP.

The WITH RESTRICT ON DROP clause can be removed using the ALTER TABLE statement with the DROP RESTRICT ON DROP clause. After the WITH RESTRICT ON DROP clause is removed from the definition of the table, the table, the database, and the containing table space can be dropped using the DROP statement.

CCSID *encoding-scheme*
Specifies the encoding scheme for string data stored in the table. If the IN clause is specified with a table space, the value must agree with the encoding scheme that is already in use for the specified table space. The specific CCSIDs for SBCS, mixed, and graphic data are determined by the table space or database specified in the IN clause. If the IN clause is not specified, the value specified is used for the table being created as well as for the table space that Db2 implicitly creates. The specific CCSIDs for SBCS, mixed, and graphic data are determined by the default CCSIDs for the server for the specified encoding scheme. The valid values are ASCII, EBCDIC, and UNICODE.

If IN ACCELERATOR is specified, a Unicode column cannot be defined in an EBCDIC table and a column cannot be defined as ASCII mixed or graphic. *IBM Db2 Analytics Accelerator for z/OS: Stored Procedures Reference* contains a complete description of encoding schemes allowed in an accelerator.

If the CCSID clause is not specified, the encoding scheme for the table depends on the IN clause:

- If the IN clause is specified, the encoding scheme already in use for the table space or database specified in the IN clause is used.

- If the IN clause is not specified, the encoding scheme of the new table is the same as the scheme for the table that is specified in the LIKE clause.

If the CCSID clause is specified for a materialized query table, the encoding scheme specified in the clause must be the same as the scheme for the result CCSID of the fullselect. The CCSID must also be the same as the CCSID of the table space for the table being created.

VOLATILE or NOT VOLATILE
Specifies how Db2 chooses to access the table.

VOLATILE
Specifies that Db2 uses index access to the table whenever possible for SQL operations. However, be aware that list prefetch and certain other optimization techniques might be disabled when VOLATILE is used.

One instance in which you might want to use VOLATILE is for a table whose size can vary greatly. If statistics are taken when the table is empty or has only a few rows, those statistics might not be appropriate when the table has many rows.

Another instance in which you might want to use VOLATILE is for a table that contains groups of rows, as defined by the primary key on the table. All but the last column of the primary key of such a table indicate the group to which a given row belongs. The last column of the primary key is the sequence number indicating the order in which the rows are to be read from the group. VOLATILE maximizes concurrency of operations on rows within each group, since rows are usually accessed in the same order for each operation. If IN ACCELERATOR is specified, VOLATILE must not be specified. For this usage, the primary index must be the only index that is defined on the table, and list prefetch is disabled to ensure the sequence in which the rows are locked.

NOT VOLATILE
Specifies that SQL access to this table should be based on the current statistics. NOT VOLATILE is the default.

CARDINALITY
An optional keyword that currently has no effect, but that is provided for Db2 family compatibility.

LOGGED or NOT LOGGED
Specifies whether changes that are made to the data in the implicitly created table space are recorded in the log. This parameter applies to the implicitly created table space and to all indexes of this table. XML table spaces and indexes associated with the XML table spaces inherit the logging attribute from the associated base table space. Auxiliary indexes also inherit the logging attribute from the associated base table space.

Do not specify LOGGED or NOT LOGGED if the table space name is specified by using the IN *table-space-name* clause or if the IN ACCELERATOR clause is specified.

LOGGED
Specifies that changes that are made to the data in the implicitly created table space are recorded in the log.

LOGGED is the default.

NOT LOGGED
Specifies that changes that are made to data in the implicitly created table space are not recorded in the log.

NOT LOGGED prevents undo and redo information from being recorded in the log. However, control information for the implicitly created table space will continue to be recorded in the log.

COMPRESS YES or COMPRESS NO
Specifies whether data compression applies to the rows of the implicitly created table space. The default is specified by the value of the subsystem parameter USE DATA COMPRESSION.

If the IN *table-space-name* clause or the IN ACCELERATOR clause is specified, COMPRESS YES or COMPRESS NO must not be specified.

COMPRESS YES
Specifies that data compression applies to the rows of the implicitly created table space. The rows are not compressed until the LOAD or REORG utility is run on the table in the implicitly created table space.

COMPRESS NO
Specifies that data compression is not used for the rows of the implicitly created table space.

APPEND NO or APPEND YES
Specifies whether append processing is used for the table. The APPEND clause must not be specified for a table that is created in a work file table space.

NO
Specifies that append processing is not used for the table. For insert and LOAD operations, Db2 will attempt to place data rows in a well clustered manner with respect to the value in the row's cluster key column.

NO is the default.

YES
Specifies that data rows are to be placed into the table by disregarding the clustering during insert and LOAD operations.

DSSIZE *integer* G
Specifies the maximum size for the implicitly created partition-by-growth or partition-by-range table space. This value is only applied to the implicitly created base table space, not to any associated implicitly created XML or LOB table spaces.

Do not specify DSSIZE *integer* G if any of the following conditions are true:

- The table space name is specified by using the IN *table-space-name* clause.
- The PARTITION BY clause includes the EVERY *integer-constant* G clause.
- The statement contains an accelerator-only table.

The default is specified by the value of the subsystem parameter MAXIMUM PARTITION SIZE.

For more detailed information about the DSSIZE clause, refer to "CREATE TABLESPACE" on page 1573.

BUFFERPOOL *bpname*
Specifies the buffer pool be use for the implicitly created table space and determines the page size of the table space. For 4KB, 8KB, 16KB and 32KB page buffer pools, the page sizes are 4 KB, 8 KB, 16 KB, and 32 KB, respectively.

bpname must identify an activated buffer pool. The privilege set must include SYSADM authority, SYSCTRL authority, or the USE privilege on the buffer pool.

Do not specify BUFFERPOOL *bpname* if the table space name is specified by using the IN *table-space-name* clause or the IN ACCELERATOR clause is specified.

If you do not specify the BUFFERPOOL clause, Db2 selects the buffer pool as described in Implicitly defined table spaces (Db2 Administration Guide).

Refer to "Naming conventions" on page 77 for more information about *bpname*.

MEMBER CLUSTER
Specifies that data that is inserted by an insert operation is not clustered by the implicit clustering index (the first index) or the explicit clustering index. Db2 places the data in the implicitly created table space based on available space.

Do not specify MEMBER CLUSTER if the table space name is specified by using the IN *table-space-name* clause or if IN ACCELERATOR clause is specified.

TRACKMOD YES or TRACKMOD NO
Specifies whether Db2 tracks modified pages in the space map pages of the implicitly created table space. The IMPTKMOD subsystem parameter specifies the default value.

Do not specify TRACKMOD YES or TRACKMOD NO if the table space name is specified by using the IN *table-space-name* clause or if using the IN ACCELERATOR clause.

TRACKMOD YES
Changed pages are tracked in the space map pages to help improve performance of incremental image copies.

TRACKMOD NO
Changed pages are not tracked in the space map pages. Db2 uses the LRSN value in each page to determine whether a page has been changed.

Notes

Owner privileges:
The owner of the table has all table privileges (see "GRANT (table or view privileges)" on page 1801) with the ability to grant these privileges to others. For more information about ownership of the object, see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

Table design:
Designing tables is part of the process of database design. For more information, see Db2 database design (Introduction to Db2 for z/OS) .

Creating a table in a segmented (non-UTS) table space (deprecated):
A table cannot be created in a segmented table space if any of the following conditions are true:

- The available space in the data set is less than the segment size specified for the table space, and
- The data set cannot be extended.

Creating a table with graphic and mixed data columns:
You cannot create an ASCII or EBCDIC table with a GRAPHIC, VARGRAPHIC, or DBCLOB column or a CHAR, VARCHAR, or CLOB column defined as FOR MIXED DATA when the setting for installation option MIXED DATA is NO.

Creating a table with distinct type columns based on LOB, ROWID, and DECFLOAT columns:
Because a distinct type is subject to the same restrictions as its source type, all the syntactic rules that apply to LOB columns (CLOB, DBCLOB, and BLOB), ROWID columns, and DECFLOAT columns apply to distinct type columns that are based on LOBs, row IDs, and DECFLOATs. For example, a table cannot have both an explicitly defined ROWID column and a column with a distinct type that is based on a row ID.

Tables with inline LOB columns:
If the 32K page size is exceeded for a table in an universal table space, Db2 recalculates the record size using 0 as the inline length for LOB columns that do not specify the INLINE LENGTH clause. After the recalculation, if the 32K page size is still exceeded, the CREATE TABLE statement returns an error.

You cannot create a table with an inline LOB column in a table space that has basic row format.

Creating a table with LOB columns:
A table with a LOB column (CLOB, DBCLOB, or BLOB) must also have a ROWID column and one or more auxiliary tables. When you create the table without explicitly defining a ROWID column, Db2 implicitly generates a ROWID column for you. This is called an *implicitly hidden ROWID column*, and Db2:

- Creates the column with a name of DB2_GENERATED_ROWID_FOR_LOBS*nn*.

  Db2 appends *nn* only if the column name already exists in the table, replacing *nn* with 00 and incrementing by 1 until the name is unique within the row.
- Defines the column as GENERATED ALWAYS.
- Appends the implicitly hidden ROWID column to the end of the row after all the other explicitly defined columns.

For example, assume that Db2 generated an implicitly hidden ROWID column named DB2_GENERATED_ROWID_FOR_LOBS for table MYTABLE. The result table for a SELECT * statement

for table MYTABLE would not contain that ROWID column. However, the result table for SELECT COL1, DB2_GENERATED_ROWID_FOR_LOBS would include the implicitly hidden ROWID column.

If the MIXED DATA subsystem parameter is set to yes, and a lowercase or mixed case hexadecimal constant is specified as the default value for a LOB column, the CREATE TABLE statement returns an error.

The definition of the table is marked incomplete until an auxiliary table is created in a LOB table space for each LOB column in the base table and index is created on each auxiliary table. The auxiliary table stores the actual values of a LOB column. If you create a table with a LOB column in a partitioned table space, there must be one auxiliary table defined for each partition of the base table space.

Unless Db2 implicitly creates the LOB table space, auxiliary table, and index on the auxiliary table for each LOB column in the base table, you need to create these objects using the CREATE TABLESPACE, CREATE AUXILIARY TABLE, and CREATE INDEX statements.

If the table space that contains the table is explicitly created and the value of the CURRENT RULES special register is 'STD' when the CREATE TABLE statement is processed, or the table space that contains the table is implicitly created, Db2 implicitly creates the LOB table space, auxiliary table, and index on the auxiliary table for each LOB column in the base table.

The privilege set must include the following privileges:

- The USE privilege on the buffer pool and the storage group that is used by the XML objects
- If the base table space is explicitly created, CREATETS is also required on the database that contains the table (DSNDB04 if the database is implicitly created)

Db2 chooses the names of implicitly created objects using these conventions:

LOB table space
Name is 8 characters long, consisting of an 'L' followed by 7 random characters.

auxiliary table
Name is 18 characters long. The first five characters of the name are the first five characters of the name of the base table. The second five characters are the first five characters of the name of the LOB column. The last eight characters are randomly generated. If a base table name or a LOB column name is less than five characters, Db2 adds underscore characters to the name to pad it to a length of five characters.

index on the auxiliary table
Name is 18 characters long. The first character of the name is an 'I'. The next ten characters are the first ten characters of the name of the auxiliary table. The last seven characters are randomly generated. The index has the COPY NO attribute.

The other attributes of these implicitly created objects are those that would have been created by their respective CREATE statements with all optional clauses omitted, with the following exceptions:

- The database name is the database name of the base table.
- If the LOB table space is implicitly created, the buffer pool is determined by the DEFAULT BUFFER POOL FOR USER LOB DATA fields of installation panel DSNTIP1. The appropriate USE privilege is required on that buffer pool.

Utility REPORT TABLESPACESET identifies the LOB table spaces that Db2 implicitly created.

Creating a table with an XML column:
When a table is created with an XML column, an XML table space, XML table, and a node ID index and document ID index are implicitly created.

The privilege set must include the following privileges:

- The USE privilege on the buffer pool and the storage group that is used by the XML objects
- If the base table space is explicitly created, CREATETS is also required on the database that contains the table (DSNDB04 if the database is implicitly created)

The buffer pool for the XML table space is determined by the DEFAULT BUFFER POOL FOR USER XML DATA fields of installation panel DSNTIP1. The appropriate USE privilege is required on that buffer pool.

The XML table space will have a larger DSSIZE than the base table space if the base table space is partitioned by range. If the base table space is partitioned by growth, the default DSSIZE of 4GB will be used for the XML table space. The DSSIZE for an XML table space that is associated with a partitioned by range base table space is determined as follows.

Table 192. Default DSSIZE for XML table spaces, given base table space DSSIZE and page size

Base table space DSSIZE	4KB base page size	8KB base page size	16KB base page size	32KB base page size
1GB - 4GB	4GB	4GB	4GB	4GB
8GB	32GB	16GB	16GB	16GB
16GB	64GB	32GB	16GB	16GB
32GB	64GB	64GB	32GB	16GB
64GB	64GB	64GB	64GB	32GB
128GB	256GB	256GB	128GB	64GB
256GB	256GB	256GB	256GB	128GB

For example: for a base table space that has a DSSIZE of 8GB and a page size of 8KB, the XML table space will have a DSSIZE of 16GB.

Naming convention for implicitly created XML objects:

Implicitly created XML table spaces names will be X*yyynnnn*, where *yyy* is derived from the first three bytes of the base table name (if the name is shorter than 3, *yyy* is padded with X). *nnnn* is a numeric string that will start at 0000 and be incremented by 1 until a unique number is found.

Implicitly created XML table names will be X*yyyyyyyyyyyyyyyyyynnn*, where *yyyyyyyyyyyyyyyyyy* is the first 18 UTF-8 bytes of the base table name or of the entire name if it is less than 18. *nnn* will only be appended if the name already exists in the table. If the name already exists, *nnn* will be replaced with 000 and will be incremented by 1 until the name is unique.

Implicitly created document ID index names will be I_DOCID*yyyyyyyyyyyyyyyyyynnn*, where *yyyyyyyyyyyyyyyyyy* is the first 18 UTF-8 bytes of the base table name or the entire name if it is less than 18. *nnn* will only be appended if the index already exists in the table. If the index already exists, *nnn* will be replaced with 000 and will be incremented by 1 until the name is unique.

Implicitly created node ID index names will be I_NODEID*yyyyyyyyyyyyyyyyyynnn*, where *yyyyyyyyyyyyyyyyyy* is the first 18 UTF-8 bytes of the XML table name or the entire name if it is less than 18. *nnn* will only be appended if the index already exists in the table. If the index already exists, *nnn* will be replaced with 000 and will be incremented by 1 until the name is unique.

Creating a table with an identity column:

When a table has an identity column, Db2 can automatically generate sequential numeric values for the column as rows are inserted into the table. Thus, identity columns are ideal for primary keys. Identity columns and ROWID columns are similar in that both types of columns contain values that Db2 generates. ROWID columns are used in large object (LOB) table spaces and can be useful in direct-row access. ROWID columns contain values of the ROWID data type, which returns a 40-byte VARCHAR value that is not regularly ascending or descending. ROWID data values are therefore not well suited to many application uses, such as generating employee numbers or product numbers. For data that is not LOB data and that does not require direct-row access, identity columns are usually a better approach, because identity columns contain existing numeric data types and can be used in a wide variety of uses for which ROWID values would not be suitable.

When a table is recovered to a point-in-time, it is possible that a large gap in the generated values for the identity column might result. For example, assume a table has an identity column that has an incremental value of 1 and that the last generated value at time T1 was 100 and Db2 subsequently generates values up to 1000. Now, assume that the table space is recovered back to time T1. The generated value of the identity column for the next row that is inserted after the recovery completes will be 1001, leaving a gap from 100 to 1001 in the values of the identity column.

If you want to ensure that an identity column has unique values, create a unique index on the column.

Creating a table with a LONG VARCHAR or LONG VARGRAPHIC column:

Although the syntax LONG VARCHAR and LONG VARGRAPHIC is allowed for compatibility with previous releases of Db2, its use is not encouraged. VARCHAR(*integer*) and VARGRAPHIC(*integer*) is the recommended syntax, because after the CREATE TABLE statement is processed, Db2 considers a LONG VARCHAR column to be VARCHAR and a LONG VARGRAPHIC column to be VARGRAPHIC.

When a column is defined using the LONG VARCHAR or LONG VARGRAPHIC syntax, Db2 determines the length attribute of the column. You can use the following information, which is provided for existing applications that require the use of the LONG VARCHAR or LONGVARGRAPHIC syntax, to calculate the byte count and the character count of the column.

To calculate the byte count, use this formula:

2*(INTEGER((INTEGER((*m*-*i*-*k*)/*j*))/2))

Where:

m
Is the maximum row size (8 less than the maximum record size)

i
Is the sum of the byte counts of all columns in the table that are not LONG VARCHAR or LONG VARGRAPHIC

j
is the number of LONG VARCHAR and LONG VARGRAPHIC columns in the table

k
k is the number of LONG VARCHAR and LONG VARGRAPHIC columns that allow nulls

To find the character count:

1. Find the byte count.
2. Subtract 2.
3. If the data type is LONG VARGRAPHIC, divide the result by 2. If the result is not an integer, drop the fractional part.

Considerations for a Unicode column in an EBCDIC table:

A column in an EBCDIC table can be defined for data encoded as Unicode UTF8 or UTF16. Specify the CCSID clause as the last part of the built-in-type specification to define a Unicode column. The CCSID clause can only be specified with the VARCHAR or VARGRAPHIC keywords as indicated, where *n* is the declared length:

Unicode encoding	Valid column definition
UTF8	VARCHAR(*n*) CCSID 1208
UTF16	VARGRAPHIC(*n*) CCSID 1200

If the IN DATABASE clause is specified without a table space name:

If you specify IN DATABASE (either explicitly or by default), but do not specify a table space, a table space is implicitly created in the specified database. The name of the table space is derived from the table name. The qualifier of the table space is the same as the qualifier of the table. The owner of the table space is SYSIBM.

If PARTITION BY RANGE is not specified or PARTITION BY SIZE is specified, the implicitly created table space is a partition-by-growth table space.

If PARTITION BY RANGE is specified, the implicitly created table space is a partition-by-range table space.

If the IN clause is not specified:
If you do not specify the IN clause, the Db2 implicitly creates a table space as described previously, but the Db2 also chooses a database. Db2 creates a name in the form of DSN*nnnnn*, where *nnnnn* is between 00001 and the maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, which has a default of 10000, inclusive. The owner of the database is SYSIBM.

- If DSN*nnnnn* already exists and is an implicitly created database, the Db2 subsystem creates the table in that database.
- If DSN*nnnnn* does not exist, the Db2 subsystem creates a database with the name DSN*nnnnn*.

If DSN*nnnnn* cannot be created because of a deadlock, timeout, or resource unavailable condition, the Db2 subsystem increments *nnnnn* by one and tries the resultant database name. If the Db2 subsystem reaches the maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, and the corresponding database name is not available, the Db2 subsystem sets *nnnnn* to 00001 and tries the resultant database name. If the Db2 subsystem attempts to create the table a number of times that is equal to the maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB without success, an error occurs.

Implicitly created table space attributes:
The attributes of the implicitly created table space can be changed by using the "ALTER TABLESPACE" on page 1224 statement.

Defining a system-period temporal table:
A system-period temporal table definition includes the following:

- A system period named SYSTEM_TIME which is defined using a row-begin column and a row-end column.
- A transaction-start-ID column.
- A system-period data versioning definition which includes the name of the associated history table, which is specified in a subsequent ALTER TABLE statement.

To ensure that the history table cannot be implicitly dropped when a system-period temporal table is dropped, use the WITH RESTRICT ON DROP clause in the definition of the history table.

Defining an application-period temporal table:
An application-period temporal table definition includes an application period named BUSINESS_TIME. The application period is defined using a begin timestamp column and an end timestamp column.

Data change operations on an application-period temporal table might result in an automatic insert of one or two additional rows when a row is updated or deleted. When an update or delete of a row in an application-period temporal table is specified for a portion of the period that is represented by that row, the row is updated or deleted and one or two rows are automatically inserted to represent the portion of the row that is not changed. New values are generated for each generated column in an application-period temporal table for each row that is automatically inserted as a result of an update or delete operation on the table. If a generated column is defined as part of a unique or primary key, parent key in a referential constraint, or unique index, it is possible that an automatic insert will violate a constraint or index, in which case an error is returned.

Bitemporal tables:
A table that is defined for system-period data versioning and contains a BUSINESS_TIME period is referred to as a bitemporal table.

Considerations for transaction-start-ID columns:
A transaction-start-ID column contains a null value if the column allows null values. A row-begin column which is unique from other row-begin column values that are generated for other transactions

exists with the transaction-start-ID column. Given that the column might contain null values, consider using one of the following methods when retrieving a value from the column:

```
COALESCE ( transaction_start_id_col, row_begin_col)
CASE WHEN transaction_start_id_col IS NOT NULL
    THEN transaction_start_id_col
        ELSE row_begin_col
END
```

Implicitly created table spaces:

If the table space is implicitly created, all of the following required system objects will also be implicitly created:

- The enforcing primary key index
- The enforcing unique key index
- Any necessary LOB table spaces, auxiliary table spaces, and auxiliary indexes
- The ROWID index (if the ROWID column is defined as GENERATED BY DEFAULT)

When Db2 implicitly creates a base table space for a table with LOB columns that can have inline LOBs, Db2 creates the base table space in reordered row format, regardless of the value of the RRF subsystem parameter.

The attributes of the implicitly created table space can be changed by using the ALTER TABLESPACE statement.

When Db2 implicitly creates a table space for a table with hash organization, Db2 creates the table space in reordered row format, regardless of the value of the RRF subsystem parameter.

Implicitly created indexes:

When the PRIMARY KEY or UNIQUE clause is used in the CREATE TABLE statement and the CREATE TABLE statement is processed by the schema processor or the table space that contains the table is implicitly created, Db2 implicitly creates the unique indexes used to enforce the uniqueness of the primary or unique keys.

When a ROWID column is defined as GENERATED BY DEFAULT in the CREATE TABLE statement, and the CREATE TABLE statement is processed by SET CURRENT RULES = 'STD' or the table space that contains the table is implicitly created, Db2 implicitly creates the unique indexes used to enforce the uniqueness of the ROWID column.

The privilege set must include the USE privilege of the buffer pool.

Each index is created as if the following CREATE INDEX statement were issued:

```
CREATE UNIQUE INDEX xxx ON table-name (column1,...)
```

Where:

- *xxx* is the name of the index that Db2 generates.
- *table-name* is the name of the table specified in the CREATE TABLE statement.
- *(column1,...)* is the list of column names that were specified in the UNIQUE or PRIMARY KEY clause of the CREATE TABLE statement, or the column is a ROWID column that is defined as GENERATED BY DEFAULT.

For more information about the schema processor, see *Db2 Administration Guide*.

In addition, if the table space that contains the table is implicitly created, Db2 will check the DEFINE DATA SET subsystem parameter to determine whether to define the underlying data set for the index space of the implicitly created index on the base table.

If DEFINE DATA SET is NO, the index is created as if the following CREATE INDEX statement is issued:

```
CREATE UNIQUE INDEX xxx ON table-name (column1,...) DEFINE NO
```

Maximum record size:

The maximum record size of a table depends on the page size of the table space, whether the table space is organized for hash access, and whether the EDITPROC clause is specified, as shown in Table 193 on page 1564.

The initial page size of the table space is the size of its buffer, which is determined by the BUFFERPOOL clause that was explicitly or implicitly specified when the table space was created. When the record size reaches 90 percent of the maximum record size for the page size of the table space, the next largest page size is automatically used.

Table 193. Maximum record size, in bytes

	Page Size = 4KB	**Page Size = 8KB**	**Page Size = 16KB**	**Page Size = 32KB**
Non-hash table	4056	8138	16330	32714
Non-hash table with EDITPROC=YES	4046	8128	16320	32704
Hash table (hash home page)	3817	7899	16091	32475
Hash table with EDITPROC=YES (hash home page)	3807	7889	16081	32465

The maximum record size corresponds to the maximum length of a VARCHAR column if that column is the only column in the table.

If the table space that contains the table is implicitly created, the proper buffer pool size is chosen according to the actual record size. If the record size reaches 90% of the maximum record size for the page size of the table space, the next largest page size will be used. Table 194 on page 1564 shows 90% of the maximum record size:

Table 194. 90% of Maximum record size, in bytes

	Page Size = 4KB	**Page Size = 8KB**	**Page Size = 16KB**	**Page Size = 32KB**
Non-hash table	3650	7324	14697	29443
Non-hash table with EDITPROC=YES	3641	7315	14688	29434
Hash table (hash home page)	3435	7109	14482	29228
Hash table with EDITPROC=YES (hash home page)	3426	7100	14473	29219

Byte counts:

The sum of the byte counts of the columns must not exceed the maximum row size of the table. The maximum row size is eight less than the maximum record size.

For columns that do not allow null values, Table 195 on page 1565 gives the byte counts of columns by data type. For columns that allow null values, the byte count is one more than shown in the table.

Table 195. Byte counts of columns by data type

Data Type	Byte Count
INTEGER	4
SMALLINT	2
BIGINT	8
FLOAT(*n*)	If *n* is between 1 and 21, the byte count is 4. If *n* is between 22 and 53, the byte count is 8.
DECIMAL	INTEGER(*p*/2)+1, where *p* is the precision
DECFLOAT(16)	9
DECFLOAT(34)	17
CHAR(*n*)	*n*
VARCHAR(*n*)	*n*+2
CLOB	6
Inline CLOB	6 + inline byte count
GRAPHIC(*n*)	2*n*
VARGRAPHIC(*n*)	2*n*+2
DBCLOB	6
Inline DBCLOB	6 + (inline char count * 2)
BINARY(*n*)	*n*
VARBINARY(*n*)	*n*+2
BLOB	6
Inline BLOB	6 + inline byte count
DATE	4
TIME	3
TIMESTAMP(*p*) WITHOUT TIME ZONE	INTEGER((*p*+1)/2) + 7 where *p* is the precision
TIMESTAMP(*p*) WITH TIME ZONE	INTEGER((*p*+1)/2) + 9 where *p* is the precision
ROWID	19
distinct type	The length of the source data type upon which the distinct type was based
XML	6 - If column cannot contain multiple versions of an XML document. 14 - If column can contain multiple versions of an XML document.

Related information:

See XML versions (Db2 Programming for XML).

Creating a materialized query table:

If the fullselect in the CREATE TABLE statement contains a SELECT *, the select list of the subselect is determined at the time the materialized query table is created. In addition, any references to user-

defined functions are resolved at the same time. The isolation level at the time when the CREATE TABLE statement is executed is the isolation level for the materialized query table. After a materialized query table is created, the REFRESH_TIME column of the row for the table in the SYSIBM.SYSVIEWS catalog table contains the default timestamp.

The owner of a materialized query table has all the table privileges with the grant option on the table irrespective of whether the owner has the necessary privileges on the base tables, views, functions, and sequences.

No unique constraints or unique indexes can be created for materialized query tables. Thus, a materialized query table cannot be a parent table in a referential constraint.

When you are creating user-maintained materialized query tables, you should create the materialized query table with query optimization disabled and then enable the table for query optimization after it is populated. Otherwise, Db2 might rewrite queries to use the empty materialized query table, and you will not get accurate results.

Considerations for implicitly hidden columns:

A column that is defined as implicitly hidden is not part of the result table of a query that specifies * in a SELECT list. However, an implicitly hidden column can be explicitly referenced in a query. For example, an implicitly hidden column can be referenced in the SELECT list or in a predicate in a query. Additionally, an implicitly hidden column can be explicitly referenced in a COMMENT, CREATE INDEX statement, ALTER TABLE statement, INSERT statement, MERGE statement, UPDATE statement, or RENAME statement. An implicitly hidden column can be referenced in a referential constraint. A REFERENCES clause that does not contain a column list refers implicitly to the primary key of the parent table. It is possible that the primary key of the parent table includes a column defined as implicitly hidden. Such a referential constraint is allowed.

If the SELECT list of the fullselect of a materialized query definition explicitly refers to an implicitly hidden column, that column will be part of the materialized query table.

If the SELECT list of the fullselect of a view definition (CREATE VIEW statement) explicitly refers to an implicitly hidden column, that column will be part of the view, however the view column is not considered 'hidden'.

Restrictions on field procedures, edit procedures, and validation exit procedures:

Field procedures, edit procedures, and validation exit procedures cannot be used on tables that have column names that are larger than 18 EBCDIC bytes. If you have tables that have field procedures or validation exit procedures and you add a column where the column name is larger than 18 bytes, the field procedures and validation exit procedures for the table will be invalidated.

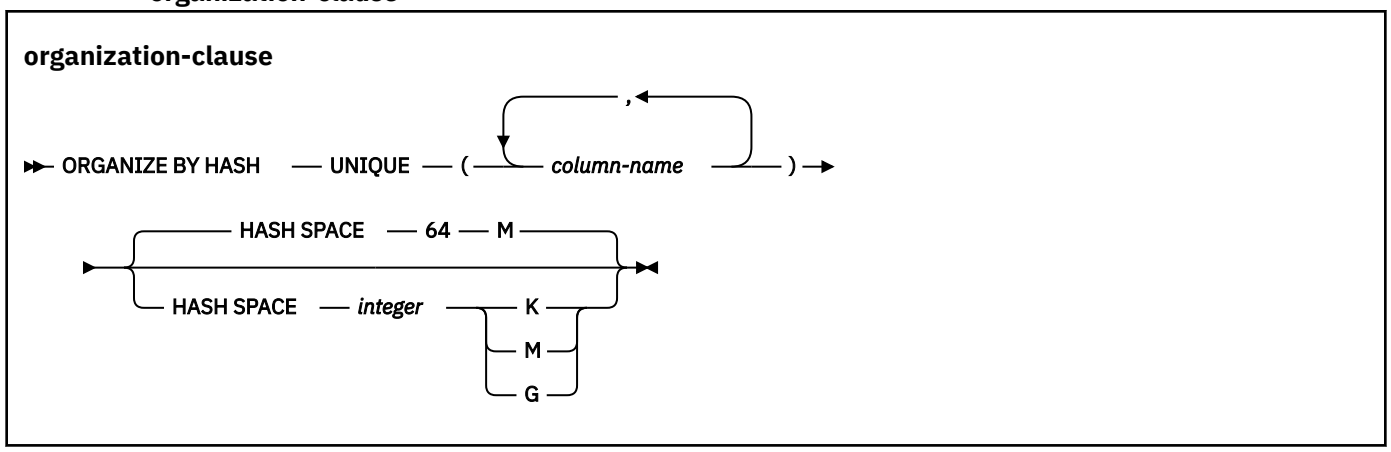
Consider using triggers to replace the functionality on field procedures, edit procedures, and validation exit procedures on tables where the column names are larger than 18 EBCDIC bytes.

Restrictions on certain SQL statements in the same unit of work as CREATE TABLE:

- A CREATE TABLE statement that contains a PARTITION BY clause should not be followed in the same unit of work by SQL statements that change data.
- A CREATE TABLE statement that contains an IN ACCELERATOR clause should be issued in a separate unit of work from other SQL statements.

Creating a table while a utility runs:

You cannot use CREATE TABLE while a Db2 utility has control of the table space implicitly or explicitly specified by the IN clause.



Restrictions involving pending definition changes:

A CREATE TABLE statement is not allowed if there are pending changes to the definition of the table space, if the CREATE TABLE statement specifies a FOREIGN KEY clause that reference a column for which there are pending definition changes, or if the CREATE TABLE statement specifies a materialized query table definition that references a table for which there are pending definition changes.

Syntax and descriptions for hash organization (deprecated)

Deprecated function: Hash-organized tables are deprecated. Beginning in Db2 12, packages bound with APPLCOMPAT(V12R1M504) or higher cannot create hash-organized tables or alter existing tables to use hash-organization. Existing hash organized tables remain supported, but they are likely to be unsupported in the future.

organization-clause

ORGANIZE BY HASH

Specifies that a hash is to be used for the data organization of the table.

If PARTITION BY RANGE is specified, and the IN clause specifies a table space, the table space must be a partition by range universal table space, and cannot be a table space with PAGENUM RELATIVE.

If PARTITION BY RANGE is not specified, and an IN clause is specified, the IN clause must identify a partition-by-growth table space.

ORGANIZE BY HASH must not be specified if the table is defined with APPEND YES.

ORGANIZE BY HASH must not be specified if the table is using basic row format.

If IN ACCELERATOR is specified, ORGANIZE BY HASH must not be specified.

UNIQUE

Specifies that Db2 enforces uniqueness of the hash key columns, preventing the table from containing two or more rows with the same value of the hash key.

(*column-name*,...)

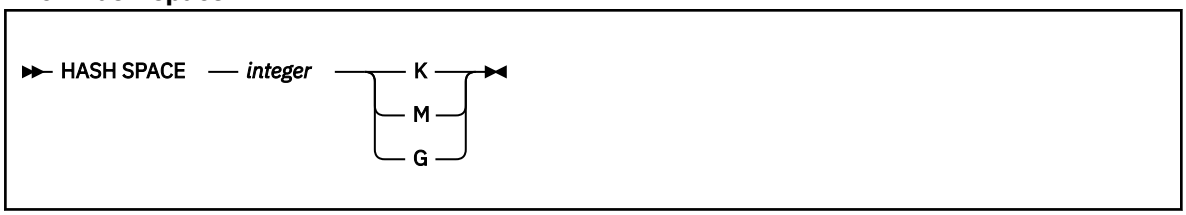
The list of column names defines the hash key that is used to determine where a row will be placed. Each *column-name* must be an unqualified name that identifies a column of the table. The same column must not be specified more than once and the specified columns must be defined as NOT NULL. The number of specified columns must not exceed 64, and the sum of their length attributes must not exceed 255. A specified column cannot be any of the following types:

- a LOB column
- a DECFLOAT column
- a XML column
- a distinct type column that is based on one of the preceding data types
- a Unicode column in an EBCDIC table

If PARTITION BY RANGE is also specified, the list of column names must specify all of the column names that are specified in *partition-expression* for the table, and must specify the column names in the same order as *partition-expression*. If the ORGANIZE BY clause contains more columns than *partition-expression*, *partition-expression* determines the partition number.

HASH SPACE *integer*K|M|G
Specifies the amount of fixed hash space to preallocate for the table. If the table is partitioned by range, this is the space for each partition.

The default is 64M for a table in a partition-by-growth table space or 64M for each partition of a partition-by-range table space.



K
Indicates that the *integer* value is multiplied by 1024 to specify the hash space size in bytes. The *integer* value must be between 256 and 268,435,456.

M
Indicates that the *integer* value is multiplied by 1,048,576 to specify the hash space size in bytes. The *integer* value must be between 1 and 262,144.

G
Indicates that the *integer* value is to be multiplied by 1,073,741,824 to specify the hash space size in bytes. The *integer* value must be between 1 and 256 for a partition by range table and must be between 1 and 131,072 for a non-partitioned table.

If a value greater than 4G is specified, the data sets for the table space are associated with a DFSMS data class that has been specified with extended format and extended addressability.

partition-hash-space

HASH SPACE *integer*K|M|G
Specifies the amount of fixed hash space to preallocate for the partition that is associated with the *partition-element*. If HASH SPACE is omitted from the partition element, the HASH SPACE value from the ORGANIZE BY clause is used. If IN ACCELERATOR is specified, HASH SPACE must not be specified.

If HASH SPACE is not specified, each partition will use the HASH SPACE value specified in *organization-clause*.

The HASH SPACE keyword in *partition-element* must only be specified if *organization-clause* is also specified.

K
Indicates that the *integer* value is multiplied by 1024 to specify the hash space size in bytes. The *integer* value must be between 256 and 268,435,456.

M
Indicates that the *integer* value is multiplied by 1,048,576 to specify the hash space size in bytes. The *integer* value must be between 1 and 262,144.

G
Indicates that the *integer* value is to be multiplied by 1,073,741,824 to specify the hash space size in bytes. The *integer* value must be between 1 and 256 for a partition by range table and must be between 1 and 131,072 for a non-partitioned table.

If a value greater than 4G is specified, the data sets for the table space are associated with a DFSMS data class that has been specified with extended format and extended addressability.

Notes for hash organization (deprecated)

Deprecated function: Hash-organized tables are deprecated. Beginning in Db2 12, packages bound with APPLCOMPAT(V12R1M504) or higher cannot create hash-organized tables or alter existing tables to use hash-organization. Existing hash organized tables remain supported, but they are likely to be unsupported in the future.

If the IN clause is specified with ORGANIZE BY HASH:

If you specify IN DATABASE (either explicitly or by default), and ORGANIZE BY HASH, Db2 will calculate an optimum buffer pool for hash organization based on the definition of the table and validate the calculated buffer pool with the buffer pool of the explicitly created table space. If the buffer pool sizes are different, Db2 will return an error.

If the table is in a partition-by-range table space, the DSSIZE value for the table space must be large enough to fit the HASH SPACE specification for each partition.

If the table is in a partition-by-growth table space, the total space calculated from the DSSIZE and MAXPARTITIONS values for the table space must be large enough for the implicitly or explicitly specified HASH SPACE.

If the IN clause is not specified with ORGANIZE BY HASH:

If you do not specify IN DATABASE (either explicitly or by default), Db2 will use the default DSSIZE of 4G for each partition for a partition-by-range table space or use the value that is specified in the partitioning clause. The hash space value that is specified on CREATE TABLE will be validated, per part, to ensure that the specified DSSIZE is adequate. If the DSSIZE is not adequate, an error will be returned.

If the maximum number of partitions needed for the specified hash space is more than the maximum number of partitions allowed, Db2 to will return an error.

If the selected buffer pool is not available, a error will be returned.

Creating a table with hash organization and LOB columns:

If the table space is a partition-by-growth table space, Db2 will preallocate as many partitions as needed depending on the value specified for HASH SPACE. If Db2 needs to implicitly create the LOB object in a new partition, the privilege set for the implicitly created LOB objects must include the USE privilege on the buffer pool for the LOB table space.

Hash space and Db2 page size:

If the specified hash space is less than or equal to 64 MB (the Db2 default), Db2 will add extra space for Db2 system pages. If the specified hash space is greater than 64 MB, Db2 will use part of the hash space for Db2 system pages. The amount of space needed for Db2 system pages depends on SEGSIZE and PAGESIZE. The larger the SEGSIZE and/or PAGESIZE becomes, the larger the requirement for Db2 system pages. Db2 can reserve up to 5 MB for system pages for the highest SEGSIZE value (64) and PAGESIZE value (32K).

Hash space and DSSIZE:

Depending on certain table space characteristics, Db2 needs to reserve space for the hash overflow area. Therefore, the amount of hash space cannot be equal to the DSSIZE value. The maximum amount of hash space that can be specified is approximately 20% less than the DSSIZE value. Db2 returns an error if the amount of hash space is too large. If the amount of hash space is too large, specify a larger value of DSSIZE, or decrease the amount of hash space.

Specifying APPEND for hash-organized tables:

Append processing is not applicable to tables with hash organization since there is no key clustering in hash organization. For insert operations into tables with hash organization, Db2 will use the internal hash algorithm to determine the location of the row.

Restrictions for tables with hash organization:

Tables that use hash organization are subject to the following restrictions:

- A table that is defined to use hash organization cannot be created in a LOB table space or XML table space.
- ORGANIZE BY HASH must not be specified if the table space is defined with the MEMBER CLUSTER clause.
- The MAXROWS clause is applicable only to the hash overflow area of the table space for tables with hash organization. The fixed hash area of each page will contain as many rows as it can hold, up to a maximum of 255.

- The ORGANIZE BY HASH UNIQUE (*column-list*) clause is required when specifying HASH SPACE *integer* K|M|G in the *partition-element*. The *organization-clause* applies to the entire table and the *partition-element* clause applies at the partition level.
- Db2 automatically creates a hash overflow index when a table is created with hash organization.

Alternative syntax and synonyms:

To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following clauses:

- NOCACHE (single clause) as a synonym for NO CACHE
- NOCYCLE (single clause) as a synonym for NO CYCLE
- NOMINVALUE (single clause) as a synonym for NO MINVALUE
- NOMAXVALUE (single clause) as a synonym for NO MAXVALUE
- NOORDER (single clause) as a synonym for NO ORDER
- PART *integer* VALUES can be specified as an alternative to PARTITION *integer* ENDING AT.
- VALUES as a synonym for ENDING AT
- DEFINITION ONLY as a synonym for WITH NO DATA
- SUMMARY between CREATE and TABLE
- TIMEZONE can be specified as an alternative to TIME ZONE.

Examples

Example 1: Create a table named DSN8B10.DEPT in the table space DSN8S11D of the database DSN8D11A. Name the five columns DEPTNO, DEPTNAME, MGRNO, ADMRDEPT, and LOCATION, allowing only MGRNO and LOCATION to contain nulls, and designating DEPTNO as the only column in the primary key. All five columns hold character string data. Assuming a value of NO for the field MIXED DATA on installation panel DSNTIPF, all five columns have the subtype SBCS.

```
CREATE TABLE DSN8B10.DEPT
  (DEPTNO   CHAR(3)     NOT NULL,
   DEPTNAME VARCHAR(36) NOT NULL,
   MGRNO    CHAR(6)             ,
   ADMRDEPT CHAR(3)     NOT NULL,
   LOCATION CHAR(16)            ,
   PRIMARY KEY(DEPTNO)          )
  IN DSN8D11A.DSN8S11D;
```

Example 2: Create a table named DSN8B10.PROJ in an implicitly created table space of the database DSN8D11A. Assign the table a validation procedure named DSN8EAPR.

```
CREATE TABLE DSN8B10.PROJ
  (PROJNO   CHAR(6)      NOT NULL,
   PROJNAME VARCHAR(24)  NOT NULL,
   DEPTNO   CHAR(3)      NOT NULL,
   RESPEMP  CHAR(6)      NOT NULL,
   PRSTAFF  DECIMAL(5,2)         ,
   PRSTDATE DATE                 ,
   PRENDATE DATE                 ,
   MAJPROJ  CHAR(6)      NOT NULL)
  IN DATABASE DSN8D11A
  VALIDPROC DSN8EAPR;
```

Example 3: Assume that table PROJECT has a non-primary unique key that consists of columns DEPTNO and RESPEMP (the department number and employee responsible for a project). Create a project activity table named ACTIVITY with a foreign key on that unique key.

```
CREATE TABLE ACTIVITY
  (PROJNO   CHAR(6)      NOT NULL,
   ACTNO    SMALLINT     NOT NULL,
   ACTDEPT  CHAR(3)      NOT NULL,
   ACTOWNER CHAR(6)      NOT NULL,
   ACSTAFF  DECIMAL(5,2)         ,
```

```
     ACSTDATE DATE         NOT NULL,
     ACENDATE DATE                 ,
     FOREIGN KEY (ACTDEPT,ACTOWNER)
        REFERENCES PROJECT (DEPTNO,RESPEMP) ON DELETE RESTRICT)
    IN DSN8D11A.DSN8S11D;
```

Example 4: Create an employee photo and resume table EMP_PHOTO_RESUME that complements the sample employee table. The table contains a photo and resume for each employee. Put the table in table space DSN8D11A.DSN8S11E. Let Db2 always generate the values for the ROWID column.

```
CREATE TABLE DSN8B10.EMP_PHOTO_RESUME
  (EMPNO      CHAR(6)     NOT NULL,
   EMP_ROWID  ROWID NOT NULL GENERATED ALWAYS,
   EMP_PHOTO  BLOB(110K),
   RESUME     CLOB(5K),
   PRIMARY KEY (EMPNO))
  IN DSN8D11A.DSN8S11E
  CCSID EBCDIC;
```

Example 5: Create an EMPLOYEE table with an identity column named EMPNO. Define the identity column so that Db2 will always generate the values for the column. Use the default value, which is 1, for the first value that should be assigned and for the incremental difference between the subsequently generated consecutive numbers.

```
CREATE TABLE EMPLOYEE
  (EMPNO      INTEGER GENERATED ALWAYS AS IDENTITY,
   ID         SMALLINT,
   NAME       CHAR(30),
   SALARY     DECIMAL(5,2),
   DEPTNO     SMALLINT)
  IN DSN8D11A.DSN8S11D;
```

Example 6: Assume a very large transaction table named TRANS contains one row for each transaction processed by a company. The table is defined with many columns. Create a materialized query table for the TRANS table that contain daily summary data for the date and amount of a transaction.

```
CREATE TABLE STRANS AS
  (SELECT YEAR AS SYEAR, MONTH AS SMONTH, DAY AS SDAY, SUM(AMOUNT) AS SSUM
   FROM TRANS
   GROUP BY YEAR, MONTH, DAY)
   DATA INITIALLY DEFERRED REFRESH DEFERRED;
```

Example 7: The following example creates a table in a partition-by-growth table space and includes the APPEND option:

```
CREATE TABLE TS01TB
     (C1 SMALLINT,
      C2 DECIMAL(9,2),
      C3 CHAR(4))
  APPEND YES
  IN TS01DB.TS01TS;
```

Example 8: The following example creates a table in a partition-by-growth table space where the table space is implicitly created:

```
CREATE TABLE TS02TB
     (C1 SMALLINT,
      C2 DECIMAL(9,2),
      C3 CHAR(4))
   PARTITION BY SIZE EVERY 4G
   IN DATABASE DSNDB04;
```

Example 9: Create a table, EMP_INFO, that contains a phone number and address for each employee. Include a row change timestamp column in the table to track the modification of employee information:

```
CREATE TABLE EMP_INFO
     (EMPNO CHAR(6) NOT NULL,
      EMP_INFOCHANGE NOT NULL
         GENERATED ALWAYS FOR EACH ROW ON UPDATE
         AS ROW CHANGE TIMESTAMP,
```

```
        EMP_ADDRESS VARCHAR(300),
        EMP_PHONENO CHAR(4),
        PRIMARY KEY (EMPNO));
```

Example 10: Create a table, TB01, that uses a range partitioning scheme with a segment size of 4 and 4 partitions.

```
CREATE TABLE TB01 (
   ACCT_NUM         INTEGER,
   CUST_LAST_NM     CHAR(15),
   LAST_ACTIVITY_DT VARCHAR(25),
   COL2             CHAR(10),
   COL3             CHAR(25),
   COL4             CHAR(25),
   COL5             CHAR(25),
   COL6             CHAR(55),
   STATE            CHAR(55))
 IN DBB.TS01

  PARTITION BY (ACCT_NUM)
   (PARTITION 1 ENDING AT (199),
    PARTITION 2 ENDING AT (299),
    PARTITION 3 ENDING AT (399),
    PARTITION 4 ENDING AT (MAXVALUE));
```

Example 11: Create a table, policy_info, that uses a SYSTEM_TIME period and create a history table, hist_policy_info. Then issue an ALTER TABLE statement to associate the policy_info table with the hist_policy_info table.

```
CREATE TABLE policy_info
    (policy_id CHAR(10) NOT NULL,
     coverage INT NOT NULL,
     sys_start TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN,
     sys_end TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END,
     create_id TIMESTAMP(12) GENERATED ALWAYS AS TRANSACTION START ID,
     PERIOD SYSTEM_TIME(sys_start,sys_end));
```

```
CREATE TABLE hist_policy_info
    (policy_id CHAR(10) NOT NULL,
     coverage INT NOT NULL,
     sys_start TIMESTAMP(12) NOT NULL,
     sys_end TIMESTAMP(12) NOT NULL,
     create_id TIMESTAMP(12));
```

```
ALTER TABLE policy_info
    ADD VERSIONING USE HISTORY TABLE hist_policy_info;
```

Example 12: Create a table, policy_info, that uses a BUSINESS_TIME period.

```
CREATE TABLE policy_info
    (policy_id CHAR(4) NOT NULL,
     coverage INT NOT NULL,
     bus_start DATE NOT NULL,
     bus_end DATE NOT NULL,
     PERIOD BUSINESS_TIME(bus_start, bus_end));
```

Example 13: Create a table, policy_info, that uses both a SYSTEM_TIME period and a BUSINESS_TIME period to keep historical rows and track a user-specified time period. A table that specifies both a SYSTEM_TIME period and a BUSINESS_TIME period is sometimes referred to as a *bitemporal table*. To enable retention of historical rows, a history table, hist_policy_info, also needs to be created and associated (using the ALTER TABLE statement) with the policy_info table.

```
CREATE TABLE policy_info
    (policy_id CHAR(4) NOT NULL,
    coverage INT NOT NULL,
    bus_start DATE NOT NULL,
    bus_end DATE NOT NULL,
    sys_start TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW BEGIN,
    sys_end TIMESTAMP(12) NOT NULL GENERATED ALWAYS AS ROW END,
    create_id TIMESTAMP(12) GENERATED ALWAYS AS TRANSACTION START ID,
    PERIOD BUSINESS_TIME(bus_start, bus_end),
    PERIOD SYSTEM_TIME(sys_start, sys_end));
```

```
CREATE TABLE hist_policy_info
    (policy_id CHAR(4) NOT NULL,
    coverage INT NOT NULL,
    bus_start DATE NOT NULL,
    bus_end DATE NOT NULL,
    sys_start TIMESTAMP(12) NOT NULL,
    sys_end TIMESTAMP(12) NOT NULL),
    create_id TIMESTAMP(12);
```

```
ALTER TABLE policy_info
    ADD VERSIONING USE HISTORY TABLE hist_policy_info;
```

Implementing Db2 tables (Db2 Administration Guide)

Conditions that prevent query routing to an accelerator

CREATE TABLESPACE

The CREATE TABLESPACE statement defines a table space at the current server. The type of table space depends on the keywords specified.

Depending on the keywords specified, the result is a partition-by-range, partition-by-growth, partitioned (non-UTS) or segmented (non-UTS) table space.

For information about the rules and restrictions for creating table spaces in work file databases, see Table spaces in a work file database.

For information about creating large object (LOB) table spaces, see “CREATE LOB TABLESPACE” on page 1424.

Db2 creates XML table spaces implicitly when you create or alter tables to add XML columns. For more information, see XML table space implicit creation (Db2 Administration Guide).

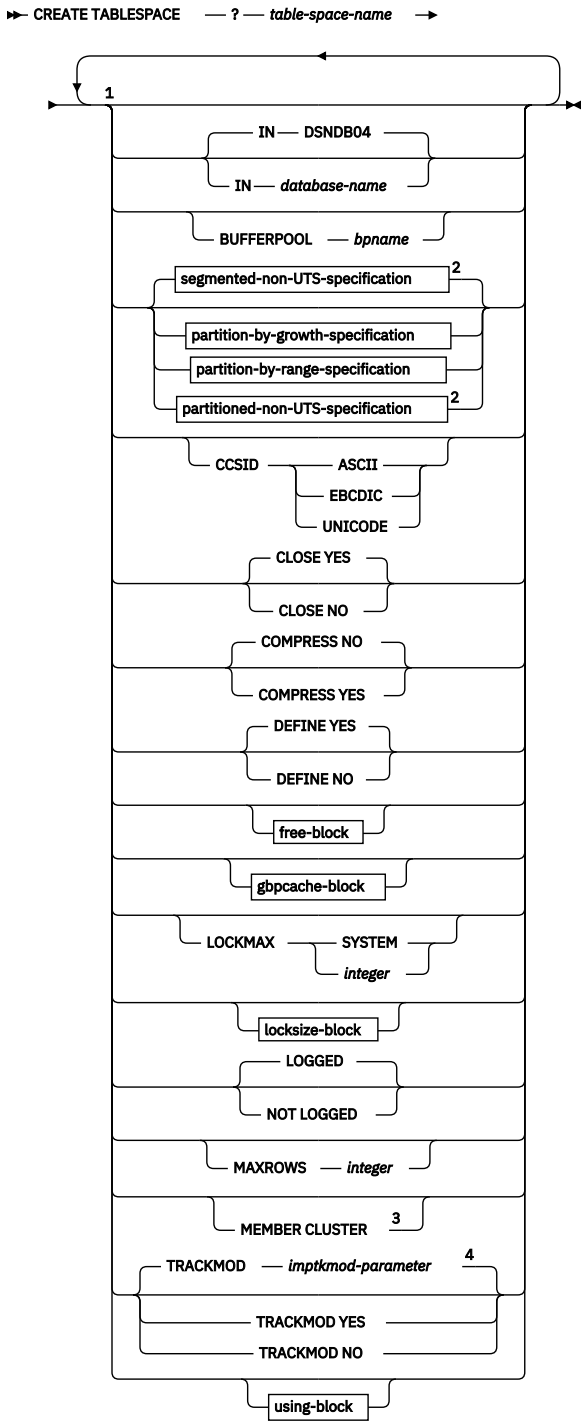
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

- The CREATETS privilege for the database
- DBADM, DBCTRL, or DBMAINT authority for the database
- SYSADM or SYSCTRL authority
- System DBADM

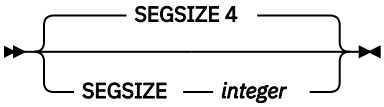


If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

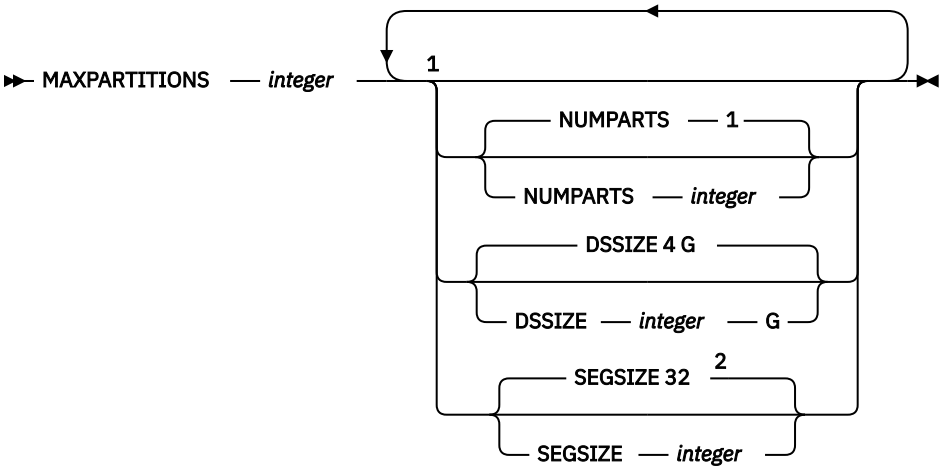
Additional privileges might be required, as explained in the description of the BUFFERPOOL and USING STOGROUP clauses.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the of the owner of the plan or package. If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified, a role is the owner. Otherwise, an authorization ID is the owner.

If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER clause is specified. In that case, the privileges set is the privileges that are held by the role that is associated with the primary authorization ID of the process.



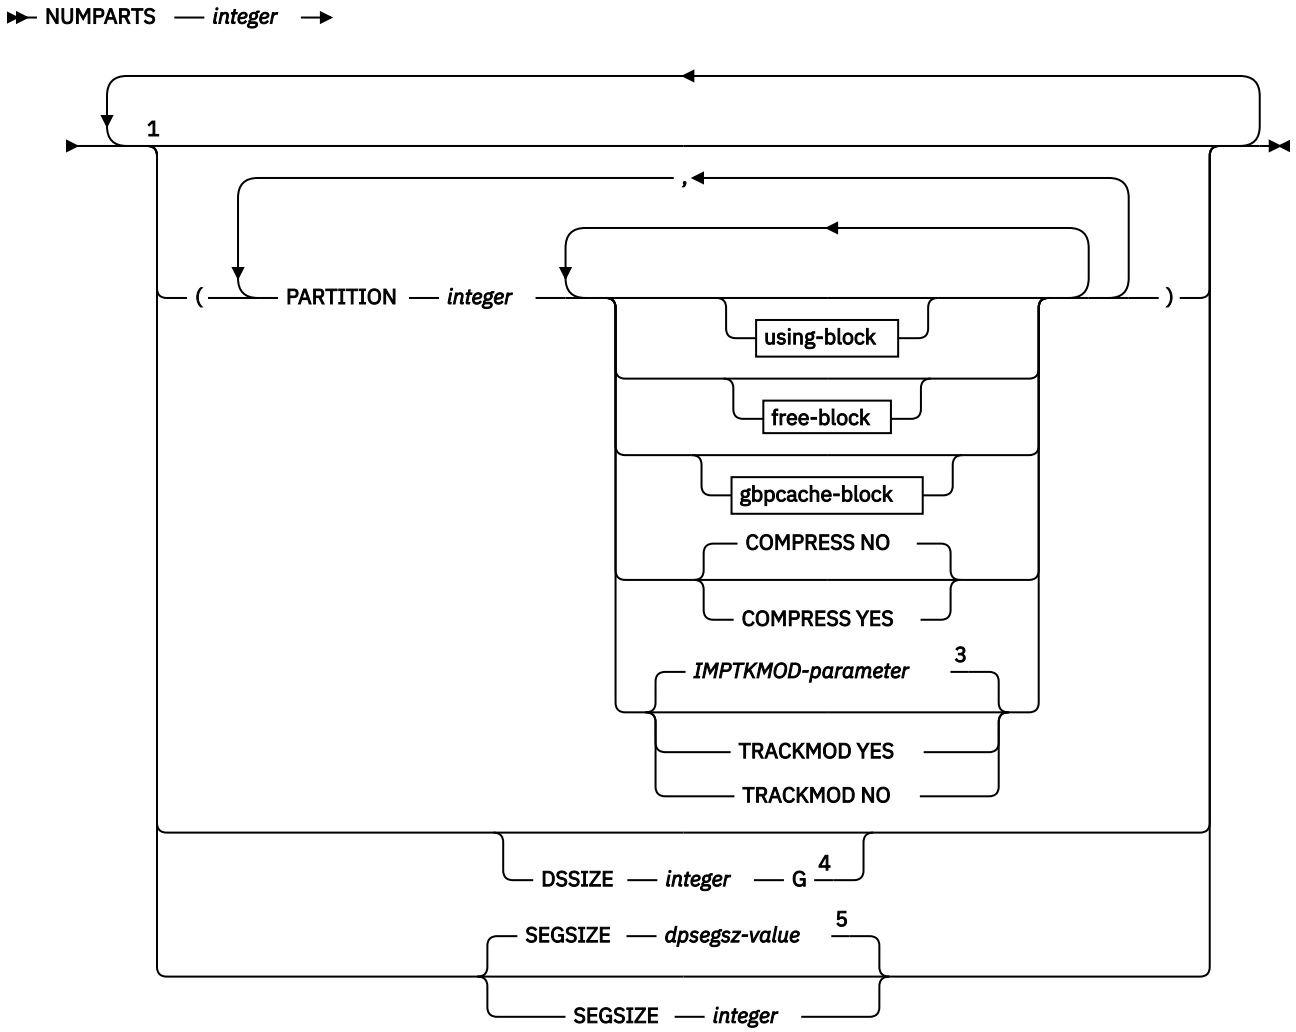
Syntax



Notes:

[1] The same clause must not be specified more than one time.
[2] Non-UTS table spaces for base tables are deprecated and likely to be unsupported in the future.
[3] MAXPARTITIONS or NUMPARTS must also be specified.
[4] *imptkmod-parameter* is the IMPTKMOD subsystem parameter value. For more information, see IMPTKMOD in macro DSN6SYSP (Db2 Installation and Migration).

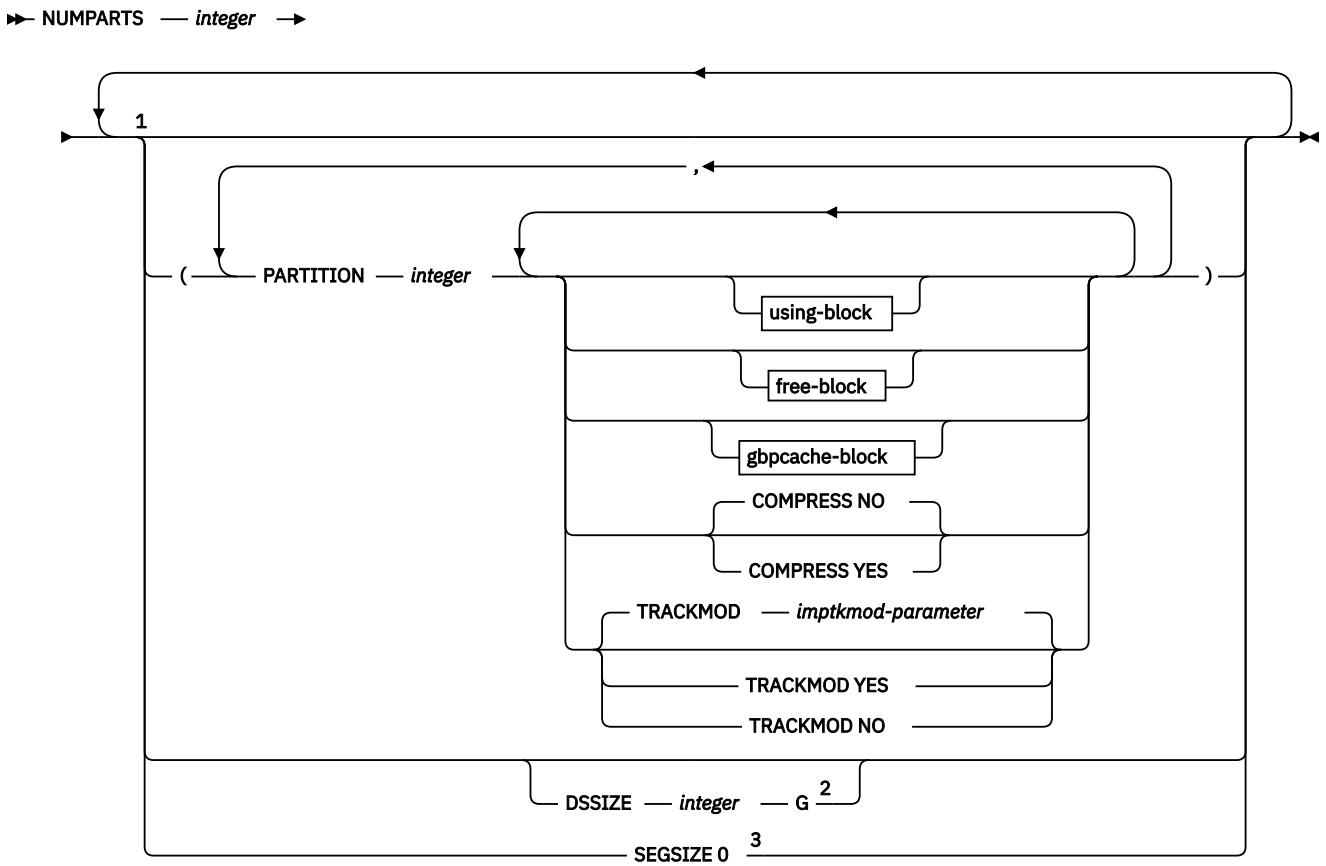
segmented-non-UTS-specification:



partition-by-growth-specification:

Notes:

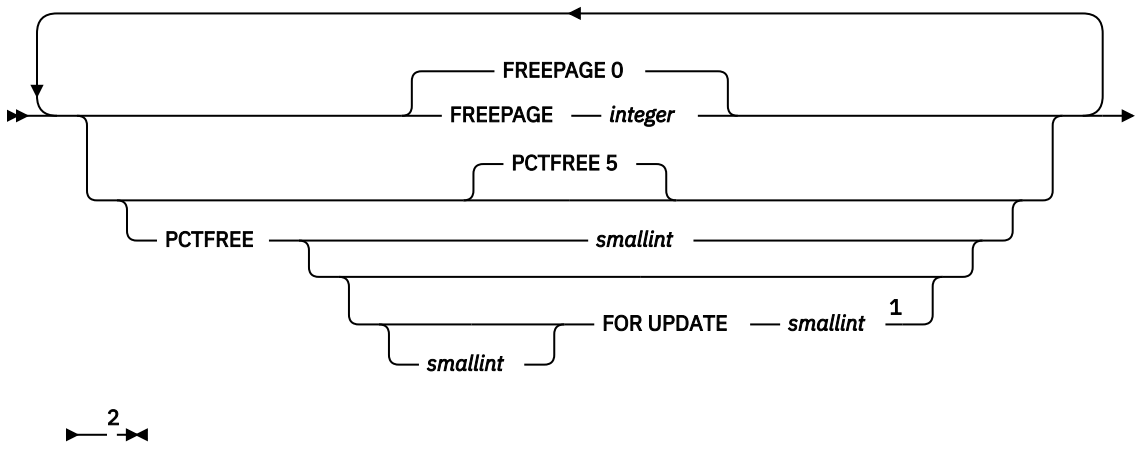
[1] The same clause must not be specified more than one time.
[2] The default SEGSIZE value is controlled by the DPSEGSZ subsystem parameter.



partition-by-range-specification:

Notes:

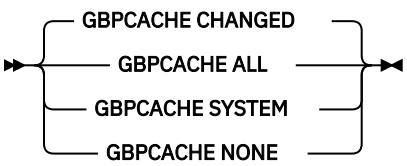
[1] Group multiple PARTITION clauses. Other clauses must not be specified more than one time.
[2] The same clause must not be specified more than one time.
[3] The IMPTKMOD subsystem parameter specified the default TRACKMOD option. For more information, see IMPTKMOD in macro DSN6SYSP (Db2 Installation and Migration).
[4] The default DSSIZE value depends on the NUMPARTS value and the buffer pool page size.
[5] *dpsegsz-value* is the DPSEGSZ subsystem parameter.



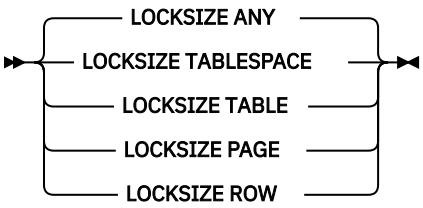
partitioned-non-UTS-specification

Notes:

[1] Group multiple PARTITION clauses. Other clauses must not be specified more than one time.
[2] The default DSSIZE value depends on the NUMPARTS value and the buffer pool page size.
[3] SEGSIZE 0 must be specified unless the DPSEGSZ subsystem parameter value is 0. For more information, see DPSEGSZ subsystem parameter.

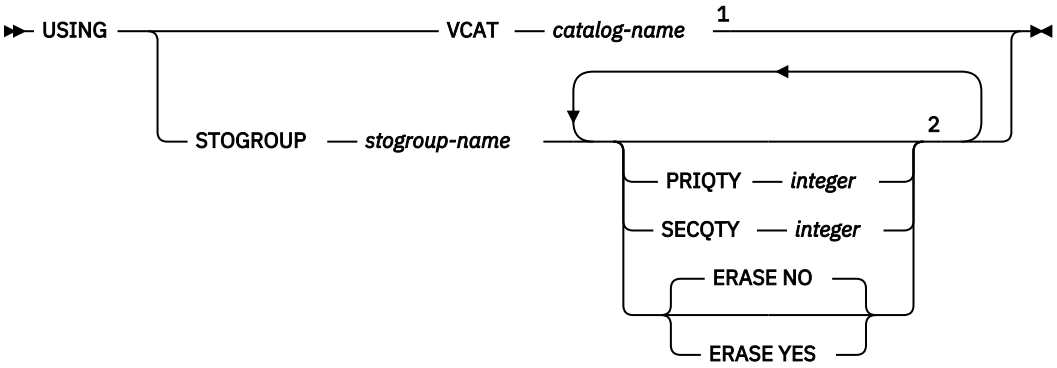


free-block:



Notes:

[1] The default PCTFREE value is controlled by the PCTFREE_UPD subsystem parameter.
[2] The same clause must not be specified more than one time.



gbpcache-block:

locksize-block:

using-block:

Notes:

[1] USING VCAT must not be specified for a partition-by-growth table space.
[2] The same clause must not be specified more than one time.

Description

table-space-name
Names the table space. The name, qualified with the *database-name* implicitly or explicitly specified by the IN clause, must not identify a table space, index space, or LOB table space that exists at the current server or that exists in the SYSPENDINGOBJECTS catalog table.

A table space that is for declared temporary tables must be in the work file database. PUBLIC implicitly receives the USE privilege (without GRANT authority) on any table space created in the work file database. This implicit privilege is not recorded in the Db2 catalog, and it cannot be revoked.

IN *database-name*
Specifies the database in which the table space is created. *database-name* must identify a database that exists at the current server and must not specify the following:

- DSNDB06
- A TEMP database
- An implicitly created database

If the table space is for declared temporary tables or static scrollable cursors, the name of the work file database must be specified.

DSNDB04 is the default.

BUFFERPOOL *bpname*

Identifies the buffer pool to be used for the table space and determines the page size of the table space. For 4KB, 8KB, 16KB and 32KB page buffer pools, the page sizes are 4 KB, 8 KB, 16 KB, and 32 KB, respectively. The *bpname* must identify an activated buffer pool, and the privilege set must include SYSADM or SYSCTRL authority, or the USE privilege on the buffer pool. If the table space is to be created in a work file database, you cannot specify 8KB and 16KB buffer pools.

If you do not specify the BUFFERPOOL clause, the default buffer pool of the database is used.

See "Naming conventions" on page 77 for more details about *bpname*. See -ALTER BUFFERPOOL (Db2) (Db2 Commands) for a description of active and inactive buffer pools.

The buffer pool page size affects the number of partitions that can be used. For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

segmented-non-UTS-specification (deprecated)

If MAXPARTITIONS and NUMPARTS are both omitted, a segmented (non-UTS) table space is created. It is not partitioned, and initially occupies one data set. For a summary of clauses that control the table space type to create, see Table space types.

Deprecated function: Non-UTS table spaces for base tables are deprecated and likely to be unsupported in the future.

SEGSIZE *integer*

Specifies the size in pages for each segment of the table space. The *integer* value must be a multiple of 4, in the range 4 - 64.

partition-by-growth-specification

Specifies the creation of a partition-by-growth table space. For a summary of clauses that control the table space type to create, see Table space types.

MAXPARTITIONS *integer*

Specifies that the table space is a partition-by-growth table space.

integer specifies the maximum number of partitions to which the table space can grow. *integer* must be in the range of 1 - 4096, depending on the corresponding value of the DSSIZE clause. The following table shows the maximum value for MAXPARTITIONS in relation to the page size or DSSIZE value for the table space.

Table 196. Maximum MAXPARTITIONS value for a given page size and DSSIZE value

DSSIZE value	4K page size	8K page size	16K page size	32K page size
1 G - 4 G	4096	4096	4096	4096
8 G	2048	4096	4096	4096
16 G	1024	2048	4096	4096
32 G	512	1024	2048	4096
64 G	254	512	1024	2048
128 G	128	256	512	1024
256 G	64	128	256	512

For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

The schema definition for the first partition is always created, and the NUMPARTS value, if specified, controls the number of partition schema definitions to initially create and allocate data sets for. The data sets for additional partitions are not allocated until they are needed.

Although the physical data sets are not defined based on the MAXPARTITIONS value, storage and CPU overhead is possible. If an increase in the number of partitions is expected by using the MAXPARTITONS clause, be aware that specifying a value larger than necessary, such as 4096 (the maximum value), as a default for all partition-by-growth table spaces can cause larger than expected storage requests.

NUMPARTS *integer*
If specified with MAXPARTITIONS, the *integer* value specifies the number of partition schema definitions to initially create. Data sets are also allocated for this many partitions, unless DEFINE NO is specified. *integer* must be a value in the range 1 - 4096 inclusive and must be less than or equal to the value that is specified for the MAXPARTITIONS clause.

If MAXPARTITIONS is not specified, see the NUMPARTS clause description in "partition-by-range-specification" on page 1580.

DSSIZE *integer* G
Specifies the data set size in *integer* gigabytes for partitions in the table space. Each partition occupies one data set, so the data set size is also the maximum size of the partitions. When DSSIZE is specified for a partition-by-growth table space, the value must be a power-of-two in the range 1 G - 256 G. The default value is 4 G.

For any DSSIZE value greater than 4 G, the data sets for the table space must be associated with a DFSMS data class that is specified with extended format and extended addressability.

The DSSIZE value affects the number of partitions that can be used. For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

SEGSIZE *integer*
Specifies the size in pages for each segment of the table space. The *integer* value must be a multiple of 4, in the range 4 - 64. The default SEGSIZE value is controlled by the DPSEGSZ subsystem parameter.

partition-by-range-specification
Specifies the creation of a partition-by-range table space or partitioned (non-UTS) table space. For a summary of clauses that control the table space type to create, see Table space types.

NUMPARTS *integer*

The maximum number of partitions depends on the buffer pool page size and DSSIZE. The total table space size depends on the number of partitions and DSSIZE. For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

PARTITION *integer*
Specifies the partition to which the following partition-level clauses apply. *integer* can range from 1 to the number of partitions given by NUMPARTS.

You can specify the PARTITION clause as many times as needed. If you use the same partition number more than once, only the last specification for that partition is used.

DSSIZE *integer* G
Specifies the data set size in *integer* gigabytes for partitions in the table space. Each partition occupies one data set, so the data set size is also the maximum size of the partitions.

When DSSIZE is specified at the table-space level for a partition-by-range table space, the default value for depends the buffer pool page size, the NUMPARTS value, as shown in the following table.

Page size	NUMPARTS value	DSSIZE default value
Any	1 - 16	4 G
Any	17 - 32	2 G
Any	33 - 64	1 G
Any	65 - 254	4 G
4K	255 - 4096	4 G
8K	255 - 4096	8 G
16K	255 - 4096	16 G
32K	255 - 4096	32 G

The DSSIZE value affects the number of partitions that can be used. For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

For any DSSIZE value greater than 4 G, the data sets for the table space must be associated with a DFSMS data class that is specified with extended format and extended addressability.

SEGSIZE *integer*
Specifies the size in pages for each segment of the table space. The *integer* value must be a multiple of 4, in the range 4 - 64. The default SEGSIZE value is controlled by the DPSEGSZ subsystem parameter.

partitioned-non-UTS-specification (deprecated)
Specifies a NUMPARTS value and SEGSIZE 0 to create a partitioned (non-UTS) table space. For a summary of clauses that control the table space type to create, see Table space types.

Deprecated function: Non-UTS table spaces for base tables are deprecated and likely to be unsupported in the future.

NUMPARTS *integer*

The maximum number of partitions depends on the buffer pool page size and DSSIZE. The total table space size depends on the number of partitions and DSSIZE. For more information about the relationship between buffer pool page size, DSSIZE, NUMPARTS, and table space size, see Maximum number of partitions and table space size.

PARTITION *integer*
Specifies the partition to which the following partition-level clauses apply. *integer* can range from 1 to the number of partitions given by NUMPARTS.

You can specify the PARTITION clause as many times as needed. If you use the same partition number more than once, only the last specification for that partition is used.

SEGSIZE 0
Specifies that the table space is a partitioned (non-UTS) table space, which does not use segmented organization. SEGSIZE 0 must be specified unless the DPSEGSZ subsystem parameter is 0. For more information, see DPSEGSZ subsystem parameter.

DSSSIZE *integer*G
See DSSSIZE in `partition-by-range-specification`.

CCSID *encoding-scheme*
Specifies the encoding scheme for a table in the table space.

If you do not specify a CCSID when it is allowed, the default is the encoding scheme of the database in which the table space resides, except for table spaces in database DSNDB04; for table spaces in DSNDB04, the default is the value of field DEF ENCODING SCHEME on installation panel DSNTIPF.

ASCII
Specifies that the data is encoded using ASCII CCSIDs. If the database in which the table space is to reside is already defined as ASCII, the ASCII CCSIDs associated with that database are used. Otherwise, the default ASCII CCSIDs of the server are used.

EBCDIC
Specifies that the data is encoded using EBCDIC CCSIDs. If the database in which the table space is to reside is already defined as EBCDIC, the EBCDIC CCSIDs associated with that database are used. Otherwise, the default EBCDIC CCSIDs of the server are used.

UNICODE
Specifies that the data is encoded using the UNICODE CCSIDs of the server.

Usually, each encoding scheme requires only a single CCSID. Additional CCSIDs are needed when mixed, graphic, or Unicode data is used.

All data stored within a table space must use the same encoding scheme unless the table space is in a work file database.

CLOSE
When the limit on the number of open data sets is reached, specifies the priority in which data sets are closed.

YES
Eligible for closing before CLOSE NO data sets. CLOSE YES is the default value, unless the table space is in a work file database.

NO
Eligible for closing after all eligible CLOSE YES data sets are closed.

COMPRESS
Specifies whether data compression applies to the rows of the table space or partition.

For partitioned table spaces, the COMPRESS attribute for each partition is the value from the first of the following conditions that apply:

- The value specified in the COMPRESS clause in the PARTITION clause for the partition
- The value specified in the COMPRESS clause that is not in any PARTITION clause
- An implicit COMPRESS NO by default.

For more information about data compression, see Compressing your data (Db2 Performance).

YES
Specifies data compression. The rows are not compressed until the LOAD or REORG utility is run on the table in the table space or partition, or until an insert operation is performed.

NO
Specifies no data compression for the table space or partition.

DEFINE
Specifies when the underlying data sets for the table space are physically allocated.

YES
The data sets are created when the table space is created (the CREATE TABLESPACE statement is executed). YES is the default.

NO
The data sets are not created until data is inserted into the table space. DEFINE NO is applicable only for Db2-managed data sets (USING STOGROUP is specified). DEFINE NO is ignored for user-managed data sets (USING VCAT is specified). Db2 uses the SPACE column in catalog table SYSTABLEPART to record the status of the data sets (undefined or allocated).

DEFINE NO is not recommended if you intend to use any tools outside of Db2 to manipulate data, such as to load data, because data sets might then exist when Db2 does not expect them to exist. When Db2 encounters this inconsistent state, applications will receive an error.

For table spaces that are created with DEFINE NO, point-in-time recover will not work before data sets exist and before a recovery copy exists.

free-block

Specifies how to leave free space when the table space is loaded or reorganized.

FREEPAGE *integer*

Specifies how often to leave a page of free space when the table space or partition is loaded or reorganized. You must specify an integer in the range 0 - 255. If you specify 0, no pages are left as free space. Otherwise, one free page is left after every *n* pages, where *n* is the specified *integer* value. However, if the table space is segmented and the integer you specify is not less than the segment size, *n* is one less than the segment size.

If the table space is segmented, the number of pages left free must be less than the SEGSIZE value. If the number of pages to be left free is greater than or equal to the SEGSIZE value, then the number of pages is adjusted downward to one less than the SEGSIZE value.

The default is FREEPAGE 0, leaving no free pages.

FREEPAGE does not apply to hash-organized table spaces.

Related information:

Reserving free space for table spaces (Db2 Performance)
Reserving free spaces for indexes (Db2 Performance)

PCTFREE *smallint*

Indicates what percentage of each page to leave as free space when the table is loaded or reorganized. *smallint* is in the range from 0 - 99. The first record on each page is loaded without restriction. When additional records are loaded, at least *smallint* percent of free space is left on each page.

The default is PCTFREE 5, which means that 5% of the space on each page is reserved as free space.

PCTFREE does not apply to table spaces for hash-organized tables except when AUTOESTSPACE(YES) is specified in a REORG TABLESPACE invocation.

FOR UPDATE *smallint*

Specifies the percentage of space to reserve as free space on each page, for use by subsequent update operations. The *smallint* value is an integer in the range -1 - 99. FOR UPDATE -1 specifies that 5% of free space is reserved initially, and the amount of free space is calculated automatically based on certain real-time statistics values. The first record on each page is always loaded without restriction.

An update operation might use more space, if it is available, than is specified by the PCTFREE or PCTFREE FOR UPDATE options.

The default FOR UPDATE value is controlled by the PCTFREE_UPD subsystem parameter.

The value is recorded in the PCTFREE_UPD column of the SYSIBM.SYSTABLEPART catalog table.

The sum of the values for PCTFREE *smallint* and FOR UPDATE *smallint* must be less than or equal to 99.

Related information:

Reserving free space for table spaces (Db2 Performance)
Reserving free spaces for indexes (Db2 Performance)

gbpcache-block

In a data sharing environment, specifies which pages of the table space or partition are written to the group buffer pool. In a non-data-sharing environment, you can specify GBPCACHE for a table space, but it is ignored. However, do not specify GBPCACHE for a table space in a work file database in either environment (data sharing or non-data-sharing).

GBPCACHE
Specifies pages of the table space or partition are written to the group buffer pool.

CHANGED
When there is inter-Db2 R/W interest on the table space or partition, updated pages are written to the group buffer pool. When there is no inter-Db2 R/W interest, the group buffer pool is not used. Inter-Db2 R/W interest exists when more than one member in the data sharing group has the table space or partition open, and at least one member has it open for update. GBPCACHE CHANGED is the default.

If the table space is in a group buffer pool that is defined to be used only for cross-invalidation (GBPCACHE NO), CHANGED is ignored and no pages are cached to the group buffer pool.

ALL
Indicates that pages are to be cached in the group buffer pool as they are read in from DASD.

Exception: In the case of a single updating Db2 when no other DB2s have any interest in the page set, no pages are cached in the group buffer pool.

If the table space is in a group buffer pool that is defined to be used only for cross-invalidation (GBPCACHE NO), ALL is ignored and no pages are cached to the group buffer pool.

NONE
Indicates that no pages are to be cached to the group buffer pool. Db2 uses the group buffer pool only for cross-invalidation.

If you specify NONE, the table space or partition must not be in recover pending status and must be in the stopped state when the CREATE TABLESPACE statement is executed.

The value of GBPCACHE for a particular partition is determined by the first of these choices that applies:

1. The GBPCACHE specified in the PARTITION clause for the partition. Do not use more than one *gbpcache-block* in any PARTITION clause.
2. The value specified in a *gbpcache-block* for the table space.
3. The default value CHANGED.

LOCKMAX
Specifies the maximum number of page or row locks an application process can hold simultaneously in the table space. If a program requests more than that number, locks are escalated. The page or row locks are released and the intent lock on the table space is promoted to S or X mode.

integer
Specifies the number of locks allowed before escalating, in the range 0 - 2147483647.

Zero (0) indicates that the number of locks on the table or table space are not counted and escalation does not occur.

SYSTEM
Indicates that the value of LOCKS PER TABLE(SPACE), on installation panel DSNTIPJ, specifies the maximum number of page or row locks a program can hold simultaneously in the table or table space.

The following table summarizes the results of specifying a LOCKSIZE value while omitting LOCKMAX.

LOCKSIZE	Resultant LOCKMAX
ANY	SYSTEM
TABLESPACE, TABLE, PAGE, ROW	0

If the lock size is TABLESPACE or TABLE, LOCKMAX must be omitted, or its operand must be 0.

locksize-block
Specifies the size of locks used for the table space, and thresholds for lock escalation in some cases.

LOCKSIZE
Specifies the size of locks used within the table space and, in some cases, also the threshold at which lock escalation occurs.

ANY
Specifies that Db2 can use any lock size.

In most cases, Db2 uses LOCKSIZE PAGE LOCKMAX SYSTEM. However, when the number of locks acquired for the table space exceeds the maximum number of locks allowed for a table space (the NUMLKTS subsystem parameter), the page locks are released and locking is set at the next higher level.

If the table space is segmented, the next higher level is the table. If the table space is segmented and not partitioned, the next higher level is the table. If the table space is partitioned, the next higher level is the partition.

TABLESPACE
Specifies table space locks.

TABLE
Specifies table locks. Use TABLE only for a segmented (non-UTS) table space. Do not use TABLE for a universal table space.

PAGE
Specifies page locks.

ROW
Specifies row locks.

LOGGED or NOT LOGGED
Specifies whether changes that are made to the data in the specified table space are recorded in the log. LOGGED and NOT LOGGED cannot be specified for table spaces in database DSNDB06, which contains the Db2 catalog. This setting applies to all tables that are created in the specified table space and to all indexes of those tables. XML table spaces and their indexes inherit the logging attribute from the associated base table space. Auxiliary indexes also inherit the logging attribute from the associated base table space.

LOGGED
Specifies that changes that are made to the data in the specified table space are recorded in the log.

LOGGED is the default.

NOT LOGGED
Specifies that changes that are made to data in the specified table space are not recorded in the log.

NOT LOGGED prevents undo and redo information from being recorded in the log; however, control information for the specified table space will continue to be recorded in the log.

MAXROWS *integer*
Specifies the maximum number of rows that Db2 will consider placing on each data page. The integer can range from 1 through 255. This value is considered for insert operations, LOAD, and REORG. For LOAD and REORG, the PCTFREE specification is considered before MAXROWS; therefore, fewer rows might be stored than the value you specify for MAXROWS.

If you do not specify MAXROWS, the default number of rows is 255.

MEMBER CLUSTER
Specifies that data inserted by an insert operation is not clustered by the implicit clustering index (the first index) or the explicit clustering index. Instead, Db2 chooses where to locate the data in the table space based on available space.

Do not specify MEMBER CLUSTER for segmented (non-UTS) table spaces.

TRACKMOD
Specifies whether Db2 tracks modified pages in the space map pages of the table space or partition.

YES
Db2 tracks changed pages in the space map pages to improve the performance of incremental image copy.

NO
Db2 does not track changed pages in the space map pages. It uses the LRSN value in each page to determine whether a page has been changed.

The value of TRACKMOD for a particular partition is given by the first of these choices that applies:

1. The TRACKMOD option specified in the PARTITION clause for that partition.
2. The TRACKMOD value specified in a *trackmod-block* at the table space level.
3. The default value specified by the IMPTKMOD subsystem parameter. For more information, see IMPTKMOD in macro DSN6SYSP (Db2 Installation and Migration).

USING block (for partitioned table spaces)
Each partition has its own USING clause; either one that you specify explicitly or one provided by default. Except as explained below, the meaning of the clause and the rules that apply to it are the same as for a nonpartitioned table space.

The USING clause for a particular partition is the first of these choices that can be found:

1. A USING clause in the PARTITION clause for the specific partition
2. A USING clause at the table space level
3. An implicit USING STOGROUP clause that identifies the default storage group of the database and accepts the defaults for PRIQTY, SECQTY, and ERASE

VCAT *catalog-name*
Indicates that the data set for the partition is managed by the user using the naming conventions set forth in *Db2 Administration Guide*. As was true for the nonpartitioned case, *catalog-name* identifies the catalog for the data set and supplies the first-level qualifier for the data set name.

One or more Db2 subsystems could share integrated catalog facility catalogs with the current server. To avoid the chance of having one of those subsystems attempt to assign the same name to different data sets, select a value for *catalog-name* that is not used by the other Db2 subsystems.

USING VCAT must not be specified for a partition-by-growth table space.

Db2 assumes one and only one data set for each partition.

STOGROUP *stogroup-name*
Indicates that Db2 will create a data set for the partition with the aid of a storage group named *stogroup-name*. The data set is defined during the execution of this statement. Db2 assumes one and only one data set for each partition.

The *stogroup-name* must identify a storage group that exists at the current server and the privilege set must include SYSADM authority, SYSCTRL authority, or the USE privilege for the storage group. The integrated catalog facility catalog used for the storage group must not contain an entry for that data set.

When USING STOGROUP is specified for a partition, the defaults for PRIQTY, SECQTY, and ERASE are the values specified in the USING STOGROUP clause that is not in any PARTITION clause. If that USING STOGROUP clause is not specified, the defaults are those specified in the description of PRIQTY, SECQTY, and ERASE.

PRIQTY *integer*
Specifies the minimum primary space allocation for a Db2-managed data set. *integer* must be a positive integer, or -1. In general, when you specify PRIQTY with a positive integer value, the primary space allocation is at least *n* kilobytes, where *n* is the value of *integer*. However, the following exceptions exist:

- For 4KB page sizes, if *integer* is greater than 0 and less than 200, *n* is 200.
- For 8KB page sizes, if *integer* is greater than 0 and less than 400, *n* is 400.

- For 16KB page sizes, if *integer* is greater than 0 and less than 800, *n* is 800.
- For 32KB page sizes, if *integer* is greater than 0 and less than 1600, *n* is 1600.
- For any page size, if *integer* is greater than 67108864, *n* is 67108864.

If you do not specify PRIQTY, or specify PRIQTY with a value of -1, Db2 uses a default value for the primary space allocation; for information on how Db2 determines the default value, see Rules for primary and secondary space allocation.

If you specify PRIQTY, and do not specify a value of -1, Db2 specifies the primary space allocation to access method services using the smallest multiple of *p* KB not less than *n*, where *p* is the page size of the table space. The allocated space can be greater than the amount of space requested by Db2. For example, it could be the smallest number of tracks that will accommodate the request. The amount of storage space requested must be available on some volume in the storage group based on VSAM space allocation restrictions. Otherwise, the primary space allocation will fail. To more closely estimate the actual amount of storage, see DEFINE CLUSTER command (DFSMS Access Method Services for Catalogs).

Executing this statement causes only one data set to be created. However, you might have more data than this one data set can hold. Db2 automatically defines more data sets when they are needed. Regardless of the value in PRIQTY, when a data set reaches its maximum size, Db2 creates a new one. To enable a data set to reach its maximum size without running out of extents, it is recommended that you allow Db2 to automatically choose the value of the secondary space allocations for extents.

If you do choose to explicitly specify SECQTY, to avoid wasting space, use the following formula to make sure that PRIQTY and its associated secondary extent values do not exceed the maximum size of the data set:

```
PRIQTY + (number of extents * SECQTY) <= DSSIZE (implicit or explicit)
```

SECQTY *integer*

Specifies the minimum secondary space allocation for a Db2-managed data set. *integer* must be a positive integer, 0, or -1. If you do not specify SECQTY, or specify SECQTY with a value of -1, Db2 uses a formula to determine a value. For information on the actual value that is used for secondary space allocation, whether you specify a value or not, see Rules for primary and secondary space allocation.

If you specify SECQTY, and do not specify a value of -1, Db2 specifies the secondary space allocation to access method services using the smallest multiple of *p* KB not less than *integer*, where *p* is the page size of the table space. The allocated space can be greater than the amount of space requested by Db2. For example, it could be the smallest number of tracks that will accommodate the request. To more closely estimate the actual amount of storage, see DEFINE CLUSTER command (DFSMS Access Method Services for Catalogs).

ERASE

Indicates whether the Db2-managed data sets for the table space are to be erased when they are deleted during the execution of a utility or an SQL statement that drops the table space.

NO

Does not erase the data sets. Operations involving data set deletion will perform better than ERASE YES. However, the data is still accessible, though not through Db2. This is the default.

YES

Erases the data sets. As a security measure, Db2 overwrites all data in the data sets with zeros before they are deleted.

USING block (for nonpartitioned table spaces)

For nonpartitioned table spaces, the USING clause indicates whether the data set for the table space is defined by you or by Db2. If Db2 is to define the data set, the clause also gives space allocation parameters and an erase rule.

If you omit USING, Db2 defines the data sets using the default storage group of the database and the defaults for PRIQTY, SECQTY, and ERASE.

VCAT *catalog-name*

Specifies that the first data set for the table space is managed by the user, and following data sets, if needed, are also managed by the user.

The data sets are linear VSAM data sets cataloged in the integrated catalog facility catalog that *catalog-name* identifies. For more information about *catalog-name* values, see "Naming conventions" on page 77.

More than one Db2 subsystem can share the integrated catalog facility catalogs with the current server. To avoid the chance of those subsystems attempting to assign the same name to different data sets, specify a *catalog-name* value that is not used by the other Db2 subsystems.

VCAT must not be specified if MAXPARTITIONS is also specified.

STOGROUP *stogroup-name*

Specifies that Db2 will define and manage the data sets for the table space. Each data set will be defined on a volume of the identified storage group. The values specified (or the defaults) for PRIQTY and SECQTY determine the primary and secondary allocations for the data set. The storage group supplies the name of a volume for the data set and the first-level qualifier for the data set name. The first-level qualifier is also the name of, or an alias[36] for, the integrated catalog facility catalog on which the data set is to be cataloged. The naming conventions for the data set are the same as if the data set is managed by the user. As was mentioned above for VCAT, the first-level qualifier could cause naming conflicts if the local Db2 can share integrated catalog facility catalogs with other Db2 subsystems.

stogroup-name must identify a storage group that exists at the current server. SYSADM or SYSCTRL authority, or the USE privilege on the storage group, is required.

The description of the storage group must include at least one volume serial number, or it must indicate that the choice of volumes is left to Storage Management Subsystem (SMS). If volume serial numbers appear in the description, each must identify a volume that is accessible to z/OS for dynamic allocation of the data set, and all identified volumes must be of the same device type.

The integrated catalog facility catalog used for the storage group must not contain an entry for the first data set of the table space. If the integrated catalog facility catalog is password protected, the description of the storage group must include a valid password.

PRIQTY *integer*

Specifies the minimum primary space allocation for a Db2-managed data set. *integer* must be a positive integer, or -1. In general, when you specify PRIQTY with a positive integer value, the primary space allocation is at least *n* kilobytes, where *n* is the value of *integer*. However, the following exceptions exist:

- For 4KB page sizes, if *integer* is greater than 0 and less than 200, *n* is 200.
- For 8KB page sizes, if *integer* is greater than 0 and less than 400, *n* is 400.
- For 16KB page sizes, if *integer* is greater than 0 and less than 800, *n* is 800.
- For 32KB page sizes, if *integer* is greater than 0 and less than 1600, *n* is 1600.
- For any page size, if *integer* is greater than 67108864, *n* is 67108864.

If you do not specify PRIQTY, or specify PRIQTY with a value of -1, Db2 uses a default value for the primary space allocation; for information on how Db2 determines the default value, see Rules for primary and secondary space allocation.

If you specify PRIQTY, and do not specify a value of -1, Db2 specifies the primary space allocation to access method services using the smallest multiple of *p* KB not less than *n*, where *p* is the page size of the table space. The allocated space can be greater than the amount of space requested by Db2. For example, it could be the smallest number of tracks

[36] The alias of an integrated catalog facility catalog.

that will accommodate the request. The amount of storage space requested must be available on some volume in the storage group based on VSAM space allocation restrictions. Otherwise, the primary space allocation will fail. To more closely estimate the actual amount of storage, see DEFINE CLUSTER command (DFSMS Access Method Services for Catalogs).

Executing this statement causes only one data set to be created. However, you might have more data than this one data set can hold. Db2 automatically defines more data sets when they are needed. Regardless of the value in PRIQTY, when a data set reaches its maximum size, Db2 creates a new one. To enable a data set to reach its maximum size without running out of extents, it is recommended that you allow Db2 to automatically choose the value of the secondary space allocations for extents.

If you do choose to explicitly specify SECQTY, to avoid wasting space, use the following formula to make sure that PRIQTY and its associated secondary extent values do not exceed the maximum size of the data set:

```
PRIQTY + (number of extents * SECQTY) <= DSSIZE (implicit or explicit)
```

SECQTY *integer*

Specifies the minimum secondary space allocation for a Db2-managed data set. *integer* must be a positive integer, 0, or -1. If you do not specify SECQTY, or specify SECQTY with a value of -1, Db2 uses a formula to determine a value. For information on the actual value that is used for secondary space allocation, whether you specify a value or not, see Rules for primary and secondary space allocation.

If you specify SECQTY, and do not specify a value of -1, Db2 specifies the secondary space allocation to access method services using the smallest multiple of *p* KB not less than *integer*, where *p* is the page size of the table space. The allocated space can be greater than the amount of space requested by Db2. For example, it could be the smallest number of tracks that will accommodate the request. To more closely estimate the actual amount of storage, see DEFINE CLUSTER command (DFSMS Access Method Services for Catalogs).

ERASE

Indicates whether the Db2-managed data sets for the table space are to be erased when they are deleted during the execution of a utility or an SQL statement that drops the table space.

NO

Does not erase the data sets. Operations involving data set deletion will perform better than ERASE YES. However, the data is still accessible, though not through Db2. This is the default.

YES

Erases the data sets. As a security measure, Db2 overwrites all data in the data sets with zeros before they are deleted.

The components of the USING block are discussed separately for nonpartitioned table spaces and partitioned table spaces. If you omit USING, the default storage group of the database must exist.

Notes

Table space types:

The following table lists the type of table space depending on the specification of the MAXPARTITIONS, NUMPARTS, and SEGSIZE clauses.

Table 197. Table space types and related clauses

Table space type to create	Clauses to specify
Partition-by-growth	Any of the following combinations: • MAXPARTITIONS and NUMPARTS • MAXPARTITIONS and SEGSIZE *n*"1" on page 1590 • MAXPARTITIONS
Partition-by-range	NUMPARTS and SEGSIZE *n*"1" on page 1590
Segmented (non-UTS) "2" on page 1590	One of the following combinations: • SEGSIZE *n*"1" on page 1590 • Omit MAXPARTITIONS, NUMPARTS, and SEGSIZE
Partitioned (non-UTS) "2" on page 1590	NUMPARTS and SEGSIZE 0

Notes:

1. Where *n* is a non-zero value. The DPSEGSZ subsystem parameter determines the default value. For more information, see DEFAULT PARTITION SEGSIZE field (DPSEGSZ subsystem parameter) (Db2 Installation and Migration).
2. Non-UTS table spaces for base tables are deprecated and likely to be unsupported in the future.

DSSIZE value greater than 4 G:
For any DSSIZE value greater than 4 G, the data sets for the table space must be associated with a DFSMS data class that is specified with extended format and extended addressability.

Applications that use currently committed access with table spaces that specify LOCKSIZE PAGE:
To ensure that readers of data in a table space that is defined with LOCKSIZE PAGE can always access currently committed data, set MAXROWS to 8 or less. If MAXROWS is greater than 8, readers might need to wait for insert or delete operations on tables in the table space to commit before the readers can access rows in the tables.

Related links: Accessing currently committed data to avoid lock contention (Db2 Performance)

Table spaces in a work file database:
If MAXPARTITIONS is specified for a table space in a work file database, the table space is a partition-by-growth table space.If MAXPARTITIONS is not specified for a table space in a work file database, the table space is a segmented (non-UTS) table space.

The following restrictions apply to table spaces created in a work file database:

- They can be created for another member only if both the executing Db2 subsystem and the other member can access the work file data sets. That is required whether the data sets are user-managed or in a Db2 storage group.
- They cannot use 8 KB or 16 KB page sizes. (The buffer pool in which you define the table space determines the page size. For example, a table space that is defined in a 4 KB buffer pool has 4 KB page sizes.)
- When you create a table space in a work file database, the following clauses are not allowed:

  CCSID
  COMPRESS
  CLOSE YES
  DEFINE NO
  DSSIZE (unless MAXPARITIONS is also specified)
  FREEPAGE
  GBPCACHE

LARGE
LOCKPART
LOCKSIZE
LOGGED
MAXROWS
MEMBER CLUSTER
NOT LOGGED
NUMPARTS (unless MAXPARITIONS is also specified)
PCTFREE
SEGSIZE (SEGSIZE 16 is always used)
TRACKMOD

Table spaces for declared temporary tables:
Declared temporary tables and sensitive static scrollable cursors must reside in segmented table spaces in the work file database. At least one table space with a 32KB page size must exist in the work file database before a declared temporary table can be defined and used or before sensitive static scrollable cursors are opened.

Table spaces in the work file database are shared by work files, created and declared global temporary tables and sensitive static scrollable cursor result tables. You cannot specify which table space is to be used for any specific object.

When you create table spaces in the work file database, it is recommended that you give each table space the same segment size, with the same minimum primary and secondary space allocation values for the data sets, to maximize the use of all the table spaces for all objects in all application processes.

Table space row formats:
Depending on the value of the RRF subsystem parameter, newly created table spaces will be in either re-ordered row format or basic row format. When the value of the RRF parameter is ENABLE, table spaces will be created in re-ordered row format. When the value of the RRF parameter is DISABLE, newly created table spaces will be created in basic row format. This includes universal table spaces, except for XML table spaces and hash table spaces, which are always created in re-ordered row format, regardless of the value of the RRF parameter.

Rules for primary and secondary space allocation:
You can specify the primary and secondary space allocation or let Db2 choose them. Having Db2 choose the values, especially the secondary space quantity, increases the possibility of reaching the maximum data set size before running out of extents. For more information, see Rules for primary and secondary space allocation (Introduction to Db2 for z/OS).

Maximum number of partitions and table space size
The following tables show how the maximum number of partitions and the total table space size depend on the buffer pool page size and DSSIZE value, with 5-byte extended addressability (EA) storage."1" on page 1593

4 KB page size

Table 198. Maximum number of partitions and table space size by DSSIZE, with 4 KB page size

DSSIZE	Maximum number of partitions	Total table space size
1G	4096	4 TB
2G	4096	8 TB
4G	4096	16 TB
8G	2048	16 TB
16G	1024	16 TB

Table 198. Maximum number of partitions and table space size by DSSIZE, with 4 KB page size (continued)

DSSIZE	Maximum number of partitions	Total table space size
32G	512	16 TB
64G	256	16 TB
128G	128	16 TB
256G	64	16 TB

8 KB page size

Table 199. Maximum number of partitions and table space size by DSSIZE, with 8 KB page size

DSSIZE	Maximum number of partitions	Total table space size
1G	4096	4TB
2G	4096	8TB
4G	4096	16TB
8G	4096	32TB
16G	2048	32TB
32G	1024	32TB
64G	512	32TB
128G	256	32TB
256G	128	32TB

16 KB page size

Table 200. Maximum number of partitions and table space size by DSSIZE, with 16 KB page size

DSSIZE	Maximum number of partitions	Total table space size
1G	4096	4 TB
2G	4096	8 TB
4G	4096	16 TB
8G	4096	32 TB
16G	4096	64 TB
32G	2048	64 TB
64G	1024	64 TB
128G	512	64 TB
256G	256	64 TB

32 KB page size

Table 201. Maximum number of partitions and table space size by DSSIZE, with 32 KB page size

DSSIZE	Maximum number of partitions	Total table space size
1G	4096	4 TB
2G	4096	8 TB
4G	4096	16 TB
8G	4096	32 TB
16G	4096	64 TB
32G	4096	128 TB
64G	2048	128 TB
128G	1024	128 TB
256G	512	128 TB

Notes:

1. For 5-byte non-EA storage, the maximum values for 4 KB page size are DSSIZE 4 G, 4096 partitions, and 16 TB for total table space.

Alternative syntax and synonyms:

For compatibility with previous releases of Db2, the following keywords are supported:

- You can specify the LOCKPART clause, but it has no effect. Db2 treats all table spaces as if they were defined as LOCKPART YES. LOCKPART YES specifies the use of selective partition locking. When all the conditions for selective partition locking are met, Db2 locks only the partitions that are accessed. When the conditions for selective partition locking are not met, Db2 locks every partition of the table space.

  LOCKSIZE TABLESPACE and LOCKPART YES are mutually exclusive.
- When creating a partitioned table space, you can specify PART as a synonym for PARTITION.
- When specifying the logging attributes for a table space, you can specify LOG YES as a synonym for LOGGED, and you can specify LOG NO as a synonym for NOT LOGGED.
- DSSIZE is the preferred clause for specifying the partition size, however you can specify the CREATE LARGE TABLESPACE when creating partitioned table spaces.

Although these keywords are supported as alternatives, they are not the preferred syntax.

Examples

Example 1: using a storage group for a segmented (non-UTS) table space

Create a table space DSN8S11D in database DSN8D11A. Let Db2 define the data sets, using storage group DSN8G110. The primary space allocation is 52 kilobytes; the secondary, 20 kilobytes. The data sets need not be erased before they are deleted.

Locking on tables in the space is to take place at the page level. Associate the table space with buffer pool BP1. The data sets can be closed when no one is using the table space.

```
CREATE TABLESPACE DSN8S11D
  IN DSN8D11A
  USING STOGROUP DSN8G110
    PRIQTY 52
    SECQTY 20
    ERASE NO
  LOCKSIZE PAGE
```

```
  BUFFERPOOL BP1
  CLOSE YES;
```

For the above example, the underlying data sets for the table space will be created immediately, which is the default (DEFINE YES). If you want to defer the creation of the data sets until data is first inserted into the table space, you would specify DEFINE NO instead of accepting the default behavior.

Because the CREATE TABLESPACE statement omits the NUMPARTS and MAXPARTITIONS clauses, the resulting table spaces is a segmented (non-UTS) table space.

Example 2: partition options for a range-partitioned table space

Assume that a large query database application uses a table space to record historical sales data for marketing statistics. Create large table space SALESHX in database DSN8D11A for the application. Create it with 82 partitions, specifying that the data in partitions 80 through 82 is to be compressed.

Let Db2 define the data sets for all the partitions in the table space, using storage group DSN8G110. For each data set, the primary space allocation is 4000 kilobytes, and the secondary space allocation is 130 kilobytes. Except for the data set for partition 82, the data sets do not need to be erased before they are deleted.

Locking on the table is to take place at the page level. There can only be one table in a partitioned table space. Associate the table space with buffer pool BP1. The data sets cannot be closed when no one is using the table space. If there are no CLOSE YES data sets to close, Db2 might close the CLOSE NO data sets when the DSMAX is reached.

```
CREATE TABLESPACE SALESHX
  IN DSN8D11A
  USING STOGROUP DSN8G110
    PRIQTY 4000
    SECQTY 130
    ERASE NO
  NUMPARTS 82
  (PARTITION 80
    COMPRESS YES,
   PARTITION 81
    COMPRESS YES,
   PARTITION 82
    COMPRESS YES
    ERASE YES)
  LOCKSIZE PAGE
  BUFFERPOOL BP1
  CLOSE NO;
```

Because the CREATE TABLESPACE statement specifies a NUMPARTS clause and no MAXPARTITIONS or SEGSIZE clause, the type of table space created depends on the value of the DPSEGSZ subsystem parameter. If the DPSEGSZ value is greater than 0 (the default is 32) a partition-by-range table space is created. If DPSEGSZ value is 0, a partitioned (non-UTS) table space is created.

Example 3: partition-by-range table space

The following example creates a partition-by-range table space, TS1, in database DSN8D11A using storage group DSN8G110. The table space has 16 pages per segment and has 55 partitions. It specifies LOCKSIZE ANY.

```
CREATE TABLESPACE TS1
  IN DSN8D11A
  USING STOGROUP DSN8G110
  NUMPARTS 55
  SEGSIZE 16
  LOCKSIZE ANY;
```

Example 4: partition-by-range table space

The following example creates a partition-by-range table space, TS2, in database DSN8D11A using storage group DSN8G110. The table space has 64 pages per segment and has seven defer-defined partitions, where every other partition is compressed.

```
CREATE TABLESPACE TS2
  IN DSN8D11A
  USING STOGROUP DSN8G110
```

```
    NUMPARTS 7
    (
     PARTITION 1 COMPRESS YES,
     PARTITION 3 COMPRESS YES,
     PARTITION 5 COMPRESS YES,
     PARTITION 7 COMPRESS YES
    )
    SEGSIZE 64
    DEFINE NO;
```

Example 5: partition-by-growth table space

The following example creates a partition-by-growth table space that has a maximum size of 2 GB for each partition, four pages per segment with a maximum of 24 partitions for the table space.

```
CREATE TABLESPACE TS01TS IN TS01DB USING STOGROUP SG1
  DSSIZE 2G
  MAXPARTITIONS 24
  LOCKSIZE ANY
  SEGSIZE 4;
```

Related information

Implementing Db2 table spaces (Db2 Administration Guide)

CREATE TRIGGER

The CREATE TRIGGER statement defines a trigger in a schema and builds a trigger package at the current server. Each time that the trigger activates, the trigger package executes one or more times.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

- The CREATEIN privilege on the schema
- SYSADM or SYSCTRL authority
- System DBADM

In defining a trigger on a table, the privilege set that is defined below must include SYSADM authority or each of the following:

- The SELECT privilege on the table on which the trigger is defined, if the REFERENCING clause is included in the trigger definition
- The SELECT privilege on any table or view in the *search-condition* of the *triggered-action*
- The necessary privileges to invoke the triggered SQL statements in the triggered action
- The authorization to define a trigger on the table, which must include at least one of the following:
  - The TRIGGER privilege on the table on which the trigger is defined
  - The ALTER privilege on the table on which the trigger is defined
  - DBADM authority on the database that contains the table
  - SYSCTRL authority
  - System DBADM authority

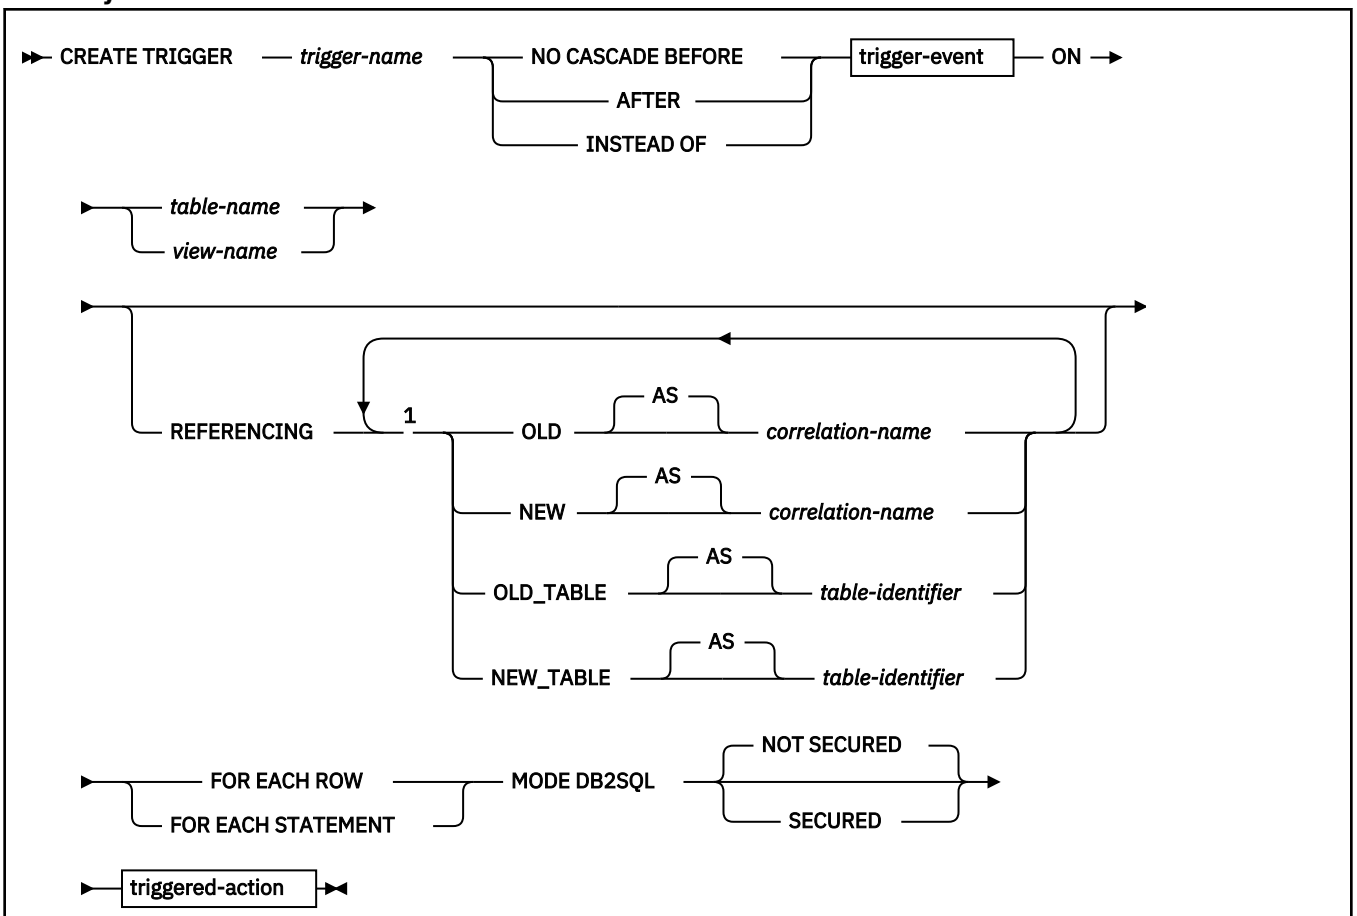
If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

In defining a trigger on a view, the privilege set that is defined below must include SYSADM authority or each of the following:

- The SELECT privilege on the view on which the trigger is defined, if the REFERENCING clause is included in the trigger definition
- The SELECT privilege on any table or view in the *search-condition* of the *triggered-action*
- The necessary privileges to invoke the triggered SQL statements in the triggered action
- The authorization to define a trigger on the view, which must include at least one of the following:
  - Ownership of the view on which the trigger is defined
  - SYSCTRL authority
  - System DBADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the owner is a role, the implicit schema match does not apply and this role needs to include one of the previously listed conditions.

If the statement is dynamically prepared and is not running in a trusted context for which the ROLE AS OBJECT OWNER clause is specified, the privilege set is the set of privileges that are held by the SQL authorization ID of the process. The specified trigger name can include a schema name (a qualifier). If the schema name is not the same as the SQL authorization ID of the process, one of the following conditions must be met:

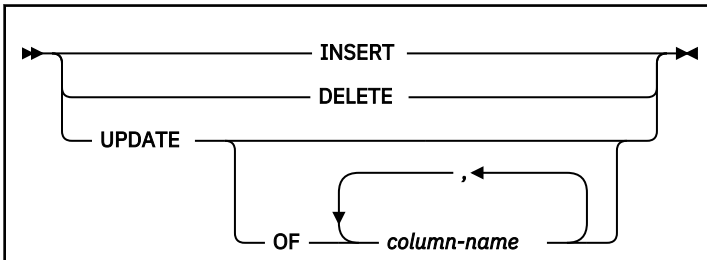


- The privilege set includes SYSADM or SYSCTRL authority.
- The SQL authorization ID of the process has the CREATEIN privilege on the schema.

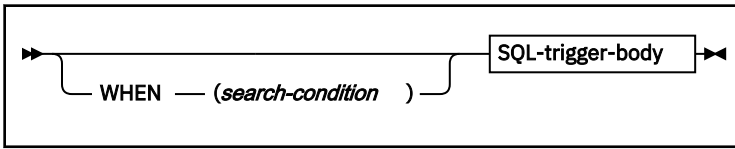
If the SECURED option is specified, at least one of the following privileges is required:

- SECADM authority
- CREATE_SECURE_OBJECT privilege

Note: If the SEPARATE SECURITY subsystem parameter is set to NO, SYSADM authority has implicit SECADM authority.

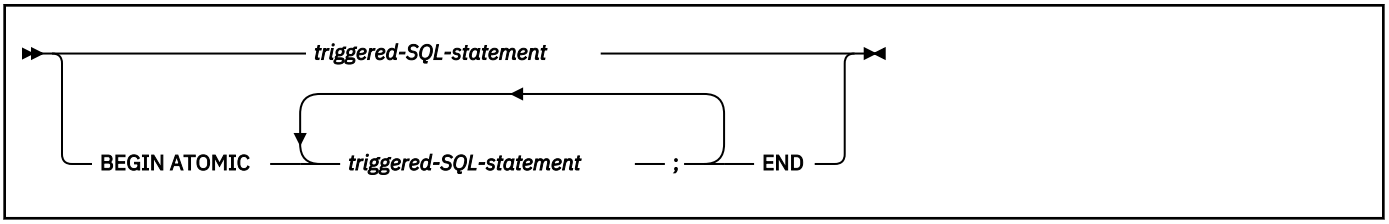


Syntax



Notes:

[1] The same clause must not be specified more than one time.



trigger-event

triggered-action

SQL-trigger-body

Description

trigger-name
Names the trigger. The name, including the implicit or explicit schema name, must not identify a trigger that exists at the current server.

The name is also used to create the trigger package; therefore, the name must also not identify a package that is already described in the catalog. The schema name becomes the collection-id of the trigger package. Although *trigger-name* can be specified as an ordinary or delimited identifier, the name should conform to the rules for an ordinary identifier. Refer to The implicitly created trigger package for additional information.

The schema name can be 'SYSTOOLS' if the privilege set includes the SYSCTRL privilege. Otherwise, the schema name must not begin with 'SYS' unless the schema name is 'SYSADM', 'SYSIBMADM', or 'SYSPROC'.

NO CASCADE BEFORE
Specifies that the trigger is a before trigger. Db2 executes the triggered action before it applies any changes caused by an insert, delete, or update operation on the subject table. It also specifies that the triggered action does not activate other triggers because the triggered action of a before trigger cannot contain any updates.

NO CASCADE BEFORE must not be specified when *view-name* is also specified. FOR EACH ROW must be specified for a BEFORE trigger.

AFTER
Specifies that the trigger is an after trigger. Db2 executes the triggered action after it applies any changes caused by an insert, delete, or update operation on the subject table. AFTER must not be specified if *view-name* is also specified.

INSTEAD OF
Specifies that the trigger is an instead of trigger. The associated triggered action replaces the action against the subject view. Only one INSTEAD OF trigger is allowed for each type of operation on a given subject view. Db2 executes the *triggered-action* instead of the insert, update, or delete operation on the subject view.

INSTEAD OF must not be specified when *table-name* is also specified. The WHEN clause can not be specified for an INSTEAD OF trigger. FOR EACH STATEMENT must not be specified for an INSTEAD OF trigger.

ON *table-name*
Identifies the subject table of the BEFORE or AFTER trigger definition. The name must identify a base table that exists at the current server. It must not identify a materialized query table, a clone table, a temporary table, an auxiliary table, an alias, a synonym, a real-time statistics table, an accelerator-only table, a catalog table, or a directory table.

ON *view-name*
Identifies the subject view of the INSTEAD OF trigger definition. The name must identify a view that exists at the current server.

view-name must not specify a view where any of the following conditions are true:

- The view is defined with the WITH CASCADED CHECK option (a symmetric view)
- The view on which a symmetric view has been defined
- The view references data that is encoded with different encoding schemes or CCSID values

- The view has a column that is a ROWID column
- The view has a column that is based on an underlying column of any of the following types:
  - A LOB, XML, or ROWID column
  - An identity column
  - A security label column
  - A row change timestamp column
  - A row-begin column
  - A row-end column
  - A transaction start ID column
- The view has columns that have field procedures
- All of the underlying tables of the view are catalog tables
- All of the underlying tables of the view are created global temporary tables
- All of the underlying tables of the view are clone tables
- The view has other views that are dependent on it

REFERENCING
Specifies the correlation names for the transition variables and the table names for the transition tables. For the rows in the subject table that are modified by the triggering SQL operation (insert, delete, or update), a correlation name identifies the columns of a specific row. *table-identifiers* identify the complete set of affected rows. Transition variables with XML types cannot be referenced inside of a trigger. If the column of a transition table is referenced, the data type of the column cannot be XML.

Each row that is affected by the triggering SQL operation is available to the triggered action by qualifying column names with *correlation-names* that are specified as follows:

OLD AS *correlation-name*
Specifies the correlation name that identifies the values in the row prior to the triggering SQL operation.

NEW AS *correlation-name*
Specifies the correlation name that identifies the values in the row as modified by the triggering SQL operation and by any SET statement in a before trigger that has already been executed.

The complete set of rows that are affected by the triggering operation is available to the triggered action by using *table-identifiers* that are specified as follows:

OLD_TABLE AS *table-identifier*
Specifies the name of a temporary table that identifies the values in the complete set of rows that are modified rows by the triggering SQL operation prior to any actual changes.

NEW_TABLE AS *table-identifier*
Specifies the name of a temporary table that identifies the values in the complete set of rows as modified by the triggering SQL operation and by any SET statement in a before trigger that has already been executed.

Only one OLD and one NEW *correlation-name* can be specified for a trigger. Only one OLD_TABLE and one NEW_TABLE *table-identifier* can be specified for a trigger. All of the *correlation-names* and *table-identifiers* must be unique from one another.

Table 202 on page 1600 summarizes the allowable combinations of transition variables and transition tables that you can specify for the various trigger types. The OLD *correlation-name* and the OLD_TABLE *table-identifier* are valid only if the triggering event is either a delete operation or an update operation. For a delete operation, the OLD *correlation-name* captures the values of the columns in the deleted row, and the OLD_TABLE *table-identifier* captures the values in the set of deleted rows. For an update operation, the OLD *correlation-name* captures the values of the columns of a row before the update operation, and the OLD_TABLE *table-identifier* captures the values in the set of updated rows.

The NEW *correlation-name* and the NEW_TABLE *table-identifier* are valid only if the triggering event is either an insert operation or an update operation. For both operations, the NEW *correlation-name* captures the values of the columns in the inserted or updated row and the NEW_TABLE *table-identifier* captures the values in the set of inserted or updated rows. For BEFORE triggers, the values of the updated rows include the changes from any SET statements in the triggered action of BEFORE triggers.

Table 202. Allowable combinations of attributes in a trigger definition

Granularity	Activation time	Triggering SQL operation	Transition variables allowed"1" on page 1600	Transition tables allowed"1" on page 1600
FOR EACH ROW	BEFORE	DELETE	OLD	None
		INSERT	NEW	None
		UPDATE	OLD, NEW	None
	AFTER	DELETE	OLD	OLD_TABLE
		INSERT	NEW	NEW_TABLE
		UPDATE	OLD, NEW	OLD_TABLE, NEW_TABLE
	INSTEAD OF	DELETE	OLD	OLD_TABLE
		INSERT	NEW	NEW_TABLE
		UPDATE	OLD, NEW	OLD_TABLE, NEW_TABLE
FOR EACH STATEMENT	AFTER	DELETE	None	OLD_TABLE
		INSERT	None	NEW_TABLE
		UPDATE	None	OLD_TABLE, NEW_TABLE

Note:

1. If a transition table or variable is referenced where it is not allowed, an error is returned.

A transition variable that has a character data type inherits the subtype and CCSID of the column of the subject table. During the execution of the triggered action, the transition variables are treated like host variables. Therefore, character conversion might occur. However, unlike a host variable, a transition variable can have the bit data attribute, and character conversion never occurs for bit data. A transition variable is considered to be bit data if the column of the table to which it corresponds is bit data.

You cannot modify a transition table; transition tables are read-only. Although a transition table does not inherit any edit or validation procedures from the subject table, it does inherit the encoding scheme and field procedures of the subject table.

The scope of each *correlation-name* and each *table-identifier* is the entire trigger definition.

FOR EACH ROW or FOR EACH STATEMENT
Specifies the conditions for which Db2 executes the triggered action.

FOR EACH ROW
Specifies that Db2 executes the triggered action for each row of the subject table that the triggering SQL operation modifies. If the triggering SQL operation does not modify any rows, the triggered action is not executed.

FOR EACH STATEMENT
Specifies that Db2 executes the triggered action only one time for the triggering operation. Even if the triggering operation does not modify or delete any rows, the triggered action is executed one time.

FOR EACH STATEMENT must not be specified for a BEFORE or INSTEAD OF trigger.

MODE DB2SQL
Specifies the mode of the trigger. MODE DB2SQL triggers are activated after all of the row operations have occurred.

NOT SECURED or SECURED
Specifies whether the trigger is considered secure. NOT SECURED is the default.

SECURED
Specifies the trigger is considered secure.

SECURED must be specified for a trigger if its subject table is using row access control or column access control. SECURED must also be specified for a trigger that is created for a view and one or more of the underlying tables in the view definition is using row access control or column access control.

NOT SECURED
Specifies the trigger is considered not secure.

NOT SECURED must not be specified for a trigger whose subject table is using row access control or column access control. NOT SECURED must also not be specified for a trigger that is created for a view and one or more of the underlying tables in the view definition is using row access control or column access control.

trigger-event
Specifies that the triggered action that is associated with the trigger is to be executed when the trigger event is applied to the subject table or view.

INSERT
Specifies that the trigger is an insert trigger. Db2 executes the triggered action whenever there is an insert operation on the subject table. However, if the insert trigger is defined on any explain table, and the insert operation was caused by Db2 adding a row to the table, the triggered action is not to be executed.

DELETE
Specifies that the trigger is a delete trigger. Db2 executes the triggered action whenever there is a delete operation on the subject table.

UPDATE
Specifies that the trigger is an update trigger. Db2 executes the triggered action whenever there is an update operation on the subject table.

If you do not specify a list of column names, an update operation on any column of the subject table, including columns that are subsequently added with the ALTER TABLE statement, activates the triggered action.

OF *column-name,...*
Each *column-name* that you specify must be a column of the subject table and must appear in the list only once. An update operation on any of the listed columns activates the triggered action.

UPDATE OF *column-name* cannot be specified for an INSTEAD OF trigger.

triggered-action
Specifies the action to be performed when the trigger is activated. The *triggered-action* is composed of one or more SQL statements and an optional condition that controls whether the statements are executed.

WHEN (*search-condition*)
Specifies a condition that evaluates to true, false, or unknown. The triggered SQL statements are executed only if the *search-condition* evaluates to true. If the WHEN clause is omitted, the associated SQL statements are always executed.

The WHEN clause must not be specified for an INSTEAD OF trigger.

search-condition must not reference the following items:

- A system-period temporal table if the trigger package is generated with the SYSTIMESENSITIVE(YES) bind option
- An archive-enabled table if the trigger package is generated with the ARCHIVESENSITIVE(YES) bind option

SQL-trigger-body
Specifies the SQL statements that are to be executed for the triggered action.

triggered-SQL-statement
Specifies the SQL statements that can be specified as the only statement in a trigger body.

BEGIN ATOMIC *triggered-SQL-statement,...* END
Specifies a list of SQL statements that are to be executed for the triggered action. The statements are executed in the order in which they are specified.

Only certain SQL statements can be specified in the *SQL-trigger-body*.

Table 203. Allowable SQL statements

	Trigger activation time		
SQL statement	**BEFORE**	**AFTER**	**INSTEAD OF**
CALL	X	X	X
DELETE (searched)		X	X
fullselect	X	X	X
INSERT		X	X
MERGE		X	X
REFRESH TABLE		X	X
SET transition variable	X		
SIGNAL	X	X	X
TRUNCATE		X	X
UPDATE (serached)		X	X
VALUES	X	X	X

The statements in the triggered action have these restrictions:

- They must not refer to host variables, parameter markers, undefined transition variables, or declared temporary tables.
- They must only refer to a table or view that is at the current server.
- They must only invoke a stored procedure or user-defined function that is at the current server. An invoked routine can, however, access a server other than the current server.
- They must not contain a fullselect that refers to the subject table if the trigger is defined as BEFORE.
- They must not modify a column that is part of a BUSINESS_TIME period.
- If the trigger is a before trigger:

- The trigger body must not contain a DELETE, INSERT, MERGE, REFRESH TABLE, TRUNCATE, UPDATE statement, or SELECT FROM *data-change-statement*, and must not reference a procedure or function that is defined as MODIFIES SQL DATA.
- The trigger body must not, directly or indirectly, issue a CALL statement for a procedure containing one of the following statements:
  - ALTER
  - COMMENT
  - CREATE
  - DELETE
  - DROP
  - EXCHANGE
  - GRANT
  - LABEL
  - LOCK TABLE
  - MERGE
  - REFRESH TABLE
  - RENAME
  - REVOKE
  - TRUNCATE
  - UPDATE

A CREATE TRIGGER statement cannot contain a hexadecimal graphic string (GX) constant.

The triggered action can refer to the values in the set of affected rows. This action is supported through the use of transition variables and transition tables.

All tables, views, aliases, sequences, roles, user-defined data types, user-defined functions, and procedures referenced in the *triggered-action* must exist at the current server when the version of the trigger is defined. The table or view that an alias refers to must also exist when the version of the trigger is defined.

Notes

Owner privileges:
When an INSTEAD OF trigger is defined, the associated privilege (INSERT, UPDATE, or DELETE on the view) is given to the owner of the view. The owner is granted the privilege with the ability to grant that privilege to others. For more information about ownership of an object, see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

Execution authorization:
The user executing the triggering SQL operation does not need authority to execute a *SQL-trigger-body*. An *SQL-trigger-body* executes using the authority of the owner of the trigger.

Activating a trigger:
Only insert, delete, or update operations can activate a trigger. The activation of a trigger might cause trigger cascading.*Trigger cascading* is the result of the activation of one trigger that executes SQL statements that cause the activation of other triggers or even the same trigger again. The triggered actions might also cause updates as a result of the original modification, which can result in the activation of additional triggers. With trigger cascading, a significant chain of triggers might be activated, causing a significant change to the database as a result of a single insert, delete, or update operation.

Loading a table with the LOAD utility does not activate any triggers that are defined for the table if the SHRLEVEL NONE option is specified or accepted as the default. If the LOAD statement includes the SHRLEVEL CHANGE option, triggers are activated when loading a table with the LOAD utility.

Adding triggers to enforce constraints:
Adding a trigger on a table that already has rows in it will not cause the *triggered-action* to be executed. Thus, if the trigger is designed to enforce constraints on the data in the table, the data in the existing rows might not satisfy those constraints.

Multiple triggers:
Multiple triggers that have the same triggering SQL operation and activation time can be defined on a table. The triggers are activated in the order in which they were created. For example, the trigger that was created first is executed first; the trigger that was created second is executed second.

Transition variables and transition tables:
The *triggered-action* can refer to the values in the set of affected rows. This action is supported through the use of transition variables and transition tables.

A transition variable has the same name, data type, and nullability attribute as the corresponding column of the table that the trigger is defined on. A transition variable contains the value of a column in an affected row. A transition variable is qualified by a correlation name that identifies whether the reference is to the old value (before the update) or the new value (after the update). A transition variable can be referenced in the search condition, or in an SQL statement in the trigger body, wherever a variable would be allowed if the reference was made outside the body of a trigger. A new transition variable can be assigned a value in a before update or insert trigger. The values of the updated rows include the changes from any assignments to transition variables in the *triggered-action* of a before trigger.

A transition table contains the complete set of affected rows: either the old values (before the update) or the new values (after the update). A transition table is read-only, and can be referenced in the *triggered-action* of an after or instead of trigger. A column of a transition table has the same name, data type, and null attribute as the corresponding column of the table that the trigger is defined on. A transition table is referenced using an associated table identifier that allows the complete set of affected rows to be treated as a table. A transition table can be referenced in a search condition, or in an SQL statement in the trigger body, wherever a table would be allowed if the reference was made outside the body of a trigger. In addition, a transition table can be passed as an argument to a user-defined function or procedure, specifying the TABLE keyword before the table identifier for the transition table. When the function or procedure is invoked, a table locator is passed for the transition table.

A transition variable or transition table is not affected after being returned from a procedure invoked from within a triggered action regardless of whether the corresponding parameter was defined in the CREATE PROCEDURE statement as IN, INOUT, or OUT.

Considerations for implicitly hidden columns:
In the body of a trigger, a transition variable that corresponds to an implicitly hidden column can be referenced. A transition table, that corresponds to a table with an implicitly hidden column, includes that column as part of the transition table. Likewise, a transition variable will exist for the column that is defined as implicitly hidden. A transition variable that corresponds to an implicitly hidden column can be referenced in the body of a trigger.

Identifier resolution:
Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, a transition variable, or a global variable. If the name is not qualified or is qualified but is still ambiguous, the following rules describe how the name is resolved. If correlation names are specified for both old and new transition variables, a reference to a transition variable must be qualified with the associated correlation name. The name is resolved by checking for a match in the following order:

- If the tables and views specified in the trigger body exist at the time the trigger is created, the name is first checked as a column name at the current server. If the name is found as a column name, but the privilege set that is used to issue the CREATE statement does not have the proper authority to access the table or view, an error is returned.
- If the name is not found as a column, the name is checked as a transition variable name.
- If the name is not found as a transition variable, the name is checked as a global variable.

- If the name is still not resolved, an error is returned.

Considerations for transition variables in AFTER and INSTEAD OF triggers:
Transition variables cannot be modified in an AFTER or INSTEAD OF trigger.

Invalidation of packages:
This statement might invalidate all packages that depend on target objects, and sometimes other related objects through cascading effects, depending on the clauses and keywords specified and other factors. For more information, see Changes that invalidate packages (Db2 Application programming and SQL).

Invalidation of cached dynamic SQL statements:
This statement might invalidate cached dynamic SQL statements that depend on target objects, and sometimes other related objects through cascading effects. For more information, see Invalidation of cached dynamic statements (Db2 Performance).

Considerations for INSTEAD OF triggers:
The addition of an INSTEAD OF trigger for a view affects the read only characteristic of the view. If a read-only view has a dependency relationship with an INSTEAD OF trigger, the type of operation that is defined for the INSTEAD OF trigger defines whether the view is deletable, insertable, or updatable.

The creation of an INSTEAD OF trigger causes dependent packages, plans, and statements in the dynamic statement cache to be marked invalid if the view definition is not read-only.

The initial values for new transition variables or new transition table columns that are visible in an INSTEAD OF INSERT trigger are set as follows:

- If a value is explicitly specified for a column in the insert operation, the corresponding new transition variable is that explicitly specified value.
- If a value is not explicitly specified for a column in the insert operation or the DEFAULT clause is specified, the corresponding new transition variable is:
  - the default value of the underlying table column if the view column is updatable (without the INSTEAD OF trigger)
  - otherwise, the null value

  If a view column is not nullable and does not have a default, the value must be explicitly specified in the insert operation.

The initial values for new transition variables that are visible in an INSTEAD OF UPDATE trigger are set as follows:

- If a value is explicitly specified for a column in the update operation, the corresponding new transition variable is that explicitly specified value
- If the DEFAULT clause is explicitly specified for a column in the update operation, the corresponding new transition variable is:
  - the default value of the underlying table column if the view column is updatable (without the INSTEAD OF trigger)
  - otherwise, the null value

  If a view column is not nullable and does not have a default, the value must be explicitly specified in the update operation.
- Otherwise, the corresponding new transition variable is the existing value of the column in the row.

Considerations for a MERGE statement:
The MERGE statement can execute insert and update operations. The applicable triggers are activated for the MERGE statement for the data change operations that are executed.

Considerations for triggers that are defined on tables that contain XML columns:
Although a trigger can be defined on a table that contains an XML column:

- An XML column cannot be referenced with a trigger transition variable in the trigger body.
- An XML column of a transition table cannot be referenced in the trigger body.

Creating a trigger with the SECURED option:
Typically, the security administrator will examine the data that is accessed by a trigger, ensure that it is secure, and grant the CREATE_SECURE_OBJECT privilege to someone who requires the privileges to create a secured trigger. After the trigger is created, the security administrator will revoke the CREATE_SECURE_OBJECT privilege from the owner of the trigger.

The trigger is considered secure after the CREATE TRIGGER statement is executed. Db2 treats the SECURED attribute as an assertion that declares that the user has established an audit procedure for all activities in the trigger body. If a secure trigger references user-defined functions, Db2 assumes those functions are secure without validation. If those functions can access sensitive data, the user with SECADM authority needs to ensure that those functions are allowed to access that data and that an audit procedure is in place for all versions of those functions, and that all subsequent ALTER FUNCTION statements or changes to external packages are being reviewed by this audit process.

A trigger must be secure if its subject table is using row access control or column access control. SECURED must also be specified for a trigger that is created for a view and one or more of the underlying tables in the view definition is using row access control or column access control.

Creating a trigger with the NOT SECURED option:
The CREATE TRIGGER statement returns an error if the subject table of the trigger is using row access control or column access control, or if the trigger is for a view and one or more of the underlying tables in the view definition is using row access control or column access control.

Row and column access control that is not enforced for transition variables and transition tables:
If row access control or column access control is enforced for the subject table of the trigger, row permissions and column masks are not applied to the initial values of transition variables and transition tables. Row access control and column access control is enforced for the triggering table, but is ignored for transition variables and transition tables that are referenced in the body of the trigger body or are passed as arguments to user-defined functions that are invoked in the body of the trigger. To ensure that there are no security concerns for SQL statements accessing sensitive data in transition variables and transition tables in the trigger action, the trigger must be created with the SECURED option. If a trigger is not secure, the CREATE TRIGGER statement returns an error.

Restrictions involving pending definition changes:
CREATE TRIGGER is not allowed if the trigger is defined on a table for which there are pending definition changes.

Considerations for the special plan, statement, and function tables for EXPLAIN:
You can create a trigger on PLAN_TABLE, DSN_STATEMNT_TABLE, or DSN_FUNCTION_TABLE. However, insert triggers that are defined on these tables are not activated when Db2 adds rows to the tables.

Dependent objects:
A trigger is dependent on the triggering table and objects that are referenced in the trigger body.

Adding a column to a subject table or a table referenced in the *triggered-action*:
If a column is added to the subject table after triggers have been defined, the following rules apply:

- If the trigger is an update trigger that was defined without an explicit list of column names, an update to the new column activates the trigger.
- If the subject table is referenced in the *triggered-action*, the new column is not accessible to the SQL statements until the trigger package is rebound.
- The OLD_TABLE and the NEW_TABLE transition tables contain the new column, but the column cannot be referenced unless the trigger is re-created. If the transition tables are passed to a user-defined function or a stored procedure, the user-defined function or stored procedure must be re-created with the new definition of the table (that is, the function or procedure must be dropped and re-created), and the package for the user-defined function or stored procedure must be rebound.

If a column is added to any table that is referenced in the *triggered-action*, the new column is not accessible to the SQL statements until the trigger package is rebound.

Dropping a column from a subject table or a table referenced in the *triggered-action*:
A column cannot be dropped from a table for which a trigger is defined.

Altering the attributes of a column that the triggered action references:
If a column is altered in the table on which the trigger is defined (the subject table), the alter is processed, and the dependent trigger packages are invalidated.

Renaming the table for which the trigger is defined, or tables referenced in the *triggered-action*:
You cannot rename a table for which a trigger is defined (the subject table). Except for the subject table, you can rename any table to which the SQL statements in the triggered action refer. After renaming such a table, drop the trigger and then re-create the trigger so that it refers to the renamed table.

Dropping the table or view for which a trigger is defined:
If the table or view that a trigger is defined on is dropped, the trigger is also dropped.

Effects of dropping or revoking privileges on an object referenced in the *triggered-action*:
Dropping an object that is referenced in the body of a trigger, or revoking a privilege to an object that is referenced in the body of a trigger, might have the following results:

- Dropping any table, view, alias, or index that is referenced or used within the SQL statements in the triggered action causes the trigger and its package to be invalidated.
- Dropping a synonym that is referenced does not have any effect on the trigger or its package.
- Dropping a user-defined function that is referenced by the SQL statements in the triggered action is not allowed. An error occurs.
- Dropping a sequence that is referenced by the SQL statements in the triggered action is not allowed. An error occurs.
- Revoking a privilege on which the trigger depends causes the trigger and its package to be invalidated. If the appropriate privilege does not exist when the trigger package is rebound, the SQL statement that references the object fails.

Error handling in triggers:
A trigger can return errors, like other SQL statements. Applications need to account for the possible errors that can be expected when a trigger is invoked.

Triggers and global variables:
The content of a global variable that is referenced by a trigger is inherited from the triggering SQL operation (delete, insert, or update).

Special registers:
The values of the special registers that are used in the trigger body are determined when the trigger is activated. The value of the CURRENT PACKAGESET special register is set to the schema name of the trigger, and the values of the other special registers are inherited from the triggering SQL operation (insert, update, or delete). Special register values are saved when a trigger is activated and are restored on return from the trigger. The CURRENT DATE, CURRENT TIME, and CURRENT TIMESTAMP special registers are not restored on return from the trigger.

Result sets for stored procedures:
If a trigger invokes a stored procedure that returns result sets, the application that activated the trigger cannot access those result sets.

Transaction isolation:
All of the statements in the *SQL-trigger-body* run under the isolation level that is in effect for the trigger.

Limiting processor time:
The Db2 resource limit facility allows you to specify the maximum amount of processor time for a dynamic, manipulative SQL statement such as SELECT or SQL data change statements. The execution of a trigger is counted as part of the triggering SQL statement.

Errors binding triggers:
When a CREATE TRIGGER statement is bound, the SQL statements within the triggered action might not be fully parsed. Syntax errors in those statements might not be caught until the CREATE TRIGGER statement is executed.

Characteristics of the package that is generated for a trigger:
The package that is associated with the trigger is named as follows:

- *location* is set to the value of the CURRENT SERVER special register.
- *collection-id* (schema) for the package is the same as the schema qualifier of the trigger.
- *package-id* is the same as the name of the trigger.
- *version-id* is an empty string.

Db2 creates the trigger package with the following initial attributes (some of these attributes can be modified using the REBIND TRIGGER PACKAGE command):

- ACTION(ADD)
- ARCHIVESENSITIVE(YES)
- BUSTIMESENSITIVE(YES)
- CURRENTDATA(NO)
- DBPROTOCOL(DRDA)
- DEGREE(1)
- DESCSTAT(value from the DESCSTAT subsystem parameter)
- DYNAMICRULES(BIND)
- ENABLE(*)
- ENCODING(0)
- EXPLAIN(NO)
- FLAG(I)
- ISOLATION(CS)
- REOPT(NONE)
- NODEFER(PREPARE)
- OPTHINT
- OWNER(authorization ID) or ROLE of appropriate
- PATH(path)
- RELEASE(COMMIT)
- ROUNDING(value from the CURRENT DECFLOAT ROUNDING MODE special register)
- SQLERROR(NOPACKAGE)
- SYSTIMESENSITIVE(YES)
- QUALIFIER(authorization ID)
- VALIDATE(BIND)

The values of OWNER, QUALIFIER, and PATH are set depending on whether the CREATE TRIGGER statement is embedded in a program or issued interactively. If the statement is embedded in a program, OWNER and QUALIFIER are the owner and qualifier of the package or plan. PATH is the value from the PATH bind option. If the statement is issued interactively, both OWNER and QUALIFIER are the SQL authorization ID. PATH is the value in the CURRENT PATH special register.

Multiple versions of a trigger package are not allowed. Use the REBIND command to explicitly rebind the trigger package. To specify the name of a trigger package for the bind commands, the trigger name must conform to the rules for an ordinary identifier.

A trigger package becomes invalid if an object or privilege on which it depends is dropped or revoked. The next time that the trigger is activated, Db2 attempts to rebind the invalid trigger package. If the automatic rebind is unsuccessful, the trigger package remains invalid.

You cannot create another package from the trigger package, such as with the BIND COPY command. The only way to drop a trigger package is to drop the trigger or the subject table. Dropping the trigger drops the trigger package; dropping the subject table drops the trigger and the trigger package.

Each time that the trigger activates, the trigger package executes one or more times.

Considerations for SQL processor programs:

SQL processor programs, such as SPUFI, the command line processor, and DSNTEP2, might not correctly parse SQL statements in the triggered action that are ended with semicolons. These processor programs accept multiple SQL statements, each separated with a terminator character, as input. Processor programs that use a semicolon as the SQL statement terminator can truncate a CREATE TRIGGER statement with embedded semicolons and pass only a portion of it to Db2. Therefore, you might need to change the SQL terminator character for these processor programs. For information on changing the terminator character for SPUFI and DSNTEP2, see Setting the SQL terminator character in a SPUFI input data set (Db2 Application programming and SQL) and DSNTEP2 and DSNTEP4 (Db2 Application programming and SQL).

Alternative syntax and synonyms:

To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following keywords:

- OLD TABLE as a synonym for OLD_TABLE
- NEW TABLE as a synonym for NEW_TABLE

Examples

Example 1: Create two triggers that track the number of employees that a company manages. The subject table is the EMPLOYEE table, and the triggers increment and decrement a column with the total number of employees in the COMPANY_STATS table. The tables have these columns:

EMPLOYEE table: ID, NAME, ADDRESS, and POSITION
COMPANY_STATS table: NBEMP, NBPRODUCT, and REVENUE

This example shows the use of transition variables in a row trigger to maintain summary data in another table.

Create the first trigger, NEW_HIRE, so that it increments the number of employees each time a new person is hired; that is, each time a new row is inserted into the EMPLOYEE table, increase the value of column NBEMP in table COMPANY_STATS by 1.

```
CREATE TRIGGER NEW_HIRE
   AFTER INSERT ON EMPLOYEE
   FOR EACH ROW MODE DB2SQL
   BEGIN ATOMIC
     UPDATE COMPANY_STATS SET NBEMP = NBEMP + 1;
   END
```

Create the second trigger, FORM_EMP, so that it decrements the number of employees each time an employee leaves the company; that is, each time a row is deleted from the table EMPLOYEE, decrease the value of column NBEMP in table COMPANY_STATS by 1.

```
CREATE TRIGGER FORM_EMP
   AFTER DELETE ON EMPLOYEE
   FOR EACH ROW MODE DB2SQL
   BEGIN ATOMIC
     UPDATE COMPANY_STATS SET NBEMP = NBEMP - 1;
   END
```

Example 2: Create a trigger, REORDER, that invokes user-defined function ISSUE_SHIP_REQUEST to issue a shipping request whenever a parts record is updated and the on-hand quantity for the affected part is less than 10% of its maximum stocked quantity. User-defined function ISSUE_SHIP_REQUEST orders a quantity of the part that is equal to the part's maximum stocked quantity minus its on-hand quantity; the function also ensures that the request is sent to the appropriate supplier.

The parts records are in the PARTS table. Although the table has more columns, the trigger is activated only when columns ON_HAND and MAX_STOCKED are updated.

```
CREATE TRIGGER REORDER
    AFTER UPDATE OF ON_HAND, MAX_STOCKED ON PARTS
    REFERENCING NEW AS NROW
```

```
    FOR EACH ROW MODE DB2SQL
    WHEN (NROW.ON_HAND < 0.10 * NROW.MAX_STOCKED)
    BEGIN ATOMIC
      VALUES(ISSUE_SHIP_REQUEST(NROW.MAX_STOCKED - NROW.ON_HAND, NROW.PARTNO));
    END
```

Example 3: Repeat the scenario in *Example 2* except use a fullselect instead of a VALUES statement to invoke the user-defined function. This example also shows how to define the trigger as a statement trigger instead of a row trigger. For each row in the transition table that evaluates to true for the WHERE clause, a shipping request is issued for the part.

```
CREATE TRIGGER REORDER
    AFTER UPDATE OF ON_HAND, MAX_STOCKED ON PARTS
    REFERENCING NEW_TABLE AS NTABLE
    FOR EACH STATEMENT MODE DB2SQL
      BEGIN ATOMIC
        SELECT ISSUE_SHIP_REQUEST(MAX_STOCKED - ON_HAND, PARTNO)
          FROM NTABLE
        WHERE (ON_HAND < 0.10 * MAX_STOCKED);
    END
```

Example 4: Assume that table EMPLOYEE contains column SALARY. Create a trigger, SAL_ADJ, that prevents an update to an employee's salary that exceeds 20% and signals such an error. Have the error that is returned with an SQLSTATE of '75001' and a description. This example shows that the SIGNAL statement is useful for restricting changes that violate business rules.

```
  CREATE TRIGGER SAL_ADJ
    AFTER UPDATE OF SALARY ON EMPLOYEE
    REFERENCING OLD AS OLD_EMP
                NEW AS NEW_EMP
    FOR EACH ROW MODE DB2SQL
    WHEN (NEW_EMP.SALARY > (OLD_EMP.SALARY * 1.20))
      BEGIN ATOMIC
        SIGNAL SQLSTATE '75001' ('Invalid Salary Increase - Exceeds 20
      END
```

Example 5: Assume that the following statements create a table, WEATHER (which stores temperature values in Fahrenheit), and a view, CELSIUS_WEATHER for users who prefer to work in Celsius instead of Fahrenheit:

```
  CREATE TABLE WEATHER
     (CITY VARCHAR(25),
      TEMPF DECIMAL(5,2));
  CREATE VIEW CELSIUS_WEATHER (CITY, TEMPC) AS
     SELECT CITY, (TEMPF-32)/1.8
     FROM WEATHER;
```

The following INSTEAD OF trigger is used on the CELSIUS_WEATHER view to convert Celsius values to Fahrenheit values and then insert the Fahrenheit value into the WEATHER table:

```
  CREATE TRIGGER CW_INSERT INSTEAD OF INSERT
     ON CELSIUS_WEATHER
     REFERENCING NEW AS NEWCW
     FOR EACH ROW MODE DB2SQL
       BEGIN ATOMIC
          INSERT INTO WEATHER VALUES
            (NEWCW.CITY,
             1.8*NEWCW.TEMPC+32)
       END;
```

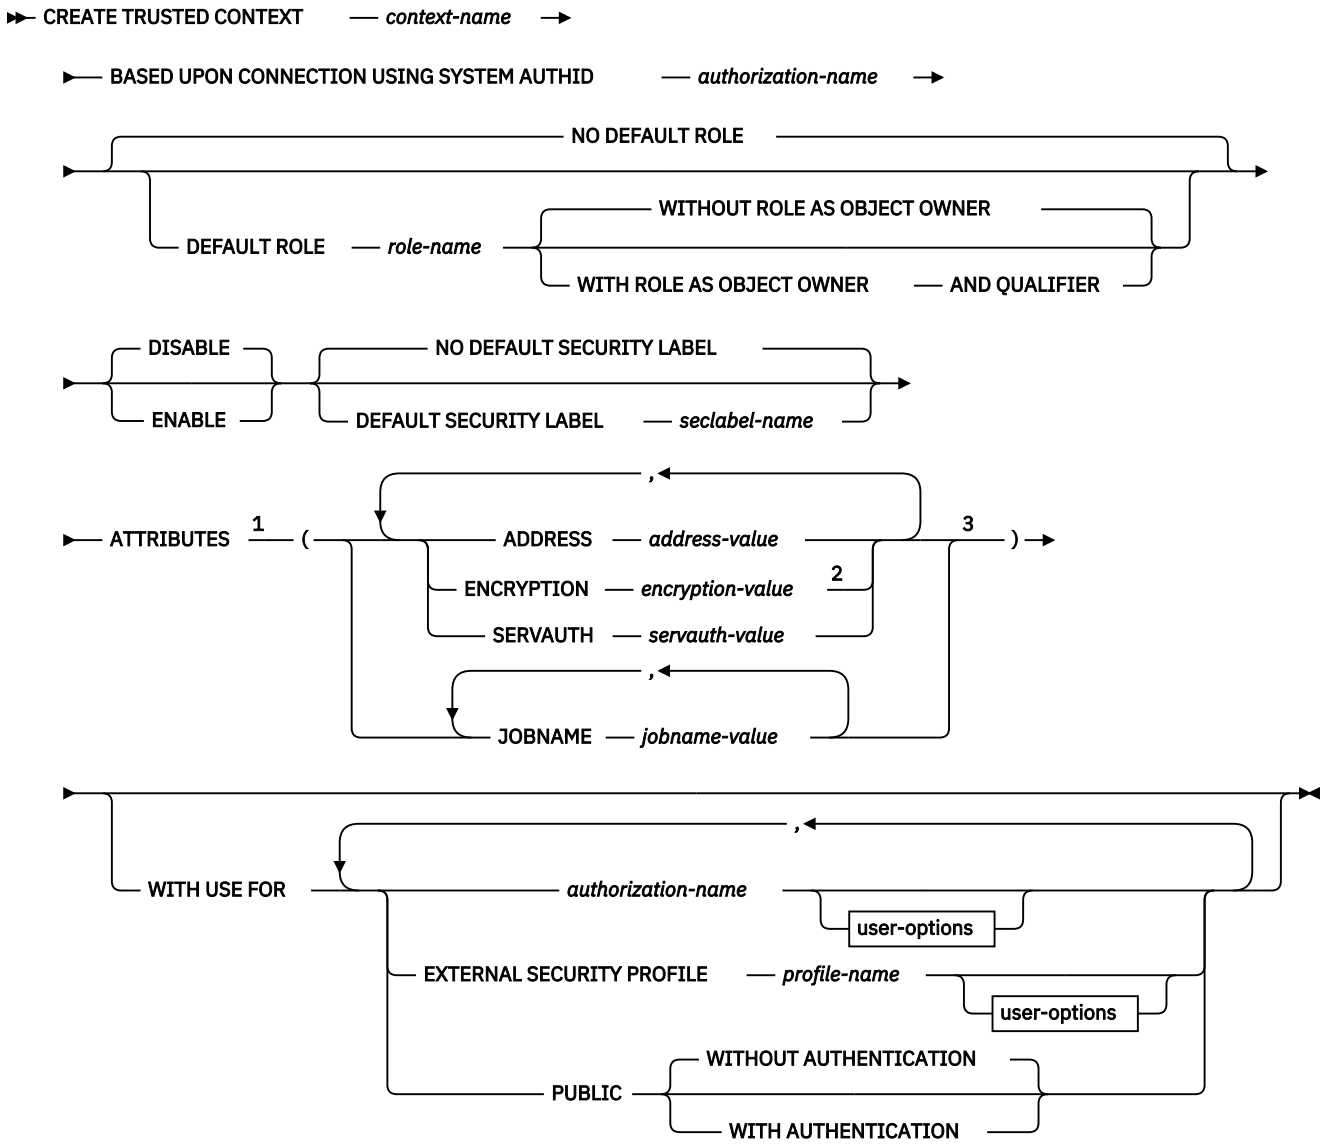
CREATE TRUSTED CONTEXT

The CREATE TRUSTED CONTEXT statement defines a trusted context at the current server.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization



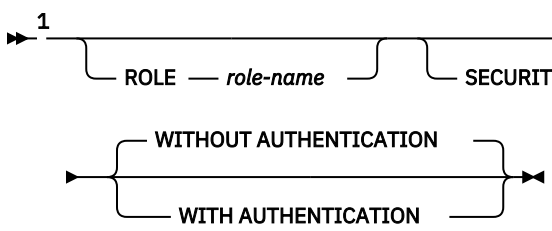
The privilege set that is defined below must include at least one of the following:

- SYSADM authority
- SECADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified, a role is the owner. Otherwise, an authorization ID is the owner.

If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER clause is specified. In that case, the privileges set is the privileges that are held by the role that is associated with the primary authorization ID of the process.

Syntax



Notes:

[1] This clause and the clauses that follow can be specified in any order. Each clause must not be specified more than one time.

[2] ENCRYPTION must not be specified more than one time.

[3] Each pair of attribute name and corresponding value must be unique.

user-options:

Notes:

[1] These clauses can be specified in any order. Each clause must not be specified more than one time.

Description

context-name
Names the trusted context. The name must not identify a trusted context that exists at the current server.

BASED UPON CONNECTION USING SYSTEM AUTHID ***authorization-name***
Specifies that the context is a connection that is established by the authorization ID that is specified by *authorization-name*. The system authorization ID is the primary authorization ID. For a remote connection, it is derived from the system user ID that is provided by an external entity, such as a middleware server. For a local connection, the system authorization ID is derived depending on the sources, as specified in Table 204 on page 1613.

Table 204. System authorization ID for a local connection

Source of local connection	System authorization ID
Started task (RRSAF)	USER parameter on JOB statement or RACF USER.
TSO	TSO logon ID
BATCH	USER parameter on JOB statement

authorization-name must not be associated with an existing trusted context.

NO DEFAULT ROLE or DEFAULT ROLE ***role-name***
Specifies whether a default role is associated with a trusted connection that is based on the specified trusted context.

NO DEFAULT ROLE
Specifies that the trusted context does not have a default role. The authorization ID of the process is the owner of any object that is created using a trusted connection that is based on this trusted context. That authorization ID must possess all of the privileges that are necessary to create that object.

NO DEFAULT ROLE is the default.

DEFAULT ROLE ***role-name***
Specifies that *role-name* is the role for the trusted context. *role-name* must identify a role that exists at the current server. This role is used with the user in a trusted connection that is based on the specified trusted context when the user does not have a user-specified role that is defined as part of the definition of this trusted context.

WITHOUT ROLE AS OBJECT OWNER or WITH ROLE AS OBJECT OWNER AND QUALIFIER
Specifies whether a role is used as the owner of objects that are created using a trusted connection that is based on the specified trusted context.

WITHOUT ROLE AS OBJECT OWNER
Specifies that a role is not used as the owner of the objects that are created using a trusted connection that is based on the specified trusted context. The authorization ID of the process is the owner of any object that is the created using a trusted connection that is based on this trusted context. That authorization ID must possess all of the privileges that are necessary to create the object.

WITHOUT ROLE AS OBJECT OWNER is the default.

WITH ROLE AS OBJECT OWNER AND QUALIFIER
Specifies that the context assigned role is the owner of the objects that are created using a trusted connection that is based on this trusted context and that role must possess all of the privileges that are necessary to create the object. The context assigned role is the role that is defined for the

user within this trusted context, if one is defined. Otherwise, the role is the default role that is associated with the trusted context. The role is also used as the grantor for any GRANT statements that are issued, and the revoker for any REVOKE statement that are issued using a trusted connection that is based on this trusted context.

AND QUALIFIER
Specifies that *role-name* will be used as the default for the CURRENT SCHEMA special register. The *role-name* will also be included in the SQL PATH (in place of CURRENT SQLID).

When `WITH ROLE AS OBJECT OWNER AND QUALIFIER` is not specified, there is no change to the default for the CURRENT SCHEMA special register and the SQL PATH.

DISABLE or ENABLE
Specifies whether the trusted context is created in the enabled or disabled state.

DISABLE
Specified that the trusted context is disabled when it is created. A trusted context that is disabled is not considered when a trusted connection is established. DISABLE is the default.

ENABLE
Specifies that the trusted context is enabled when it is created.

NO DEFAULT SECURITY LABEL or DEFAULT SECURITY LABEL *seclabel-name*
Specifies whether the trusted connection has a default security label.

NO DEFAULT SECURITY LABEL
Specifies that the trusted context does not have a default security label.

DEFAULT SECURITY LABEL *seclabel-name*
Specifies that *seclabel-name* is the default security label for the trusted context and is the security label that is used for multilevel security verification. *seclabel-name* must identify one of the RACF SECLABEL values that is defined for the SYSTEM AUTHID. This security label is used for a trusted connection that is based on the specified trusted context when the user does not have a specific security label defined as part of the definition of this trusted context. In this case, *seclabel-name* must also identify one of the RACF SECLABEL values that is defined for the user.

ATTRIBUTES
Specifies a list of one or more connection trust attributes that are used to define the trusted context.

ADDRESS *address-value*
Specifies the actual communication address that is used by the connection to communicate with the database manager. The protocol supported is only for TCP/IP. The ADDRESS attribute can be specified multiple times, but each *address-value* must be unique.

When establishing a trusted connection, if multiple values are defined for the ADDRESS attribute for a trusted context, a candidate connection is considered to match this attribute if the address that is used by a connection matches any of the defined values for the ADDRESS attribute of the trusted context.

address-value specifies a string constant that contains the value that is associated with the ADDRESS trust attribute. *address-value* must be an IPv4 address, an IPv6 address, or a secure domain name with a length no greater than 254 bytes. No validation of *address-value* is done at the time the CREATE TRUSTED CONTEXT statement is processed. *address-value* must be left justified within the string constant.

- An IPv4 address is represented as a dotted decimal address. An example of an IPv4 address is 9.112.46.111
- An IPv6 address is represented as a colon hexadecimal address. An example of an IPv6 address is 2001:0DB8:0000:0000:0008:0800:200C:417A. This address can also be express in a compressed form as 2001:DB8::8:800:200C:417A.
- A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is www.ibm.com. The gethostbyname socket call is used to resolve the domain name.

ENCRYPTION *encryption-value*

Specifies the minimum level of encryption of the data stream (network encryption).

encryption-value specifies a string constant that contains the value that is associated with the ENCRYPTION trust attribute. *encryption-value* must be left justified within the string constant. ENCRYPTION must not be specified more than one time in the statement. *encryption-value* must be one of the following:

- NONE, which specifies that no specific level of encryption is required.
- LOW, which specifies that a minimum of light encryption is required. LOW corresponds to 64-bit DRDA encryption.
- HIGH, which specifies that strong encryption is required. HIGH corresponds to SSL encryption.

The following table summarizes when a trusted context can be used depending on the encryption that is used by the existing connection. If the trusted context cannot be used for the connection, a warning is returned.

Table 205. Summary of when trusted context can be used by an existing connection

Encryption that is used by the existing connection	Value of the ENCRYPTION clause for the trusted context	Can the trusted context be used for the connection?
No encryption	NONE	Yes
No encryption	LOW	No
No encryption	HIGH	No
Low encryption (64-bit)	NONE	Yes
Low encryption (64-bit)	LOW	Yes
Low encryption (64-bit)	HIGH	No
High encryption (128-bit)	NONE	Yes
High encryption (128-bit)	LOW	Yes
High encryption (128-bit)	HIGH	Yes

JOBNAME *jobname-value*

Specifies the z/OS job name or started task name (depending on the source of the address space) for local applications. The JOBNAME attribute can be specified multiple times, but each *jobname-value* must be unique.

jobname-value specifies a string constant that contains the value that is associated with the JOBNAME trust attribute. *jobname-value* is an EBCDIC 8 byte value that specifies the job name or the started task name. The value must be left justified within the string constant. The last character in the name can be a wildcard character (*) if the first character is an alphabetic character. If the job name ends with a wildcard, any job names that begin with the specified characters are considered for establishing the trusted connection.

The following table lists possible values for the job name depending on the source of the address space.

Table 206. Job name for local connection

Source of the address space	Job name
RRSAF	Job name or started task name
TSO	TSO logon ID
BATCH	Job name on JOB statement

SERVAUTH *servauth-value*

Specifies the name of a resource in the RACF SERVAUTH class. This resource is the network access security zone name that contains the IP address of the connection that is used to communicate with Db2. The SERVAUTH attribute can be specified multiple times but each *servauth-value* must be unique.

servauth-value specifies a string constant that contains the value that is associated with the SERVAUTH trust attribute. *servauth-value* is an EBCDIC 64 byte RACF SERVAUTH CLASS resource name. *servauth-value* must be left justified in the string constant. No validation of *servauth-value* is done at the time the CREATE TRUSTED CONTEXT statement is processed.

WITH USE FOR

Specifies who can use a trusted connection that is based on the specified trusted context.

authorization-name

Specifies that the trusted connection can be used by the specified *authorization-name*. This is the Db2 primary authorization ID. The *authorization-name* must not be specified more than one time in the WITH USE FOR clause.

ROLE *role-name*

Specifies that *role-name* is the role that is used when a trusted connection is used by the specified *authorization-name*. The *role-name* must identify a role that exists at the current server. The role that is explicitly specified for the user overrides any default role that is associated with the trusted context.

SECURITY LABEL *seclabel-name*

Specifies that *seclabel-name* is the security label to use for multilevel security verification when the trusted connection is used by the specified *authorization-name*. The *seclabel-name* must be one of the RACF SECLABEL values that is defined for the user. The security label that is explicitly specified for the user overrides any default security label that is associated with the trusted context.

WITHOUT AUTHENTICATION or WITH AUTHENTICATION

Specifies whether use of the trusted connection requires authentication of the user.

WITHOUT AUTHENTICATION

Specifies that use of a trusted connection by the user does not require authentication. WITHOUT AUTHENTICATION is the default.

WITH AUTHENTICATION

Specifies that use of a trusted connection requires the authentication token with the authorization ID to authenticate the user. If a trusted connection is established locally, the authentication token is the password that is provided by the CONNECT statement with the USER and USING clauses. If the trusted connection is established from a remote client, the authentication token can be one of the following tokens:

- password
- RACF Passticket
- Kerberos token

EXTERNAL SECURITY PROFILE *profile-name*

Specifies that the trusted connection can be used by the Db2 primary authorization IDs that are permitted to use the specified *profile-name* in RACF. *profile-name* must not be specified more than one time in the WITH USE FOR clause. If an authorization ID is permitted to use more than one specified *profile-name*, the role that is specified for *profile-name* can be associated with the process if the user authentication satisfies the AUTHENTICATION definition. This role can hold additional privileges that are available to the process.

ROLE *role-name*

Specifies that *role-name* is the role that is used when a trusted connection is used by any authorization ID permitted to use the specified *profile-name* in RACF. The *role-name* must identify a role that exists at the current server. The role that is explicitly specified for the profile overrides any default role that is associated with the trusted context.

SECURITY LABEL *seclabel-name*
Specifies that *seclabel-name* is the security label to use for multilevel security verification when the trusted connection is used by any authorization ID that is permitted to use the specified *profile-name* in RACF. The *seclabel-name* must be one of the RACF SECLABEL values that is defined for the user. The security label that is explicitly specified for the profile overrides any default security label that is associated with the trusted context.

WITHOUT AUTHENTICATION or WITH AUTHENTICATION
Specifies whether use of the trusted connection requires authentication of the user.

WITHOUT AUTHENTICATION
Specifies that use of a trusted connection by the user does not require authentication. WITHOUT AUTHENTICATION is the default.

WITH AUTHENTICATION
Specifies that use of a trusted connection requires the authentication token with the authorization ID to authenticate the user. If a trusted connection is established locally, the authentication token is the password that is provided by the CONNECT statement with the USER and USING clauses. If the trusted connection is established from a remote client, the authentication token can be one of the following tokens:

- password
- RACF Passticket
- Kerberos token

PUBLIC
Specifies that a trusted connection that is based on the specified trusted context can be used by any user. All users that are using a trusted connection that is defined with PUBLIC use the privileges that are associated with the default role for the associated trusted context. If the default role is not defined for the trusted context, there is no role associated with the users that use a trusted connection that is based on the specified trusted context.

If the default security label for the trusted context is defined, all users that are using the trusted context must have the security label defined as one of the RACF SECLABEL values for the user. The default security label is used for multilevel security verification with all users that are using the trusted context.

WITHOUT AUTHENTICATION or WITH AUTHENTICATION
Specifies whether use of the trusted connection requires authentication of the user.

WITHOUT AUTHENTICATION
Specifies that use of a trusted connection by the user does not require authentication. WITHOUT AUTHENTICATION is the default.

WITH AUTHENTICATION
Specifies that use of a trusted connection requires the authentication token with the authorization ID to authenticate the user. If a trusted connection is established locally, the authentication token is the password that is provided by the CONNECT statement with the USER and USING clauses. If the trusted connection is established from a remote client, the authentication token can be one of the following tokens:

- password
- RACF Passticket
- Kerberos token

Notes

Owner privileges: There are no specific privileges on a trusted context.

Requirement for trusted connections: To use trusted connections, you cannot set the ALL subsystem parameter to ALL and set the RESTART subsystem parameter to DEFER on installation panel DSNTIPS.

Order of precedence for users of a trusted connection: The specifications for a user are determined in the following order of precedence:

- *authorization-name*
- EXTERNAL SECURITY PROFILE *profile-name*
- PUBLIC

For example, assume that a trusted context is defined with use for JOE WITH AUTHENTICATION, EXTERNAL SECURITY PROFILE SPROFILE WITHOUT AUTHENTICATION, and PUBLIC WITH AUTHENTICATION. Users JOE and SAM are permitted to use the RACF PROFILE SPROFILE. If the trusted connection is used by JOE, authentication is required. If the trusted connection is used by SAM, authentication is not required. However, if user SALLY uses the trusted connection, authentication is required.

User-clause SYSTEM AUTHID considerations: If the *authorization-name* that is specified in the SYSTEM AUTHID clause is the same as the *authorization-name* that is specified in the user-clause *authorization-name*, the role or the security label that is specified for *authorization-name* takes precedence over the default value. The value that is specified for the *profile-name*, is permitted to use the profile. If the authorization name that is specified in the SYSTEM AUTHID clause is permitted to use one of the profile names and is not defined in *authorization-name*, the role or the security label that is specified for that *profile-name* takes precedence over the default value.

If authentication is required for SYSTEM AUTHID, either by specification of the AUTHENTICATION clause in the *user-clause* or by setting the value of the TCP/IP Already Verified subsystem parameter to NO, the authentication requirement takes precedence when establishing a remote trusted connection. For example, if *authorization-name* is the same as the authorization name that is specified for SYSTEM AUTHID and the WITHOUT AUTHENTICATION clause is specified, but the TCP/IP Already Verified subsystem parameter is set to NO, an authentication token is required for SYSTEM AUTHID when the remote trusted connection is established. If *authorization-name* is the SYSTEM AUTHID and the WITH AUTHENTICATION clause is specified, but the TCP/IP Already Verified subsystem parameter is set to YES, an authentication token is still required for SYSTEM AUTHID.

Specifying a role in the definition of a trusted context: The definition of a trusted context can designate a role for a specific authorization ID, and a default role for use for an authorization ID for which a specific role has not been specified in the definition of the trusted context. This role can be used with a trusted connection that is based on the trusted context, but it does not make the role available outside of a trusted connection that is based on the trusted context. When an SQL statement that is not a CREATE, GRANT, or REVOKE statement is issued using a trusted connection, the privileges that are held by a role that is in effect for the authorization ID within the definition of the associated trusted context are considered in addition to other privileges that are directly held by the authorization ID of the statement. The CREATE, GRANT, and REVOKE statements only consider the privileges of the role that is in effect for the trusted connection, or the authorization ID of the statement if a role is not in effect for the trusted connection. If ROLE AS OBJECT OWNER is in effect for a trusted connection, the role that is in effect for the authorization ID for the trusted connection becomes the owner of any object that is created while using the trusted connection.

When a newly created trusted context takes effect: The newly created trusted context takes effect after the CREATE TRUSTED CONTEXT statement is committed. If the CREATE TRUSTED CONTEXT statement results in an error or is rolled back, no trusted context is created.

Examples

Example 1: The following statement creates a trusted context called CTX1, which is based on a connection and can only be used by users JOE and SAM. Authentication information is required for JOE to use the trusted connection. The trusted context specifies a default role called CTXROLE. However, when

JOE uses the trusted connection, the default role is overridden by the user role, ROLE1. When SAM uses the trusted connection, SAM uses the default role. CTX1 is enabled when it is created.

```
CREATE TRUSTED CONTEXT CTX1
    BASED UPON CONNECTION USING SYSTEM AUTHID ADMF001
    ATTRIBUTES (ADDRESS '9.30.131.203',
                ENCRYPTION 'LOW')
    DEFAULT ROLE CTXROLE
    ENABLE
    WITH USE FOR SAM, JOE ROLE ROLE1 WITH AUTHENTICATION;
```

Example 2: The following statement creates a trusted context, CTX2, for a started task, WASPROD. CTX2 is based on a connection, can be used by user SALLY, specifies a default role CTXROLE, and is enabled when it is created. SALLY uses the default role that is associated with the trusted context.

```
CREATE TRUSTED CONTEXT CTX2
     BASED UPON CONNECTION USING SYSTEM AUTHID ADMF002
     ATTRIBUTES (JOBNAME 'WASPROD')
     DEFAULT ROLE CTXROLE WITH ROLE AS OBJECT OWNER AND QUALIFIER
     ENABLE
     WITH USE FOR SALLY;
```

CREATE TYPE

The CREATE TYPE statement defines a user-defined data type at the current server.

The following types of user-defined data types can be defined:

Array
A user-defined data type that is an ordinary array or an associative array. The elements of an array type are based on one of the built-in data types. See “CREATE TYPE (array)” on page 1619.

Distinct
A user-defined data type that shares a common representation with one of the built-in data types. Functions that cast between the user-defined distinct type and the source built-in data type are generated when the user-defined distinct type is created. Optionally, support for comparison operations to use with the user-defined distinct type can be generated when the user-defined distinct type is created. See “CREATE TYPE (distinct)” on page 1624.

CREATE TYPE (array)

The CREATE TYPE (array) statement defines an array type at the current server. An array type is a user-defined data type that is an ordinary array or an associative array. The elements of an array type are based on one of the built-in data types.

Invocation

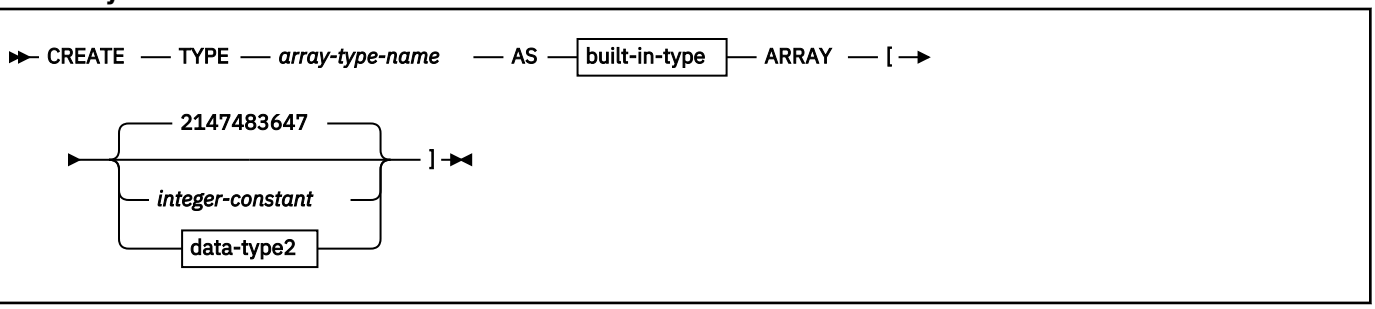
This statement can be embedded in an application program or issued through the use of dynamic SQL statements. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is in effect for the package.

Authorization

The privilege set that is defined below must include at least one of the following:

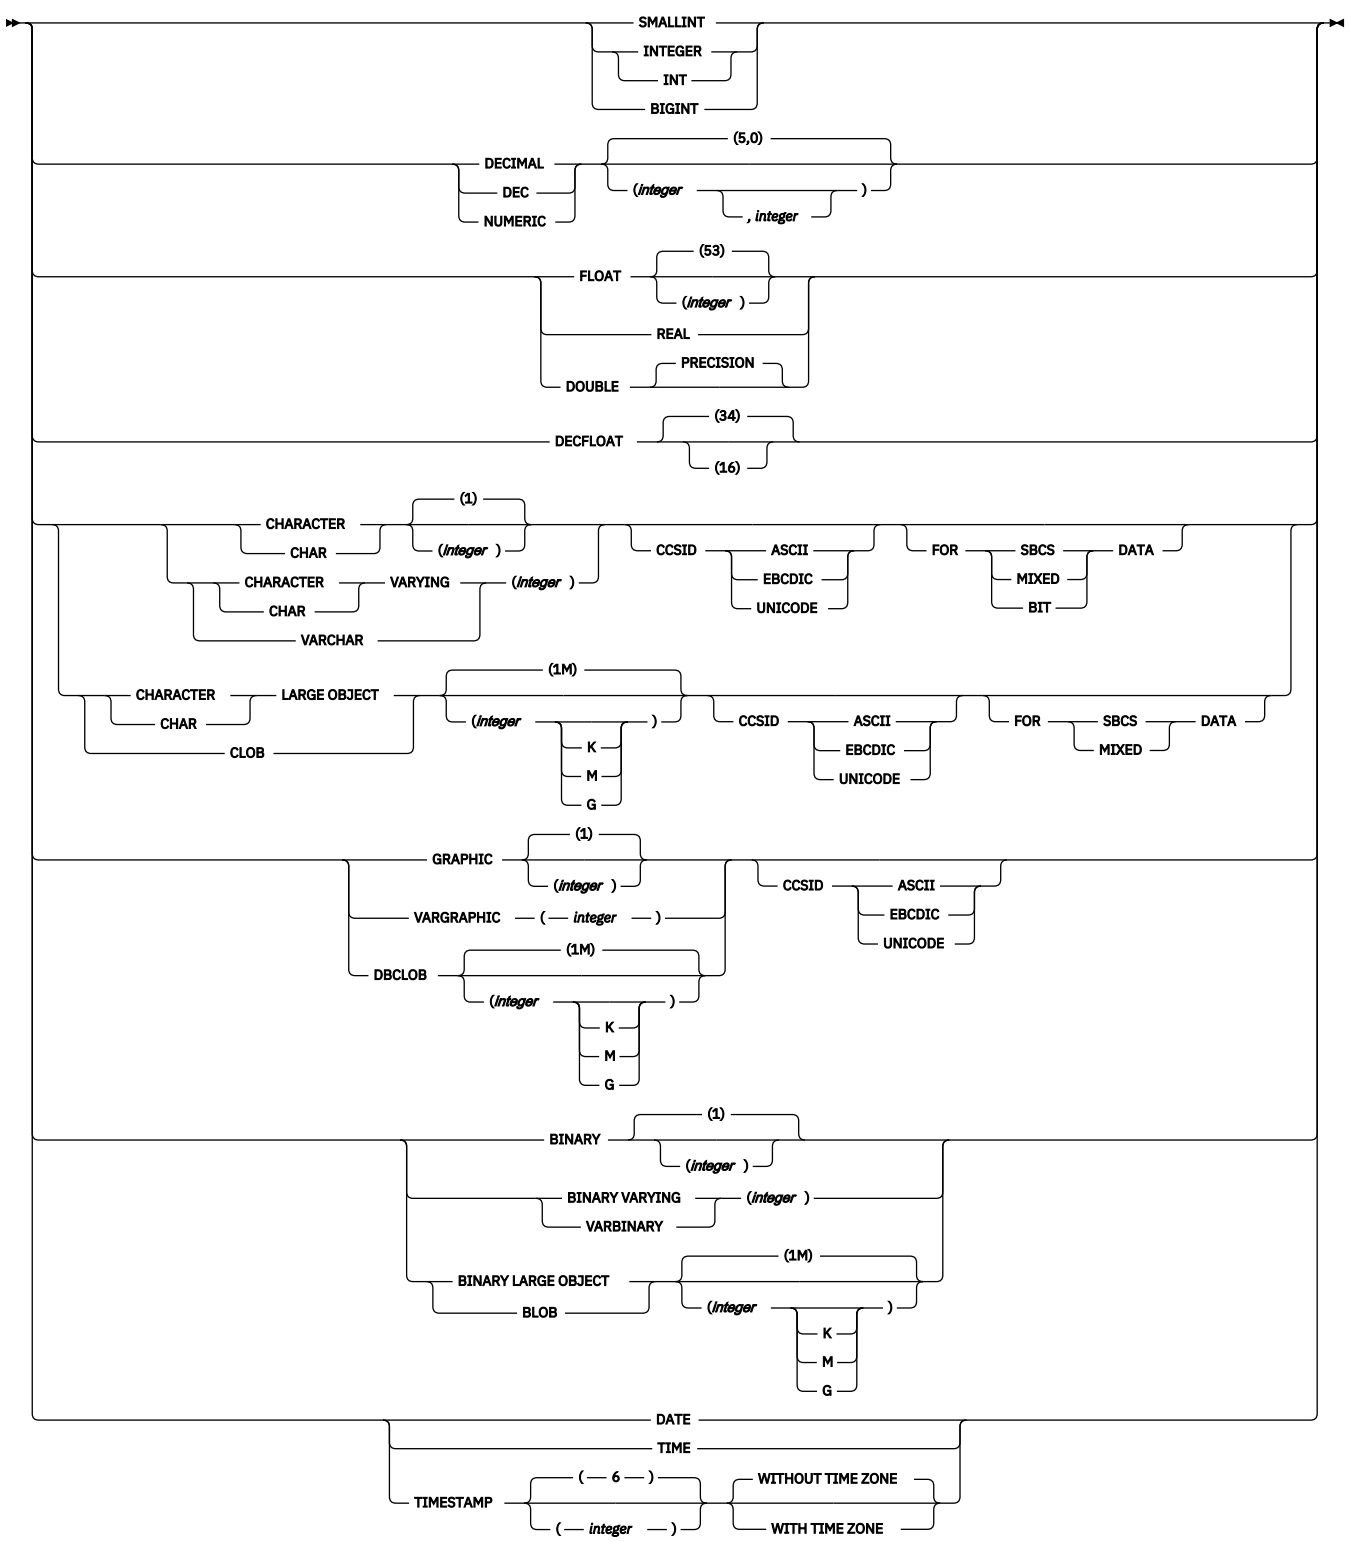
- The CREATEIN privilege on the schema
- SYSADM or SYSCTRL authority
- System DBADM

The authorization ID that matches the schema name implicitly has the CREATEIN privilege on the schema.



Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package.

If the statement is running under a trusted context for which the ROLE AS OBJECT OWNER clause is specified, the owner is a role. The implicit schema match does not apply, and this role needs to include one of the previously listed conditions.



If the statement is dynamically prepared and is not running in a trusted context for which the ROLE AS OBJECT OWNER clause is specified, the privilege set is the set of privileges that are held by the SQL authorization ID of the process. The specified distinct type name can include a schema name (a qualifier). If the schema name is not the same as the SQL authorization ID of the process, one of the following conditions must be met:

- The privilege set includes SYSADM or SYSCTRL authority.
- The SQL authorization ID of the process has the CREATEIN privilege on the schema.

Description

array-type-name
Names the array type. The name, including the implicit or explicit qualifier, must not identify any other built-in or user-defined type that exists at the current server.

The unqualified form of *array-type-name* must not be any of the following system-reserved keywords, even if you specify them as delimited identifiers:

```
ALL                     LIKE                    UNIQUE
AND                     MATCH                   UNKNOWN
ANY                     NOT                     =
BETWEEN                 NULL                    =
DISTINCT                ONLY                    <
EXCEPT                  OR                      <=
EXISTS                  OVERLAPS                <
FALSE                   SIMILAR                 >
FOR                     SOME                    >=
FROM                    TABLE                   >
IN                      TRUE                    <>
IS                      TYPE
```

The schema name can be 'SYSTOOLS' if the privilege set includes the SYSADM or SYSCTRL privilege. Otherwise, the schema name must not begin with 'SYS' unless the schema name is 'SYSADM'.

built-in-type
Specifies the built-in data type of the array elements. The data type must not be ROWID or XML. For more information on built-in data types, see built-in-type in CREATE TABLE.

CCSID ASCII, EBCDIC, or UNICODE in a *built-in-type* specification
If the data type is a character or graphic string and a CCSID clause is not specified for *built-in-type*, the default CCSID for *built-in-type* is determined as follows:

- If *data-type2* is a character string data type with an explicit CCSID clause, that same CCSID value is used for *built-in-type*.
- If *data-type2* is a character string data type without an explicit CCSID clause, the CCSID for *built-in-type* is determined from the encoding scheme that is indicated by the value of field DEF ENCODING SCHEME on installation panel DSNTIPF.

If a CCSID clause is specified for *built-in-type* and for *data-type2*, the CCSID values must be the same.

FOR SBCS, MIXED, or BIT DATA in a *built-in-type* specification
Specifies a subtype for a character string data type (VARCHAR). Do not use this clause with any other data type.

SBCS
Single-byte data.

MIXED
Mixed data. Do not specify MIXED if the value of field MIXED DATA on installation panel DSNTIPF is NO unless the CCSID UNICODE clause is also specified.

BIT
Bit data.

If you do not specify the FOR SBCS DATA, FOR MIXED DATA, or FOR BIT DATA clause, the default value is determined as follows:

- For ASCII or EBCDIC data:
  - The default is SBCS when the value of field MIXED DATA on installation panel DSNTIPF is NO.
  - The default is MIXED when the value is YES.
- For Unicode data, the default subtype is MIXED.

ARRAY[*integer-constant*]
Specifies that the type is an ordinary array with a maximum cardinality of *integer-constant*. The value must be an integer that is greater than 0 and less than or equal to the largest positive integer value

(2147483647). The default is 2147483647. Each varying-length string array element is allocated as its maximum length.

The cardinality of an array value is determined by the highest element position that is assigned to the array value. The maximum cardinality of an array is limited by the total amount of memory that is available to Db2 applications. Therefore, although an array with a large cardinality can be created, not all elements might be available for use. An attempt to assign a value to an array element when there is not enough memory results in an error.

ARRAY[*data-type2*]
Specifies that the type is an associative array that is indexed by values of data type *data-type2*. The data type must be the INTEGER or VARCHAR data type. The value that is specified as the index during assignment of a value to an array element must be assignable to a value of *data-type2*.

The cardinality of an array value is determined by the number of unique index values that are used when during assignment of array elements.

CCSID ASCII, EBCDIC, or UNICODE in a *data-type2* specification
If the data type is a character string, and a CCSID clause is not specified for *data-type2*, the default CCSID is determined as follows:

- If *built-in-type* is a character string data type with an explicit CCSID clause, that same CCSID value is used for *data-type2*.
- If *built-in-type* is a character string data type without an explicit CCSID clause, the CCSID for *data-type2* is determined from the encoding scheme that is indicated by the value of field DEF ENCODING SCHEME on installation panel DSNTIPF.

If a CCSID clause is specified for *built-in-type* and for *data-type2*, the CCSID values must be the same.

FOR SBCS, MIXED, or BIT DATA in a *data-type2* specification
Specifies a subtype for a character string data type (VARCHAR). Do not use this clause with any other data type.

SBCS
Single-byte data.

MIXED
Mixed data. Do not specify MIXED if the value of field MIXED DATA on installation panel DSNTIPF is NO unless the CCSID UNICODE clause is also specified.

BIT
Bit data.

If you do not specify the FOR SBCS DATA, FOR MIXED DATA, or FOR BIT DATA clause, the default value is determined as follows:

- For ASCII or EBCDIC data:
  - The default is SBCS when the value of field MIXED DATA on installation panel DSNTIPF is NO.
  - The default is MIXED when the value is YES.
- For Unicode data, the default subtype is MIXED.

Notes

Array type usage: A user-defined array type can only be used as the data type of:

- An SQL variable
- A parameter or RETURNS *data-type* of an SQL scalar function
- A parameter of a native SQL procedure
- The target data type for a CAST specification

Generated cast functions: The successful execution of the CREATE TYPE (array) statement causes the Db2 database manager to generate cast functions for the user-defined array type. Those cast functions are recorded in the Db2 catalog. The unqualified names of the two cast functions are ARRAY and the

name of the array type. A generated cast function cannot be explicitly dropped. The cast functions that are generated for an array type are implicitly dropped when the array type is dropped with the DROP statement.

Examples

Example 1: Create an ordinary array user-defined type named PHONENUMBERS, with a maximum of 50 elements. The elements are of the DECIMAL(10,0) data type.

```
CREATE TYPE PHONENUMBERS AS DECIMAL(10,0) ARRAY[50];
```

Example 2: Create an ordinary array user-defined type named NUMBERS, in the schema GENERIC. You do not know the maximum number of elements, so you use the default value. The elements are of the DECFLOAT(34) data type.

```
CREATE TYPE GENERIC.NUMBERS AS DECFLOAT(34) ARRAY[];
```

Example 3: Create an associative array user-defined type named PERSONAL_PHONENUMBERS. The elements are of the DECIMAL(16, 0) data type. The array type is indexed by strings such as 'Home', 'Work', or 'Cell', so the index data type must be VARCHAR.

```
CREATE TYPE PERSONAL_PHONENUMBERS AS DECIMAL(16,0) ARRAY[VARCHAR(8)];
```

Example 4: Create an associative array user-defined type named CAPITALSARRAY. The elements are capital cities. The index values are province, territory, or country names, so the index data type must be VARCHAR.

```
CREATE TYPE CAPITALSARRAY AS VARCHAR(30) ARRAY[VARCHAR(20)];
```

Example 5: Create an associative array user-defined type named PRODUCTS. The elements are product descriptions of up to 40 characters. The index values are product numbers, which have the INTEGER data type.

```
CREATE TYPE PRODUCTS AS VARCHAR(40) ARRAY[INTEGER];
```

CREATE TYPE (distinct)

The CREATE TYPE (distinct) statement defines a distinct type, which is a data type that a user defines. A distinct type must be based on one of the built-in data types.

Successful execution of the statement also generates:

- A function to cast between the distinct type and its source type
- A function to cast between the source type and its distinct type
- As appropriate, support for the use of comparison operators with the distinct type

Invocation

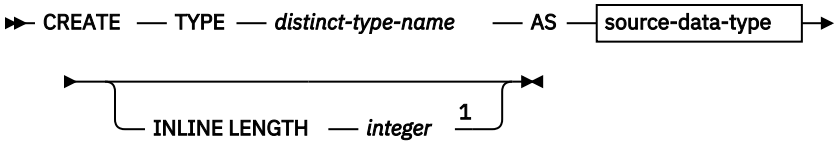
This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

- The CREATEIN privilege on the schema
- SYSADM or SYSCTRL authority

- System DBADM

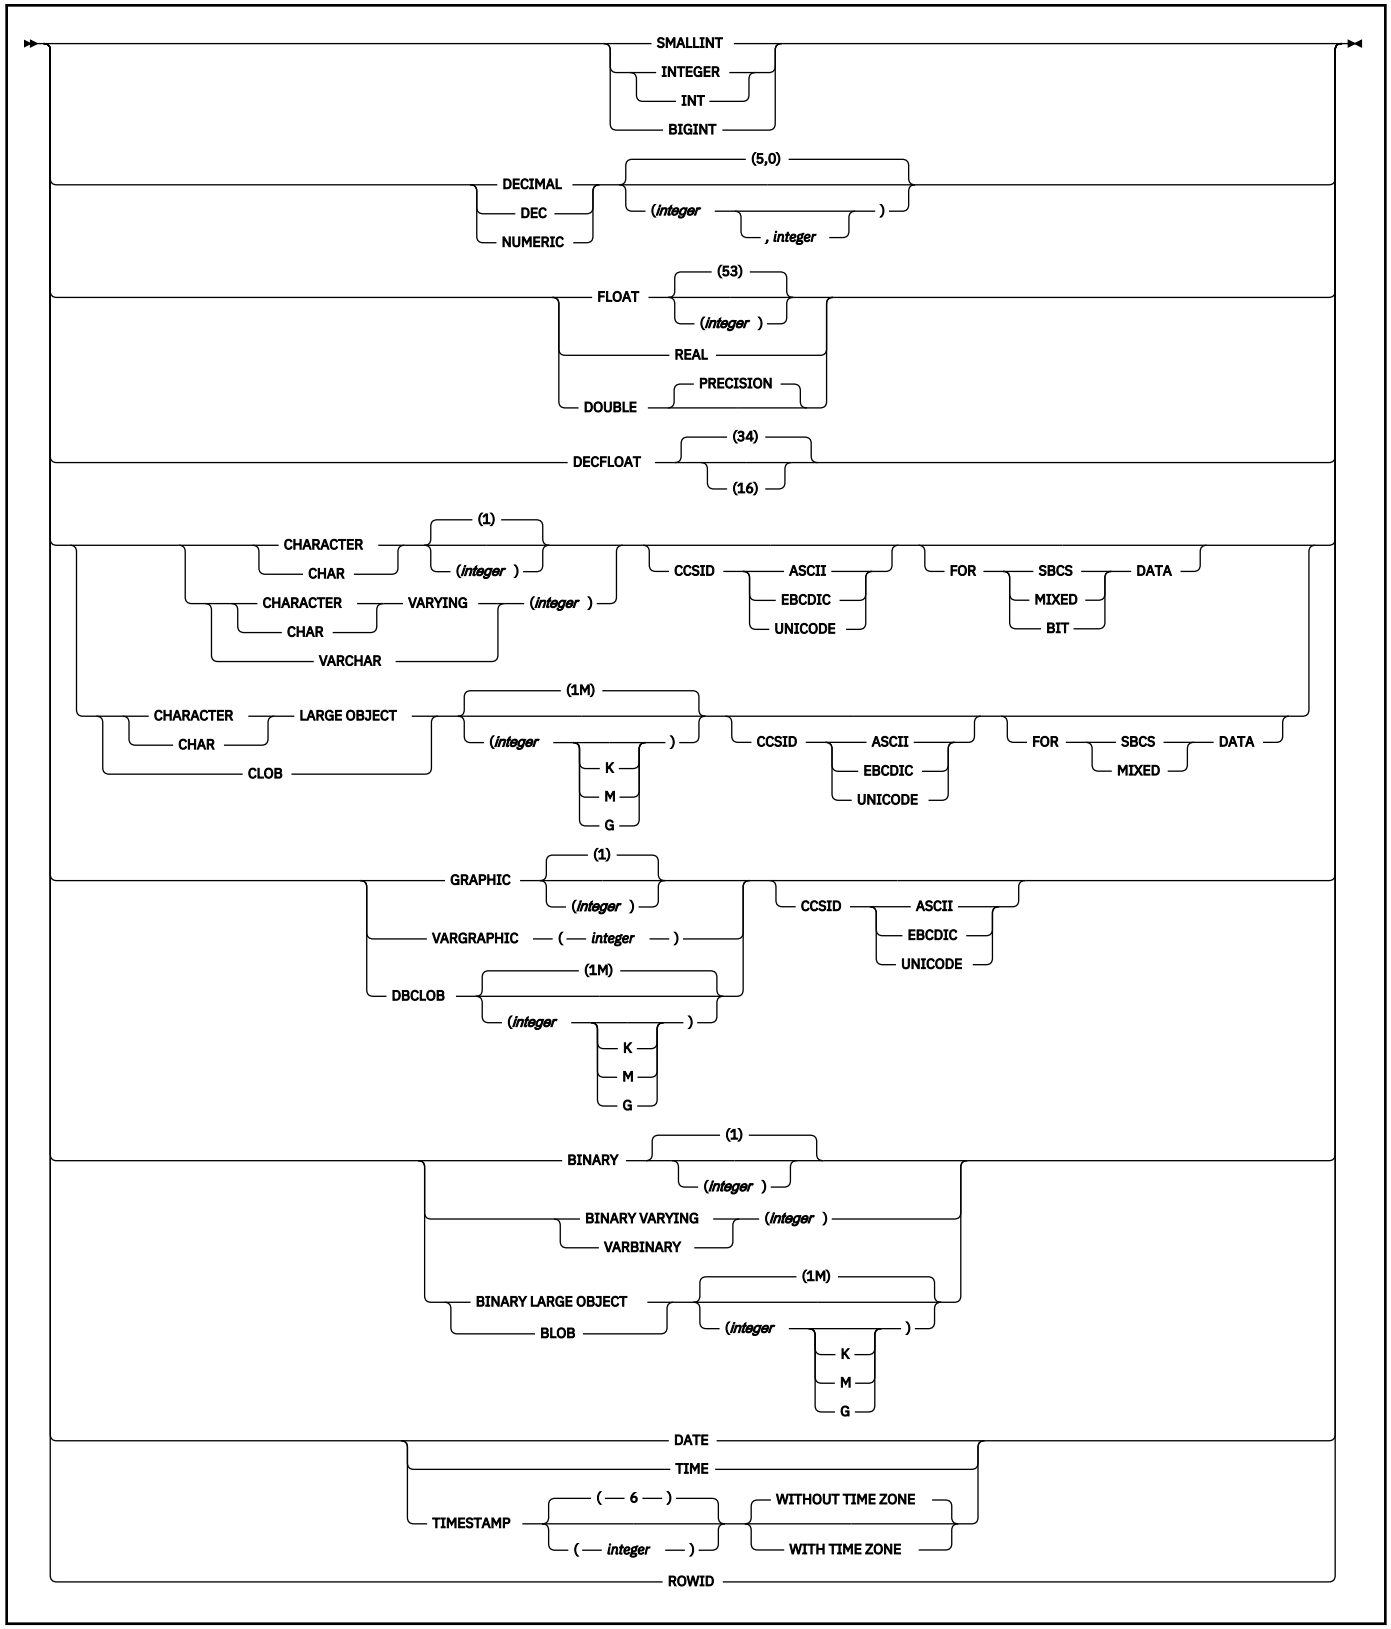


The authorization ID that matches the schema name implicitly has the CREATEIN privilege on the schema.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the owner is a role, the implicit schema match does not apply and this role needs to include one of the previously listed conditions.

If the statement is dynamically prepared and is not running in a trusted context for which the ROLE AS OBJECT OWNER clause is specified, the privilege set is the set of privileges that are held by the SQL authorization ID of the process. The specified distinct type name can include a schema name (a qualifier). If the schema name is not the same as the SQL authorization ID of the process, one of the following conditions must be met:

- The privilege set includes SYSADM or SYSCTRL authority.
- The SQL authorization ID of the process has the CREATEIN privilege on the schema.



Syntax

Notes:

[1] INLINE LENGTH can only be specified when *source-data-type* is a LOB data type.

source-data-type

Description

distinct-type-name

Names the distinct type. The name, including the implicit or explicit qualifier, must not identify a distinct type that exists at the current server.

- The unqualified form of *distinct-type-name* must not be the name of a built-in data type, BOOLEAN, or any of following system-reserved keywords even if you specify them as delimited identifiers:

```
ALL                     LIKE                    UNIQUE
AND                     MATCH                   UNKNOWN
ANY                     NOT                     =
BETWEEN                 NULL                    ¬=
DISTINCT                ONLY                    <
EXCEPT                  OR                      <=
EXISTS                  OVERLAPS                ¬<
FALSE                   SIMILAR                 >
FOR                     SOME                    >=
FROM                    TABLE                   ¬>
IN                      TRUE                    <>
IS                      TYPE
```

- The qualified form of *distinct-type-name* is an SQL identifier (the schema name) followed by a period and an SQL identifier.

The schema name can be 'SYSTOOLS' if the privilege set includes the SYSADM or SYSCTRL privilege. Otherwise, the schema name must not begin with 'SYS' unless the schema name is 'SYSADM'.

source-data-type
Specifies the data type that is used as the basis for the internal representation of the distinct type. The data type must be a built-in data type. For more information on built-in data types, see built-in-type.

If the distinct type is based on a character or graphic string data type, the FOR clause indicates the subtype. If you do not specify the FOR clause, the distinct type is defined with the default subtype. For ASCII or EBCDIC data, the default is SBCS when the value of field MIXED DATA on installation panel DSNTIPF is NO. The default is MIXED when the value is YES. For UNICODE character data, the default subtype is mixed.

If the distinct type is based on a string data type, the CCSID clause indicates whether the encoding scheme of the data is ASCII, EBCDIC or UNICODE. If you do not specify CCSID ASCII, CCSID EBCDIC, or UNICODE, the encoding scheme is the value of field DEF ENCODING SCHEME on installation panel DSNTIPF.

INLINE LENGTH ***integer***
Specifies the default inline length for columns that reference the distinct type. INLINE LENGTH can only be specified when *source-data-type* is a LOB data type. Only columns in a table that is in a universal table space can inherit the specified inline length for the distinct type. If the table is not in a universal table space, the specified inline length is ignored.

Where *source-data-type* is BLOB and CLOB, *integer* specifies the maximum number of bytes that are stored in the base table space for columns that reference this distinct type. *integer* must be between 0 and 32680 (inclusive) for a BLOB or CLOB *source-data-type*.

Where *source-data-type* is DBCLOB, *integer* specifies the maximum number of double-byte characters that are stored in the table space for columns that reference the distinct type. *integer* must be between 0 and 16340 (inclusive) for a DBCLOB *source-data-type*.

If INLINE LENGTH is specified with a value of 0 for *integer*, any column that references the distinct type will not have an inline length unless the CREATE TABLE or ALTER TABLE ADD statement specifies an inline length for the column.

If INLINE LENGTH is not specified, any column that reference the distinct type takes its default vale from the value of the LOB INLINE LENGTH parameter on installation panel DSNTIPD.

integer cannot be greater than the maximum length of the distinct type.

Notes

Owner privileges:
The owner of the distinct type is authorized to define columns, parameters, or variables with the distinct type (USAGE privilege) with the ability to grant these privileges to others. See "GRANT (type or JAR file privileges)" on page 1804. The owner is also authorized to invoke the generated cast function (EXECUTE privilege; see "GRANT (function or procedure privileges)" on page 1784). The owner is given the USAGE and EXECUTE privileges with the GRANT option. For more information about ownership of the object, see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

Base data types with DBCS or mixed data:
When the implicit or explicit encoding scheme is ASCII or EBCDIC and the base data type is graphic or a character type is MIXED DATA, then the value of field FOR MIXED DATA on installation panel DSNTIPF must be YES; otherwise, an error occurs.

Generated cast functions:
The successful execution of the CREATE TYPE (distinct) statement causes Db2 to generate the following cast functions:

- A function to convert from the distinct type to its base data type
- A function to convert from the base data type to the distinct type
- A function to cast from a data type *A* to distinct type *DT*, where *A* is promotable to the base data type *S* of distinct type *DT*

  For some base data types, Db2 supports an additional function to convert from:

  – INTEGER to the distinct type if the source type is SMALLINT
  – VARCHAR to the distinct type if the source type is CHAR
  – VARGRAPHIC to the distinct type if the source type is GRAPHIC
  – VARBINARY to the distinct type if the source type is BINARY
  – DOUBLE to the distinct type if the source type is REAL

The cast functions are created as if the following statements were executed:

```
CREATE FUNCTION source-type-name (distinct-type-name)
   RETURNS source-type-name …
CREATE FUNCTION distinct-type-name (source-type-name)
   RETURNS distinct-type-name …
```

In cases in which a length, precision, or scale is specified for the base type in the CREATE TYPE statement, the unqualified name of the cast function that converts from the distinct type to the base type is the name of the base data type. The data type of the value that the cast function returns includes any length, precision, or scale values that were specified for the base data type on the CREATE TYPE statement. (See Table 207 on page 1629 for details.)

For example, assume that a distinct type named T_SHOESIZE is created with the following statement:

```
CREATE TYPE CLAIRE.T_SHOESIZE AS VARCHAR(2)
```

When the statement is executed, Db2 also generates the following cast functions. VARCHAR converts from the distinct type to the source type, and T_SHOESIZE converts from the source type to the distinct type.

```
FUNCTION CLAIRE.VARCHAR (CLAIRE.T_SHOESIZE) RETURNS SYSIBM.VARCHAR (2)
FUNCTION CLAIRE.T_SHOESIZE (SYSIBM.VARCHAR (2)) RETURNS CLAIRE.T_SHOESIZE
```

Notice that function VARCHAR returns a value with a data type of VARCHAR(2) and that function T_SHOESIZE has an input parameter with a data type of VARCHAR(2).

The schema of the generated cast functions is the same as the schema of the distinct type. No other function with the same name and function signature must already exist in the database.

In the preceding example, if T_SHOESIZE was based on a SMALLINT, CHAR, or GRAPHIC data type instead of a VARCHAR data type, another cast function would have been generated in addition to the two functions to cast between the distinct type and the base data type. For example, assume that T_SHOESIZE is created with this statement:

```
CREATE TYPE CLAIRE.T_SHOESIZE AS CHAR(2)
```

When the statement is executed, Db2 generates these cast functions:

```
FUNCTION CLAIRE.CHAR (CLAIRE.T_SHOESIZE) RETURNS SYSIBM.CHAR (2)
   FUNCTION CLAIRE.T_SHOESIZE (SYSIBM.CHAR (2)) RETURNS CLAIRE.T_SHOESIZE
   FUNCTION CLAIRE.T_SHOESIZE (SYSIBM.VARCHAR (2)) RETURNS CLAIRE.T_SHOESIZE
```

Notice that the third function enables the casting of a VARCHAR(2) to T_SHOESIZE. This additional function is created to enable casting a constant, such as 'AB', directly to the distinct type. Without the additional function, you would have to first cast 'AB', which has a data type of VARCHAR, to a data type of CHAR and then cast it to the distinct type.

You cannot explicitly drop a generated cast function. The cast functions that are generated for a distinct type are implicitly dropped when the distinct type is dropped with the DROP statement.

For each built-in data type that can be the base data type for a distinct type, the following table gives the names of the generated cast functions, the data types of the input parameters, and the data types of the values that the functions returns.

Table 207. CAST functions on distinct types

Source type name	Function name	Parameter-type	Return-type
SMALLINT	*distinct-type-name*	SMALLINT	*distinct-type-name*
	distinct-type-name	INTEGER	*distinct-type-name*
	SMALLINT	*distinct-type-name*	SMALLINT
INTEGER	*distinct-type-name*	INTEGER	*distinct-type-name*
	INTEGER	*distinct-type-name*	INTEGER
BIGINT	*distinct-type-name*	BIGINT	*distinct-type-name*
	BIGINT	*distinct-type-name*	BIGINT
DECIMAL	*distinct-type-name*	DECIMAL (p,s)	*distinct-type-name*
	DECIMAL	*distinct-type-name*	DECIMAL (p,s)
NUMERIC	*distinct-type-name*	DECIMAL (p,s)	*distinct-type-name*
	DECIMAL	*distinct-type-name*	DECIMAL (p,s)

	ROWID	*distinct-type-name*	ROWID

Notes: NUMERIC and FLOAT are not recommended when creating a distinct type for a portable application. Use DECIMAL and DOUBLE (or REAL) instead.

Built-in functions:
When a distinct type is defined, the built-in functions (such as AVG, MAX, and LENGTH) are not automatically supported for the distinct type. You can use a built-in function on a distinct type only after a sourced user-defined function, which is based on the built-in function, has been created for the distinct type. For information on defining sourced user-defined functions, see "CREATE FUNCTION (sourced)" on page 1372.

Arithmetic operators with distinct type operands:
A distinct type cannot be used with arithmetic operators even if its base data type is numeric.

For additional information see "Arithmetic with distinct type operands" on page 237.

Alternative syntax and synonyms:
The WITH COMPARISONS clause, which specifies that system-generated comparison operators are to be created for comparing two instances of the distinct type, can be specified as the last clause of the statement. Use WITH COMPARISONS only if it is required for compatibility with other products in the Db2 family. If the base data type is either BLOB, CLOB, or DBCLOB and WITH COMPARISONS is specified, a warning occurs as in previous releases.

To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following clauses:

- DISTINCT TYPE as a synonym for TYPE
- TIMEZONE can be specified as an alternative to TIME ZONE

.

Examples

Example 1: Create a distinct type named SHOESIZE that is based on an INTEGER data type.

```
CREATE TYPE SHOESIZE AS INTEGER;
```

The successful execution of this statement also generates two cast functions. Function INTEGER(SHOESIZE) returns a value with data type INTEGER, and function SHOESIZE(INTEGER) returns a value with distinct type SHOESIZE.

Example 2: Create a distinct type named MILES that is based on a DOUBLE data type.

```
CREATE TYPE MILES AS DOUBLE;
```

The successful execution of this statement also generates two cast functions. Function DOUBLE(MILES) returns a value with data type DOUBLE, and function MILES(DOUBLE) returns a value with distinct type MILES.

CREATE VARIABLE

The CREATE VARIABLE statement creates a global variable at the current server.

Invocation

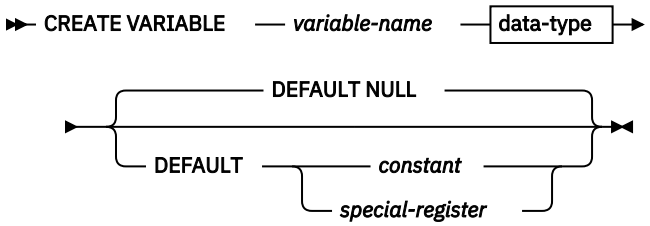
This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

The privilege set that is defined below must include at least one of the following:

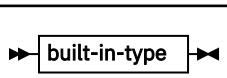
- The CREATEIN privilege on the schema
- System DBADM authority
- SYSADM authority
- SYSCTRL authority

Privilege set: The authorization ID that matches the schema name implicitly has the CREATEIN privilege on the schema. If the statement is embedded in an application program, the privilege set is the set of privileges that are held by the owner of the package. If the owner is a role, the implicit schema does not apply and this role needs to include one of the previously listed privileges or authorities.



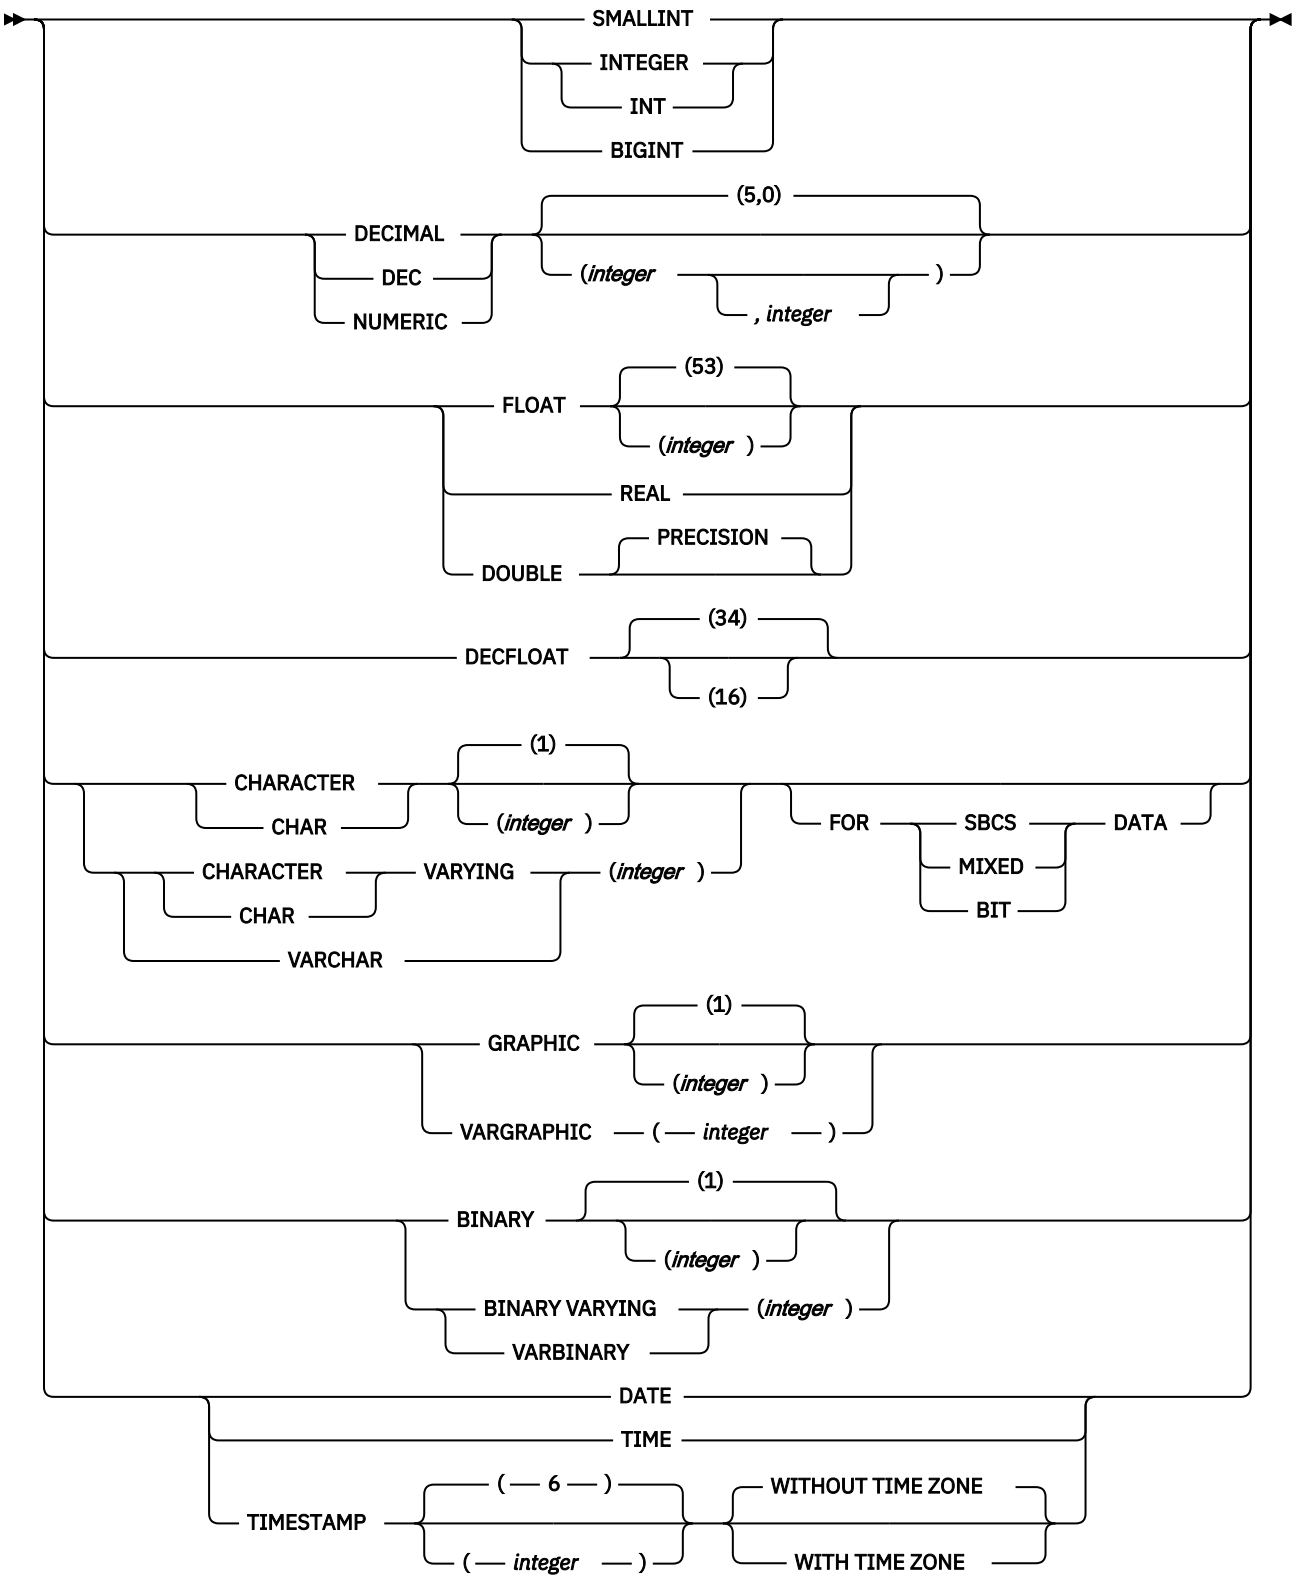
If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process unless the process is within a trusted context and the ROLE AS OBJECT OWNER AND QUALIFIER clause is in effect. If the schema name is not the same as the SQL authorization ID of the process, one of the following conditions must be met:

- The privilege set includes SYSADM or SYSCTRL authority.
- The SQL authorization ID of the process has the CREATEIN privilege on the schema.



When the ROLE AS OBJECT OWNER AND QUALIFIER clause is in effect, the privilege set is the set privileges that are held by the role. If the schema name does not match this role, one of the following conditions must be met:

- The privilege set includes SYSADM or SYSCTRL authority.
- This role has the CREATEIN privilege on the schema.



Syntax

data-type:

built-in-type:

Description

variable-name

Names the global variable. The name, including the implicit or explicit qualifier, must not identify a global variable that exists at the current server. If the qualifier is not specified, the contents of the CURRENT SCHEMA special register is used.

The schema name must not begin with 'SYS' unless the schema name is 'SYSADM'.

data-type
Specifies the data type of the global variable.

built-in-type
The data type of the global variable is a built-in type. For information about the data types, see built-in-type. The data type cannot be a LOB data type, ROWID, or XML. If the data type is a string data type, it must be Unicode.

DEFAULT, DEFAULT NULL, DEFAULT *constant*, or DEFAULT *special-register*
The default value that is assigned to the global variable if a value is not explicitly specified. Specifies a value for the global variable when it is first referenced in the session. The default value is determined on this first reference. If the DEFAULT clause is not specified, the default for the global variable is the null value.

DEFAULT NULL
Specifies null as the default value for the global variable. The value of a global variable is always nullable.

DEFAULT *constant*
Specifies that the value of the constant is the default value for the global variable. The value of the constant must conform to the rules for assigning that value to the global variable. *constant* cannot be any of the constants NAN, SNAN, or INFINITY.

DEFAULT *special-register*
Specifies that the value of the special register, when the global variable is instantiated, is used as the default value of the global variable. The value of the specified special register must conform to the rules for assigning that value to the global variable. The following special registers must not be specified:

- CURRENT GET_ACCEL_ARCHIVE
- CURRENT QUERY_ACCELERATION
- CURRENT TEMPORAL BUSINESS_TIME
- CURRENT TEMPORAL SYSTEM_TIME

Notes

Session scope:
Global variables have a session scope. Although they are available for use to all sessions that are active at the current server, the value of the global variable is private for each session.

Modifications to the value of a global variable:
Global variables are not under transaction control. Modifications to the value of a global variable are not affected by either a COMMIT or ROLLBACK statement.

Privileges to use a global variable:
Reading from or writing to a global variable requires that the authorization ID or role that is in effect have the appropriate privileges on the global variable. The owner of the variable is implicitly granted all privileges on the variable.

Setting the default value:
After a global variable has been created, it is instantiated to its default value when it is first referenced within a given scope. If a global variable is referenced within a statement, it is instantiated independently from the execution of that statement.

Using a newly created global variable:
If a global variable is created within a session, it cannot be used by other sessions until the unit of work has committed. However, the newly created global variable can be used within the session in which it is created before the unit of work commits.

Examples

Example 1: Create a global variable to indicate what printer to use for the session.

```
CREATE VARIABLE MYSCHEMA.MYJOB_PRINTER VARCHAR(30)
 DEFAULT 'Default printer';
```

Example 2: Create a global variable to indicate the department where an employee works.

```
CREATE VARIABLE SCHEMA1.GV_DEPTNO INTEGER
 DEFAULT 'Unassigned';
```

CREATE VIEW

The CREATE VIEW statement creates a view on tables or views at the current server.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

For every table or view identified in the *fullselect*, the privilege set that is defined below must include at least one of the following:

- The SELECT privilege on the table or view
- Ownership of the table or view
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SQLADM authority (catalog tables only)
- System DBADM authority (catalog tables only)
- ACCESSCTRL authority (catalog tables only)
- SYSCTRL authority (catalog tables only)
- SECADM authority (catalog tables only)

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Authority requirements depend in part on the choice of the owner of the view. For information on how to choose the owner, see the description of *view-name* in “ALTER VIEW” on page 1256.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the of the owner of the plan or package. If the application is bound in a trusted context with the ROLE AS OBJECT OWNER clause specified, a role is the owner. Otherwise, an authorization ID is the owner.

- If this privilege set includes SYSADM authority, the owner of the view can be any authorization ID. If that set includes SYSCTRL but not SYSADM authority, the following is true: the owner of the view can be any authorization ID, provided the view does not refer to user tables or views in the first FROM clause of its defining fullselect. (It could refer instead, for example, to catalog tables or views thereof.)

  If the view satisfies the rules in the preceding paragraph, and if no errors are present in the CREATE statement, the view is created, even if the owner has no privileges at all on the tables and views identified in the fullselect of the view definition.

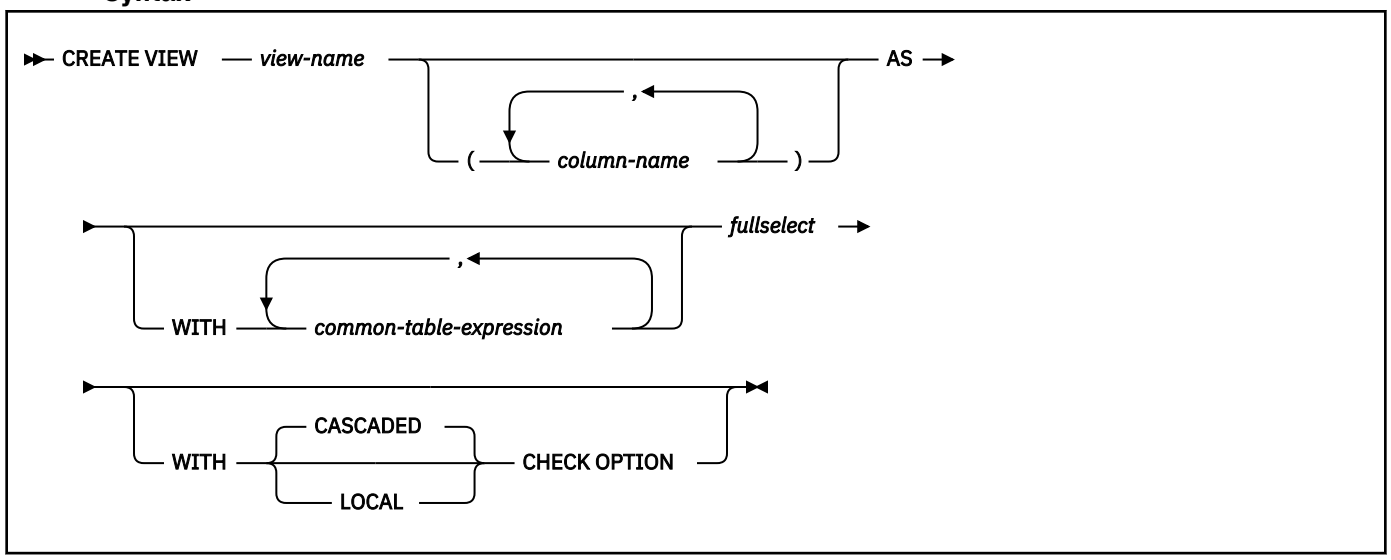
- If the privilege set includes system DBADM authority, the owner of the view can be any authorization ID. However, to create a view on a user table, either the owner of the view or the creator must have the SELECT privilege on all the tables or views in the CREATE VIEW statement.
- If the privilege set lacks system DBADM, SYSADM and SYSCTRL but includes DBADM authority on at least one of the databases that contains a table from which the view is created, the owner of the view can be any authorization ID if all of the following conditions are true:
  - The value of subsystem parameter DBACRVW is set to YES.
  - The view is not based only on views.

  Note: The owner of the view must have the SELECT privilege on all tables and views in the CREATE VIEW statement, or, if the owner does not have the SELECT privilege on a table, the creator must have DBADM authority on the database that contains that table.
- If the privilege set lacks SYSADM, SYSCTRL, system DBADM, and DBADM authority, or if the authorization ID of the application plan or package fails to meet any of the previous conditions, the owner of the view must be the owner of the application plan or package.

If ROLE AS OBJECT OWNER is in effect, the schema qualifier must be the same as the role, unless the role has the CREATEIN privilege on the schema, SYSADM authority, system DBADM authority, or SYSCTRL authority.

If ROLE AS OBJECT OWNER is not in effect, one of the following rules applies:

- If the privilege set lacks the CREATIN privilege on the schema, SYSADM authority, system DBADM authority, or SYSCTRL authority, the schema qualifier (implicit or explicit) must be the same as one of the authorization ids of the process.
- If the privilege set includes system DBADM authority, SYSADM authority or SYSCTRL authority, the schema qualifier can be any valid schema name.



If the statement is dynamically prepared, the following rules apply:

- If the SQL authorization ID of the process has SYSADM authority, the owner of the view can be any authorization ID. If that authorization ID has SYSCTRL but not SYSADM authority, the following is true: the owner of the view can be any authorization ID, provided the view does not refer to user tables or views in the first FROM clause of its defining fullselect. (It could refer instead, for example, to catalog tables or views thereof.)

  If the view satisfies the rules in the preceding paragraph, and if no errors are present in the CREATE statement, the view is created, even if the owner has no privileges at all on the tables and views identified in the fullselect of the view definition.
- If the SQL authorization ID of the process has system DBADM authority, the owner of the view can be any authorization ID. However, to create a view on a user table, either the owner of the view or the SQL authorization ID must have the SELECT privilege on all the tables or views in the CREATE VIEW statement.
- If SQL authorization ID of the process lacks system DBADM authority, SYSADM and SYSCTRL but includes DBADM authority on at least one of the databases that contains a table from which the view is created, the owner of the view can be different from the SQL authorization ID if all of the following conditions are true:
  - The value of field DBADM CREATE AUTH was set to YES on panel DSNTIPP during Db2 installation.
  - The view is not based only on views.

  Note: The owner of the view must have the SELECT privilege on all tables and views in the CREATE VIEW statement, or, if the owner does not have the SELECT privilege on a table, the creator must have DBADM authority on the database that contains that table.
- If the SQL authorization ID of the process lacks SYSADM, SYSCTRL, system DBADM authority, or DBADM authority, or if the SQL authorization ID of the process fails to meet any of the previous conditions, only the authorization IDs of the process can own the view. In this case, the privilege set is the privileges that are held by the authorization ID selected for ownership.

Syntax

Description

view-name
Names the view. The name, including the implicit or explicit qualifier, must not identify a table, view, alias, or synonym that exists at the current server or a table that exists in the SYSIBM.SYSPENDINGOBJECTS catalog table. The unqualified name must not be the same as an existing synonym.

If the name is qualified, the name can be a two-part or three-part name. If a three-part name is used, the first part must match the value of the field Db2 LOCATION NAME of installation panel DSNTIPR at the current server. (If the current server is not the local Db2, this name is not necessarily the name in the CURRENT SERVER special register.)

column-name,...
Names the columns in the view. If you specify a list of column names, it must consist of as many names as there are columns in the result table of the fullselect. Each name must be unique and unqualified. If you do not specify a list of column names, the columns of the view inherit the names of the columns of the result table of the fullselect.

You must specify a list of column names if the result table of the fullselect has duplicate column names or an unnamed column (a column derived from a constant, function, or expression that was not given a name by the AS clause). For more details about unnamed columns, see the information about names of result columns under "select-clause" on page 933.

AS
Identifies the view definition.

WITH *common-table-expression*
Defines a common table expression for use with the fullselect that follows. The fullselect must not contain a period specification. For an explanation of common table expression, see "common-table-expression" on page 988.

fullselect
Defines the view. At any time, the view consists of the rows that would result if the fullselect were executed.

The *fullselect* must conform to the following rules:

- The *fullselect* must not refer to any host variables or parameter markers (question marks), but can refer to global variables.
- The *fullselect* must not refer to any declared temporary tables.
- The *fullselect* must not include an invocation of the UNPACK function.

- The *fullselect* must not contain a period specification.
- The FROM clause of the *fullselect* must not include a *data-change-table-reference*.
- The FROM clause of the *fullselect* must not include a view for which an INSTEAD OF trigger is defined.
- The outer SELECT list of the outer *fullselect* must not result in a column that is an array.

For an explanation of *fullselect*, see "fullselect" on page 982.

WITH CASCADED CHECK OPTION or WITH LOCAL CHECK OPTIONS
Specifies that every row that is inserted or updated through the view must conform to the definition of the view. A row that does not conform to the definition of the view is a row that cannot be retrieved using that view.

The CHECK OPTION clause must not be specified if the view is read-only, includes a subquery, references a function that is not deterministic or has an external action, or if the fullselect of the view refers to a created temporary table. If the CHECK OPTION clause is specified for an updatable view that does not allow inserts, it applies to updates only.

If the CHECK OPTION clause is omitted, the definition of the view is not used in the checking of any insert or update operations that use the view. Some checking might still occur during insert or update operations if the view is directly or indirectly dependent on another view that includes the CHECK OPTION clause. Because the definition of the view is not used, rows might be inserted or updated through the view that do not conform to the definition of the view.

The difference between the two forms of the check option, CASCADED and LOCAL, is meaningful only when a view is dependent on another view. The default is CASCADED. The view on which another view is directly or indirectly defined is an *underlying view*.

CASCADED
Update and insert operations on view V must satisfy the search conditions of view V and all underlying views, regardless of whether the underlying views were defined with a check option. Furthermore, every updatable view that is directly or indirectly defined on view V inherits those search conditions (the search conditions of view V and all underlying views of V) as a constraint on insert or update operations. WITH CASCADED CHECK OPTION must not be specified if a view on which the specified view definition is dependent has an INSTEAD OF trigger defined.

LOCAL
Update and insert operations on view V must satisfy the search conditions of view V and underlying views that are defined with a check option (either WITH CASCADED CHECK OPTION or WITH LOCAL CHECK OPTION). Furthermore, every updatable view that is directly or indirectly defined on view V inherits those search conditions (the search conditions of view V and all underlying views of V that are defined with a check option) as a constraint on insert or update operations.

The LOCAL form of the CHECK option lets you update or insert rows that do not conform to the search condition of view V. You can perform these operations if the view is directly or indirectly defined on a view that was defined without a check option.

Table 208 on page 1639 illustrates the effect of using the default check option, CASCADED. The information in Table 208 on page 1639 is based on the following views:

- CREATE VIEW V1 AS SELECT COL1 FROM T1 WHERE COL1 > 10
- CREATE VIEW V2 AS SELECT COL1 FROM V1 WITH CASCADED CHECK OPTION
- CREATE VIEW V3 AS SELECT COL1 FROM V2 WHERE COL1 < 100

Table 208. Examples using default check option, CASCADED

SQL statement	Description of result
INSERT INTO V1 VALUES(5)	Succeeds because V1 does not have a check option and it is not dependent on any other view that has a check option.

Table 208. Examples using default check option, CASCADED (continued)

SQL statement	Description of result
INSERT INTO V2 VALUES(5)	Results in an error because the inserted row does not conform to the search condition of V1 which is implicitly is part of the definition of V2.
INSERT INTO V3 VALUES(5)	Results in an error because the inserted row does not conform to the search condition of V1.
INSERT INTO V3 VALUES(200)	Succeeds even though it does not conform to the definition of V3 (V3 does not have the view check option specified); it does conform to the definition of V2 (which does have the view check option specified).

The difference between CASCADED and LOCAL is shown best by example. Consider the following updatable views, where x and y represent either LOCAL or CASCADED:

V1 is defined on Table T0.
V2 is defined on V1 WITH x CHECK OPTION.
V3 is defined on V2.
V4 is defined on V3 WITH y CHECK OPTION.
V5 is defined on V4.

This example shows V1 as an *underlying view* for V2 and V2 as *dependent* on V1.

Table 209 on page 1640 shows the views in which search conditions are checked during an insert or update operation:

Table 209. Views in which search conditions are checked during insert and update operations

View used in INSERT or UPDATE operation	x = LOCAL y = LOCAL	x = CASCADED y = CASCADED	x = LOCAL y = CASCADED	x = CASCADED y = LOCAL
V1	None	None	None	None
V2	V2	V2, V1	V2	V2, V1
V3	V2	V2, V1	V2	V2, V1
V4	V4, V2	V4, V3, V2, V1	V4, V3, V2, V1	V4, V2, V1
V5	V4, V2	V4, V3, V2, V1	V4, V3, V2, V1	V4, V2, V1

Notes

Owner privileges

The owner of a view always acquires the SELECT privilege on the view and the authority to drop the view. If all of the privileges that are required to create the view are held with the GRANT option before the view is created, the owner of the view receives the SELECT privilege with the GRANT option. Otherwise, the owner receives the SELECT privilege without the GRANT option. For example, assume that a view definition also refers to a user-defined function. If the owner's EXECUTE privilege on the user-defined function is held without the GRANT option, the owner acquires the SELECT privilege on the view without the GRANT option.

The owner can also acquire INSERT, UPDATE, and DELETE privileges on the view. Acquiring these privileges is possible if the view is not "read-only", which means a single table of view is identified in the first FROM clause of the fullselect. For each privilege that the owner has on the identified table or view (INSERT, UPDATE, and DELETE) before the new view is created, the owner acquires that privilege on the view. The owner receives the privilege with the GRANT option if the privilege is held

on the table or view with the GRANT option. Otherwise, the owner receives the privileges without the GRANT option.

With appropriate Db2 authority, a process can create views for those who have no authority to create the views themselves. The owner of such a view has the SELECT privilege on the view, without the GRANT option, and can drop the view.

For more information on the ownership of an object, see "Authorization, privileges, permissions, masks, and object ownership" on page 87.

Authorization for views created for other users:
When a process with appropriate authority creates a view for another user that does not have authorization for the underlying table or view, the SELECT privilege for the created view is implicitly granted to the user.

Considerations for row access control and column access control:
The view definition might reference a table for which row access control or column access control is activated. If the view definition references a table for which row access control or column access control is activated, the WITH CHECK OPTION clause must not be specified if the search conditions from the view or from the underlying views will be checked during an insert or update operation. Note that the WITH CHECK OPTION clause is ignored if such search conditions do not exist.

Read-only views:
A view is *read-only* if one or more of the following statements is true of its definition:

- The first FROM clause identifies more than one table or view, or identifies a table function, a nested table expression, a common table expression, or a collection-derived table.
- The first SELECT clause specifies the keyword DISTINCT.
- The outer fullselect contains a GROUP BY clause.
- The outer fullselect contains a HAVING clause.
- The first SELECT clause contains an aggregate function.
- It contains a subquery such that the base object of the outer fullselect, and of the subquery, is the same table.
- The first FROM clause identifies a read-only view.
- The first FROM clause identifies a system-maintained materialized query table.
- The outer fullselect is not a subselect (contains a set operator).

A read-only view cannot be the object of an SQL data change statement or a TRUNCATE statement. A view that includes GROUP BY or HAVING cannot be referred to in a subquery of a basic predicate.

Insertable views:
A view is insertable if an INSTEAD OF trigger for the insert operation has been defined for the view, or if at least one column of the view is updatable (independent of an INSTEAD OF trigger for update).

Considerations for implicitly hidden columns:
It is possible that the result table of the fullselect will include a column of a base table that is defined as implicitly hidden. This can occur when the implicitly hidden column is explicitly referenced in the fullselect of the view definition. However, the corresponding column of the view does not inherit the implicitly hidden attribute. Columns of a view cannot be defined as hidden.

Testing a view definition:
You can test the semantics of your view definition by executing SELECT * FROM *view-name*.

The two forms of a view definition:
Both the source and the operational form of a view definition are stored in the Db2 catalog. Those two forms are not necessarily equivalent because the operational form reflects the state that exists when the view is created. For example, consider the following statement:

```
CREATE VIEW V AS SELECT * FROM S;
```

In this example, S is a synonym or alias for A.T, which is a table with columns C1, C2, and C3®. The operational form of the view definition is equivalent to:

```
SELECT C1, C2, C3 FROM A.T;
```

Adding columns to A.T using ALTER TABLE and dropping S does not affect the operational form of the view definition. Thus, if columns are added to A.T or if S is redefined, the source form of the view definition can be misleading.

View restrictions:

A view definition cannot contain references to remote objects. A view definition cannot map to more than 15 base table instances. A view definition cannot reference a declared global temporary table.

Restrictions involving pending definition changes:

CREATE VIEW is not allowed if the view references a column on which there are pending definition changes.

Considerations for inline LOB columns:

If the view references a table that contains an inline LOB column and Db2 determines that the inline attribute can be passed on to the view, the view will then inherit the inline attribute, otherwise the inline attribute is not inherited by the view.

Considerations for XML columns:

If the view has an XML column and the column of the underlying base table for the view has an XML type modifier, the view column has the same type modifier. However, if there is an instead of trigger defined on the view, validation of the column, according to XML schemas in the type modifier, is not enforced during insert or update to this view.

Examples

Example 1: Create the view DSN8B10.VPROJRE1. PROJNO, PROJNAME, PROJDEP, RESPEMP, FIRSTNME, MIDINIT, and LASTNAME are column names. The view is a join of tables and is therefore read-only.

```
CREATE VIEW DSN8B10.VPROJRE1
  (PROJNO,PROJNAME,PROJDEP,RESPEMP,
   FIRSTNME,MIDINIT,LASTNAME)
  AS SELECT ALL
  PROJNO,PROJNAME,DEPTNO,EMPNO,
  FIRSTNME,MIDINIT,LASTNAME
  FROM DSN8B10.PROJ, DSN8B10.EMP
  WHERE RESPEMP = EMPNO;
```

In the example, the WHERE clause refers to the column EMPNO, which is contained in one of the base tables but is not part of the view. In general, a column named in the WHERE, GROUP BY, or HAVING clause need not be part of the view.

Example 2: Create the view DSN8B10.FIRSTQTR that is the UNION ALL of three fullselects, one for each month of the first quarter of 2000. The common names are SNO, CHARGES, and DATE.

```
 CREATE VIEW DSN8B10.FIRSTQTR (SNO, CHARGES, DATE) AS
SELECT SNO, CHARGES, DATE
FROM MONTH1
WHERE DATE BETWEEN '01/01/2000' and '01/31/2000'
  UNION All
SELECT SNO, CHARGES, DATE
FROM MONTH2
WHERE DATE BETWEEN '02/01/2000' and '02/29/2000'
  UNION All
SELECT SNO, CHARGES, DATE
FROM MONTH3
WHERE DATE BETWEEN '03/01/2000' and '03/31/2000';
```

DECLARE CURSOR

The DECLARE CURSOR statement defines a cursor.

Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java.

Authorization

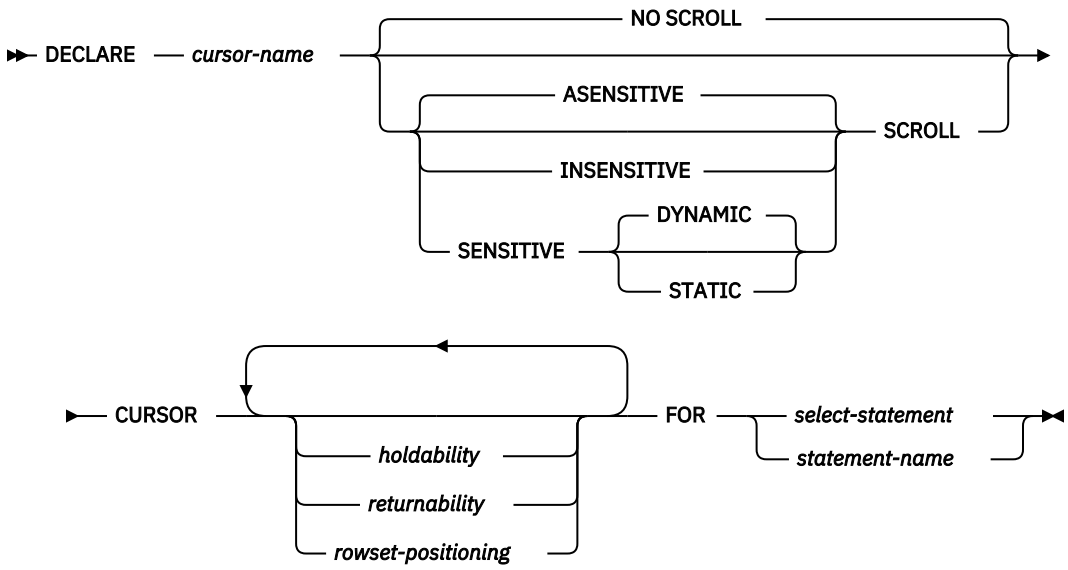
For each table or view identified in the SELECT statement of the cursor, the privilege set must include at least one of the following:

- The SELECT privilege
- Ownership of the object
- DBADM authority for the corresponding database (tables only)
- SYSADM authority
- SYSCTRL authority (catalog tables only)
- DATAACCESS authority

If the *select-statement* contains an SQL data change statement, the authorization requirements of that statement also apply to the DECLARE CURSOR statement.

The SELECT statement of the cursor is one of the following:

- The prepared select statement identified by *statement-name*
- The specified *select-statement*

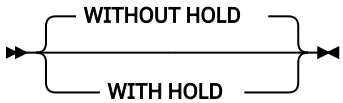


If statement-name is specified:

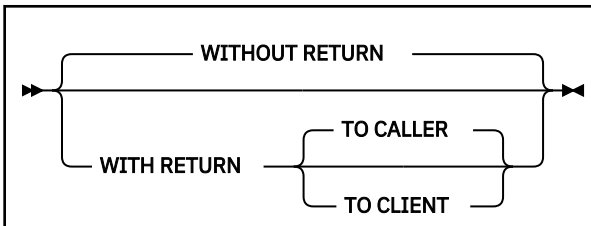
- The privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.)
- The authorization check is performed when the SELECT statement is prepared.
- The cursor cannot be opened unless the SELECT statement is successfully prepared.

If select-statement is specified:

- The privilege set consists of the privileges that are held by the authorization ID of the owner of the plan or package.
- If the plan or package is bound with VALIDATE(BIND), the authorization check is performed at bind time, and the bind is unsuccessful if any required privilege does not exist.
- If the plan or package is bound with VALIDATE(RUN), an authorization check is performed at bind time, but all required privileges need not exist at that time. If all privileges exist at bind time, no authorization checking is performed when the cursor is opened. If any privilege does not exist at bind time, an authorization check is performed the first time the cursor is opened within a unit of work. The OPEN is unsuccessful if any required privilege does not exist.

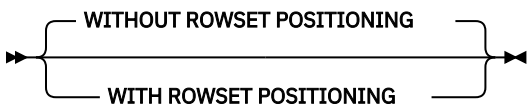


Syntax



Notes:

[1] The same clause must not be specified more than once.



holdability:

returnability:

rowset-positioning:

Description

cursor-name
Names the cursor. The name must not identify a cursor that has already been declared in the source program. The name is usually VARCHAR(128); however, if the cursor is defined WITH RETURN, the name is limited to VARCHAR(30).

NO SCROLL or SCROLL
Specifies whether the cursor is scrollable or not scrollable.

NO SCROLL
Specifies that the cursor is not scrollable. This is the default.

SCROLL
Specifies that the cursor is scrollable. For a scrollable cursor, whether the cursor has sensitivity to inserts, updates, or deletes depends on the cursor sensitivity option in effect for the cursor. If a sensitivity option is not specified, ASENSITIVE is the default.

ASENSITIVE
Specifies that the cursor should be as sensitive as possible. This is the default.

A cursor that defined as ASENSITIVE will be either insensitive or sensitive dynamic; it will not be sensitive static. For information about how the effective sensitivity of the cursor is returned to the application with the GET DIAGNOSTICS statement or in the SQLCA, see "OPEN" on page 1844.

The sensitivity of a cursor is a factor in the choice of access path. Explicitly specify the sensitivity level that you need, instead of specifying ASENSITIVE.

INSENSITIVE
Specifies that the cursor does not have sensitivity to inserts, updates, or deletes that are made to the rows underlying the result table. As a result, the size of the result table, the order of the rows, and the values for each row do not change after the cursor is opened. In addition, the cursor is read-only. The SELECT statement or *attribute-string* of the PREPARE statement cannot contain a FOR UPDATE clause, and the cursor cannot be used for positioned updates or deletes.

SENSITIVE
Specifies that the cursor has sensitivity to changes that are made to the database after the result table is materialized. The cursor is always sensitive to updates and deletes that are made using the cursor (that is, positioned updates and deletes using the same cursor). When the current value of a row no longer satisfies the *select-statement* or *statement-name*, that row is no longer visible through the cursor. When a row of the result table is deleted from the underlying base table, the row is no longer visible through the cursor.

If Db2 cannot make changes visible to the cursor, then an error is issued at bind time for OPEN CURSOR. Db2 cannot make changes visible to the cursor when the cursor implicitly becomes read-only. For example, when the result table must be materialized, as when the FROM clause of the SELECT statement contains more than one table or view. The current list of conditions that result in an implicit read-only cursor can be found in Read-only cursors.

The default is DYNAMIC.

DYNAMIC
Specifies that the result table of the cursor is dynamic, meaning that the size of the result table might change after the cursor is opened as rows are inserted into or deleted from the underlying table, and the order of the rows might change. Rows that are inserted, deleted, or updated by statements that are executed by the same application process as the cursor are visible to the cursor immediately. Rows that are inserted, deleted, or updated by statements that are executed by other application processes are visible only after the statements are committed. If a column for an ORDER BY clause is updated via a cursor or any means outside the process, the next FETCH statement behaves as if the updated row was deleted and re-inserted into the result table at its correct location. At the time of a positioned update, the cursor is positioned before the next row of the original location and there is no current row, making the row appear to have moved.

If a SENSITIVE DYNAMIC cursor is not possible, an error is returned. For example, if a temporary table is needed an error is returned. The SELECT statement of a cursor that is defined as SENSITIVE DYNAMIC cannot contain an SQL data change statement.

The FETCH FIRST *n* ROWS ONLY clause must not be specified for the outermost fullselect for a sensitive dynamic cursor.

STATIC

Specifies that the size of the result table and the order of the rows do not change after the cursor is opened. Rows inserted into the underlying table are not added to the result table regardless of how the rows are inserted. Rows in the result table do not move if columns in the ORDER BY clause are updated in rows that have already been materialized. Positioned updates and deletes are allowed if the result table is updatable. The SELECT statement of a cursor that is defined as SENSITIVE STATIC cannot contain an SQL data change statement.

A STATIC cursor has visibility to changes made by *this* cursor using positioned updates or deletes. Committed changes made outside this cursor are visible with the SENSITIVE option of the FETCH statement. A FETCH SENSITIVE can result in a *hole* in the result table (that is, a difference between the result table and its underlying base table). If an updated row in the base table of a cursor no longer satisfies the predicate of its SELECT statement, an update hole occurs in the result table. If a row of a cursor was deleted in the base table, a delete hole occurs in the result table. When a FETCH SENSITIVE detects an update hole, no data is returned (a warning is issued), and the cursor is left positioned on the update hole. When a FETCH SENSITIVE detects a delete hole, no data is returned (a warning is issued), and the cursor is left positioned on the delete hole.

Updates through a cursor result in an automatic re-fetch of the row. This re-fetch means that updates can create a hole themselves. The re-fetched row also reflects changes as a result of triggers updating the same row. It is important to reflect these changes to maintain the consistency of data in the row.

Using a function that is not deterministic (built-in or user-defined) in the WHERE clause of the *select-statement* or *statement-name* of a SENSITIVE STATIC cursor can cause misleading results. This situation occurs because Db2 constructs a temporary result table and retrieves rows from this table for FETCH INSENSITIVE statements. When Db2 processes a FETCH SENSITIVE statement, rows are fetched from the underlying table and predicates are re-evaluated. Using a function that is not deterministic can yield a different result on each FETCH SENSITIVE of the same row, which could also result in the row no longer being considered a match.

A FETCH INSENSITIVE on a SENSITIVE STATIC SCROLL cursor is not sensitive to changes made outside the cursor, unless a previous FETCH SENSITIVE has already refreshed that row; however, positioned updates and delete changes with the cursor are visible.

STATIC cursors are insensitive to insertions.

WITHOUT HOLD or WITH HOLD

Specifies whether the cursor should be prevented from being closed as a consequence of a commit operation.

WITHOUT HOLD

Does not prevent the cursor from being closed as a consequence of a commit operation. This is the default.

WITH HOLD

Prevents the cursor from being closed as a consequence of a commit operation. A cursor declared with WITH HOLD is closed at commit time if one of the following is true:

- The connection associated with the cursor is in the release pending status.
- The bind option DISCONNECT(AUTOMATIC) is in effect.
- The environment is one in which the option WITH HOLD is ignored.

When WITH HOLD is specified, a commit operation commits all of the changes in the current unit of work. For example, with a non-scrollable cursor, an initial FETCH statement is needed after a COMMIT statement to position the cursor on the row that follows the row that the cursor was positioned on before the commit operation.

WITH HOLD has no effect on an SQL data change statement within a SELECT statement. When a COMMIT is issued, the changes caused by the SQL data change statement are committed, regardless of whether or not the cursor is declared WITH HOLD.

All cursors are implicitly closed by a connect (Type 1) or rollback operation. A cursor is also implicitly closed by a commit operation if WITH HOLD is ignored or not specified.

Cursors that are declared with WITH HOLD in CICS or in IMS non-message-driven programs will not be closed by a rollback operation if the cursor was opened in a previous unit of work and no changes have been made to the database in the current unit of work. The cursor cannot be closed because CICS and IMS do not broadcast the rollback request to Db2 for a null unit of work.

If a cursor is closed before the commit operation, the effect is the same as if the cursor was declared without the option WITH HOLD.

WITH HOLD is ignored in IMS message driven programs (MPP, IFP, and message-driven BMP). WITH HOLD maintains the cursor position in a CICS pseudo-conversational program until the end-of-task (EOT).

For details on restrictions that apply to declaring cursors with WITH HOLD, see *Db2 Application Programming and SQL Guide*.

WITHOUT RETURN or WITH RETURN

Specifies whether the result table of the cursor is intended to be used as a result set that will be returned from a procedure. If *statement-name* is specified, the default is the corresponding prepare attribute of the statement. Otherwise, the default is `WITHOUT RETURN`.

WITHOUT RETURN

Specifies that the result table of the cursor is not intended to be used as a result set that will be returned from a procedure.

WITH RETURN

Specifies that the result table of the cursor is intended to be used as a result set that will be returned from a procedure. WITH RETURN is relevant only if the DECLARE CURSOR statement is contained within the source code for a procedure. In other cases, the precompiler might accept the clause, but it has not effect.

When a cursor that is declared using the WITH RETURN TO CALLER clause remains open at the end of a program or routine, that cursor defines a result set from the program or routine. Use the CLOSE statement to close a cursor that is not intended to be a result set from the program or routine. Although Db2 will automatically close any cursors that are not declared using with a WITH RETURN clause, the use of the CLOSE statement is recommended to increase the portability of applications.

For non-scrollable cursors, the result set consists of all rows from the current cursor position to the end of the result table. For scrollable cursors, the result set consists of all rows of the result table.

TO CALLER

Specifies that the cursor can return a result set to the caller of the procedure. The caller is the program or routine that executed the SQL CALL statement that invokes the procedure that contains the DECLARE CURSOR statement. For example, if the caller is a procedure, the result set, is returned to the procedure. If the caller is a client application, the result set is returned to the client application.

If the statement is contained within the source code for a procedure, WITH RETURN TO CALLER specifies that the cursor can be used as a result set cursor. A result set cursor is used when the result table of a cursor is to be returned from a procedure. Specifying TO CALLER is optional.

In other cases, the clause is ignored and the cursor cannot be used as a result set cursor.

TO CLIENT

Specifies that the cursor can return a result set to the client application. This cursor is invisible to any intermediate nested procedures. If a function or trigger calls the procedure (either

directly or indirectly), the result set cannot be returned to the client and the cursor will be closed after the procedure finishes.

rowset-positioning
Specifies whether multiple rows of data can be accessed as a rowset on a single FETCH statement for the cursor. The default is WITHOUT ROWSET POSITIONING.

WITHOUT ROWSET POSITIONING
Specifies that the cursor can be used only with row-positioned FETCH statements. The cursor is to return a single row for each FETCH statement and the FOR *n* ROWS clause cannot be specified on a FETCH statement for this cursor. WITHOUT ROWSET POSITIONING or single row access refers to how data is fetched from the database engine. For remote access, data might be blocked and returned to the client in blocks.

WITH ROWSET POSITIONING
Specifies that the cursor can be used with either row-positioned or rowset-positioned FETCH statements. This cursor can be used to return either a single row or multiple rows, as a rowset, with a single FETCH statement. ROWSET POSITIONING refers to how data is fetched from the database engine. For remote access, if any row qualifies, at least 1 row is returned as a rowset. The size of the rowset depends on the number of rows specified on the FETCH statement and on the number of rows that qualify. Data might be blocked and returned to the client in blocks.

Db2 REXX applications do not support cursors that are declared WITH ROWSET POSITIONING. To allow a cursor for a SELECT statement in a Db2 REXX application to be used with row-positioned or rowset-positioned FETCH statements, specify WITH ROWSET POSITIONING in the attribute string of the PREPARE statement for the SELECT statement.

select-statement
Specifies the result table of the cursor. See "select-statement" on page 987 for an explanation of *select-statement*.

The *select-statement* must not include parameter markers (except for REXX), but can include references to host variables. In host languages, other than REXX, the declarations of the host variables must precede the DECLARE CURSOR statement in the source program. In REXX, parameter markers must be used in place of host variables and the statement must be prepared.

The USING clause of the OPEN statement can be used to specify host variables that will override the values of the host variables or parameter markers that are specified as part of the statement in the DECLARE CURSOR statement.

The *select-statement* must not contain an SQL data change statement if the cursor is defined as SENSITIVE DYNAMIC or SENSITIVE STATIC.

The outer select list of the *select-statement* of a scrollable cursor must not be an array value.

statement-name
Identifies the prepared *select-statement* that specifies the result table of the cursor whenever the cursor is opened. The *statement-name* must not be identical to a statement name specified in another DECLARE CURSOR statement of the source program. For an explanation of prepared SELECT statements, see "PREPARE" on page 1849.

The prepared *select-statement* must not contain an SQL data change statement if the cursor is defined as SENSITIVE DYNAMIC or SENSITIVE STATIC.

Notes

A cursor in the open state designates a result table and a position relative to the rows of that table. The table is the result table specified by the SELECT statement of the cursor.

Read-only cursors:

If the result table is *read-only*, the cursor is *read-only*. The cursor that references a view with instead of triggers are read-only since positioned UPDATE and positioned DELETE statements are not allowed using those cursors. The result table is *read-only* if one or more of the following statements is true about the *select-statement* of the cursor:

- The first FROM clause identifies or contains any of the following:
  - More than one table or view
  - A catalog table with no updatable columns
  - A read-only view
  - A nested table expression
  - A table function
  - A system-maintained materialized query table
  - A single table that is a system-period temporal table, and a period specification for SYSTEM_TIME is used
  - A single view that directly or indirectly references a system-period temporal table in the FROM clause of the outer fullselect of the view definition, and a period specification for SYSTEM_TIME is used
- The first SELECT clause specifies the keyword DISTINCT, contains an aggregate function, or uses both
- It contains an SQL data change statement
- The outer subselect contains a GROUP BY clause, a HAVING clause, or both clauses
- It contains a subquery such that the base object of the outer subselect, and of the subquery, is the same table
- Any of the following operators or clauses are specified:
  - A set operator
  - An ORDER BY clause (except when the cursor is declared as SENSITIVE STATIC scrollable)
  - A FOR READ ONLY clause
- It is executed with isolation level UR and a FOR UPDATE clause is not specified.
- It is a VALUES clause.

If the result table is not read-only, the cursor can be used to update or delete the underlying rows of the result table.

Tables for which row or column access controls are enforced:
The *select-statement* of the cursor can reference a table for which row or column access controls are enforced. The row or column access controls do not effect the determination of whether the cursor is read-only and do not effect the cursor sensitivity.

Work file database requirement for static scrollable cursors:
To use a static scrollable cursor, you must first create a work file database and at least one table space with a 32KB page size in this database because a static scrollable cursor requires a temporary table for its result table while the cursor is open. Db2 chooses a table space to use for the temporary result table. Dynamic scrollable cursors do not require a declared temporary table.

For static scrollable cursor declarations that contain empty strings, Db2 assigns one byte in the temporary table space for each empty string. The following example shows a scrollable cursor declaration with an empty string:

```
EXEC SQL DECLARE CSROWSTAT SENSITIVE STATIC SCROLL CURSOR
  WITH ROWSET POSITIONING WITH HOLD FOR
  SELECT ID1,''
  FROM TB;
```

Cursors in COBOL and Fortran programs:
In COBOL and Fortran source programs, the DECLARE CURSOR statement must precede all statements that explicitly refer to the cursor by name. This rule does not necessarily apply to the other host languages because the precompiler provides a two-pass option for these languages. This rule applies to other host languages if the two-pass option is not used.

Cursors in REXX:

If host variables are used in a DECLARE CURSOR statement within a REXX procedure, the DECLARE CURSOR statement must be the object of a PREPARE and EXECUTE.

Scope of a cursor:

The scope of *cursor-name* is the source program in which it is defined; that is, the application program submitted to the precompiler. Thus, you can only refer to a cursor by statements that are precompiled with the cursor declaration. For example, a COBOL program called from another program cannot use a cursor that was opened by the calling program. Furthermore, a cursor defined in a Fortran subprogram can only be referred to in that subprogram. Cursors that specify WITH RETURN in a procedure and are left open are returned as result sets.

Although the scope of a cursor is the program in which it is declared, each package (or DBRM of a plan) created from the program includes a separate instance of the cursor, and more than one instance of the cursor can be used in the same execution of the program. For example, assume a program is precompiled with the CONNECT(2) option and its DBRM is used to create a package at location X and a package at location Y. The program contains the following SQL statements:

```
DECLARE C CURSOR FOR ...
CONNECT TO X
OPEN C
FETCH C INTO ...
CONNECT TO Y
OPEN C
FETCH C INTO ...
```

The second OPEN C statement does not cause an error because it refers to a different instance of cursor C. The same notion applies to a single location if the packages are in different collections.

A SELECT statement is evaluated at the time the cursor is opened. If the same cursor is opened, closed, and then opened again, the results can be different. If the SELECT statement of the cursor contains CURRENT DATE, CURRENT TIME or CURRENT TIMESTAMP, all references to these special registers yields the same respective datetime value on each FETCH operation. The value is determined when the cursor is opened. Multiple cursors using the same SELECT statement can be opened concurrently. They are each considered independent activities.

Blocking of data:

To process data more efficiently, Db2 might block data for read-only cursors. If a cursor is not going to be used in a positioned UPDATE or positioned DELETE statement, define the cursor as FOR READ ONLY.

Positioned deletes and isolation level UR:

Specify FOR UPDATE if you want to use the cursor for a positioned DELETE and the isolation level is UR because of a BIND option. In this case, the isolation level is CS.

Returning a result set from a stored procedure:

A cursor that is declared in a stored procedure returns a result set when all of the following conditions are true:

- The cursor is declared with the WITH RETURN option. In a distributed environment, blocks of each result set of the cursor's data are returned with the CALL statement reply.
- The cursor is left open after exiting from the stored procedure. A cursor declared with the SCROLL option must be left positioned *before* the first row before exiting from the stored procedure.
- The cursor is declared with the WITH HOLD option if the stored procedure is defined to commit on return.

The result set is the set of all rows after the current position of the cursor after exiting the stored procedure. The result set is assumed to be read-only. If that same procedure is invoked again, open result set cursors for a stored procedure at a given site are automatically closed by the database management system.

Scrollable cursors specified with user-defined functions:

A row can be fetched more than once with a scrollable cursor. Therefore, if a scrollable cursor is defined with a function that is not deterministic in the select list of the cursor, a row can be fetched

multiple times with different results for each fetch. (However, the value of a function that is not deterministic in the WHERE clause of a scrollable cursor is captured when the cursor is opened and remains unchanged until the cursor is closed.) Similarly, if a scrollable cursor is defined with a user-defined function with external action, the action is executed with every fetch.

Multiple instances of a cursor that is defined with RETURN TO CLIENT: If the cursor is declared in a native SQL procedure, a cursor that is declared as WITH RETURN TO CLIENT can be opened even when a cursor with the same name is already in the open state. In this case, the already open cursor becomes a result set cursor and is no longer accessible by using its cursor name. A new cursor is opened and becomes accessible by using the cursor name. When a CLOSE statement is issued, the last instance of the cursor will be closed. Closing the new cursor does not make the cursor that was previously accessible by that name accessible by the cursor name again. Cursors that become result set cursors in this way cannot be accessed at the server and can be processed only at the client.

Examples

The statements in the following examples are assumed to be in PL/I programs.

Example 1: Declare C1 as the cursor of a query to retrieve data from the table DSN8B10.DEPT. The query itself appears in the DECLARE CURSOR statement.

```
EXEC SQL DECLARE C1 CURSOR FOR
   SELECT DEPTNO, DEPTNAME, MGRNO
   FROM DSN8B10.DEPT
   WHERE ADMRDEPT = 'A00';
```

Example 2: Declare C1 as the cursor of a query to retrieve data from the table DSN8810.DEPT. Assume that the data will be updated later with a searched update and should be locked when the query executes. The query itself appears in the DECLARE CURSOR statement.

```
EXEC SQL DECLARE C1 CURSOR FOR
   SELECT DEPTNO, DEPTNAME, MGRNO
   FROM DSN8B10.DEPT
   WHERE ADMRDEPT = 'A00'
   FOR READ ONLY WITH RS USE AND KEEP EXCLUSIVE LOCKS;
```

Example 3: Declare C2 as the cursor for a statement named STMT2.

```
EXEC SQL DECLARE C2 CURSOR FOR STMT2;
```

Example 4: Declare C3 as the cursor for a query to be used in positioned updates of the table DSN8B10.EMP. Allow the completed updates to be committed from time to time without closing the cursor.

```
EXEC SQL DECLARE C3 CURSOR WITH HOLD FOR
  SELECT * FROM DSN8B10.EMP
    FOR UPDATE OF WORKDEPT, PHONENO, JOB, EDLEVEL, SALARY;
```

Instead of specifying which columns should be updated, you could use a FOR UPDATE clause without the names of the columns to indicate that all updatable columns are updated.

Example 5: In stored procedure SP1, declare C4 as the cursor for a query of the table DSN8B10.PROJ. Enable the cursor to return a result set to the caller of SP1, which performs a commit on return.

```
EXEC SQL DECLARE C4 CURSOR WITH HOLD WITH RETURN FOR
   SELECT PROJNO, PROJNAME
   FROM DSN8B10.PROJ
   WHERE DEPTNO = 'A01';
```

Example 6: In the following example, the DECLARE CURSOR statement associates the cursor name C5 with the results of the SELECT and specifies that the cursor is scrollable. C5 allows positioned updates and deletes because the result table can be updated.

```
EXEC SQL DECLARE C5 SENSITIVE STATIC SCROLL CURSOR FOR
   SELECT DEPTNO, DEPTNAME, MGRNO
```

```
   FROM DSN8B10.DEPT
   WHERE ADMRDEPT = 'A00';
```

Example 7: In the following example, the DECLARE CURSOR statement associates the cursor name C6 with the results of the SELECT and specifies that the cursor is scrollable.

```
EXEC SQL DECLARE C6 INSENSITIVE SCROLL CURSOR FOR
   SELECT DEPTNO, DEPTNAME, MGRNO
   FROM DSN8B10.DEPT
   WHERE DEPTNO;
```

Example 8: The following example illustrates how an application program might use dynamic scrollable cursors. First create and populate a table.

```
CREATE TABLE ORDER
      (ORDERNUM  INTEGER,
       CUSTNUM   INTEGER,
       CUSTNAME  VARCHAR(20),
       ORDERDATE CHAR(8),
       ORDERAMT  DECIMAL(8,3),
       COMMENTS  VARCHAR(20));
```

Populate the table by inserting or loading about 500 rows.

```
EXEC SQL DECLARE CURSOR ORDERSCROLL
   SENSITIVE DYNAMIC SCROLL FOR
   SELECT ORDERNUM, CUSTNAME, ORDERAMT, ORDERDATE FROM ORDER
   WHERE ORDERAMT > 1000
   FOR UPDATE OF COMMENTS;
```

Open the scrollable cursor.

```
OPEN CURSOR ORDERSCROLL;
```

Fetch forward from the scrollable cursor.

```
-- Loop-to-fill-screen
      -- do 10 times
       FETCH FROM ORDERSCROLL INTO :HV1, :HV2, :HV3, :HV4;
      -- end
```

Fetch RELATIVE from the scrollable cursor.

```
-- Skip-forward-100-rows
      FETCH RELATIVE +100
       FROM ORDERSCROLL INTO :HV1, :HV2, :HV3, :HV4;
```

```
-- Skip-backward-50-rows
      FETCH RELATIVE -50
       FROM ORDERSCROLL INTO :HV1, :HV2, :HV3, :HV4;
```

Fetch ABSOLUTE from the scrollable cursor.

```
-- Re-read-the-third-row
      FETCH ABSOLUTE +3
       FROM ORDERSCROLL INTO :HV1, :HV2, :HV3, :HV4;
```

Fetch RELATIVE from scrollable cursor.

```
-- Read-the-third-row-from current position
      FETCH SENSITIVE RELATIVE +3
       FROM ORDERSCROLL INTO :HV1, :HV2, :HV3, :HV4;
```

Do a positioned update through the scrollable cursor.

```
-- Update-the-current-row
      UPDATE ORDER SET COMMENTS = "Expedite"
```

```
          WHERE CURRENT OF ORDERSCROLL;
```

Close the scrollable cursor.

```
   CLOSE CURSOR ORDERSCROLL;
```

Example 9: Declare C1 as the cursor of a query to retrieve a rowset from the table DEPT. The prepared statement is MYCURSOR.

```
   EXEC SQL DECLARE C1 CURSOR
      WITH ROWSET POSITIONING FOR MYCURSOR;
```

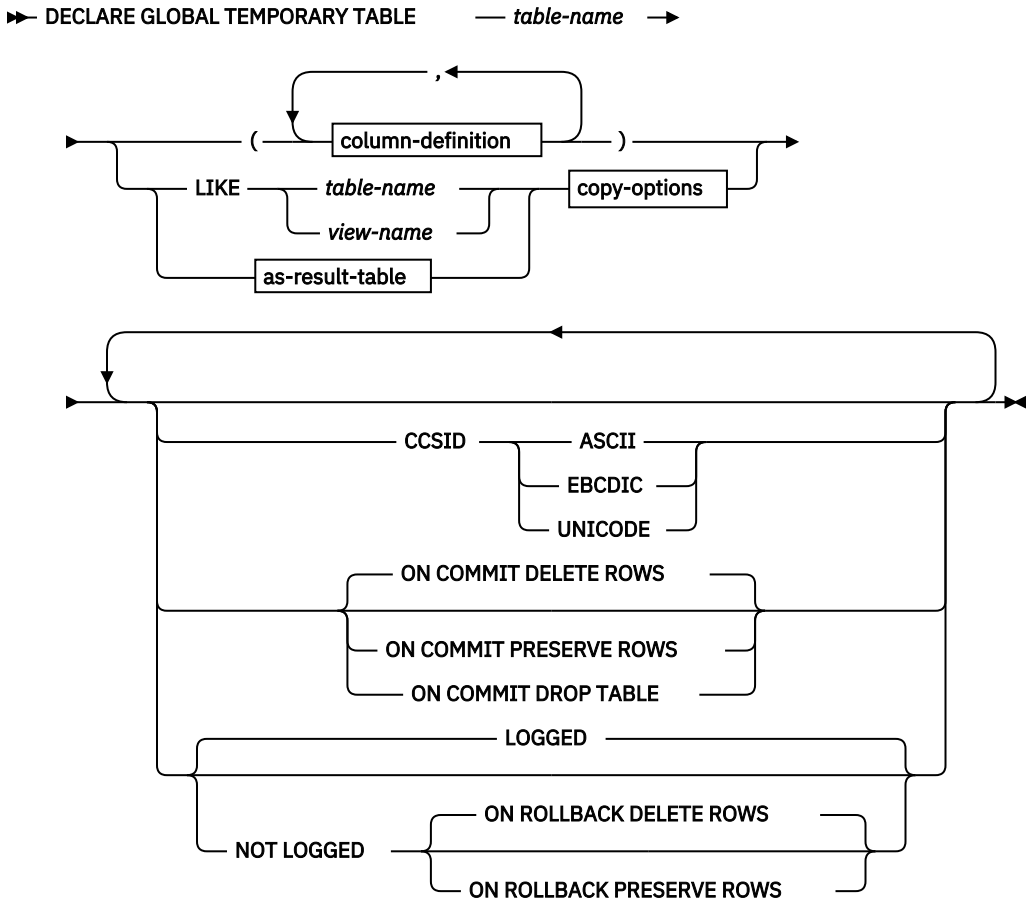
DECLARE GLOBAL TEMPORARY TABLE

The DECLARE GLOBAL TEMPORARY TABLE statement defines a declared temporary table for the current application process. The declared temporary table resides in the work file database and its description does not appear in the system catalog. It is not persistent and cannot be shared with other application processes. Each application process that defines a declared temporary table of the same name has its own unique description and instance of the temporary table. When the application process terminates, the temporary table is dropped.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

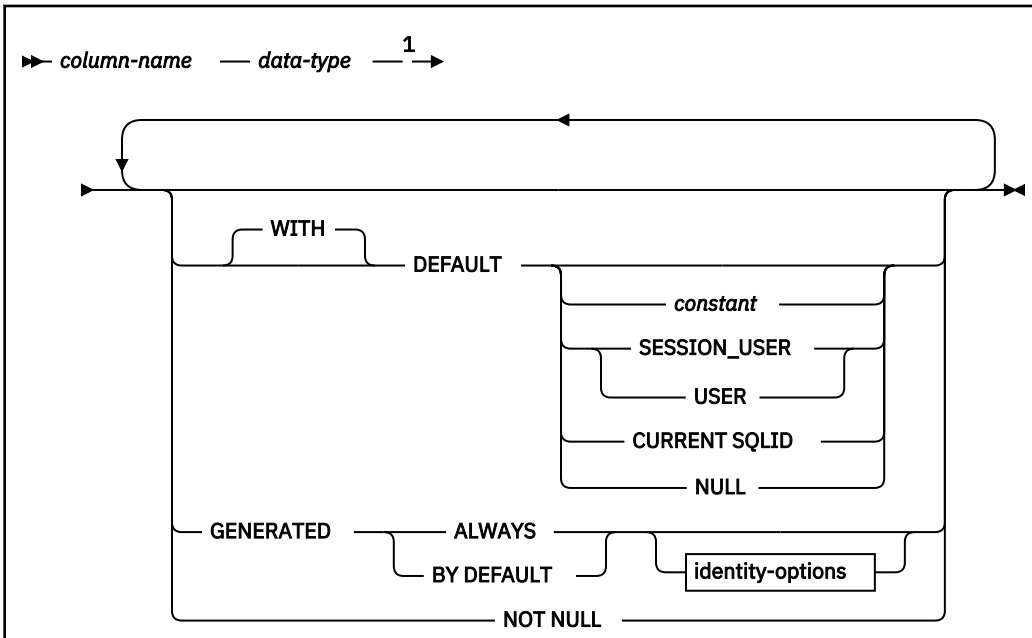


None are required, unless the LIKE clause or AS *fullselect* is specified. In those cases, additional privileges might be required.

PUBLIC implicitly has the following privileges without GRANT authority for declared temporary tables:

- The CREATETAB privilege to define a declared temporary table in the database that is defined AS WORKFILE, which is the database for declared temporary tables.
- The USE privilege to use the table spaces in the database that is defined as WORKFILE.
- All table privileges on the table and authority to drop the table. (Table privileges for a declared temporary table cannot be granted or revoked.)

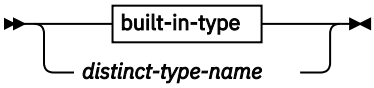
These implicit privileges are not recorded in the Db2 catalog and cannot be revoked.



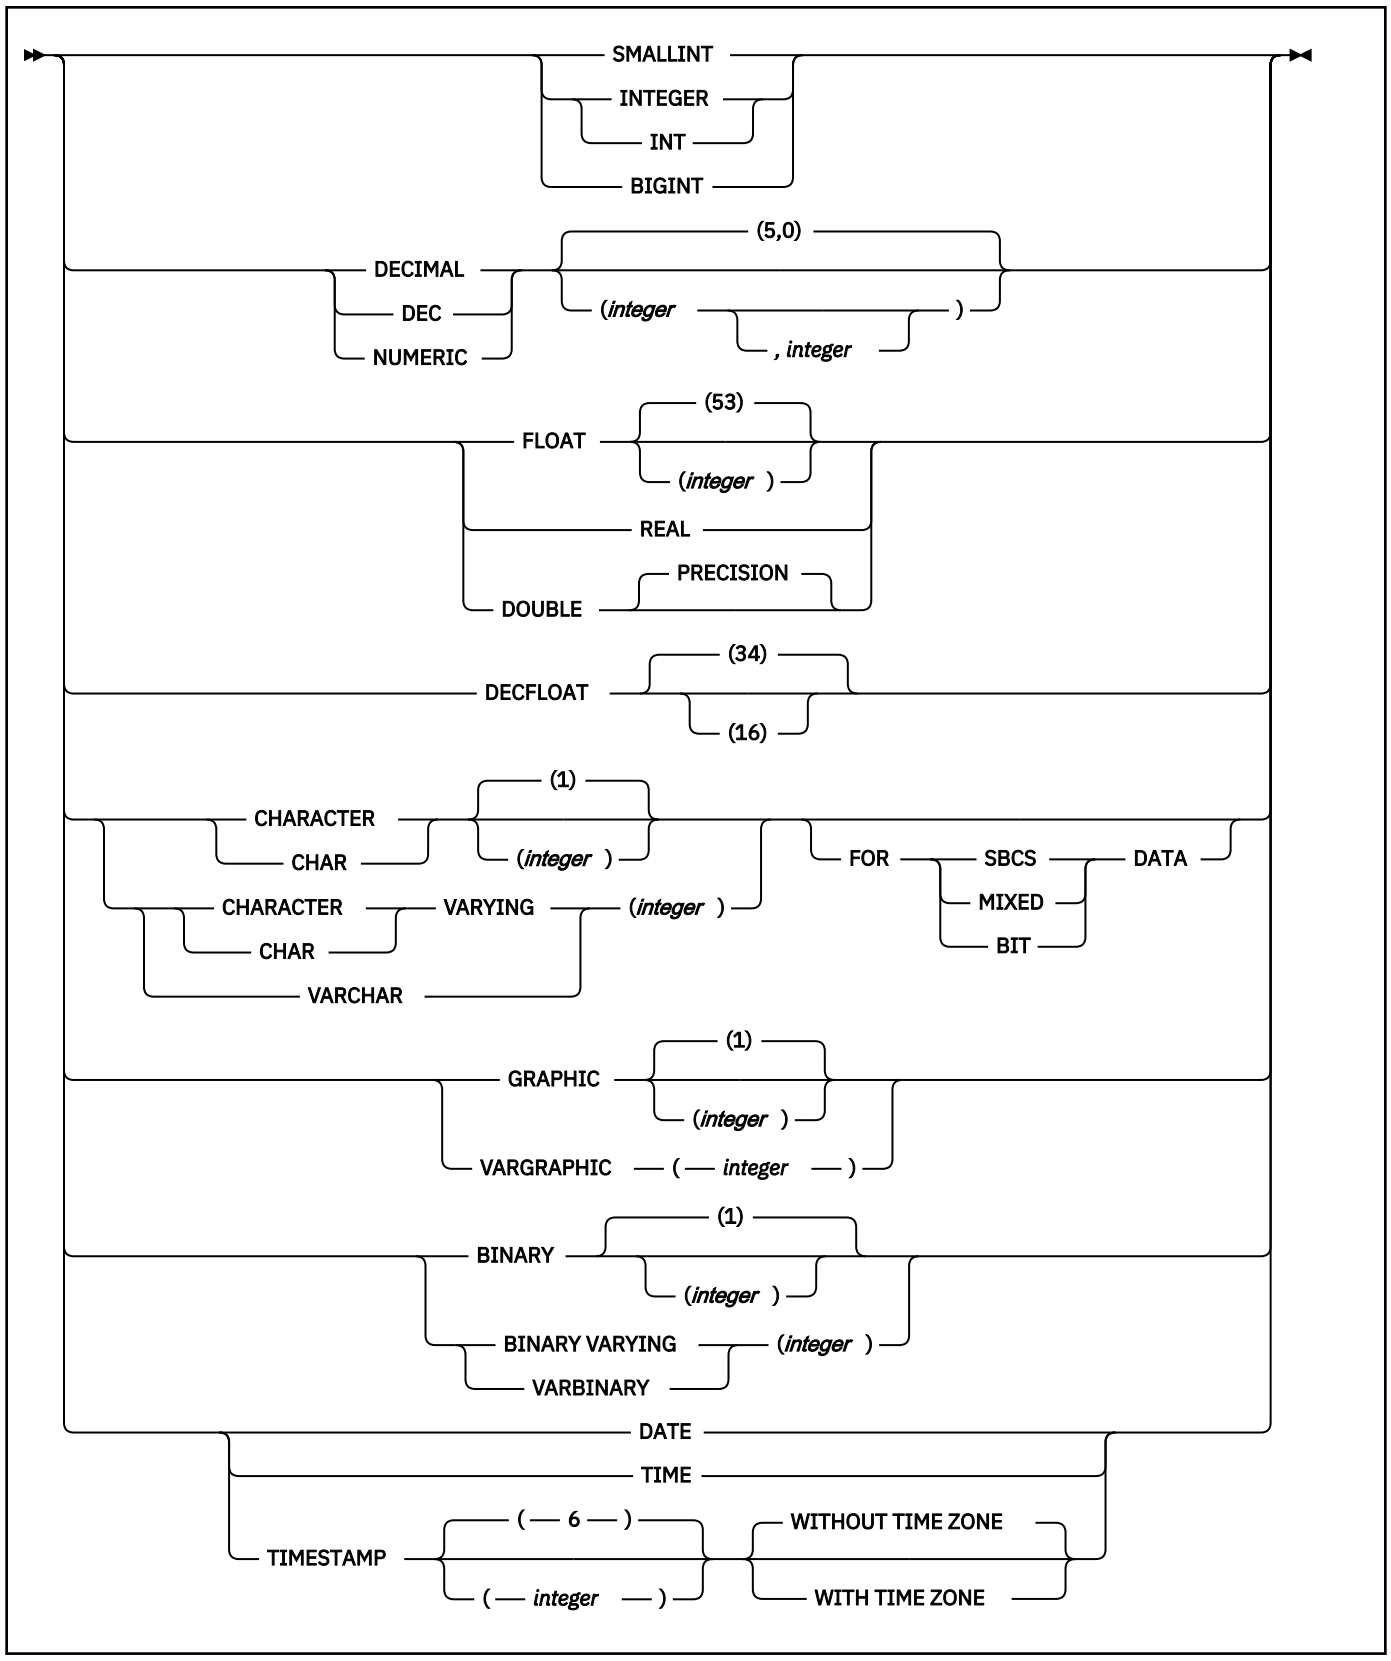
Syntax

Notes:

[1] The same clause must not be specified more than one time.



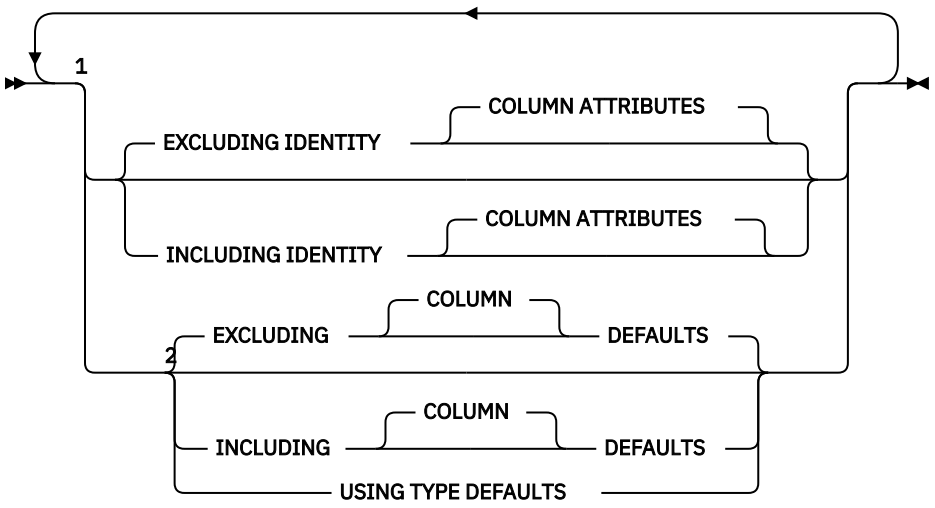
column-definition:



Notes:

[1] The same clause must not be specified more than once.

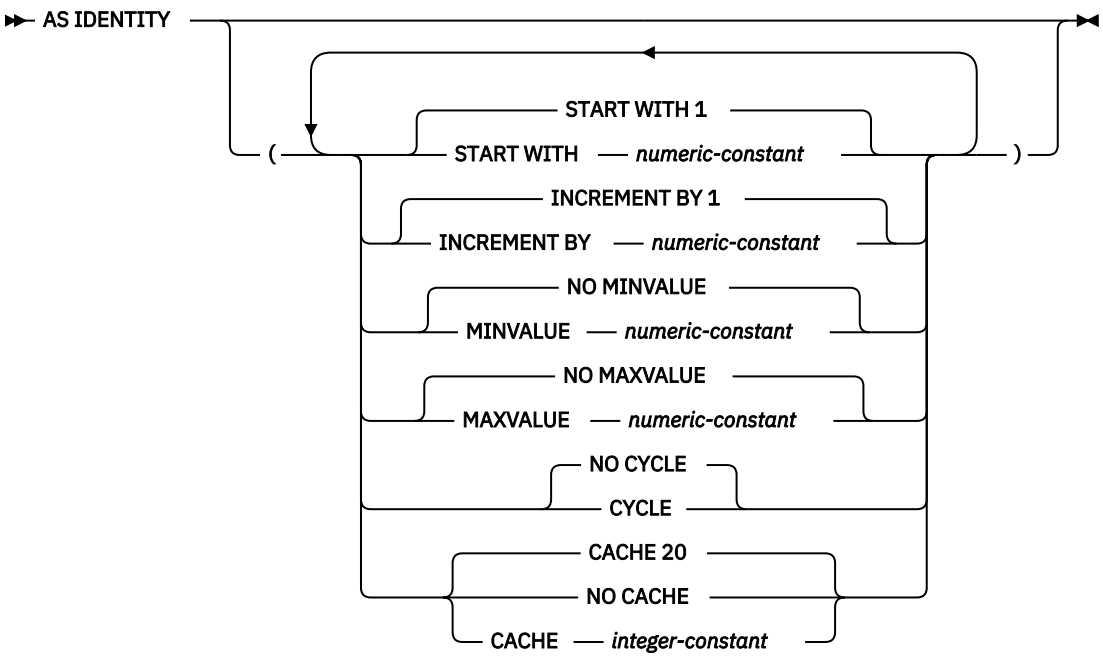
data-type:



built-in-type:

as-result-table:

copy-options:



Notes:

[1] These clauses can be specified in any order and must not be specified more than one time.

[2] EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, and USING TYPE DEFAULTS must not be specified with the LIKE clause.

identity-options:

Notes:

[1] Separator commas can be specified between the attributes when an identity column is defined

Description

table-name

Names the temporary table. The qualifier, if specified explicitly, must be SESSION. If the qualifier is not specified, it is implicitly defined to be SESSION.

If a table, view, synonym, or alias already exists with the same name and an implicit or explicit qualifier of SESSION:

- The declared temporary table is still defined with SESSION.*table-name*. An error is not issued because the resolution of a declared temporary table name does not include the persistent and shared names in the Db2 catalog tables.
- Any references to SESSION.*table-name* will resolve to the declared temporary table rather than to any existing SESSION.*table-name* whose definition is persistent and is in the Db2 catalog tables.

column-definition
Defines the attributes of a column for each instance of the table. The number of columns defined must not exceed 750. The maximum record size must not exceed 32683 bytes. The maximum row size must not exceed 32675 bytes (8 bytes less than the maximum record size).

column-name
Names the column. The name must not be qualified and must not be the same as the name of another column in the table.

data-type
Specifies the data type of the column. The data type can be any built-in data type that can be specified for the CREATE TABLE statement except for a LOB (BLOB, CLOB, and DBCLOB), ROWID, or XML type. The FOR *subtype* DATA clause can be specified as part of *data-type*. For more information on the data types and the rules that apply to them, see built-in-type.

DEFAULT
Specifies a default value for the column. This clause must not be specified more than once in the same *column-definition*.

Omission of NOT NULL and DEFAULT from a *column-definition* is an implicit specification of DEFAULT NULL.

If DEFAULT is specified without a value after it, the default value of the column depends on the data type of the column, as follows:

Data type
Default value

Numeric
0

Fixed-length character string
A string of blanks

Fixed-length graphic string
A string of blanks

Fixed-length binary string
Hexadecimal zeros

Varying-length string
A string of length 0

Date
CURRENT DATE

Time
CURRENT TIME

Timestamp
CURRENT TIMESTAMP(*p*) where *p* is the corresponding timestamp precision.

Timestamp with time zone
CURRENT TIMESTAMP(*p*) WITH TIME ZONE where *p* is the corresponding timestamp precision.

A default value other than the one that is listed above can be specified in one of the following forms:

constant
Specifies a constant as the default value for the column. The value of the constant must conform to the rules for assigning that value to the column. A hexadecimal graphic string constant (GX) cannot be specified.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register at the time of an insert or update operation or LOAD as the default value for the column. The data type of the column must be a character string with a length attribute greater than or equal to the length attribute of the SESSION_USER special register.

CURRENT SQLID
Specifies the value of the SQL authorization ID of the process at the time of an SQL data change statement or LOAD as the default value for the column. The data type of the column must be a character string with a length attribute greater than or equal to the length attribute of the CURRENT SQLID special register.

NULL
Specifies null as the default value for the column. If NOT NULL was specified, DEFAULT NULL must not be specified within the same *column-definition*.

GENERATED
Specifies that Db2 generates values for the column. GENERATED must be specified if the column is to be considered an IDENTITY column. If DEFAULT is specified for the column for an update operation, Db2 generates a value for both GENERATED ALWAYS and GENERATED BY DEFAULT.

ALWAYS
Specifies that Db2 always generates a value for the column when a row is inserted into the table.

BY DEFAULT
Specifies that Db2 generates a value for the column when a row is inserted into the table unless a value is specified. BY DEFAULT is the recommended value only when you are using data propagation.

Defining a column as GENERATED BY DEFAULT does not necessarily guarantee the uniqueness of the values. To ensure uniqueness of the values, define a unique, single-column index on the column.

AS IDENTITY
Specifies that the column is an identity column for the table. A table can have only one identity column. AS IDENTITY can be specified only if the data type for the column is an exact numeric type with a scale of zero (SMALLINT, INTEGER, BIGINT, DECIMAL with a scale of zero).

An identity column is implicitly NOT NULL. An identity column cannot have a DEFAULT clause. For the descriptions of the identity attributes, see the description of the AS IDENTITY clause in "CREATE TABLE" on page 1509.

NOT NULL
Specifies that the column cannot contain nulls. Omission of NOT NULL indicates that the column can contain nulls.

LIKE *table-name* or *view-name*
Specifies that the columns of the table have the same name, data type, and nullability attributes as the columns of the identified table or view. If a table is identified, the column default attributes are also defined by that table. If row permissions or column access control is enforced for the table specified by *table-name*, row and column access controls are not inherited by the new table. The name specified must identify a table, view, synonym, or alias that exists at the current server. The identified table must not be an auxiliary table or an accelerator-only table. *table-name* or *view-name* must not contain a Unicode column in an EBCDIC table.

The privilege set must include the SELECT privilege on the identified table or view.

This clause is similar to the LIKE clause on CREATE TABLE, but it has the following differences:

- If LIKE results in a column having a LOB data type, a ROWID data type, or distinct type, the DECLARE GLOBAL TEMPORARY TABLE statement fails.
- In addition to these data type restrictions, if any column has any other attribute value that is not allowed in a declared temporary table, that attribute value is ignored. The corresponding column in the new temporary table has the default value for that attribute unless otherwise indicated.

When the identified object is a table, the column name, data type, nullability, and default attributes are determined from the columns of the specified table; any identity column attributes are inherited only if the INCLUDING IDENTITY COLUMN ATTRIBUTES clause is specified.

as-result-table
Specifies that the table definition is based on the column definitions from the result of a query expression.

The behavior of these column attributes is controlled with the INCLUDING or USING TYPE DEFAULTS clauses, which are defined below.

AS *(fullselect)*
Specifies an implicit definition of *n* columns for the declared global temporary table, where *n* is the number of columns that would result from the *fullselect*. The columns of the new table are defined by the columns that result from the *fullselect*. Every select list element must have a unique name. The AS clause can be used in the *select-clause* to provide unique names. The implicit definition includes the column name, data type, and nullability characteristic of each of the result columns of *fullselect*. A column of the new table that corresponds to an implicitly hidden column of a base table referenced in the *fullselect* is not considered hidden in the new table.Row and column access controls that are enforced on the base table are not inherited by the new table.

The result table of the *fullselect* must not contain a column that has a LOB data type, a ROWID data type, an XML data type or a distinct type.

If *fullselect* results in other column attributes that are not applicable for a declared temporary table, those attributes are ignored in the implicit definition for the declared temporary table.

If *fullselect* results in a row change timestamp column, the corresponding column of the new table inherits only the data type of the row change timestamp column. The new column is not considered as a generated column.

The *fullselect* must not refer to variables or include parameter markers (question marks), but can refer to global variables. The outermost SELECT list of the outermost *fullselect* must not reference data that is encoded with different encoding schemes, and must not result in a column that is an array.

WITH NO DATA
Specifies that the *fullselect* is not executed. You can use the INSERT INTO statement with the same *fullselect* specified in the AS clause to populate the declared temporary table with the set of rows from the result table of the *fullselect*.

copy-options
Specifies whether identity column attributes and column defaults are inherited from the definition of the source of the result table.

EXCLUDING IDENTITY COLUMN ATTRIBUTES or INCLUDING IDENTITY COLUMN ATTRIBUTES
Specifies whether identity column attributes are inherited from the columns resulting from the *fullselect*, *table-name*, or *view-name*.

EXCLUDING IDENTITY COLUMN ATTRIBUTES
Specifies that the table does not inherit the identity attributes of the columns resulting from the *fullselect*, *table-name*, or *view-name*.

INCLUDING IDENTITY COLUMN ATTRIBUTES
Specifies that the table inherits the identity attributes, if any, of the columns resulting from the *fullselect* or *table-name*. In general, the identity attributes are copied if the element of the

corresponding column in the table or *fullselect* is the name of a table column that directly or indirectly maps to the name of a base table column that is an identity column.

If the INCLUDING IDENTITY COLUMN ATTRIBUTES clause is specified with the AS fullselect clause, the columns of the new table do not inherit the identity attribute in the following cases:

- The select list of the *fullselect* includes multiple instances of an identity column name (that is, selecting the same column more than once).
- The select list of the *fullselect* includes multiple identity columns (that is, it involves a join).
- The identity column is included in an expression in the select list.
- The *fullselect* includes a set operation.

If INCLUDING IDENTITY COLUMN ATTRIBUTES is not specified, the new table will not have an identity column.

If the LIKE clause identifies a view, INCLUDING IDENTITY COLUMN ATTRIBUTES must not be specified.

EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, or USING TYPE DEFAULTS
Specifies whether the table inherits the default values of the columns of the fullselect. EXCLUDING COLUMN DEFAULTS, INCLUDING COLUMN DEFAULTS, and USING TYPE DEFAULTS must not be specified if the LIKE clause is specified.

EXCLUDING COLUMN DEFAULTS
Specifies that the table does not inherit the default values of the columns of the fullselect. The default values of the column of the new table are either null or there are no default values. If the column can be null, the default is the null value. If the column cannot be null, there is no default value, and an error occurs if a value is not provided for a column on an insert operation for the new table.

INCLUDING COLUMN DEFAULTS
Specifies that the table inherits the default values of the columns of the fullselect. A default value is the value that is assigned to the column when a value is not specified on an insert operation or LOAD. Columns resulting from the fullselect that are not updatable will not have a default defined in the corresponding column of the created table.

USING TYPE DEFAULTS
Specifies that the default values for the declared temporary table depend on the data type of the columns that result from *fullselect*, as follows:

Data type
Default value

Numeric
0

Fixed-length character string
Blanks

Fixed-length graphic string
Blanks

Fixed-length binary string
Hexadecimal zeros

Varying-length string
A string of length 0

Date
CURRENT DATE

Time
CURRENT TIME

Timestamp
CURRENT TIMESTAMP(*p*) where *p* is the corresponding timestamp precision.

Timestamp(*integer*) with time zone
CURRENT TIMESTAMP(*p*) WITH TIME ZONE where *p* is the corresponding timestamp precision.

CCSID *encoding-scheme*
Specifies the encoding scheme for string data that is stored in the table. For declared temporary tables, the encoding scheme for the data cannot be specified for the table space or database, and all data in one table space or the database need not use the same encoding scheme. Because there can be only one work file database for all declared temporary tables for each Db2 member, there can be a mixture of encoding schemes in both the database and each table space.

For declared temporary tables, the CCSID clause can be specified whether or not the LIKE clause is specified. If the CCSID clause is specified, the encoding scheme of the new table is the scheme that is specified in the CCSID clause. If the CCSID clause is not specified, the encoding scheme of the new table is the same as the scheme for the table specified in the LIKE clause or as the scheme for the table identified by the AS (fullselect) clause.

ASCII
Specifies that the data is encoded by using the ASCII CCSIDs of the server.

EBCDIC
Specifies that the data is encoded by using the EBCDIC CCSIDs of the server.

UNICODE
Specifies that the data is encoded by using the UNICODE CCSIDs of the server.

An error occurs if the CCSIDs for the encoding scheme have not been defined. Usually, each encoding scheme requires only a single CCSID. Additional CCSIDs are needed when mixed, graphic, or UNICODE data is used.

ON COMMIT
Specifies what happens to the table for a commit operation. The default is ON COMMIT DELETE ROWS.

DELETE ROWS
Specifies that all of the rows of the table are deleted if there is no open cursor that is defined as WITH HOLD that references the table.

PRESERVE ROWS
Specifies that all of the rows of the table are preserved. Thread reuse capability is not available to any application process or thread that contains, at its most recent commit, an active declared temporary table that was defined with the ON COMMIT PRESERVE ROWS clause.

DROP TABLE
Specifies that the table is implicitly dropped at commit if there is no open cursor that is defined as WITH HOLD that references the table. If there is an open cursor defined as WITH HOLD on the table at commit, the rows are preserved.

LOGGED or NOT LOGGED
Specifies whether operations for the table are to be logged. This option also applies to any indexes that are associated with the table. Indexes inherit the logging attribute from their associated tables.

LOGGED
Specifies that insert, update, or delete operations for the declared temporary table are logged. Create and drop actions for the table are also logged. This is the default option.

NOT LOGGED
Specifies that insert, update, or delete operations for the declared temporary table are not logged. However, create and drop actions for the table are logged.

ON ROLLBACK DELETE ROWS
Specifies that when a ROLLBACK or ROLLBACK TO SAVEPOINT statement is issued, all rows of the global temporary table are deleted. This is the default.

ON ROLLBACK PRESERVE ROWS
Specifies that when a ROLLBACK or ROLLBACK TO SAVEPOINT statement is issued, all rows of the global temporary table are preserved.

If a ROLLBACK or ROLLBACK TO SAVEPOINT statement is issued, the following actions occur for tables that were created or dropped:

- If the table was created within the unit of work or savepoint, the table is dropped.
- If the table was dropped within the unit of work or savepoint, the table is re-created without any data.

For statements that insert multiple rows, the ATOMIC and NOT ATOMIC CONTINUE ON SQLEXCEPTION options of the INSERT statement determine the result of an error. If ATOMIC is specified, an error during insertion causes all rows in the global temporary table to be deleted. If NOT ATOMIC CONTINUE ON SQLEXCEPTION is specified, an error during insertion causes all rows in the table to be deleted, but the next insert is processed. At the end of the insert, the table includes only the rows that were inserted after the last error.

Restriction: In CREATE TABLESPACE and ALTER TABLESPACE statements, LOG YES and LOG NO can be used as syntax alternatives for LOGGED and NOT LOGGED, respectively. These syntax alternatives cannot be used in a DECLARE GLOBAL TEMPORARY TABLE statement.

Notes

Instantiation, scope, and termination

For the following explanations, P denotes an application process, and T is a declared temporary table executed in P:

- An empty instance of T is created when a DECLARE GLOBAL TEMPORARY TABLE statement is executed in P.
- Any SQL statement in P can reference T, and any of those references to T in P is a reference to that same instance of T. ()

  If a DECLARE GLOBAL TEMPORARY statement is specified within an SQL PL compound statement, the scope of the declared temporary table is the application process and not just the compound statement. A declared temporary table cannot be defined multiple times by the same name in other compound statements in that application process, unless the table has been dropped explicitly.
- If T was declared at a remote server, the reference to T must use the same Db2 connection that was used to declare T and that connection must not have been terminated after T was declared. When the connection to the database server at which T was declared terminates, T is dropped.
- If T was defined with the ON COMMIT DELETE ROWS clause specified implicitly or explicitly, when a commit operation terminates a unit of work in P and there is no open WITH HOLD cursor in P that is dependent on T, the commit deletes all rows from T.
- If T is defined with the ON COMMIT DROP TABLE clause, when a commit operation terminates a unit of work in P and no program in P has a WITH HOLD cursor open that is dependent on T, the commit includes the operation DROP TABLE T.
- When a rollback operation terminates a unit of work or savepoint in P, and that unit of work or savepoint includes the declaration of SESSION.T, the changes to table T are undone.

  When a rollback operation terminates a unit of work or savepoint in P, and that unit of work or savepoint includes the declaration of SESSION.T, the rollback drops table T.

  When a rollback operation terminates a unit of work or savepoint in P, and that unit of work or savepoint includes the drop of the declaration of declared temporary table SESSION.T, the rollback undoes the drop of table T.
- When the application process that declared T terminates, T is dropped.
- When a rollback operation terminates a unit of work or a savepoint in P, and that unit of work or savepoint includes a modification to SESSION.T the following actions occur:

  - If NOT LOGGED was specified, all rows from SESSION.T are deleted unless ON ROLLBACK PRESERVE ROWS was also specified.
  - If NOT LOGGED was not specified, the changes to table T are undone.
- If NOT LOGGED was specified and an INSERT, UPDATE or DELETE statement fails during execution (not a compilation error), all rows from SESSION.T are deleted.
- When a rollback operation terminates a unit of work or a savepoint in P, and that unit of work or savepoint includes the declaration of SESSION.T, the rollback includes the operation DROP SESSION.T.
- When a rollback operation terminates a unit of work or a savepoint in P, and that unit of work or savepoint includes the drop of a declared temporary table SESSION.T, the rollback undoes the drop of the table. If NOT LOGGED was specified, the table is also emptied.
- When the application process that declared T terminates or disconnects from the database, T is dropped and its instantiated rows are destroyed.

Privileges

When a declared temporary table is defined, PUBLIC is implicitly granted all table privileges on the table and authority to drop the table. These implicit privileges are not recorded in the Db2 catalog and cannot be revoked. This enables any SQL statement in the application process to reference a declared temporary table that has already been defined in that application process.

Referring to a declared temporary table in other SQL statements

Many SQL statements support declared temporary tables. To refer to a declared temporary table in an SQL statement other than DECLARE GLOBAL TEMPORARY TABLE, you must qualify the table name with SESSION. You can either specify SESSION explicitly in the table name or use the QUALIFIER bind option to specify SESSION as the qualifier for all SQL statements in the plan or package.

If you use SESSION as the qualifier for a table name but the application process does not include a DECLARE GLOBAL TEMPORARY TABLE statement for the table name, Db2 assumes that you are not referring to a declared temporary table. Db2 resolves such table references to a table whose definition is persistent and appears in the Db2 catalog tables.

With the exception of the DECLARE GLOBAL TEMPORARY TABLE statement, any static SQL statement that references a declared temporary table is incrementally bound at run time. This is because the definition of the declared temporary table does not exist until the DECLARE GLOBAL TEMPORARY statement is executed in the application process that contains those SQL statements and the definition does not persist when the application process finishes running.

When a plan or package is bound, any static SQL statement (other than the DECLARE GLOBAL TEMPORARY TABLE statement) that references a *table-name* that is qualified by SESSION, regardless of whether the reference is for a declared temporary table, is not completely bound. However, the bind of the plan or package succeeds if there are no other errors. No object dependencies, including non-DECLARE GLOBAL TEMPORARY TABLE objects, are recorded in the Db2 catalog for any such statements. These static SQL statements are then incrementally bound at run time when the static SQL statement is issued.

The incremental binds are necessary for the following reasons:

- The definition of the declared temporary table does not exist until the DECLARE GLOBAL TEMPORARY TABLE statement for the table is executed in the same application process that contains those SQL statements. Therefore, Db2 must wait until the plan or package is run to determine if SESSION.*table-name* refers to a base table or a declared temporary table.
- The definition of a declared temporary table does not persist after the table it is explicitly dropped (DROP statement), implicitly dropped (ON COMMIT DROP TABLE), or the application process that defined it finishes running. When the application process terminates or is re-used as a reusable application thread, the instantiated rows of the table are deleted and the definition of the declared temporary table is dropped if it has not already been explicitly or implicitly dropped.

After the plan or package is bound, any static SQL statement that refers to a *table-name* that is qualified by SESSION has a new statement status of M in the Db2 catalog table (STATUS column of SYSIBM.SYSSTMT or SYSIBM.SYSPACKSTMT).

Thread reuse

If a declared temporary table is defined in an application process that is running as a local thread, the application process or local thread that declared the table qualifies for explicit thread reuse if:

- The table was defined with both the default ON COMMIT DELETE ROWS attribute and the NOT LOGGED ON ROLLBACK DELETE ROWS attribute.
- The table was defined with PRESERVE ROWS specified on either the ON COMMIT or NOT LOGGED ON ROLLBACK option and the table was explicitly dropped with the DROP TABLE statement before the thread's commit operation.
- The table was defined with the ON COMMIT DROP TABLE attribute. When a declared temporary table is defined with the ON COMMIT DROP TABLE and a commit occurs, the table is implicitly dropped if there are no open cursors defined with the WITH HOLD option.

When the thread is reused, the declared temporary table is dropped and its rows are destroyed. However, if you do not explicitly or implicitly drop all declared temporary tables before or when your thread performs a commit and the thread becomes idle waiting to be reused, as with all thread reuse situations, the idle thread holds resources and locks. This includes some declared temporary table resources and locks on the table spaces and the database descriptor (DBD) for the work file database. So, instead of using the implicit drop feature of thread reuse to drop your declared temporary tables, it is recommended that you:

- Use the DROP TABLE statement to explicitly drop your declared temporary tables before the thread performs a commit and becomes idle.
- Define the declared temporary tables with ON COMMIT DROP TABLE clause so that the tables are implicitly dropped when a commit occurs.

Explicitly dropping the tables before a commit occurs or having them implicitly dropped when the commit occurs enables you to maximize the use of declared temporary table resources and release locks when multiple threads are using declared temporary table.

Remote threads qualify for thread reuse differently than local threads. If a declared temporary table is defined (with or without ON COMMIT DELETE ROWS) in an application process that is running as a remote or DDF thread (also known as Database Access Thread or DBAT), the remote thread qualifies for thread reuse only when the declared temporary table is explicitly dropped before the thread performs a commit operation. Dropping the declared temporary table enables the remote thread to qualify for the implicit thread reuse that is supported for DDF threads via connection pooling and to become an inactive DBAT (type 1 inactive thread) or an inactive connection (type 2 inactive thread).

Parallelism support

Only I/O and CP parallelism are supported. Any query that involves a declared temporary table is limited to parallel tasks on a single CPC.

Restrictions on the use of declared temporary tables

Declared temporary tables cannot:

- Be specified in referential constraints.
- Be referenced in any SQL statements that are defined in an SQL function body (CREATE FUNCTION or ALTER FUNCTION statements), a trigger body (CREATE TRIGGER statement). If you refer a table name that is qualified with SESSION in a trigger body, Db2 assumes that you are referring to a base table.
- Be referenced in a CREATE INDEX statement unless the schema name of the index is SESSION.

In addition, do not refer to a declared temporary table in any of the following statements.

ALTER INDEX
ALTER TABLE
COMMENT
CREATE ALIAS
CREATE FUNCTION (TABLE LIKE clause)
CREATE PROCEDURE (TABLE LIKE clause)
CREATE TRIGGER
CREATE VIEW
GRANT (table or view privileges)
LABEL
LOCK TABLE
REFRESH TABLE
RENAME
REVOKE (table or view privileges)

Declared global temporary tables and dynamic statement caching

The Db2 dynamic statement cache feature does not support dynamic SQL statements that reference declared temporary tables, even if the SQL statement also includes references to base or persistent tables. Db2 will not insert such statements into the dynamic statement cache. Instead, these dynamic statements are processed as if statement caching is not in effect. Declared temporary tables are unique and specific to an application process or Db2 thread, cannot be shared across threads, are not described in the Db2 catalog, and do not persist beyond termination of the Db2 thread or application process. These attributes prevent the use of the dynamic statement cache feature where tables and SQL statements are shared across threads or application processes.

Table space requirements in the work file database

Db2 stores all declared temporary tables in the work file database. You cannot define a declared temporary table unless a table space with at least an 32KB page size exists in the work file database.

Alternative syntax and synonyms

To provide compatibility with previous releases, Db2 allows you to specify:

- LONG VARCHAR as a synonym for VARCHAR(*integer*) and LONG VARGRAPHIC as a synonym for VARGRAPHIC(*integer*) when defining the data type of a column.

  However, the use of these synonyms is not encouraged because after the statement is processed, Db2 considers a LONG VARCHAR column to be VARCHAR and a LONG VARGRAPHIC column to be VARGRAPHIC.
- DEFINITION ONLY as a synonym for WITH NO DATA.
- TIMEZONE can be specified as an alternative to TIME ZONE.

Examples

Example 1: Define a declared temporary table with column definitions for an employee number, salary, commission, and bonus.

```
DECLARE GLOBAL TEMPORARY TABLE SESSION.TEMP_EMP
   (EMPNO     CHAR(6)   NOT NULL,
    SALARY    DECIMAL(9, 2),
    BONUS     DECIMAL(9, 2),
    COMM      DECIMAL(9, 2))
    CCSID EBCDIC
    ON COMMIT PRESERVE ROWS;
```

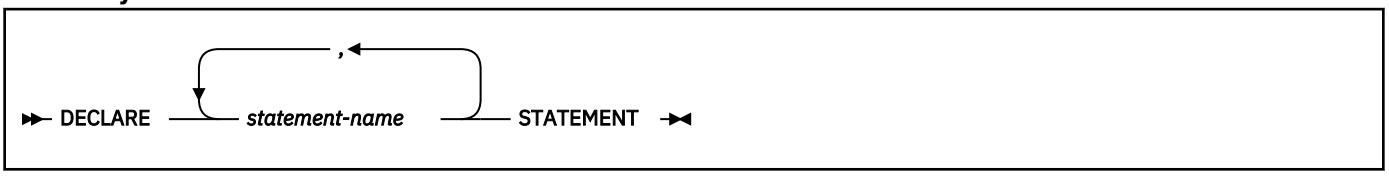
Example 2: Assume that base table USER1.EMPTAB exists and that it contains three columns, one of which is an identity column. Declare a temporary table that has the same column names and attributes (including identity attributes) as the base table.

```
DECLARE GLOBAL TEMPORARY TABLE TEMPTAB1
   LIKE USER1.EMPTAB
   INCLUDING IDENTITY
   ON COMMIT PRESERVE ROWS;
```

In the above example, Db2 uses SESSION as the implicit qualifier for TEMPTAB1.

DECLARE STATEMENT

The DECLARE STATEMENT statement is used for application program documentation. It declares names that are used to identify prepared SQL statements.



Invocation

This statement can only be embedded in an application program. It is not an executable statement.

Authorization

None required.

Syntax

Description

***statement-name* STATEMENT**

Lists one or more names that are used in your application program to identify prepared SQL statements.

Example

This example shows the use of the DECLARE STATEMENT statement in a PL/I program.

```
EXEC SQL DECLARE OBJECT_STATEMENT STATEMENT;

EXEC SQL INCLUDE SQLDA;
EXEC SQL DECLARE C1 CURSOR FOR OBJECT_STATEMENT;

( SOURCE_STATEMENT IS "SELECT DEPTNO, DEPTNAME,
  MGRNO FROM DSN8B10.DEPT WHERE ADMRDEPT = 'A00'"  )

EXEC SQL PREPARE OBJECT_STATEMENT FROM SOURCE_STATEMENT;
EXEC SQL DESCRIBE OBJECT_STATEMENT INTO SQLDA;

/* Examine SQLDA */

EXEC SQL OPEN C1;

DO WHILE (SQLCODE = 0);
  EXEC SQL FETCH C1 USING DESCRIPTOR SQLDA;

/* Print results */

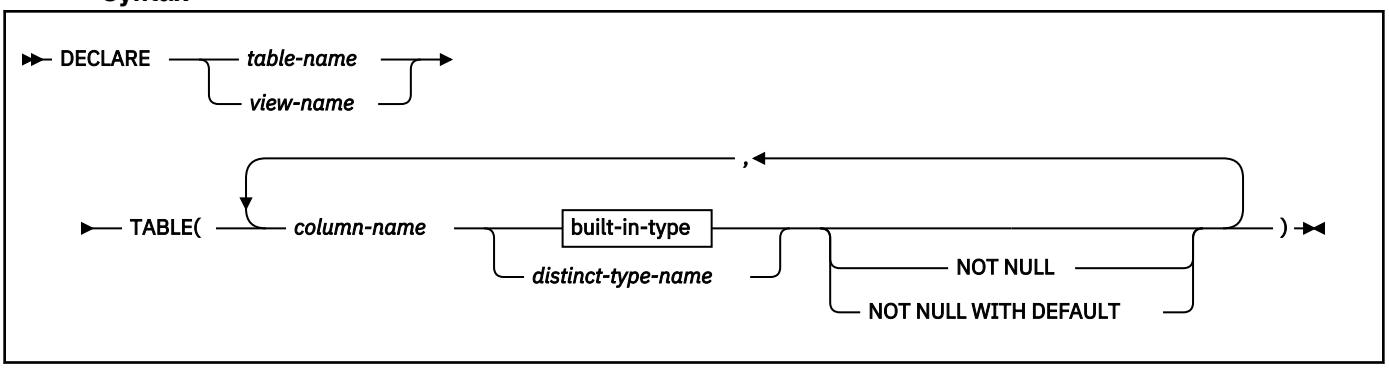
END;

EXEC SQL CLOSE C1;
```

DECLARE TABLE

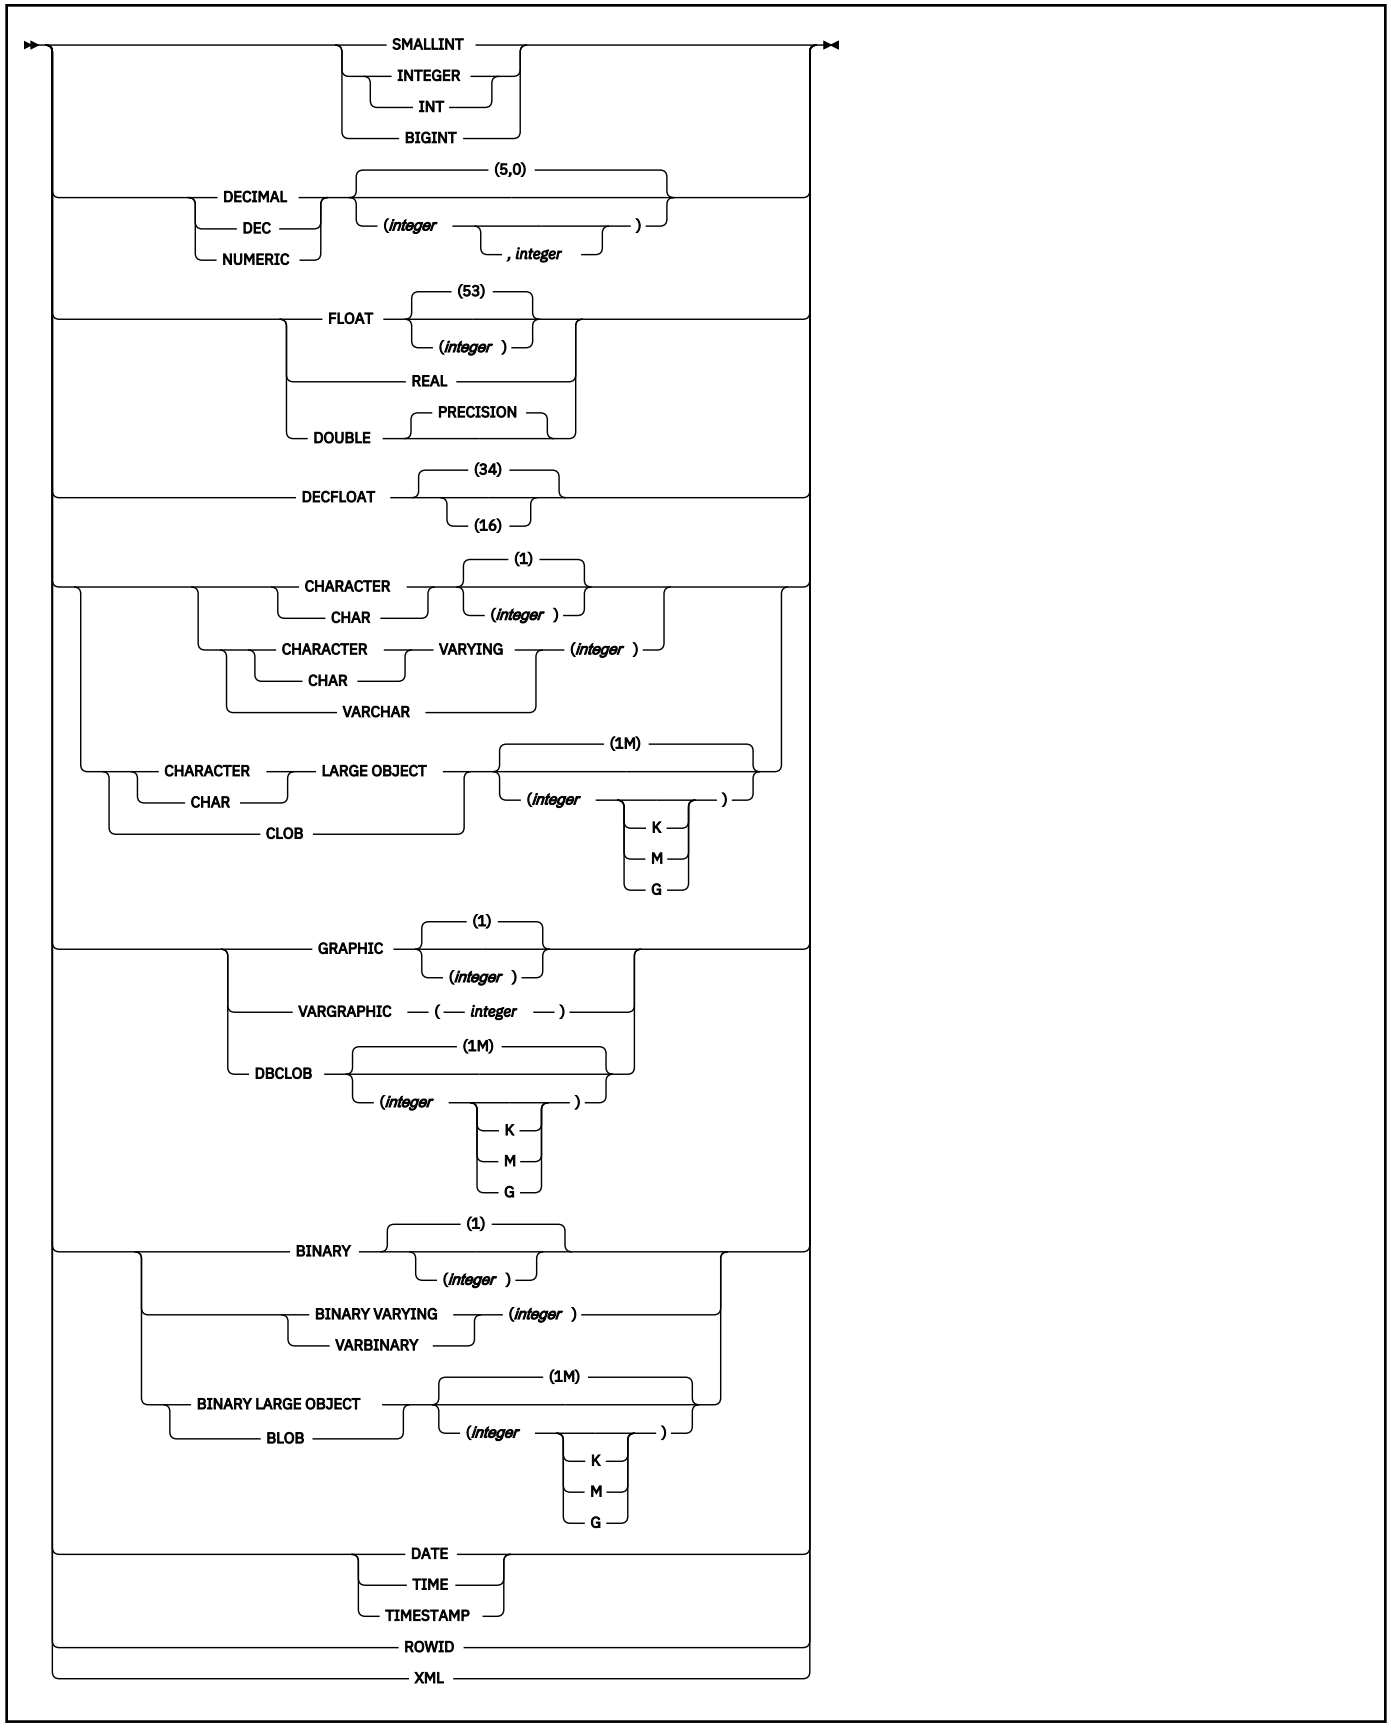
The DECLARE TABLE statement is used for application program documentation. It also provides the precompiler with information used to check your embedded SQL statements. (The DCLGEN subcommand can be used to generate declarations for tables and views described in any accessible Db2 catalog.

For more information about DCLGEN, see Declaring table and view definitions (Db2 Application programming and SQL) and DCLGEN (DECLARATIONS GENERATOR) (DSN) (Db2 Commands).)



Invocation

This statement can only be embedded in an application program. It is not an executable statement.



Authorization

None required.

Description

table-name* or *view-name
Specifies the name of the table or view to document. If the table is defined in your application program, the description of the table in the SQL statement in which it is defined (for example, CREATE TABLE or DECLARE GLOBAL TEMPORARY TABLE statement) and the DECLARE TABLE statement must be identical.

column-name
Specifies the name of a column of the table or view.

The precompiler uses these names to check for consistency of names within your SQL statements. It also uses the data type to check for consistency of names and data types within your SQL statements.

built-in-type
Specifies the built-in data type of the column. Use one of the built-in data types.

SMALLINT
For a small integer.

INTEGER or INT
For a large integer.

BIGINT
For a big integer.

DECIMAL(*integer*,*integer*) or DEC(*integer*,*integer*)
DECIMAL(*integer*) or DEC(*integer*)
DECIMAL or DEC
For a decimal number. The first integer is the precision of the number. That is, the total number of digits, which can range from 1 to 31. The second integer is the scale of the number. That is, the number of digits to the right of the decimal point, which can range from 0 to the precision of the number.

You can use DECIMAL(*p*) for DECIMAL(*p*,0) and DECIMAL for DECIMAL(5,0).

You can also use the word NUMERIC instead of DECIMAL. For example, NUMERIC(8) is equivalent to DECIMAL(8). Unlike DECIMAL, NUMERIC has no allowable abbreviation.

FLOAT(*integer*)
FLOAT
For a floating-point number. If *integer* is between 1 and 21 inclusive, the format is single precision floating-point. If the integer is between 22 and 53 inclusive, the format is double precision floating-point.

You can use DOUBLE PRECISION or FLOAT for FLOAT(53).

REAL
For single precision floating-point.

DOUBLE or DOUBLE PRECISION
For double precision floating-point

DECFLOAT(*integer*)
For a decimal floating-point number. The value of *integer* must be either 16 or 34 and represents the number of significant digits that can be stored. If *integer* is omitted, the DECFLOAT column will be capable of representing 34 significant digits.

CHARACTER(*integer*) or CHAR(*integer*)
CHARACTER or CHAR
For a fixed-length character string of length *integer*, which can range 1 - 255. If the length specification is omitted, a length of 1 character is assumed.

VARCHAR(*integer*), CHAR VARYING(*integer*), or CHARACTER VARYING(*integer*)
For a varying-length character string of maximum length *integer*, which can range from 1 to the maximum record size minus 10 bytes. See Table 193 on page 1564 to determine the maximum record size.

CCSID 1208
Specifies that the column is a Unicode column encoded in UTF-8. This clause must not be specified for an ASCII or Unicode table.

CLOB(*integer* [K|M|G]), CHAR LARGE OBJECT(*integer* [K|M|G]), or CHARACTER LARGE OBJECT(*integer* [K|M|G])
CLOB, CHAR LARGE OBJECT, or CHARACTER LARGE OBJECT
For a character large object (CLOB) string of the specified maximum length in bytes. The maximum length must be in the range of 1 - 2147483647. A CLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see "Restrictions using LOBs" on page 112.

When *integer* is not specified, the default length is 1M. The maximum value that can be specified for *integer* depends on whether a units indicator is also specified as shown in the following list.

integer
The maximum value for *integer* is 2147483647. The maximum length of the string is *integer*.

***integer* K**
The maximum value for *integer* is 2097152. The maximum length is 1024 times *integer*.

***integer* M**
The maximum value for *integer* is 2048. The maximum length is 1,048,576 times *integer*.

***integer* G**
The maximum value for *integer* is 2. The maximum length is 1,073,741,824 times *integer*.

If you specify a value that evaluates to 2 gigabytes (2,147,483,648), Db2 uses a value that is one byte less, or 2147483647.

GRAPHIC(*integer*)
GRAPHIC
For a fixed-length graphic string of length *integer*, which can range 1 - 127. If the length specification is omitted, a length of 1 character is assumed.

VARGRAPHIC(*integer*)
For a varying-length graphic string of maximum length *integer*, which must range from 1 to *n*/2, where *n* is the maximum row size minus 2 bytes.

CCSID 1200
Specifies that the column is a Unicode column encoded in UTF-16. This clause must not be specified for an ASCII or Unicode table.

DBCLOB(*integer* [K|M|G])
DBCLOB
For a double-byte character large object (DBCLOB) string of the specified maximum length in double-byte characters. The maximum length must be in the range of 1 - 1,073,741,823. A DBCLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see "Restrictions using LOBs" on page 112.

When *integer* is not specified, the default length is 1M. The meaning of *integer* K|M|G is similar to CLOB. The difference is that the number specified is the number of double-byte characters.

CCSID 1200
Specifies that the column is a Unicode column encoded in UTF-16. This clause must not be specified for an ASCII or Unicode table.

BINARY(*integer*)
A fixed-length binary string of length *integer*. The *integer* can range from 1 through 255. If the length specification is omitted, a length of 1 byte is assumed.

BINARY VARYING(*integer*) or VARBINARY(*integer*)
A varying-length binary string of maximum length *integer*, which can range from 1 through 32704. The length is limited by the page size of the table space.

BLOB (*integer* [K|M|G] or BINARY LARGE OBJECT(*integer* [K|M|G])
BLOB or BINARY LARGE OBJECT
For a binary large object (BLOB) string of the specified maximum length in bytes. The maximum length must be in the range of 1 through 2147483647. A BLOB column has a varying-length. It cannot be referenced in certain contexts regardless of its maximum length. For more information, see "Restrictions using LOBs" on page 112.

When *integer* is not specified, the default length is 1M. The meaning of *integer* K|M|G is the same as for CLOB.

DATE
For a date.

TIME
For a time.

TIMESTAMP(*integer*) WITHOUT TIME ZONE
For a timestamp. *integer* specifies the optional timestamp precision attribute and must be in the range from 0 to 12. The timestamp precision denotes the number of fractional second digits that are included in the timestamp. The default is 6.

TIMESTAMP(*integer*) WITH TIME ZONE
For a timestamp with time zone. *integer* specifies the optional timestamp precision attribute and must be in the range from 0 to 12. The timestamp precision denotes the number of fractional second digits that are included in the timestamp. The default is 6.

ROWID
For a row ID type.

A table can contain at most two ROWID columns. If it contains two, one column is implicitly generated by Db2 and the other column is explicitly defined as a ROWID without the IMPLICITLY HIDDEN attribute. The values in a ROWID column are unique for every row in the table and cannot be updated. You must specify NOT NULL with ROWID.

XML
For an XML document. Only well-formed XML documents can be inserted into an XML column.

If the XML column is the first XML column that you create for the table, a BIGINT DOCID column is implicitly created and is used to store a unique document identifier for the XML columns of a row.

distinct-type-name
Specifies the distinct type (user-defined data type) of the column. An implicit or explicit schema name qualifies the name.

NOT NULL
Specifies that the column does not allow null values and does not provide a default value.

NOT NULL WITH DEFAULT
Specifies that the column does not allow null values but provides a default value.

Notes

Error handling during processing: If an error occurs during the processing of the DECLARE TABLE statement, a warning message is issued, and the precompiler continues processing your source program.

Documenting a distinct type column: Although you can specify the name of a distinct type as the data type of a column in the DECLARE TABLE statement, use the built-in data type on which the distinct type is based instead. Using the base type enables the precompiler to check the embedded SQL statements for errors; otherwise, error checking is deferred until bind time.

To determine the source data type of the distinct type, check the value of column SOURCETYPE in catalog table SYSDATATYPES.

Examples

Example 1: Issue a DECLARE TABLE statement for the sample employee table, DSN8B10.EMP.

```
EXEC SQL DECLARE DSN8B10.EMP TABLE
     (EMPNO     CHAR(6)     NOT NULL,
      FIRSTNME  VARCHAR(12) NOT NULL,
      MIDINIT   CHAR(1)     NOT NULL,
      LASTNAME  VARCHAR(15) NOT NULL,
      WORKDEPT  CHAR(3)             ,
      PHONENO   CHAR(4)             ,
      HIREDATE  DATE                ,
      JOB       CHAR(8)             ,
      EDLEVEL   SMALLINT            ,
      SEX       CHAR(1)             ,
      BIRTHDATE DATE                ,
      SALARY    DECIMAL(9,2)        ,
      BONUS     DECIMAL(9,2)        ,
      COMM      DECIMAL(9,2)        );
```

Example 2: Issue a DECLARE TABLE statement for a table that includes a column with a distinct type.

Assume that table CANADIAN_SALES keeps information for your company's sales in Canada. The table includes one column, TOTAL, that is defined as a distinct type. The distinct type CANADIAN_DOLLAR was created with the following definition:

```
CREATE TYPE CANADIAN_DOLLAR AS DECIMAL(9,2);
```

The CANADIAN_SALES table was created with the following definition, which uses the distinct type CANADIAN_DOLLAR as the data type for the TOTAL column.

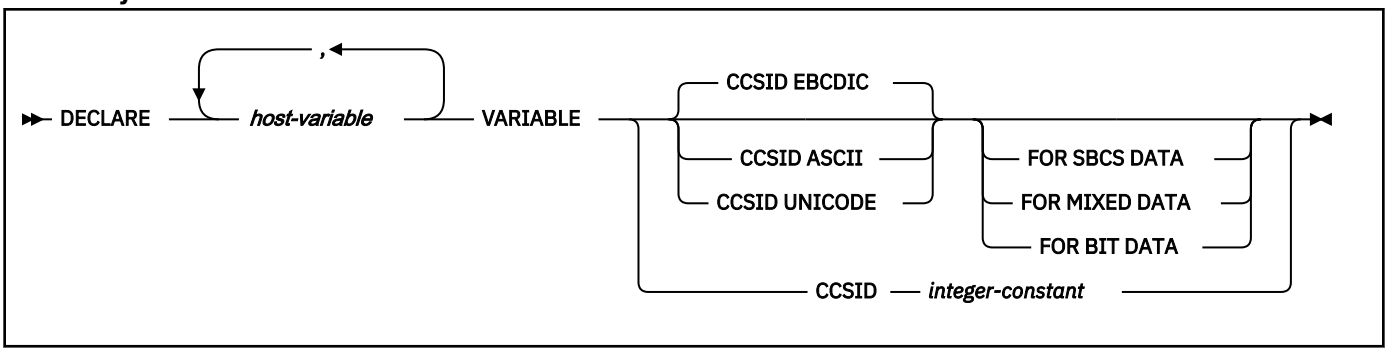
```
CREATE TABLE CANADIAN_SALES
     (PRODUCT_ITEM   INTEGER,
      MONTH          INTEGER,
      YEAR           INTEGER,
      TOTAL          CANADIAN_DOLLAR); -- TOTAL column data type is a distinct type
```

A DECLARE TABLE statement must include only built-in data types. Therefore, in the DECLARE TABLE statement for the CANADIAN_SALES table, you need to use the source data type for the CANADIAN_DOLLAR distinct type, which is DECIMAL(9,2).

```
DECLARE TABLE CANADIAN_SALES
     (PRODUCT_ITEM   INTEGER,
      MONTH          INTEGER,
      YEAR           INTEGER,
      TOTAL          DECIMAL(9,2)); -- Define the column using the source built-in data type
```

DECLARE VARIABLE

The DECLARE VARIABLE statement defines a CCSID for a host variable and the subtype of the variable. When it appears in an application program, the DECLARE VARIABLE statement causes the Db2 precompiler to tag a host variable with a specific CCSID. When the host variable appears in an SQL statement, the Db2 precompiler places this CCSID into the structures that it generates for the SQL statement.



Invocation

This statement can only be embedded in an application program. It is not an executable statement.

Authorization

None required.

Syntax

Description

host-variable
Identifies a character or graphic string host variable defined in the program. An indicator variable cannot be specified for the host-variable.

CCSID ASCII, EBCDIC, or UNICODE
Specifies that the appropriate default CCSID for the specified encoding scheme of the server should be used.

CCSID ASCII
Specifies that the default ASCII CCSID for the type of the variable at the server should be used.

CCSID EBCDIC
Specifies that the default EBCDIC CCSID for the type of the variable at the server should be used. CCSID EBCDIC is the default if this option is not specified.

CCSID UNICODE
Specifies that the default UNICODE CCSID for the type of the variable at the server should be used.

FOR SBCS DATA, FOR MIXED DATA, or FOR BIT DATA
Specifies the type of data contained in the variable *host-variable*. The FOR clause cannot be specified when declaring a graphic host variable.

For ASCII or EBCDIC data, if this clause is not specified when declaring a character host variable, the default is FOR SBCS DATA if MIXED DATA = NO on the installation panel DSNTIPF. The default is FOR MIXED DATA if MIXED DATA = YES on the installation panel DSNTIPF.

For UNICODE data, the default is always FOR MIXED DATA, regardless of the setting of MIXED DATA on the installation panel DSNTIPF.

FOR SBCS DATA
Specifies that the values of the host variable can contain only SBCS (single-byte character set) data.

FOR MIXED DATA
Specifies that the values of the host variable can contain both SBCS data and DBCS data.

FOR BIT DATA
Specifies that the values of the host-variable are not associated with a coded character set and, therefore, are never converted. The CCSID of a FOR BIT DATA host variable is 65535.

CCSID *integer-constant*
Specifies that the values of the host variable contain data that is encoded using CCSID *integer-constant*. If the integer is an SBCS CCSID, the host variable is SBCS data. If the integer is a mixed data CCSID, the host variable is mixed data. For character host variables, the CCSID specified must be an SBCS, mixed CCSID, or UNICODE (UTF-8) CCSID. For graphic host variables, the CCSID specified must be a DBCS or UNICODE (UTF-16) CCSID. The valid range of values for the integer is 1 - 65533.

Notes

Placement of statement: The DECLARE VARIABLE statement can be specified anywhere in an application program that SQL statements are valid with the following exception. The DECLARE VARIABLE statement must occur before an SQL statement that refers to a host variable specified in the DECLARE VARIABLE statement.

CCSID exceptions for EXECUTE IMMEDIATE or PREPARE: When the host variable appears in an SQL statement, the Db2 precompiler places the appropriate numeric CCSID into the structures it generates for the SQL statement. This placement of the CCSID occurs for any SQL statement other than the EXECUTE IMMEDIATE or PREPARE statements. The placement of the CCSID also occurs for a *host-variable* in an EXECUTE IMMEDIATE or PREPARE statement, but it does not occur for a variable in a *string-expression* in an EXECUTE IMMEDIATE or PREPARE statement.

If a PL/1 application program contains at least one DECLARE VARIABLE statement, a *string-expression* in any EXECUTE IMMEDIATE or PREPARE statement cannot be preceded by a colon. An expression that consists of just a variable name preceded by a colon is interpreted as a *host-variable*.

Specific host languages: If a DECLARE VARIABLE statement is used in an assembler source program, the ONEPASS SQL processing option must not be used. If a DECLARE VARIABLE statement is used in a C, C++, or PL/I source program, the TWOPASS SQL processing option must be used. For those languages, or COBOL, the host-variable definition can either precede or follow a DECLARE VARIABLE statement that refers to that variable. If a DECLARE VARIABLE statement is used in a FORTRAN source program, then the host-variable definition must precede the DECLARE VARIABLE statement.

Example

Example: Define the following host variables using PL/I data types: FRED as fixed length bit data, JEAN as fixed length UTF-8 (mixed) data, DAVE as varying length UTF-8 (mixed) data, PETE as fixed length graphic UTF-16 data, and AMBER as varying length graphic UTF-16 data.

Use the DECLARE VARIABLE statement to specify a data subtype or CCSID for these host variables: FRED as CCSID EBCDIC, JEAN as CCSID 1208 or CCSID UNICODE, DAVE as CCSID 1208 or CCSID UNICODE, PETE as CCSID 1200 or CCSID UNICODE, and AMBER as CCSID 1200 or CCSID UNICODE.

```
EXEC SQL BEGIN DECLARE SECTION;
   DCL FRED CHAR(10);
       EXEC SQL DECLARE :FRED VARIABLE CCSID EBCDIC FOR BIT DATA;
   DCL JEAN CHAR(30);
       EXEC SQL DECLARE :JEAN VARIABLE CCSID 1208;
   DCL DAVE CHAR(9) VARYING;
       EXEC SQL DECLARE :DAVE VARIABLE CCSID UNICODE;
   DCL PETE GRAPHIC(10);
       EXEC SQL DECLARE :PETE VARIABLE CCSID 1200;
   DCL AMBER GRAPHIC(20) VARYING;
       EXEC SQL DECLARE :AMBER VARIABLE CCSID UNICODE;
EXEC SQL END DECLARE SECTION;
```

DELETE

The DELETE statement deletes rows from a table or view. Deleting a row from a view deletes the row from the table on which the view is based if no INSTEAD OF DELETE trigger is defined for this view. If such a trigger is defined, the trigger is activated instead.

The table or view can be at the current server or any Db2 subsystem with which the current server can establish a connection.

There are two forms of this statement:

- The *searched* DELETE form is used to delete one or more rows, optionally determined by a search condition.
- The *positioned* DELETE form specifies that one or more rows corresponding to the current cursor position are to be deleted.

Invocation

This statement can be embedded in an application program or issued interactively. A positioned DELETE is embedded in an application program. Both the embedded and interactive forms are executable statements that can be dynamically prepared.

Authorization

Authority requirements depend on whether the object identified in the statement is a user-defined table, a catalog table, or a view, and whether the statement is a searched DELETE and SQL standard rules are in effect:

When a table other than a catalog table is identified: The privilege set must include at least one of the following:

- The DELETE privilege on the table
- Ownership of the table
- DBADM authority on the database that contains the table
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

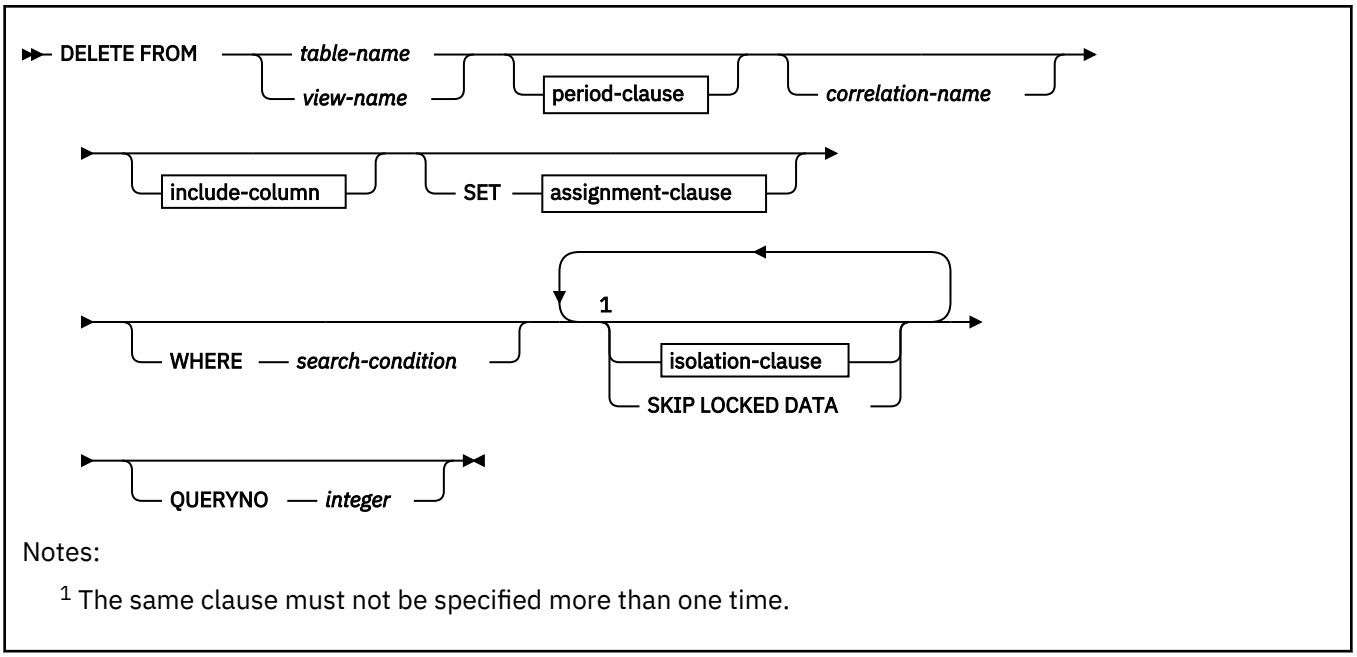
When a catalog table is identified: The privilege set must include at least one of the following:

- DBADM authority on the catalog database
- SYSCTRL authority
- SYSADM authority

When a view is identified: The privilege set must include at least one of the following:

- The DELETE privilege on the view
- SYSADM authority

If the *search-condition* in a searched DELETE contains a reference to a column of the table or view, or the *expression* in the *assignment-clause* contains a reference to a column of the table or view, the privilege set must include at least one of the following:

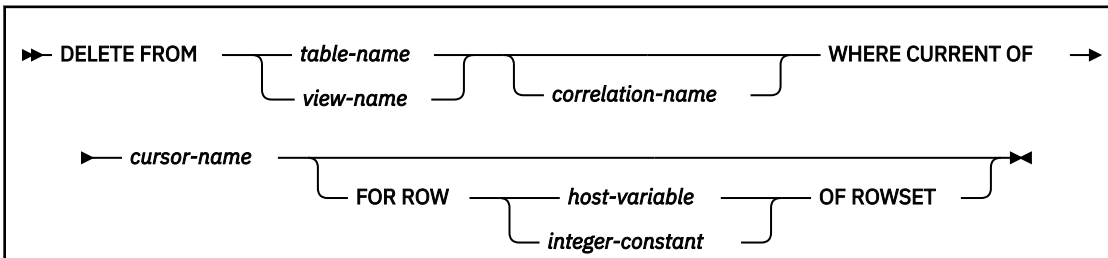


- The SELECT privilege on the table or view
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table that is not a catalog table
- DATAACCESS
- SYSADM authority

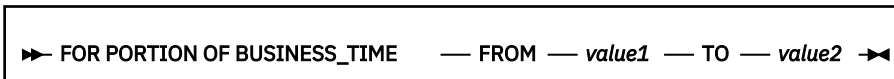
If the *search-condition* in a searched DELETE includes a subquery, or if the *assignment-clause* includes a *scalar-fullselect* or a *row-fullselect*, see “Authorization” on page 931 for an explanation of the authorization required.

The owner of a view, unlike the owner of a table, might not have DELETE authority on the view (or might have DELETE authority without being able to grant it to others). The nature of the view itself can preclude its use for DELETE. For more information, see the description of authority in “CREATE VIEW” on page 1636.

If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see “Authorization IDs and dynamic SQL” on page 91.)

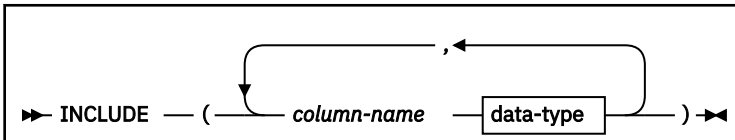


searched delete:

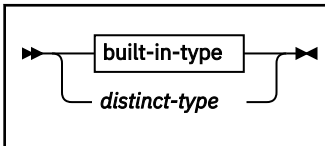


Notes:

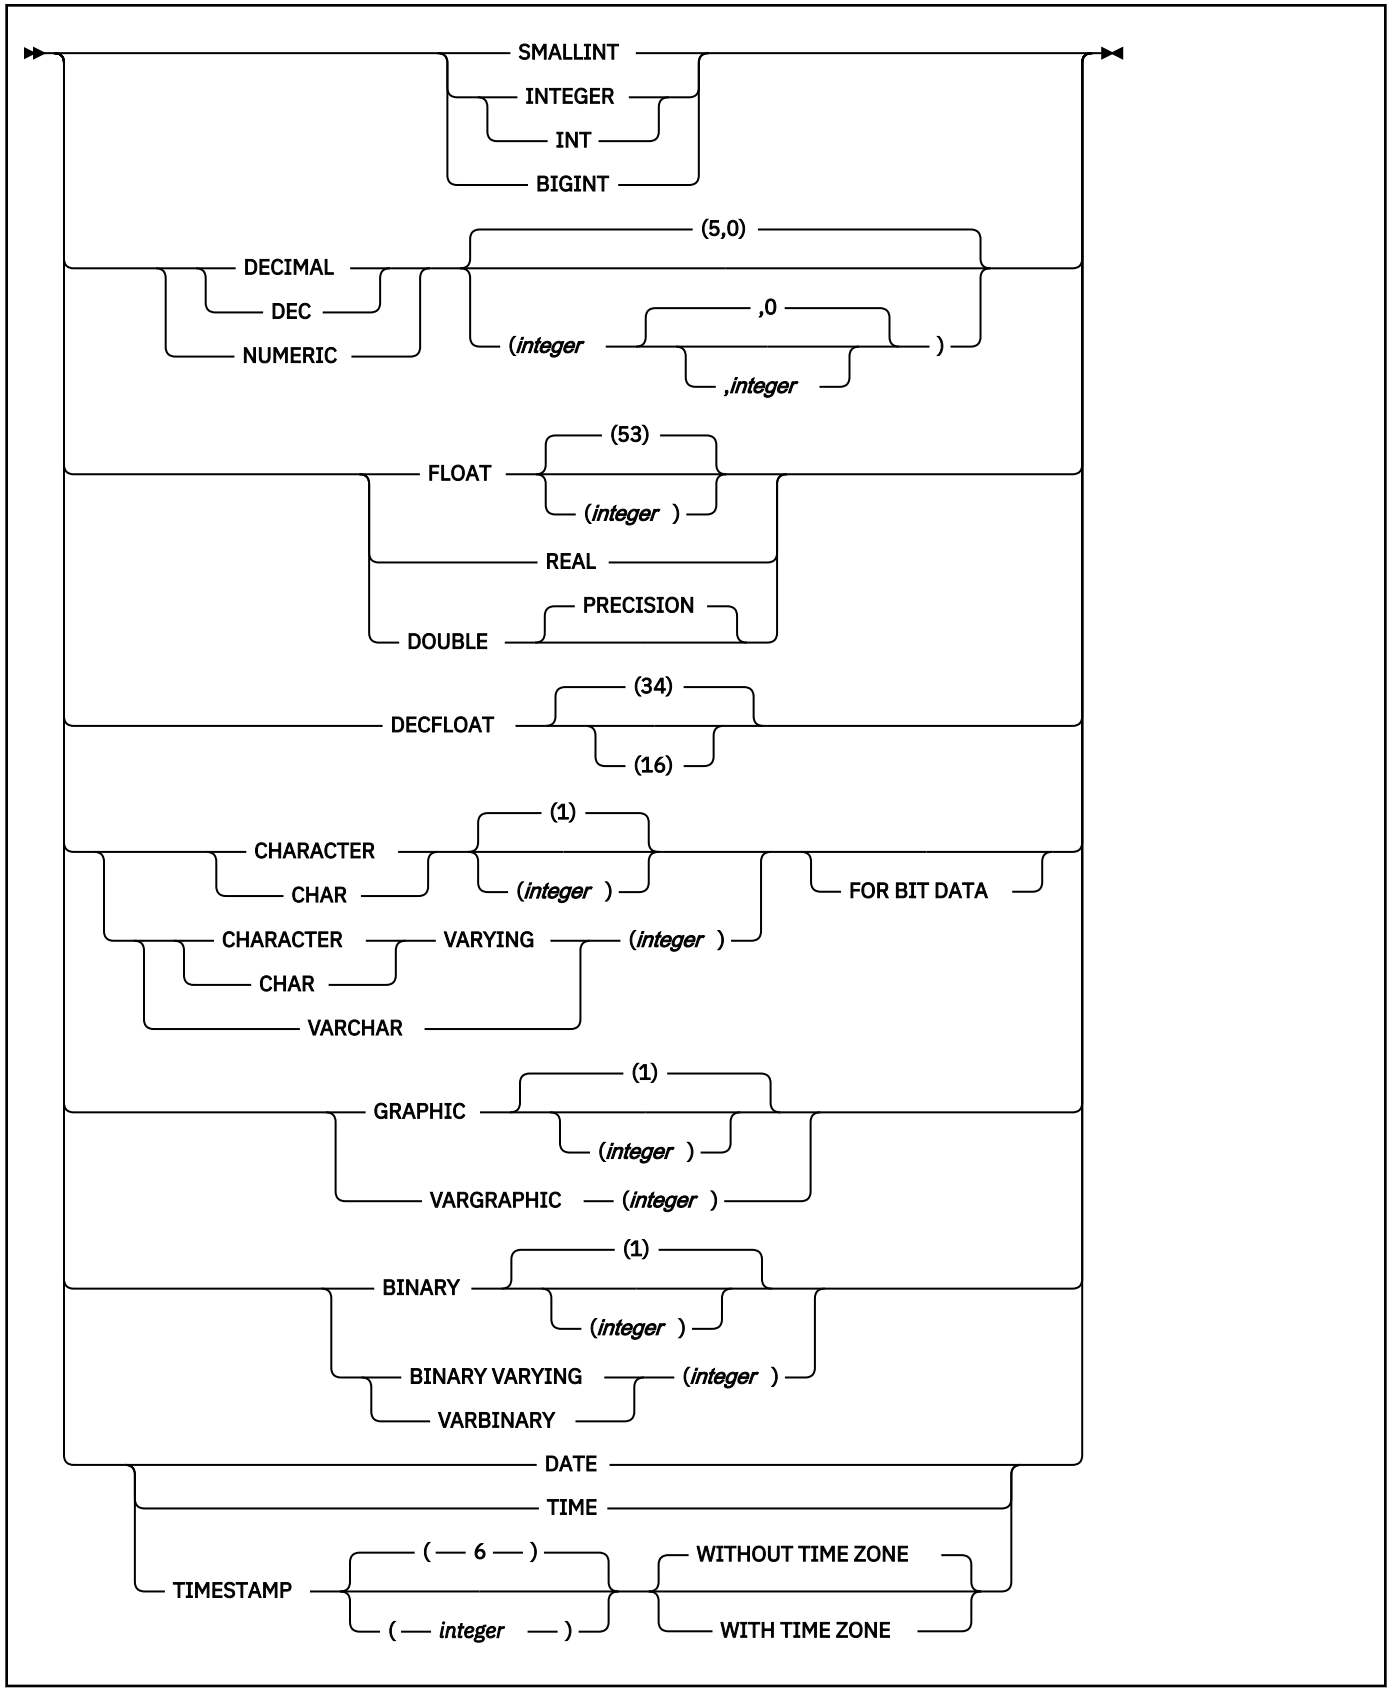
[1] The same clause must not be specified more than one time.



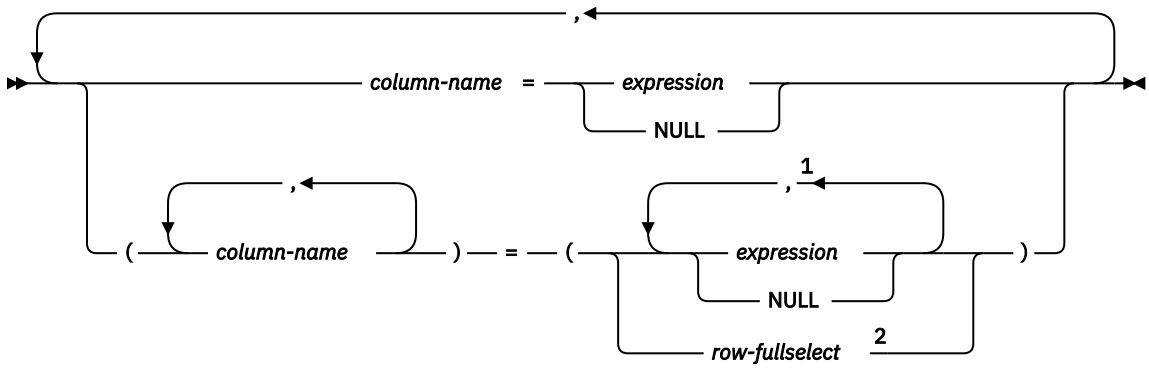
positioned delete:



period-clause:

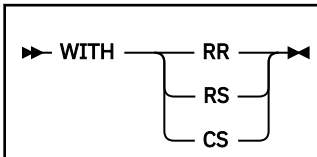


include-column:



data-type:

built-in-type:



assignment clause:

Notes:

[1] The number of *expressions* and NULL keywords must match the number of *column-names*.
[2] The number of columns in the select list must match the number of *column-names*.

isolation-clause:

Description

FROM *table-name* or *view-name*

Identifies the table or view from which rows are to be deleted. The name must identify a table or view that exists at the Db2 subsystem that is identified by the implicitly or explicitly specified location name. The name must not identify:

- An auxiliary table
- A catalog table for which deletes are not allowed
- A view of such a catalog table
- A directory table
- A read-only view (see "CREATE VIEW" on page 1636)
- A system-maintained materialized query table
- A table that is implicitly created for an XML column
- An archive-enabled table if the SYSIBMADM.GET_ARCHIVE global variable is set to Y, the ARCHIVESENSITIVE bind option is set to YES, and the operation is a positioned delete

In an IMS or CICS application, the Db2 subsystem that contains the identified table or view must be a remote server that supports two-phase commit.

period-clause

Specifies that a period clause applies to the target of the delete operation. The same period name must not be specified more than one time. If the target of the delete operation is a view:

- The FROM clause of the outer fullselect of the view definition must include a reference, directly or indirectly, to an application-period temporal table.
- An INSTEAD OF trigger must not be defined for that view.

FOR PORTION OF BUSINESS_TIME

Specifies that the delete only applies to row values for the portion of the BUSINESS_TIME period in the row that is specified by the period clause. BUSINESS_TIME must be a period that is defined on the table.

FOR PORTION OF BUSINESS_TIME must not be specified if the value of the CURRENT TEMPORAL BUSINESS_TIME special register is not NULL when the BUSTIMESENSITIVE bind option is set to YES.

FROM *value1* TO *value2*

Specifies that the delete operation applies to rows for the period that is specified from *value1* to *value2*. No rows are deleted if *value1* is greater than or equal to *value2*, or if *value1* or *value2* is the null value.

For the period condition that is specified with FROM *value1* TO *value2*, the period that is specified by *period-name* in a row of the target table of the delete:

- Overlaps the beginning of the specified period if the value of the begin column is less than *value1* and the value of the end column is greater than *value1*.
- Overlaps the end of the specified period if the value of the end column is greater than or equal to *value2* and the value of the begin column is less than *value2*.
- Is fully contained within the specified period if the value for the begin column for *period-name* in the row is greater than or equal to *value1* and the value for the corresponding end column in the row is less than or equal to *value2*.
- Is partially contained in the specified period if the row overlaps the beginning of the specified period or the end of the specified period.
- Fully overlaps the specified period if the period in the row overlaps the beginning of the specified period and overlaps the end of the specified period, .
- Is not contained in the period if both columns of *period-name* are less than or equal to *value1* or are greater than *value2*.

If the period *period-name* in a row is not contained in the specified period, the row is not deleted. Otherwise, the delete operation is applied based on the specification of the PORTION OF clause and how the values in the columns of *period-name* overlap the specified period as follows:

- If the period *period-name* in a row is fully contained within the specified period, the row is deleted.
- If the period *period-name* in a row is partially contained in the specified period and overlaps the beginning of the specified period:
  - The row is deleted.
  - A row is inserted using the original values from the row, except that the end column is set to *value1*, and new values are used for other generated columns.
- If the period *period-name* in a row is partially contained in the specified period and overlaps the end of the specified period:
  - The row is deleted.
  - A row is inserted using the original values from the row, except that the begin column is set to *value2*, and new values are used for other generated columns.
- If the period *period-name* in a row fully overlaps the specified period:
  - The row is deleted.
  - A row is inserted using the original values from the row, except that the end column is set to *value1*, a column defined as DATA CHANGE OPERATION is set to 'I', and new values are used for other generated columns.
  - An additional row is inserted using the original values from the row, except that the begin column is set to *value2*, a column defined as DATA CHANGE OPERATION is set to 'I', and new values are used for other generated columns.

Any existing delete triggers are activated for the rows that are deleted, and any existing insert triggers are activated for the rows that are implicitly inserted.

value1, value2
Specifies expressions that return a value of a built-in data type. The result of each expression must be comparable to the data type of the columns of the specified period. See the comparison rules described in "Assignment and comparison" on page 135. Each expression can contain any of the following supported operands:

- A constant
- A special register
- A variable
- An array element specification
- A built-in scalar function whose arguments are supported operands
- A CAST specification where the cast operand is a supported operand
- An expression that uses arithmetic operators and operands

Each expression must not have a timestamp precision that is greater than the precision of the columns for the period.

If the begin and end columns of the period are defined as TIMESTAMP WITHOUT TIME ZONE, each expression must not return a value of a timestamp with a time zone.

A period clause for a view must not contain a global variable or an untyped parameter marker.

correlation-name
Specifies an alternate name that can be used within the *search-condition* to designate the table or view. (For an explanation of correlation names, see "Correlation names" on page 205.)

include-column
Specifies a set of columns that are included, along with the columns of *table-name* or *view-name*, in the result table of the DELETE statement when it is nested in the FROM clause of the outer fullselect that is used in a subselect, SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that is identified by *table-name* or *view-name*. If no value is assigned to a column that is specified by an *include-column*, a NULL value is returned for that column.

INCLUDE
Introduces a list of columns that are to be included in the result table of the DELETE statement. The included columns are only available if the DELETE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

column-name
Specifies the name for a column of the result table of the DELETE statement that is not the same name as another included column nor a column in the table or view that is specified in *table-name* or *view-name*.

data-type
Specifies the data type of the included column. The included columns are nullable.

built-in-type
Specifies a built-in data type. See "CREATE TABLE" on page 1509 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an INCLUDE column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

SET
Introduces the assignment of values to columns.

assignment-clause
The assignment-clause introduces a list of one or more *column-names* and the values that are to be assigned to the columns. The *column-names* are the only columns that can be set using the *assignment-clause*.

column-name
Identifies an INCLUDE column.

Assignments to included columns are only processed when the DELETE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. The columns that are named in the INCLUDE clause are the only columns that can be set using the SET clause. The null value is returned for an included column that is not set by using an explicit SET clause.

expression
Indicates the new value of the column. The *expression* is any expression of the type described in "Expressions" on page 229. It must not include an aggregate function.

A *column-name* in an expression must identify a column of the table or view. For each row that is deleted, the value of the column in the expression is the value of the column in the row before the row is deleted.

NULL
Specifies the null value as the new value of the column. Specify NULL only for nullable columns.

row-fullselect
Specifies a fullselect that returns a single row. The column values are assigned to each of the corresponding *column-names*. If the fullselect returns no rows, the null value is assigned to each column; an error occurs if any column that is to be deleted is not nullable. An error also occurs if there is more than one row in the result.

If the fullselect refers to columns that are to be deleted, the value of such a column in the fullselect is the value of the column in the row before the row is deleted.

WHERE
Specifies the rows to be deleted. You can omit the clause, give a search condition, or specify a cursor. For a created temporary table or a view of a created temporary table, you must omit the clause. When the clause is omitted, all the rows of the table or view are deleted.

search-condition
Is any search condition as described in Chapter 2, "Language elements," on page 73. Each *column-name* in the search condition, other than in a subquery, must identify a column of the table or view.

The search condition is applied to each row of the table or view and the deleted rows are those for which the result of the search condition is true.

If the search condition contains a subquery, the subquery can be thought of as being executed each time the search condition is applied to a row, and the results used in applying the search condition. In actuality, a subquery with no correlated references is executed just once, whereas it is possible that a subquery with a correlated reference must be executed once for each row.

Let T2 denote the object table of a DELETE statement and let T1 denote a table that is referred to in the FROM clause of a subquery of that statement. T1 must not be a table that can be affected by the DELETE on T2. Thus, the following rules apply:

- T1 must not be a dependent of T2 in a relationship with a delete rule of CASCADE or SET NULL, unless the result of the subquery is materialized before the DELETE action is executed.
- T1 must not be a dependent of T3 in a relationship with a delete rule of CASCADE or SET NULL if deletes of T2 cascade to T3.

WHERE CURRENT OF *cursor-name*
Identifies the cursor to be used in the delete operation. *cursor-name* must identify a declared cursor as explained in the description of the DECLARE CURSOR statement in "DECLARE CURSOR" on page 1643. If the DELETE statement is embedded in a program, the DECLARE CURSOR statement must include *select-statement* rather than *statement-name*.

The table or view named must also be named in the FROM clause of the SELECT statement of the cursor, and the result table of the cursor must be capable of being deleted. For an explanation of read-only result tables, see Read-only cursors. Note that the object of the DELETE statement must not be identified as the object of the subquery in the WHERE clause of the SELECT statement of the cursor.

If the cursor is ambiguous and the plan or package was bound with CURRENTDATA(NO), Db2 might return an error to the application if DELETE WHERE CURRENT OF is attempted for any of the following:

- A cursor that is using block fetching
- A cursor that is using query parallelism
- A cursor that is positioned on a row that has been modified by this or another application process

When the DELETE statement is executed, the cursor must be open and positioned on a row or rowset of the result table.

- If the cursor is positioned on a single row, that row is the one deleted, and after the deletion the cursor is positioned before the next row of its result table. If there is no next row, the cursor positioned after the last row.
- If the cursor is positioned on a rowset, all rows corresponding to the rows of the current rowset are deleted, and after the deletion the cursor is positioned before the next rowset of its result table. If there is no next rowset, the cursor positioned after the last rowset.

A positioned DELETE must not be specified for a cursor that references a view on which an instead of delete trigger is defined, even if the view is an updatable view.

FOR ROW n OF ROWSET

Specifies which row of the current rowset is to be deleted. The corresponding row of the rowset is deleted, and the cursor remains positioned on the current rowset. If the rowset consists of a single row, or all other rows in the rowset have already been deleted, then the cursor is positioned before the next rowset of the result table. If there is no next rowset, the cursor is positioned after the last rowset.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with scale zero, must not include an indicator variable, and *k* must be in the range 1 - 32767. The cursor must be positioned on a rowset, and the specified value must be a valid value for the set of rows most recently retrieved for the cursor.

If the specified row cannot be deleted, an error is returned. It is possible that the specified row is within the bounds of the rowset most recently requested, but the current rowset contains less than the number of rows that were implicitly or explicitly requested when that rowset was established.

If, via a positioned delete against a sensitive static cursor that specifies a particular row of the current rowset, and that row has been identified as a delete hole (that is, a row in the result table whose corresponding row has deleted from the base table), an error is returned.

If, via a positioned delete against a sensitive static cursor that specifies a particular row of the current rowset, and that row has been identified as an update hole (that is, a row in the result table whose corresponding row has been updated so that it no longer satisfies a predicate of the SELECT statement), an error is returned.

It is possible for another application process to delete a row in the base table of the SELECT statement so that the specified row of the cursor no longer has a corresponding row in the base table. An attempt to delete such a row results in an error.

If the FOR ROW n OF ROWSET clause is not specified, the current position of cursor determines the rows that are affected by the statement:

- If the cursor is positioned on a single row, that row is the one deleted. After the row is deleted, the cursor is positioned before the next row of its result table. If there is no next row, the cursor positioned after the last row.

- If the cursor is positioned on a rowset, all rows corresponding to the rows of the current rowset are deleted. After the rows are deleted, the cursor is positioned before the next rowset of its result table. If there is no next rowset, the cursor positioned after the last rowset.

isolation-clause
Specifies the isolation level used when locating the rows to be deleted by the statement.

WITH
Introduces the isolation level, which may be one of the following:

RR
Repeatable read

RS
Read stability

CS
Cursor stability

The default isolation level of the statement is the isolation level of the package or plan in which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

SKIP LOCKED DATA
The SKIP LOCKED DATA clause specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. SKIP LOCKED DATA can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

For DELETE statements, SKIP LOCKED DATA can be specified only in the searched form of the DELETE statement. SKIP LOCKED DATA is ignored if it is specified when the isolation level that is in effect is repeatable read (WITH RR) or uncommitted read (WITH UR). The default isolation level of the statement depends on the isolation level of the package or plan with which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the QUERYNO clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *Managing Performance*.

Notes

Delete operation errors:
If an error occurs during the execution of any delete operation, no changes are made. If an error occurs during the execution of a positioned delete, the position of the cursor is unchanged. However, it is possible for an error to make the position of the cursor invalid, in which case the cursor is closed. It is also possible for a delete operation to cause a rollback, in which case the cursor is closed.

Position of cursor:
If an application process deletes a row on which any of its cursors are positioned, those cursors are positioned before the next row of the result table. Let C be a cursor that is positioned before row R (as a result of an OPEN, a DELETE through C, a DELETE through some other cursor, or a searched DELETE). In the presence of an SQL data change statements that affect the base table from which R is derived, the next FETCH operation referencing C does not necessarily position C on R. For example, the operation can position C on R', where R' is a new row that is now the next row of the result table.

Locking:
Unless appropriate locks already exist, one or more exclusive locks are acquired during the execution of a successful delete operation. Until the locks are released by a commit or rollback operation, the effect of the delete operation can only be perceived by the application process that performed the deletion and the locks can prevent other application processes from performing operations on the table. Locks are not acquired when rows are deleted from a declared temporary table unless all the rows are deleted (DELETE FROM T). When all the rows are deleted from a declared temporary table, a segmented table lock is acquired on the pages for the table and no other table in the table space is affected.

Triggers:
Delete operations can cause triggers to be activated. A trigger might cause other statements to be executed or might raise error conditions that are based on the deleted rows. If a DELETE statement on a view causes an INSTEAD OF trigger to be activated, referential integrity is checked against the updates that are performed in the trigger and not against the underlying tables of the view that cause the trigger to be activated.

Triggers defined on a table for which row or column access control is also enforced:
Row permissions and column masks are not applied to the initial values of transition variables and transition tables. Row and column access control that is enforced for the triggering table is also ignored for any transition variables or transition tables that are referenced in the trigger body or that are passed as arguments to user-defined functions that are invoked in the trigger body. To ensure that no security concern exists for SQL statements in the trigger action (access to sensitive data in transition variables and transition tables, for example), the trigger must be secure. For information about securing a trigger, see “CREATE TRIGGER” on page 1595 and “ALTER TRIGGER” on page 1244.

Referential integrity:
If the identified table or the base table of the identified view is a parent, the rows selected must not have any dependents in a relationship with a delete rule of RESTRICT or NO ACTION. In addition, the delete operation must not cascade to descendent rows that have dependents in a relationship with a delete rule of RESTRICT or NO ACTION.

If the delete operation is not prevented by a RESTRICT or NO ACTION delete rule, the selected rows are deleted and any rows that are dependents of the selected rows are also deleted.

- The nullable columns of foreign keys in any rows that are their dependents in a relationship governed by a delete rule of SET NULL are set to the null value.
- Any rows that are their dependents in a relationship governed by a delete rule of CASCADE are also deleted, and these rules apply, in turn, to those rows.

The only difference between NO ACTION and RESTRICT is when the referential constraint is enforced. RESTRICT (IBM SQL rules) enforces the rule immediately, and NO ACTION (SQL standard rules) enforces the rule at the end of the statement. This difference matters only in the case of a searched DELETE involving a self-referencing constraint that deletes more than one row. NO ACTION might allow the DELETE to be successful where RESTRICT (if it were allowed) would prevent it.

Check constraint:
A check constraint can prevent the deletion of a row in a parent table when there are dependents in a relationship with a delete rule of SET NULL. If deleting a row in the parent table would cause a column in a dependent table to be set to null and there is a check constraint that specifies that the column must not be null, the row is not deleted.

Referential constraints defined on a table for which row or column access control is enforced:
Row and column access controls do not effect referential constraints.

Nesting user-defined functions or stored procedures:
A DELETE statement can implicitly or explicitly refer to user-defined functions or stored procedures. This is known as *nesting* of SQL statements. A user-defined function or stored procedure that is nested within the DELETE must not access the table from which you are deleting rows.

Indexes with VARBINARY columns:
If the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.

Number of rows deleted:
Except as noted below, a delete operation sets SQLERRD(3) in the SQLCA to the number of deleted rows. This number does not include any rows that were deleted as a result of a CASCADE delete rule or a trigger.

DELETE FROM T without a WHERE clause deletes all rows of T. If a table T is contained in a segmented table space and is not a parent table, this deletion will be performed without accessing T. The SQLERRD(3) field is set to -1. (For a complete description of the SQLCA, including exceptions to the above, see "SQL communication area (SQLCA)" on page 2086.

Rules for positioned DELETE with SENSITIVE STATIC scrollable cursor:
When a SENSITIVE STATIC scrollable cursor has been declared, the following rules apply:

- *Delete attempt of delete holes or update holes.* If, with a positioned delete against a SENSITIVE STATIC scrollable cursor, an attempt is made to delete a row that has been identified as a delete hole (that is, a row in the result table whose corresponding row has been deleted from the base table), an error occurs.

  If an attempt is made to delete a row that has been identified as an update hole (that is, a row in the result table whose corresponding row has been updated so that it no longer satisfies the predicate of the SELECT statement), an error occurs.
- *Delete operations.* Positioned delete operations with SENSITIVE STATIC scrollable cursors perform as follows:
  1. The SELECT list items in the target row of the base table of the cursor are compared with the values in the corresponding row of the result table (that is, the result table must still agree with the base table). If the values are not identical, the delete operation is rejected and an error occurs. The operation can be attempted again after a successful FETCH SENSITIVE has occurred for the target row.
  2. The WHERE clause of the SELECT statement is re-evaluated to determine whether the current values in the base table still satisfy the search criteria. The values in the SELECT list are compared to determine that these values have not changed. If the WHERE clause evaluates as true, and the values in the SELECT list have not changed, the delete operation is allowed to proceed. Otherwise, an error occurs, the delete operation is rejected, and an update hole appears in the cursor.
  3. After the base table row is successfully deleted, the temporary result table is updated and the row is marked as a delete hole.
- *Rollback of delete holes.* Delete holes are usually permanent. Once a delete hole is identified, it remains a delete hole until the cursor is closed. However, if a positioned delete using *this* cursor actually caused the creation of the hole (that is, this cursor was used to make the changes that resulted in the hole) and the delete was subsequently rolled back, then the row is no longer considered a delete hole.
- *Result table.* Any deletes, either positioned or searched, to rows of the base table on which a SENSITIVE STATIC scrollable cursor is defined are reflected in the result table if a positioned update or positioned delete is attempted with the scrollable cursor. A SENSITIVE STATIC scrollable cursor sees these deletes when a FETCH SENSITIVE is attempted.

If the FOR ROW *n* OF ROWSET clause is not specified, the entire rowset fetched by the most recent FETCH statement that returned data for the specified cursor is deleted.

Deleting rows from a table with multilevel security:

When you delete rows from a table with multilevel security, Db2 compares the security label of the user (the primary authorization ID) to the security label of the row. The delete proceeds according to the following rules:

- If the security label of the user and the security label of the row are equivalent, the row is deleted.
- If the security label of the user dominates the security label of the row, the user's write-down privilege determines the security the result of the DELETE statement:
  - If the user has write-down privilege or write-down control is not enabled, the row is deleted.
  - If the user does not have write-down privilege and write-down control is enabled, the row is not deleted.
- If the security label of the row dominates the security label of the user, the row is not deleted.

Deleting rows from a table for which row and column access control is enforced:

When a DELETE statement is issued for a table for which row access control is enforced, the rules specified in the row permissions affect whether a row can be deleted. Typically those rules are based on the authorization ID or role of the process.

A table for which row access control is enforced has at least one row permission, the default row permission that prevents all access to the table. When multiple row permissions are defined and enabled for a table, a row access control search condition is derived by using the logical OR operator to the search condition in each enabled permission. This row access control search condition is applied to the table to determine which rows are accessible to the authorization ID or role of the DELETE statement. If the WHERE clause is specified in the DELETE statement, the user-specified predicates are applied on the accessible rows to determine the rows to be deleted. If there is no WHERE clause, the accessible rows are the rows to be deleted.

If there are rows to be deleted, and there is a DELETE trigger for the table, the trigger is activated.

When a DELETE statement is issued for a table for which column access control is enforced, column masks do not affect the DELETE statement.

The preceding rules are not applicable to *include-columns*. *include-columns* are subject to the rules for the select list because they are not the columns of the object table of the DELETE statement.

Other SQL statements in the same unit of work:

The following statements cannot follow a DELETE statement in the same unit of work:

- An ALTER TABLE statement that changes the data type of a column (ALTER COLUMN SET DATA TYPE)
- An ALTER INDEX statement that changes the padding attribute of an index with varying-length columns (PADDED to NOT PADDED or vice versa)
- A CREATE TABLE statement that creates an accelerator-only table.
- An INSERT, UPDATE or DELETE statement that updates an accelerator-only table from a different accelerator

Considerations for a system-period temporal table:

If the DELETE statement has a search condition that contains a correlated subquery that references the history table (explicitly referencing the name of the history table or implicitly referenced through the use of a period specification in the FROM clause), the deleted rows that are stored as historical rows are potentially visible for delete operations for the rows that are subsequently processed for the statement.

The mass delete operation is not used for a DELETE statement that does not contain a search condition if the table is defined as a system-period temporal table.

If the CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value, the underlying target of the DELETE statement cannot be a system-period temporal table. This restriction applies regardless of whether the system-period temporal table is directly or indirectly referenced.

Considerations for a history table:

When a row of a system-period temporal table is deleted, a historical copy of the row is inserted into the corresponding history table and the end timestamp of the historical row is captured in the form of a system determined value that corresponds to the time of the data change operation. Db2 generates a value using the time-of-day clock during execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. Db2 ensures the uniqueness of the generated values for an end column in a history table across transactions. If a conflicting transaction is updating the same row in the system-period temporal table and the row that is to be inserted into the associated history table will have a value for the end column that is greater than the value of the corresponding begin column, an error is returned.

Considerations for an application-period temporal table:

A DELETE statement that contains a FOR PORTION OF BUSINESS_TIME clause for an application-period temporal table indicates the two points in time between which the specified delete operations are effective.

Suppose that FOR PORTION OF BUSINESS_TIME is specified and the period value for a row is only partially contained in the period that is specified from *value1* up to *value2*. (The period value for a row is specified by the values of the begin column and end column.) In this case, the row is deleted and one or two rows are automatically inserted to represent the portion of the row that is not deleted. For each row that is automatically inserted as a result of a delete operation on the table, new values are generated for each generated column in the application-period temporal table. If a generated column is defined as part of a unique or primary key, parent key in a referential constraint, or unique index, an automatic insert might violate a constraint or index. In this case, an error is returned.

When an application-period table is the target of a DELETE statement and the value in effect for the CURRENT TEMPORAL BUSINESS_TIME special register is not the null value, Db2 adds the following additional predicates to the statement:

```
   bt_begin <= CURRENT TEMPORAL BUSINESS_TIME AND
bt_end > CURRENT TEMPORAL BUSINESS_TIME
```

In the preceding code, bt_begin and bt_end are the begin and end columns of the BUSINESS_TIME period of the target table of the DELETE statement.

Deleting rows from archive-enabled tables:

If the target of the DELETE statement is an archive-enabled table, existing rows in the associated archive table are not affected.

When a row of an archive-enabled table is deleted, the effect on the associated archive table is determined by the setting of the SYSIBMADM.MOVE_TO_ARCHIVE global variable. If the global variable is set to Y, a copy of a deleted row is inserted into the associated archive table. Otherwise, a copy of a deleted row is not inserted into the associated archive table.

A data change statement cannot reference an archive-enabled table when a system-period temporal table or application-period temporal table is also referenced.

Syntax alternatives:

For compatibility with other SQL implementations, the FROM keyword that immediately follows the DELETE keyword can be omitted.

Examples

Assume that the statements in the examples are embedded in PL/I programs.

Example 1: From the table DSN8B10.EMP delete the row on which the cursor C1 is currently positioned.

```
EXEC SQL DELETE FROM DSN8B10.EMP WHERE CURRENT OF C1;
```

Example 2: From the table DSN8B10.EMP, delete all rows for departments E11 and D21.

```
EXEC SQL DELETE FROM DSN8B10.EMP
  WHERE WORKDEPT = 'E11' OR WORKDEPT = 'D21';
```

Example 3: From employee table X, delete the employee who has the most absences.

```
EXEC SQL DELETE FROM EMP X
  WHERE ABSENT = (SELECT MAX(ABSENT) FROM EMP Y
  WHERE X.WORKDEPT = Y.WORKDEPT);
```

Example 4: Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows of table T1, delete all 10 rows in the rowset.

```
EXEC SQL DELETE FROM T1 WHERE CURRENT OF CS1;
```

Example 5: Assuming cursor CS1 is positioned on a rowset consisting of 10 rows of table T1, delete the fourth row of the rowset.

```
EXEC SQL DELETE FROM T1 WHERE CURRENT OF CS1 FOR ROW 4 OF ROWSET;
```

Example 6: Delete rows in table T1 if the value for column COL2 matches the cardinality of array INTA. The array INTA is specified as an argument for the CARDINALITY function in the DELETE statement.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[6];
DECLARE INTA AS INTARRAY;
SET INTA = ARRAY[1, 2, 3, 4, 5];
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
INSERT INTO T1 VALUES('abc', 10);
DELETE FROM T1 WHERE COL2 = CARDINALITY(INTA);
```

DESCRIBE

The DESCRIBE statement obtains information about an object. You can obtain the following types of information with this statement, each of which is described separately.

- Cursors

  Gets information about the result set that is associated with the cursor. This information, such as column information, is put into a descriptor. See “DESCRIBE CURSOR” on page 1689.
- Input parameter markers of a prepared statement.

  Gets information about the input parameter markers in a prepared statement. This information is put into a descriptor. See “DESCRIBE INPUT” on page 1691.
- The output of a prepared statement

  Gets information about a prepared statement or information about the select list columns in a prepared SELECT statement. This information is put into a descriptor. See “DESCRIBE OUTPUT” on page 1693.
- Procedures

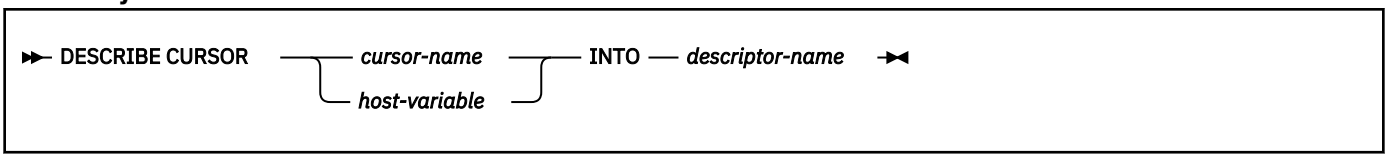
  Gets information about the result sets returned by a stored procedure. The information, such as the number of result sets, is put into a descriptor. See “DESCRIBE PROCEDURE” on page 1698.
- Tables

  Gets information about a table or view. This information is put into a descriptor. See “DESCRIBE TABLE” on page 1700.

DESCRIBE CURSOR

The DESCRIBE CURSOR statement obtains information about the result set that is associated with the cursor. The information, such as column information, is put into a descriptor. Use DESCRIBE CURSOR for

result set cursors from stored procedures. The cursor must be defined with the ALLOCATE CURSOR statement.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

Description

cursor-name* or *host-variable

Identifies a cursor by the specified *cursor-name* or the cursor name contained in *host-variable*. The name must identify a cursor that has already been allocated in the source program.

A column of the result table of the cursor must not be an array.

If *host-variable* is used:

- It must be a character string variable that has a maximum length of 18 bytes.
- It must not be followed by an indicator variable.
- The cursor name must be left justified within the host variable and must not contain embedded blanks.
- If the length of the cursor name is less than the length of the host variable, it must be padded on the right with blanks.

Exception: The syntax described above applies to all languages except REXX. For REXX, the syntax is DESCRIBE CURSOR *:hostvar*.

INTO *descriptor-name*

Identifies an SQL descriptor area (SQLDA). The information returned in the SQLDA describes the columns in the result set associated with the named cursor.

The considerations for allocating and initializing the SQLDA are similar to those of a varying-list SELECT statement. For more information, see *Db2 Application Programming and SQL Guide*.

For REXX: The SQLDA is not allocated before it is used.

After the DESCRIBE CURSOR statement is executed, the contents of the SQLDA are the same as after a DESCRIBE for a SELECT statement, with the following exceptions:

- The first 5 bytes of the SQLDAID field are set to 'SQLRS'.
- Bytes 6 to 8 of the SQLDAID field are reserved. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1.

These exceptions do not apply to a REXX SQLDA, which does not include the SQLDAID field.

Notes

Using cursors for result sets: Column names are included in the information that DESCRIBE CURSOR obtains when the statement that generates the result set is either:

- Dynamic

- Static and the value of field DESCRIBE FOR STATIC on installation panel DSNTIP4 was YES when the package or stored procedure was bound. If the value of the field was NO, the returned information includes only the data type and length of the columns.

Using host variables: If the DESCRIBE CURSOR statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Examples

The statements in the following examples are assumed to be in PL/I programs.

Example 1: Place information about the result set associated with cursor C1 into the descriptor named by :sqlda1.

```
EXEC SQL DESCRIBE CURSOR C1 INTO :sqlda1
```

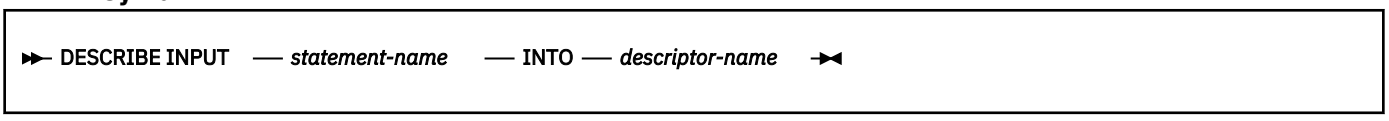
Example 2: Place information about the result set associated with the cursor named by :hv1 into the descriptor named by :sqlda2.

```
EXEC SQL DESCRIBE CURSOR :hv1 INTO :sqlda2
```

DESCRIBE INPUT

The DESCRIBE INPUT statement obtains information about the input parameter markers of a prepared statement.

For an explanation of prepared statements, see "PREPARE" on page 1849.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

The statement can be executed if the privilege set for PREPARE includes the EXPLAIN privilege.

Syntax

Description

statement-name
Identifies the prepared statement. When the DESCRIBE INPUT statement is executed, the name must identify a statement that has been prepared by the application process at the current server. An input parameter marker must not refer to an array value.

INTO *descriptor-name*
Identifies an SQL descriptor area (SQLDA), which is described in "SQL descriptor area (SQLDA)" on page 2095. See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C. The information returned in the SQLDA describes the parameter markers.

Before the DESCRIBE INPUT statement is executed, the user must set the SQLN field in the SQLDA and the SQLDA must be allocated. Considerations for initializing and allocating the SQLDA are similar to those for the DESCRIBE statement (see "DESCRIBE" on page 1689). An occurrence of an extended

SQLVAR is needed for each parameter in addition to the required base SQLVAR only if the input data contains LOBs.

For REXX: The SQLDA is not allocated before it is used.

After the DESCRIBE INPUT statement is executed, all the fields in the SQLDA except SQLN are either set by Db2 or ignored. The SQLDA contents are similar to the contents returned for the DESCRIBE statement (see page The SQLDA contents returned after DESCRIBE) with these exceptions:

- In the SQLDAID, Db2 sets the value of the seventh byte only to the space character or '2'. A value of '3' is never used. The value '2' indicates that two SQLVAR entries (an occurrence of both a base SQLVAR and an extended SQLVAR) are required for each parameter because the input data contains LOBs. The seventh byte is a space character when either of the following conditions is true:
  - The input data does not contain LOBs. Only a base SQLVAR occurrence is needed for each parameter.
  - Only a base SQLVAR occurrence is needed for each column of the result, and the SQLDA is not large enough to contain the returned information.
- The SQLD field is set to the number of parameter markers being described. The value is 0 if the statement being described does not have input parameter markers.
- The SQLNAME field is not used.
- The SQLDATATYPE is set to a nullable, regardless of the usage of the parameter markers in the prepared statement.
- The SQLDATATYPE-NAME is not used if an extended SQLVAR entry is present. DESCRIBE INPUT does not return information about distinct types.

For complete information on the contents of the fields, see “SQL descriptor area (SQLDA)” on page 2095.

Notes

Preparing the SQLDA for OPEN or EXECUTE: This note is relevant if you are applying DESCRIBE INPUT to a prepared statement and you intend to use the SQLDA in an OPEN or EXECUTE statement. To prepare the SQLDA for that purpose:

- Set SQLDATA to a valid address.
- If SQLTYPE is odd, set SQLIND to a valid address.

For the meaning of those fields in that context, see “SQL descriptor area (SQLDA)” on page 2095.

Support for extended dynamic SQL in a distributed environment: Unlike the DESCRIBE statement, which can be used in a distributed environment to describe static SQL statements generated by extended dynamic SQL, you cannot describe host variables in static SQL statements that are generated by extended dynamic SQL. A DESCRIBE INPUT statement issued against such static SQL statements always fails.

For information on how the DESCRIBE statement supports extended dynamic SQL, see Support for extended dynamic SQL in a distributed environment.

Using host variables: If the DESCRIBE INPUT statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Example

Execute a DESCRIBE INPUT statement with an SQLDA that has enough SQLVAR occurrences to describe any number of input parameters a prepared statement might have. Assume that five parameter markers at most will need to be described and that the input data does not contain LOBs.

```
     /* STMT1_STR contains INSERT statement with VALUES clause  */
  EXEC SQL  PREPARE STMT1_NAME FROM :STMT1_STR;
 … /* code to set SQLN to 5 and to allocate the SQLDA         */
  EXEC SQL  DESCRIBE INPUT STMT1_NAME INTO :SQLDA;
 .
```

```
.
.
```

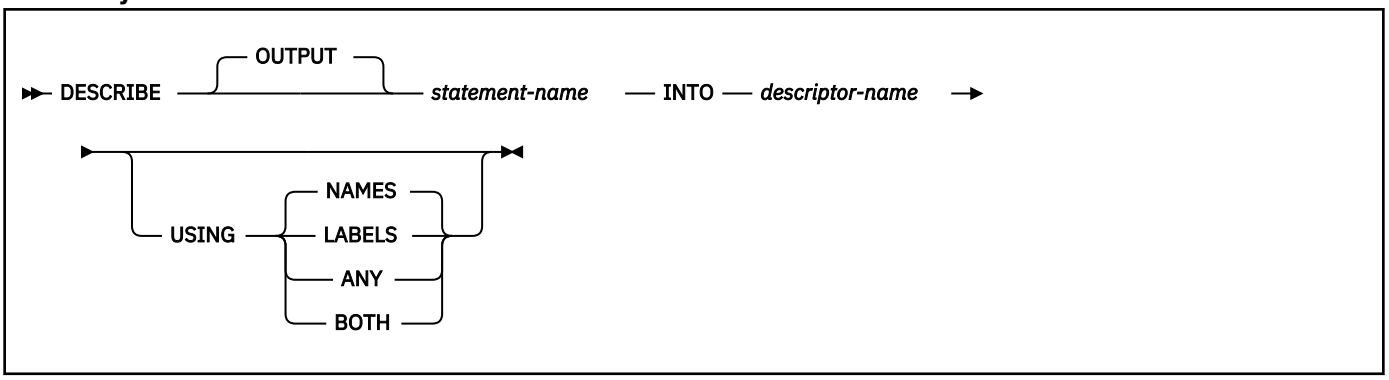
This example uses the first technique described in Allocating the SQLDA to allocate the SQLDA.

DESCRIBE OUTPUT

The DESCRIBE OUTPUT statement obtains information about a prepared statement.

For an explanation of prepared statements, see "PREPARE" on page 1849.

Invocation



This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

The statement can be executed if the privilege set for PREPARE includes the EXPLAIN privilege.

See "PREPARE" on page 1849 for the authorization required to create a prepared statement.

Syntax

Description

OUTPUT
When a *statement-name* is specified, optional keyword to indicate that the describe will return information about the select list columns in a the prepared SELECT statement.

statement-name
Identifies the prepared statement. When the DESCRIBE statement is executed, the name must identify a statement that has been prepared by the application process at the current server. A column of the result table of the prepared statement must not be an array.

INTO *descriptor-name*
Identifies an SQL descriptor area (SQLDA), which is described in "SQL descriptor area (SQLDA)" on page 2095. See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

For languages other than REXX: Before the DESCRIBE statement is executed, the user must set the following variable in the SQLDA and the SQLDA must be allocated.

SQLN
Indicates the number of SQLVAR occurrences provided in the SQLDA. Db2 does not change this value. For techniques to determine the number of required occurrences, see Allocating the SQLDA.

For REXX: The SQLDA is not allocated before it is used. An SQLDA consists of a set of stem variables. There is one occurrence of variable *stem.*SQLD, followed by zero or more occurrences of a set of variables that is equivalent to an SQLVAR structure. Those variables begin with *stem.n*.

After the DESCRIBE statement is executed, all the fields in the SQLDA except SQLN are either set by Db2 or ignored. For information on the contents of the fields, see The SQLDA contents returned after DESCRIBE.

USING
Indicates what value to assign to each SQLNAME variable in the SQLDA. If the requested value does not exist, SQLNAME is set to a length of 0.

NAMES
Assigns the name of the column. This is the default.

LABELS
Assigns the label of the column. (Column labels are defined by the LABEL statement.)

ANY
Assigns the column label, and if the column has no label, the column name.

BOTH
Assigns both the label and name of the column. In this case, two or three occurrences of SQLVAR per column, depending on whether the result set contains distinct types, are needed to accommodate the additional information. To specify this expansion of the SQLVAR array, set SQLN to 2×*n* or 3×*n*, where *n* is the number of columns in the object being described. For each of the columns, the first *n* occurrences of SQLVAR, which are the base SQLVAR entries, contain the column names. Either the second or third *n* occurrences of SQLVAR, which are the extended SQLVAR entries, contain the column labels. If there are no distinct types, the labels are returned in the second set of SQLVAR entries. Otherwise, the labels are returned in the third set of SQLVAR entries.

Notes

Using PREPARE INTO clause: Information about a prepared statement can also be obtained by using the INTO clause of the PREPARE statement.

Allocating the SQLDA: Before the DESCRIBE or PREPARE INTO statement is executed, the value of SQLN must be set to a value greater than or equal to zero to indicate how many occurrences of SQLVAR are provided in the SQLDA. Also, enough storage must be allocated to contain the number of occurrences that SQLN specifies. To obtain the description of the columns of the result table of a prepared SELECT statement, the number of occurrences of SQLVAR must be at least equal to the number of columns. Furthermore, if USING BOTH is specified, or if the columns include LOBs or distinct types, the number of occurrences of SQLVAR should be two or three times the number of columns. See “Determining how many SQLVAR occurrences are needed” on page 2099 for more information.

First technique: Allocate an SQLDA with enough occurrences of SQLVAR to accommodate any select list that the application will have to process. At the extreme, the number of SQLVARs could equal three times the maximum number of columns allowed in a result table. After the SQLDA is allocated, the application can use the SQLDA repeatedly.

This technique uses a large amount of storage that is never deallocated, even when most of this storage is not used for a particular select list.

Second technique: Repeat the following two steps for every processed select list:

1. Execute a DESCRIBE statement with an SQLDA that has no occurrences of SQLVAR; that is, an SQLDA for which SQLN is zero.
2. Allocate a new SQLDA with enough occurrences of SQLVAR. Use the values that are returned in SQLD and SQLCODE to determine the number of SQLVAR entries that are needed. The value of SQLD is the number of columns in the result table, which is either the required number of occurrences of SQLVAR or a fraction of the required number (see “Determining how many SQLVAR occurrences are needed” on page 2099 for details). If the SQLCODE is +236, +237, +238, or +239, the number of SQLVAR

entries that is needed is two or three times the value in SQLD, depending on whether USING BOTH was specified. Set SQLN to reflect the number of SQLVAR entries that have been allocated.

3. Execute the DESCRIBE statement again, using the new SQLDA.

This technique allows better storage management than the first technique, but it doubles the number of DESCRIBE statements.

Third technique: Allocate an SQLDA that is large enough to handle most (hopefully, all) select lists but is also reasonably small. If an execution of DESCRIBE fails because SQLDA is too small, allocate a larger SQLDA and execute the DESCRIBE statement again.

For the new larger SQLDA, use the values that are returned in SQLD and SQLCODE from the failing DESCRIBE statement to calculate the number of occurrences of SQLVAR that are needed, as described in technique two. Remember to check for SQLCODEs +236, +237, +238, and +239, which indicate whether *extended* SQLVAR entries are needed because the data includes LOBs or distinct types.

This third technique is a compromise between the first two techniques. Its effectiveness depends on a good choice of size for the original SQLDA.

The SQLDA contents returned on DESCRIBE: After a DESCRIBE statement is executed, the following list describes the contents of the SQLDA fields as they are set by Db2 or ignored. These descriptions do not necessarily apply to the uses of an SQLDA in other SQL statements (EXECUTE, OPEN, FETCH). For more on the other uses, see “SQL descriptor area (SQLDA)” on page 2095.

SQLDAID

Db2 sets the first 6 bytes to 'SQLDA ' (5 letters followed by the space character) and the eighth byte to a space character. The seventh byte is set to indicate the number of SQLVAR entries that are needed to describe each column of the result table as follows:

space

The value of space occurs when:

- USING BOTH was not specified and the columns being described do not include LOBs or distinct types. Each column only needs one SQLVAR entry. If the SQL standard option is yes, Db2 sets SQLCODE to warning code +236. Otherwise, SQLCODE is zero.
- USING BOTH was specified and the columns being described do not include LOBs or distinct types. Each column needs two SQLVAR entries. Db2 sets SQLD to two times the number of columns of the result table. The second set of SQLVARs is used for the labels.

2

Each column needs two SQLVAR entries. Two entries per column are required when:

- USING BOTH was not specified and the columns being described include LOBs or distinct types or both. Db2 sets the second set of SQLVAR entries with information for the LOBs or distinct types being described.
- USING BOTH was specified and the columns include LOBs but not distinct types. Db2 sets the second set of SQLVAR entries with information for the LOBs and labels for the columns being described.

3

Each column needs three SQLVAR entries. Three entries are required only when USING BOTH is specified and the columns being described include distinct types. The presence of LOB data does not matter. It is the distinct types and not the LOBs that cause the need for three SQLVAR entries per column when labels are also requested. Db2 sets the second set of SQLVAR entries with information for the distinct types (and LOBs, if any) and the third set of SQLVAR entries with the labels of the columns being described.

A REXX SQLDA does not contain this field.

SQLDABC

The length of the SQLDA in bytes. Db2 sets the value to SQLN×44+16.

A REXX SQLDA does not contain this field.

SQLD
If the prepared statement is a query, Db2 sets the value to the number of columns in the object being described (the value is actually twice the number of columns in the case where USING BOTH was specified and the result table does not include LOBs or distinct types). Otherwise, if the statement is not a query, Db2 sets the value to 0.

SQLVAR
An array of field description information for the column being described. There are two types of SQLVAR entries—the base SQLVAR and the extended SQLVAR.

If the value of SQLD is 0, or is greater than the value of SQLN, no values are assigned to any occurrences of SQLVAR. If the value of SQLN was set so that there are enough SQLVAR occurrences to describe the specified columns (columns with LOBs or distinct types and a request for labels increase the number of SQLVAR entries that are needed), the values are assigned to the first *n* occurrences of SQLVAR so that the first occurrence of SQLVAR contains a description of the first column, the second occurrence of SQLVAR contains a description of the second column, and so on. This first set of SQLVAR entries are referred to as *base SQLVAR* entries. Each column always has a base SQLVAR entry.

If the DESCRIBE statement included the USING BOTH clause, or the columns being described include LOBs or distinct types, additional SQLVAR entries are needed. These additional SQLVAR entries are referred to as the *extended SQLVAR* entries. There can be up to two sets of extended SQLVAR entries for each column.

For REXX, the SQLVAR is a set of stem variables that begin with *stem.n*, instead of a structure. The REXX SQLDA uses only a base SQLVAR. The way in which Db2 assigns values to the SQLVAR variables is the same as for other languages. That is, the *stem.*1 variables describe the first column in the result table, the *stem.*2 variables describe the second column in the result table, and so on. If USING BOTH is specified, the *stem.n*+1 variables also describe the first column in the result table, the *stem.n*+2 variables also describe the second column in the result table, and so on.

The base SQLVAR:

SQLTYPE
A code that indicates the data type of the column and whether the column can contain null values. For the possible values of SQLTYPE, see “SQLTYPE and SQLLEN” on page 2106.

SQLLEN
A length value depending on the data type of the result columns. SQLLEN is 0 for LOB and XML data types. For the other possible values of SQLLEN, see “SQLTYPE and SQLLEN” on page 2106.

In a REXX SQLDA, for DECIMAL or NUMERIC columns, Db2 sets the SQLPRECISION and SQLSCALE fields instead of the SQLLEN field.

SQLDATA
The CCSID of a string column. For possible values, see “SQLDATA” on page 2109.

In a REXX SQLDA, Db2 sets the SQLCCSID field instead of the SQLDATA field.

SQLIND
Reserved.

SQLNAME
The unqualified name or label of the column, depending on the value of USING (NAMES, LABELS, ANY, or BOTH). The field is a string of length 0 if the column does not have a name or label. For more details on unnamed columns, see the discussion of the names of result columns under “select-clause” on page 933. This value is returned in the encoding scheme specified by the ENCODING bind option for the plan or package that contains the statement.

The extended SQLVAR:

SQLLONGLEN
The length attribute of a BLOB, CLOB, or DBCLOB column.

*****
Reserved.

SQLDATALEN
Not Used.

SQLDATATYPE-NAME
For a distinct type, the fully qualified distinct type name. Otherwise, the value is the fully qualified name of the built-in data type.

For a label, the label for the column.

This value is returned in the encoding scheme specified by the ENCODING bind option for the plan or package that contains this statement.

The REXX SQLDA does not use the extended SQLVAR.

Performance considerations: Although Db2 does not change the value of SQLN, you might want to reset this value after the DESCRIBE statement is executed. If the contents of SQLDA from the DESCRIBE statement is used in a later FETCH statement, set SQLN to *n* (where *n* is the number of columns of the result table) before executing the FETCH statement. For details, see Preparing the SQLDA for data retrieval.

Preparing the SQLDA for data retrievals: This note is relevant if you are applying DESCRIBE to a prepared query and you intend to use the SQLDA in the FETCH statements you employ to retrieve the result table rows. To prepare the SQLDA for that task, you must set the SQLDATA field of SQLVAR. SQLIND must be set if SQLTYPE is odd, and SQLNAME must be set when overriding the CCSID. For the meaning of those fields in that context, see "SQL descriptor area (SQLDA)" on page 2095.

Also, SQLN and SQLDABC should be reset (if necessary) to *n* and *n*×44+16, where *n* is the number of columns in the result table. Doing so can improve performance when the rows of the result table are fetched.

Support for extended dynamic SQL in a distributed environment: In a distributed environment where Db2 for z/OS is the server and the requester supports extended dynamic SQL, such as DB2 Server for VSE & VM, a DESCRIBE statement that is executed against an SQL statement in the extended dynamic package appears to Db2 as a DESCRIBE statement against a static SQL statement in the Db2 package. A DESCRIBE statement cannot normally be issued against a static SQL statement. However, a DESCRIBE against a static SQL statement that is generated by extended dynamic SQL executes without error if the package has been rebound after field DESCRIBE FOR STATIC on installation panel DSNTIP4 has been set to YES.

YES indicates that Db2 generates an SQLDA for the DESCRIBE at bind time so that DESCRIBE requests for static SQL statements can be satisfied at execution time. For more information, see *Db2 Installation Guide*.

Avoiding double preparation when using REOPT(ALWAYS) or REOPT(ONCE): If bind option REOPT(ALWAYS) or REOPT(ONCE) is in effect, DESCRIBE causes the statement to be prepared if it is not already prepared. If issued before an OPEN or an EXECUTE, the DESCRIBE causes the statement to be prepared without input variables. If the statement has input variables, the statement must be prepared again when it is opened or executed. When REOPT(ONCE) is in effect, the statement is always prepared twice even if there are no input variables. Therefore, to avoid preparing statements twice, issue the DESCRIBE after the OPEN. For non-cursor statements, open and fetch processing are performed on the EXECUTE. So, if a DESCRIBE must be issued, the statement will be prepared twice.

The use of a prepared statement for an EXPLAIN statement can cause duplicate entries in the explain tables when the prepared statement specifies the REOPT(ALWAYS) bind option and is executed using the jcc driver.

Errors occurring on DESCRIBE: In local and remote processing, the DEFER(PREPARE) and REOPT(ALWAYS)/REOPT(ONCE) bind options can cause some errors that are normally issued during PREPARE processing to be issued on DESCRIBE.

Considerations for implicitly hidden columns: A DESCRIBED OUTPUT statement only returns information about implicitly hidden columns if the column (of a base table that is defined as implicitly hidden) is explicitly specified as part of the SELECT list of the final result table of the query described. If implicitly

hidden columns are not part of the result table of a query, a DESCRIBE OUTPUT statement that returns information about that query will not contain information about any implicitly hidden columns.

Using host variables: If the DESCRIBE statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Considerations for array elements: CCSID UNICODE is returned for a result column that corresponds to a reference to an array element with a datetime data type.

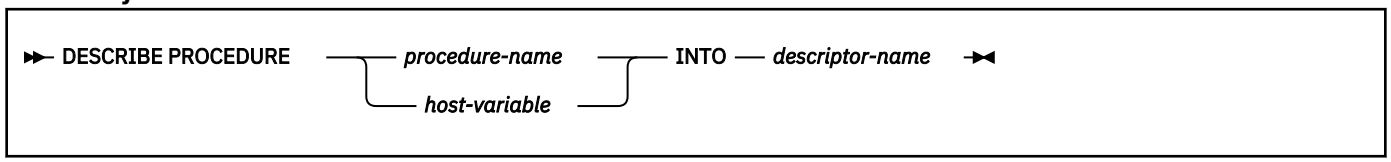
Example

In a PL/I program, execute a DESCRIBE statement with an SQLDA that has no occurrences of SQLVAR. If SQLD is greater than zero, use the value to allocate an SQLDA with the necessary number of occurrences of SQLVAR and then execute a DESCRIBE statement using that SQLDA. This is the second technique described in Allocating the SQLDA.

```
EXEC SQL  BEGIN DECLARE SECTION;
  DCL  STMT1_STR   CHAR(200)  VARYING;
EXEC SQL  END DECLARE SECTION;
EXEC SQL  INCLUDE SQLDA;
EXEC SQL  DECLARE DYN_CURSOR CURSOR FOR STMT1_NAME;
… /* code to prompt user for a query, then to generate */
    /* a select-statement in the STMT1_STR            */
EXEC SQL  PREPARE STMT1_NAME FROM :STMT1_STR;
… /* code to set SQLN to zero and to allocate the SQLDA */
EXEC SQL  DESCRIBE STMT1_NAME INTO :SQLDA;
… /* code to check that SQLD is greater than zero, to set */
    /* SQLN to SQLD, then to re-allocate the SQLDA          */
EXEC SQL  DESCRIBE STMT1_NAME INTO :SQLDA;
… /* code to prepare for the use of the SQLDA             */
EXEC SQL  OPEN DYN_CURSOR;
… /* loop to fetch rows from result table                 */
EXEC SQL  FETCH DYN_CURSOR USING DESCRIPTOR :SQLDA;
.
.
.
```

DESCRIBE PROCEDURE

The DESCRIBE PROCEDURE statement gets information about the result sets returned by a stored procedure. The information, such as the number of result sets, is put into a descriptor.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

Description

procedure-name* or *host-variable

Identifies the stored procedure that returned one or more result sets. When the DESCRIBE PROCEDURE statement is executed, the procedure name must identify a stored procedure that the

requester has already invoked using the SQL CALL statement. The procedure name can be specified as a one, two, or three-part name. The procedure name in the DESCRIBE PROCEDURE statement must be specified the same way that it was specified on the CALL statement. For example, if a two-part procedure name was specified on the CALL statement, you must specify a two-part procedure name in the DESCRIBE PROCEDURE statement.

If a host variable is used:

- It must be a character string variable with a length attribute that is not greater than 254.
- It must not be followed by an indicator variable.
- The value of the host variable is a specification that depends on the database server. Regardless of the server, the specification must:
  - Be left justified within the host variable
  - Not contain embedded blanks
  - Be padded on the right with blanks if its length is less than that of the host variable

Exception: The syntax described above applies to all languages except REXX. For REXX, the syntax is DESCRIBE PROCEDURE *:hostvar*.

INTO *descriptor-name*

Identifies an SQL descriptor area (SQLDA). The information returned in the SQLDA describes the result sets returned by the stored procedure.

Considerations for allocating and initializing the SQLDA are similar to those for DESCRIBE TABLE.

The contents of the SQLDA after executing a DESCRIBE PROCEDURE statement are:

- The first 5 bytes of the SQLDAID field are set to 'SQLPR'.

  A REXX SQLDA does not contain SQLDAID.
- Bytes 6 to 8 of the SQLDAID field are reserved.
- The SQLD field is set to the total number of result sets. A value of 0 in the field indicates there are no result sets.
- There is one SQLVAR entry for each result set.
- The SQLDATA field of each SQLVAR entry is set to the result set locator value associated with the result set.

  For a REXX SQLDA, SQLLOCATOR is set to the result set locator value.
- The SQLIND field of each SQLVAR entry is set to the estimated number of rows in the result set

  For a REXX SQLDA, the SQLIND field is not used for DESCRIBE.
- The SQLNAME field is set to the name of the cursor used by the stored procedure to return the result set. This value is returned in the encoding scheme specified by the ENCODING bind option for the plan or package that contains this statement.

Notes

SQLDA information: A value of -1 in the SQLIND field indicates that an estimated number of rows in the result set is not provided. Db2 for z/OS always sets SQLIND to -1. For a REXX SQLDA, the SQLIND field is not used for DESCRIBE.

DESCRIBE PROCEDURE does not return information about the parameters expected by the stored procedure.

Assignment of locator values: Locator values are assigned to the SQLVAR entries in the SQLDA in the order that the associated cursors are opened at run time. Locator values are not provided for cursors that are closed when control is returned to the invoking application. If a cursor was closed and later re-opened before returning to the invoking application, the most recently executed OPEN CURSOR statement for the cursor is used to determine the order in which the locator values are returned for the procedure result sets. For example, assume procedure P1 opens three cursors A, B, C, closes cursor B and then issues

another OPEN CURSOR statement for cursor B before returning to the invoking application. The locator values are assigned in the order A, C, B.

Alternatively, an ASSOCIATE LOCATORS statement can be used to copy the locator values to result set locator variables.

Using host variables: If the DESCRIBE PROCEDURE statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Examples

The statements in the following examples are assumed to be in PL/I programs.

Example 1: Place information about the result sets returned by stored procedure P1 into the descriptor named by SQLDA1. Assume that the stored procedure is called with a one-part name from current server SITE2.

```
EXEC SQL CONNECT TO SITE2;
EXEC SQL CALL P1;
EXEC SQL DESCRIBE PROCEDURE P1 INTO :SQLDA1;
```

Example 2: Repeat the scenario in Example 1, but use a two-part name to specify an explicit schema name for the stored procedure to ensure that stored procedure P1 in schema MYSCHEMA is used.

```
EXEC SQL CONNECT TO SITE2;
EXEC SQL CALL MYSCHEMA.P1;
EXEC SQL DESCRIBE PROCEDURE MYSCHEMA.P1 INTO :SQLDA1;
```

Example 3: Place information about the result sets returned by the stored procedure identified by host variable HV1 into the descriptor named by SQLDA2. Assume that host variable HV1 contains the value SITE2.MYSCHEMA.P1 and the stored procedure is called with a three-part name.

```
EXEC SQL CALL SITE2.MYSCHEMA.P1;
EXEC SQL DESCRIBE PROCEDURE :HV1 INTO :SQLDA2;
```

The preceding example would be invalid if host variable HV1 had contained the value MYSCHEMA.P1, a two-part name. For the example to be valid with that two-part name in host variable HV1, the current server must be the same as the location name that is specified on the CALL statement as the following statements demonstrate. This is the only condition under which the names do not have to be specified the same way and a three-part name on the CALL statement can be used with a two-part name on the DESCRIBE PROCEDURES statement.

```
EXEC SQL CONNECT TO SITE2;
EXEC SQL CALL SITE2.MYSCHEMA.P1;
EXEC SQL ASSOCIATE LOCATORS (:LOC1, :LOC2)
         WITH PROCEDURE :HV1;
```

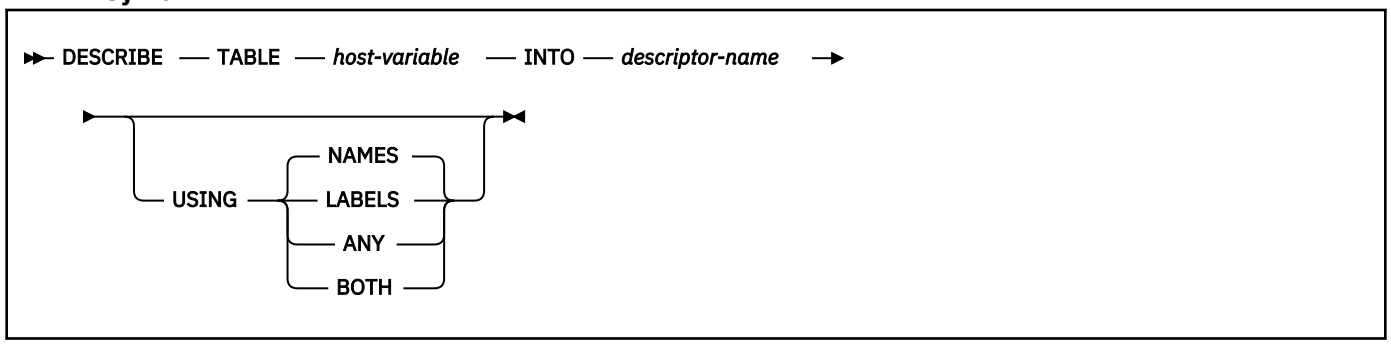
DESCRIBE TABLE

The DESCRIBE TABLE statement obtains information about a designated table or view.

Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization



The privileges that are held by the authorization ID that owns the plan or package must include at least one of the following (if there is a plan, authorization checking is done only against the plan owner):

- Ownership of the table or view
- The SELECT, INSERT, UPDATE, DELETE, or REFERENCES privilege on the object
- The ALTER or INDEX privilege on the object (tables only)
- DBADM authority over the database that contains the object (tables only)
- SYSADM authority
- SYSCTRL authority (catalog tables only)
- ACCESSCTRL authority (catalog tables only)
- System DBADM
- DATAACCESS authority
- EXPLAIN authority
- SQLADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

For an RRSAF application that does not have a plan and in which the requester and the server are Db2 for z/OS systems, authorization to execute the package is performed against the primary or secondary authorization ID of the process.

Syntax

Description

TABLE *host-variable*

Identifies the table or view. The name must not identify an auxiliary table. When the DESCRIBE statement is executed, the host variable must contain a name which identifies a table or view that exists at the current server. This variable must be a fixed-length or varying-length character string with a length attribute less than 256. The name must be followed by one or more blanks if the length of the name is less than the length of the variable. It cannot contain a period as the first character and it cannot contain embedded blanks. In addition, the quotation mark is the escape character regardless of the value of the string delimiter option. An indicator variable must not be specified for the host variable.

INTO *descriptor-name*

Identifies an SQL descriptor area (SQLDA), which is described in "SQL descriptor area (SQLDA)" on page 2095. See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

For languages other than REXX: Before the DESCRIBE statement is executed, the user must set the following variable in the SQLDA and the SQLDA must be allocated.

SQLN

Indicates the number of SQLVAR occurrences provided in the SQLDA. Db2 does not change this value. For techniques to determine the number of required occurrences, see Allocating the SQLDA.

For REXX: The SQLDA is not allocated before it is used. An SQLDA consists of a set of stem variables. There is one occurrence of variable *stem.*SQLD, followed by zero or more occurrences of a set of variables that is equivalent to an SQLVAR structure. Those variables begin with *stem.n*.

After the DESCRIBE statement is executed, all the fields in the SQLDA except SQLN are either set by Db2 or ignored. For information on the contents of the fields, see The SQLDA contents returned after DESCRIBE.

USING
Indicates what value to assign to each SQLNAME variable in the SQLDA. If the requested value does not exist, SQLNAME is set to a length of 0.

NAMES
Assigns the name of the column. This is the default.

LABELS
Assigns the label of the column. (Column labels are defined by the LABEL statement.)

ANY
Assigns the column label, and if the column has no label, the column name.

BOTH
Assigns both the label and name of the column. In this case, two or three occurrences of SQLVAR per column, depending on whether the result set contains distinct types, are needed to accommodate the additional information. To specify this expansion of the SQLVAR array, set SQLN to 2x*n* or 3x*n*, where *n* is the number of columns in the object being described. For each of the columns, the first *n* occurrences of SQLVAR, which are the base SQLVAR entries, contain the column names. Either the second or third *n* occurrences of SQLVAR, which are the extended SQLVAR entries, contain the column labels. If there are no distinct types, the labels are returned in the second set of SQLVAR entries. Otherwise, the labels are returned in the third set of SQLVAR entries.

For a declared temporary table, the name of the column is assigned regardless of the value specified in the USING clause because declared temporary tables cannot have labels.

Notes

See "DESCRIBE OUTPUT" on page 1693 for information about the following topics:

- Allocating the SQLDA
- The SQLDA contents that are returned on DESCRIBE
- Performance considerations for DESCRIBE
- Using host variables in DESCRIBE statements

Considerations for implicitly hidden columns: A DESCRIBE TABLE statement does return information about implicitly hidden columns in tables.

DROP

The DROP statement removes an object at the current server. Except for storage groups, any objects that are directly or indirectly dependent on that object are also removed. Whenever an object is dropped, its description is deleted from the catalog at the current server, and any packages that refer to the object are invalidated.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

To drop the following objects, the privilege set must include at least one of the listed authorities or privileges:

Table, table space, or index:

- Ownership of the object (for an index, the owner is the owner of the table or index)
- DBADM authority
- SYSADM or SYSCTRL authority
- System DBADM

If the table space is in a database that is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Database:

- The DROP privilege on the database
- DBADM or DBCTRL authority for the database
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the privileges must be on the implicit database or on DSNDB04.

Storage group:

- Ownership of the object
- SYSADM or SYSCTRL authority

View:

- Ownership of the object
- SYSADM or SYSCTRL authority
- System DBADM

Alias for a table or view:

- Ownership of the object
- SYSADM or SYSCTRL authority
- System DBADM

Alias for a sequence:

- Ownership of the object
- The DROPIN privilege on the schema
- SYSADM or SYSCTRL authority
- System DBADM

Package:

- Ownership of the package
- The BINDAGENT privilege granted from the package owner
- PACKADM authority for the collection or for all collections
- SYSADM or SYSCTRL authority

Synonym:
Ownership of the synonym

Role or trusted context:

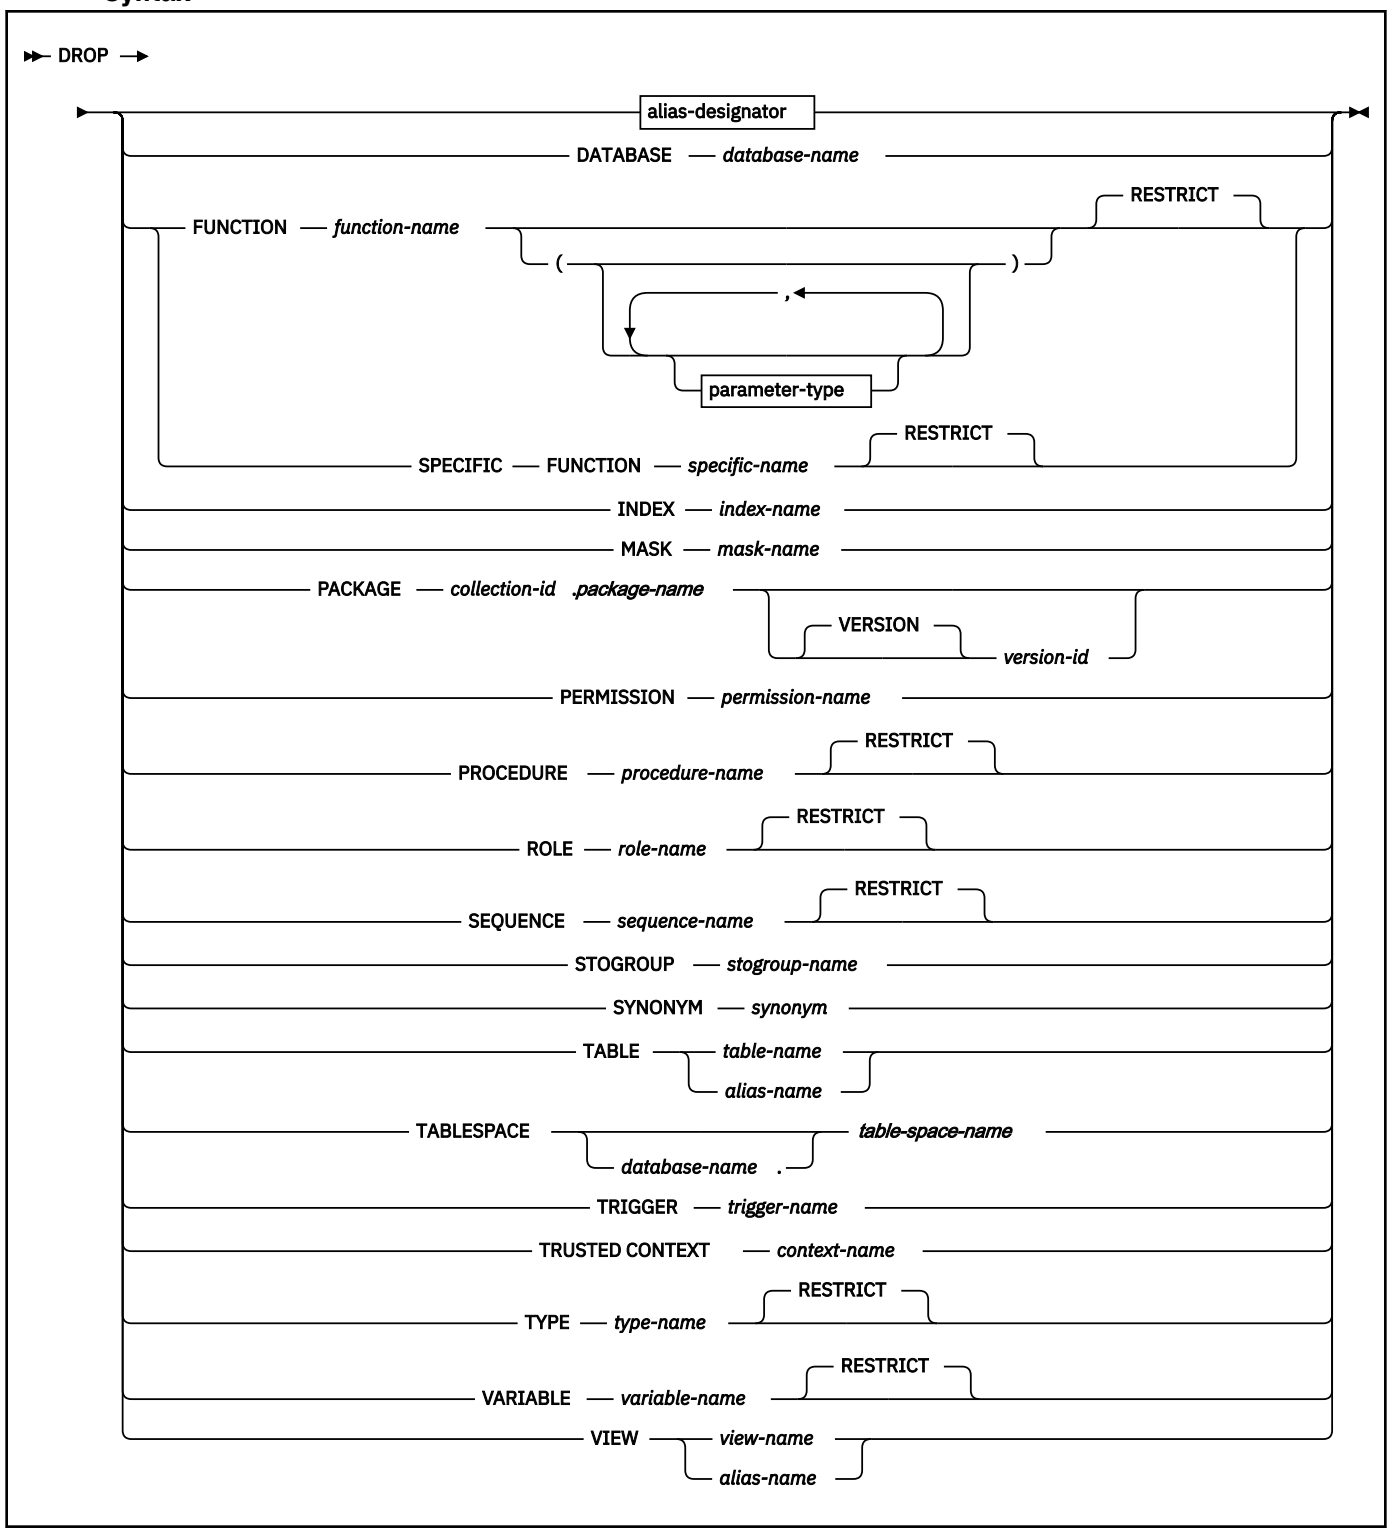
- Ownership of the object
- SYSADM or SYSCTRL authority

- SECADM

If the installation parameter SEPARATE SECURITY is NO, SYSADM authority has implicit SECADM and SYSCTRL authority and can drop a role or trusted context.

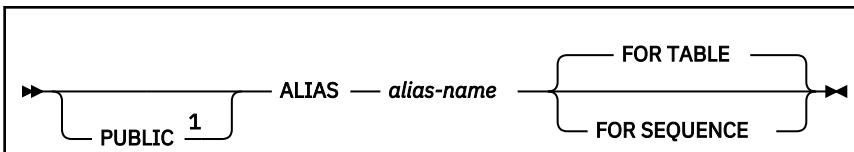
Row permission or column mask:
At least SECADM authority

User-defined type, global variable, sequence, stored procedure, trigger, or user-defined function:



- Ownership of the object [37]
- The DROPIN privilege on the schema
- SYSADM or SYSCTRL authority
- System DBADM

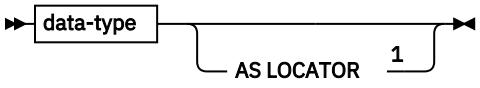
The authorization ID that matches the schema name implicitly has the DROPIN privilege on the schema.



Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is the union of the privilege sets that are held by each authorization ID of the process. If running in a trusted context with a role, the privilege set also includes those privileges that are held by the role that is associated with the primary authorization ID. However, the implicit schema match does not apply to the role when determining if DROPIN schema privilege is held.

[37] Not applicable for stored procedures defined in releases of Db2 for z/OS prior to Version 6.

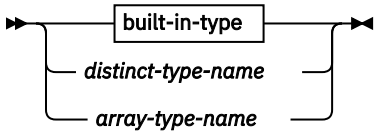
Syntax



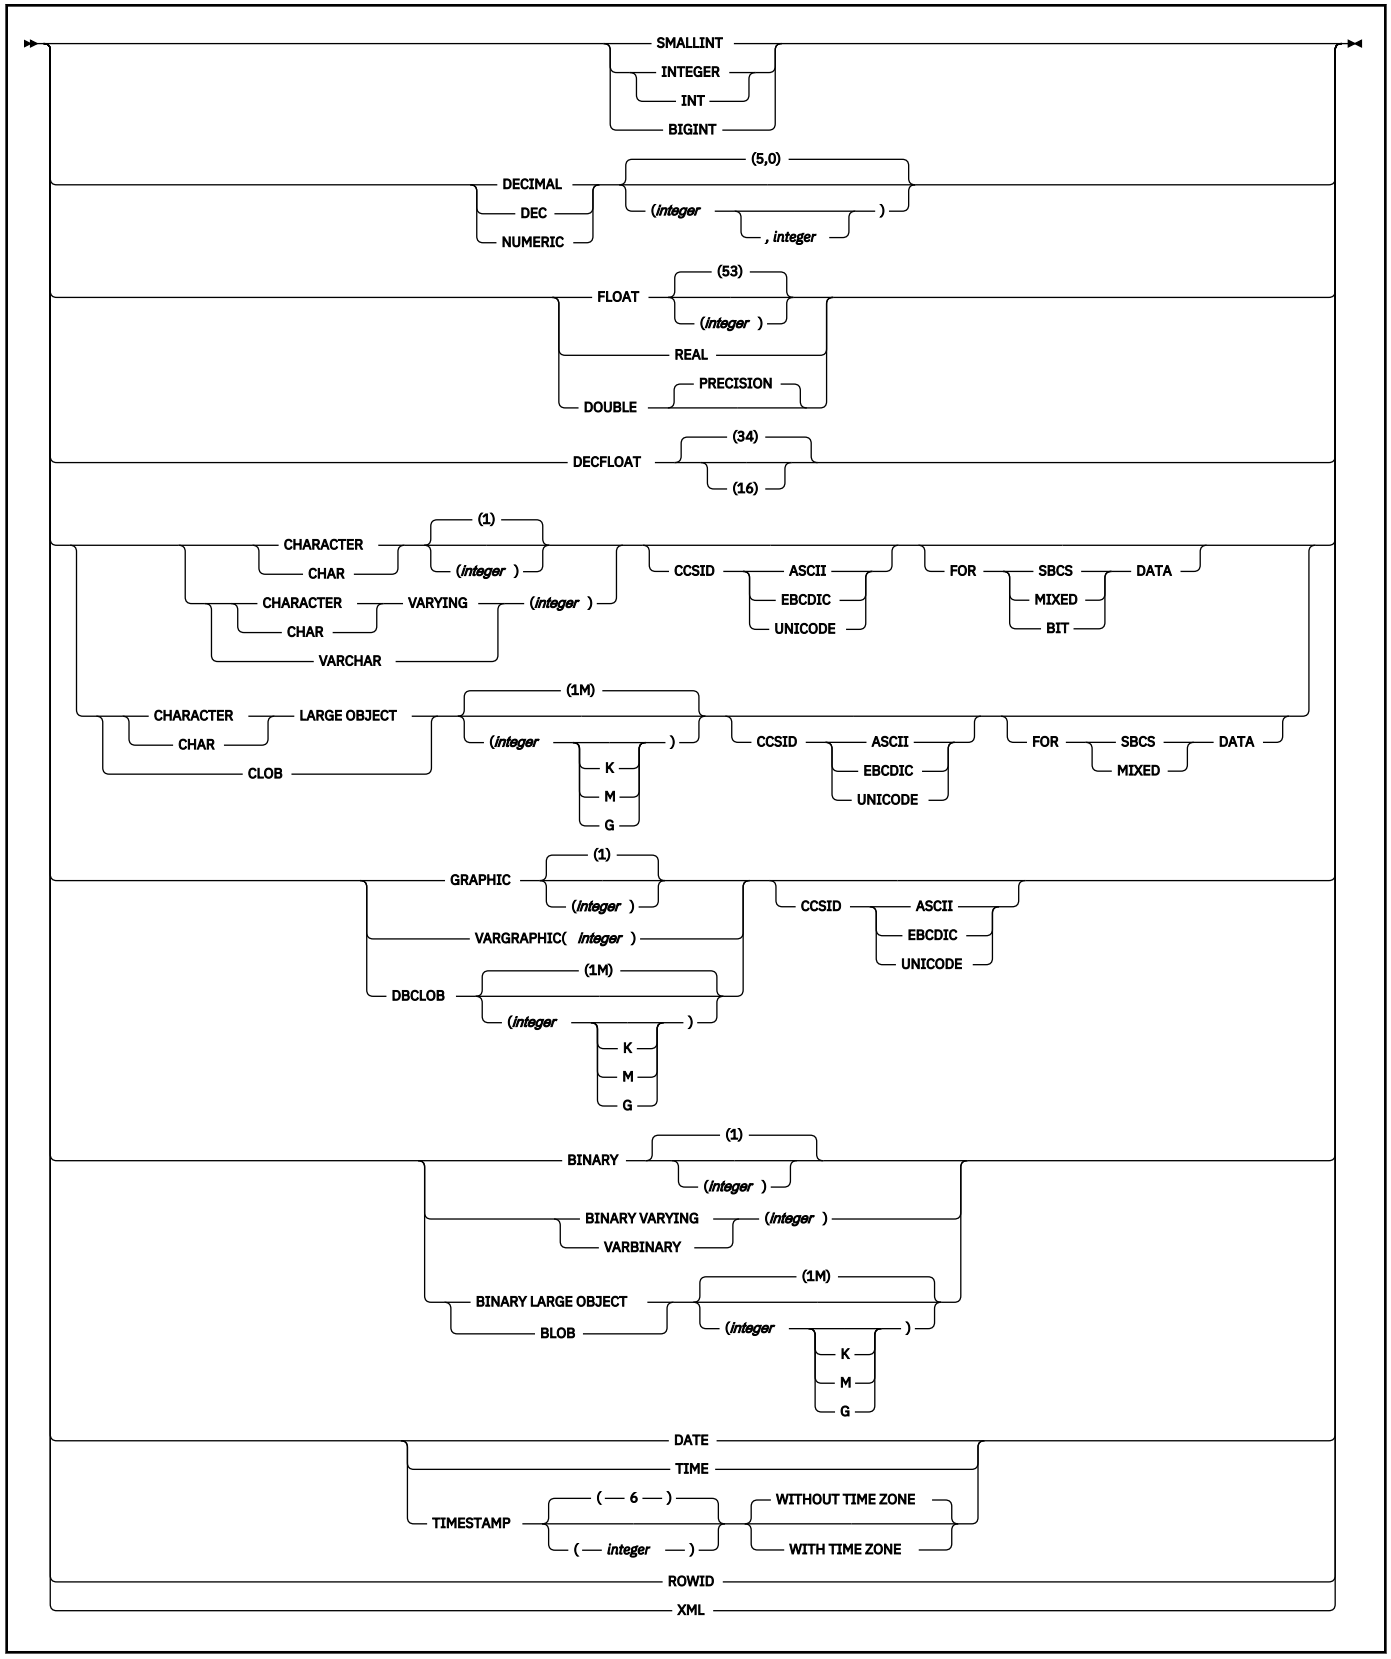
alias-designator:

Notes:

[1] If PUBLIC is specified, FOR SEQUENCE must also be specified.



parameter type:



Notes:

[1] AS LOCATOR can be specified only for a LOB data type or a distinct type based on a LOB data type.

data type:

built-in-type:

Description

alias-designator

PUBLIC
Specifies that the alias to be dropped is a public alias. The *alias-name* must identify an alias that exists in the SYSPUBLIC schema.

If the PUBLIC keyword is specified, *alias-name* must identify a public alias that exists at the current server.

ALIAS *alias-name*
Identifies the alias to be dropped. The *alias-name* must identify an alias that exists at the current server.

Dropping an alias for a table or view has no effect on any view, materialized query table, or synonym that was defined using the alias. If the alias is referenced in the definition of a row permission or a column mask, it cannot be dropped.

Dropping an alias for a sequence has no effect on any view or materialized query table that was defined using the alias. If the alias is referenced in the definition of an inline SQL function, it cannot be dropped. When an alias for a sequence is dropped, all packages that refer to the sequence alias are invalidated.

If the alias is referenced in the definition of a row permission or a column mask, the alias cannot be dropped.

FOR TABLE
Specifies that the alias to be dropped is for a table or view. Dropping an alias for a table has no effect on any view, materialized query table, or synonym that was defined using the alias.

FOR SEQUENCE
Specifies that the alias to be dropped is for a sequence. Dropping an alias for a sequence has no effect on any view, or materialized query table that was defined using the alias.

DATABASE *database-name*
Identifies the database to drop. The name must identify a database that exists at the current server. DSNDB04 or DSNDB06 must not be specified. The privilege set must include SYSADM authority.

Whenever a database is dropped, all of its table spaces, tables, index spaces, and indexes are also dropped. Any pending changes to the definitions of the table spaces and indexes in the database are also dropped.

You can drop a database that contains a history table only if the database also contains the associated system-period temporal table. You can drop a database that contains a system-period temporal table when the associated history table is in another database. In this case, the action cascades to drop the history table in the other database.

You can drop a database that contains an archive table only if the database also contains the associated archive-enabled table. You can drop a database that contains an archive-enabled table when the associated archive table is contained in another database. In this case, the action cascades to drop the archive table in the other database.

The database cannot be dropped if it is associated with an accelerator-only table.

FUNCTION or SPECIFIC FUNCTION
Identifies the function to drop. The function must exist at the current server, and it must have been defined with the CREATE FUNCTION statement. The particular function can be identified by its name, function signature, or specific name. The specified function definition is dropped from the schema.

Functions that are implicitly generated by the CREATE TYPE statement cannot be dropped using the DROP statement. They are implicitly dropped when the distinct type is dropped.

As indicated by the default keyword RESTRICT, the function is not dropped if any of the following dependencies exist:

- Another function is sourced on the function.
- A view uses the function.
- A trigger package uses the function.

- The definition of a materialized query table uses the function.
- The definition of a row permission or a column mask uses the function.

When a function is dropped, all privileges on the function are also dropped. Any packages that are dependent on the function dropped are made inoperative. If the function is a compiled SQL scalar function, the package associated with the function is also dropped.

All versions of a compiled SQL scalar function are dropped. To drop a specific version of a compiled SQL scalar function, use an "ALTER FUNCTION (compiled SQL scalar)" on page 1031 statement with the DROP VERSION clause.

FUNCTION *function-name*
Identifies the function by its name. The *function-name* must identify exactly one function. The function can have any number of parameters defined for it. If there is more than one function of the specified name in the specified or implicit schema, an error is returned.

FUNCTION *function-name (parameter-type,...)*
Identifies the function by its function signature, which uniquely identifies the function. The *function-name (parameter-type, ...)* must identify a function with the specified function signature. The specified parameters must match the data types in the corresponding position that were specified when the function was created. The number of data types, and the logical concatenation of the data types is used to identify the specific function instance which is to be dropped. Synonyms for data types are considered a match.

If the function was defined with a table parameter (the LIKE TABLE *name* AS LOCATOR clause was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to uniquely identify the function. Instead, use one of the other syntax variations to identify the function with its function name, if unique, or its specific name.

If *function-name ()* is specified, the function identified must have zero parameters.

function-name
Identifies the name of the function.

(parameter-type,...)
Identifies the parameters of the function.

If an unqualified distinct type name is specified, Db2 searches the SQL path to resolve the schema name for the distinct type.

For data types that have a length, precision, or scale attribute, use one of the following:

- Empty parentheses indicate that the database manager ignores the attribute when determining whether the data types match. For example, DEC() will be considered a match for a parameter of a function defined with a data type of DEC(7,2). Similarly DECFLOAT() will be considered a match for DECFLOAT(16) or DECFLOAT(34). However, FLOAT cannot be specified with empty parenthesis because its parameter value indicates a specific data type (REAL or DOUBLE).
- If a specific value for a length, precision, or scale attribute is specified, the value must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement. If the data type is FLOAT, the precision does not have to exactly match the value that was specified because matching is based on the data type (REAL or DOUBLE).
- If length, precision, or scale is not explicitly specified, and empty parentheses are not specified, the default attributes of the data type are implied. The implicit length must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement.

For data types with a subtype or encoding scheme attribute, specifying the FOR *subtype* DATA clause or the CCSID clause is optional. Omission of either clause indicates that Db2 ignores the attribute when determining whether the data types match. If you specify either clause, it must match the value that was implicitly or explicitly specified in the CREATE FUNCTION statement.

AS LOCATOR
Specifies that the function is defined to receive a locator for this parameter. If AS LOCATOR is specified, the data type must be a LOB or a distinct type based on a LOB.

SPECIFIC FUNCTION ***specific-name***
Identifies the function by its specific name. The *specific-name* must identify a specific function that exists at the current server.

INDEX ***index-name***
Identifies the index to drop. The name must identify a user-defined index that exists at the current server but must not identify a populated index on an auxiliary table or an index that was implicitly created for a table that contains an XML column. (For details on dropping user-defined indexes on catalog tables, see "SQL statements allowed on the catalog" on page 2469.) A populated index on an auxiliary table can only be dropped by dropping the base table. The name must not identify an auxiliary table for an object that is involved in a clone relationship.

If the index that is dropped was created by specifying the ENDING AT clause to define partition boundaries, the table is converted to use table-controlled partitioning. The high limit key for the last partition is set to the highest possible value for ascending key columns or the lowest possible value for descending key columns.

Whenever an index is directly or indirectly dropped, its index space is also dropped. The name of a dropped index space cannot be reused until a commit operation is performed. Any pending changes to the definitions of the index is also dropped.

If the index is a unique index used to enforce a unique constraint (primary or unique key), the unique constraint must be dropped before the index can be dropped. In addition, if a unique constraint supports a referential constraint, the index cannot be dropped unless the referential constraint is dropped.

However, a unique index (for a unique key only) can be dropped without first dropping the unique key constraint if the unique key was created in a release of Db2 before Version 7 and if the unique key constraint has no associated referential constraints. For information about dropping constraints, see "ALTER TABLE" on page 1140.

If the table space is explicitly created and a unique index is dropped and that index was defined on a ROWID column that is defined as GENERATED BY DEFAULT, the table can still be used, but rows cannot be inserted into that table.

If the table space is implicitly created, the index cannot be dropped if it is defined on a ROWID column that is defined as GENERATED BY DEFAULT.

If an empty index on an auxiliary table is dropped, the base table is marked incomplete. If the base table space is implicitly created, the index on an auxiliary table cannot be dropped.

Drop index will result in the deletion of rows in the SYSCOLDIST and SYSCOLDISTATS catalog tables if no other indexes on the table have the same column group in their key sequence prefix.

MASK ***mask-name***
Identifies the column mask to drop. The name must identify a column mask that exists at the current server.

PACKAGE ***collection-id.package-name***
Identifies the package version to drop. The name plus the implicitly or explicitly specified *version-id* must identify a package version that exists at the current server. Omission of the *version-id* is an implicit specification of the null version.

The name must not identify a trigger package or a package that is associated with an SQL routine. A trigger package can only be dropped by dropping the associated trigger or subject table. A package that is associated with a native SQL procedure can only be dropped with an ALTER PROCEDURE statement with a DROP VERSION clause that specifies the particular version that is to be dropped, or with a DROP PROCEDURE statement if it is the only version that is defined for the procedure.

Specify this clause to drop a package that is created as the result of a BIND COPY command used to deploy a version of a native SQL procedure.

If a package has current, previous, and original copies, the DROP statement will drop all copies.

VERSION ***version-id***
version-id is the version identifier that was assigned to the package's DBRM when the DBRM was created. If *version-id* is not specified, a null version is used as the version identifier.

Delimit the version identifier when it:

- Is generated by the VERSION(AUTO) precompiler option
- Begins with a digit
- Contains lowercase or mixed-case letters

For more on version identifiers, see the information on preparing an application program for execution in *Db2 Application Programming and SQL Guide*.

PERMISSION ***permission-name***
Identifies the row permission to drop. The name must identify a row permission that exists at the current server. The name must not identify the default row permission that was created implicitly by Db2.

PROCEDURE ***procedure-name***
Identifies the stored procedure to drop. The name must identify a stored procedure that was defined with the CREATE PROCEDURE statement at the current server. The specified procedure definition is dropped from the schema. All privileges on the procedure are also dropped, and any packages that are dependent on the procedure are marked invalid. If the procedure is an SQL procedure, the package that is associated with the procedure is also dropped.

As indicated by the default keyword RESTRICT, the procedure is not dropped if any of the following dependencies exist:

- A trigger definition contains a CALL statement that identifies the procedure.
- An SQL routine definition contains a CALL statement that identifies the procedure.

All versions of a native SQL procedure are dropped. To drop a specific version of a native SQL procedure, use an "ALTER PROCEDURE (SQL - native)" on page 1106 statement with the DROP VERSION clause.

Use a DROP PACKAGE statement to drop a package for a version of a native SQL procedure that is created using the BIND COPY command.

ROLE ***role-name***
Identifies the role to drop. *role-name* must identify a role that exists at the current server.

When a role is dropped, all privileges and authorities that have been previously granted to that role are revoked. If the role that is dropped is the owner of statements in the dynamic statement cache, the cached statements are invalidated.

The role is not dropped if any REVOKE restrictions are encountered. REVOKE restrictions include the following:

- Restrictions that are encountered when dependent privileges are included when the privileges of a role are revoked.
- The role is the grantor of any privilege or authority that used ACCESSCTRL or SECADM authority to perform the grant.

If RESTRICT is specified, the role is not dropped is any of the following dependencies exist:

- The role is associated with any trusted context or any user in a trusted context.
- The role is associated with a currently running thread.
- The role is the owner of any of the following objects:

Alias	Row permission
Array type	Sequence
Column mask	Storage group
Database	Stored procedure
Distinct type	Table
Global variable	Table space
Index	Trigger
JAR file	Trusted context
Materialized query table	User-defined function
Package	View
Role	

SEQUENCE *sequence-name*
Identifies the sequence to drop. The name must identify an existing sequence at the current server.

sequence-name must not be the name of an internal sequence object that is used by Db2 (including an implicitly generated sequence for a DB2_GENERATED_DOCID_FOR_XML column). Sequences that are generated by the system for identity columns or implicitly created databases cannot be dropped by using the DROP SEQUENCE statement. A sequence object for an identity column is implicitly dropped when the table that contains the identify column is dropped.

The default keyword RESTRICT indicates that the sequence is not dropped if any of the following dependencies exist:

- A trigger that uses the sequence in a NEXT VALUE or PREVIOUS VALUE expression exists.
- An inline SQL function that uses the sequences in a NEXT VALUE or PREVIOUS VALUE expression exists.

Whenever a sequence is dropped, all privileges on the sequence are also dropped, and the packages that refer to the sequence are invalidated. Dropping a sequence, even if the drop process is rolled back, results in the loss of the still-unassigned cache values for the sequence.

STOGROUP *stogroup-name*
Identifies the storage group to drop. The name must identify a storage group that exists at the current server but not a storage group that is used by any table space or index space.

For information on the effect of dropping the default storage group of a database, see Dropping a default storage group.

SYNONYM *synonym*
Identifies the synonym to drop. In a static DROP SYNONYM statement, the name must identify a synonym that is owned by the owner of the plan or package. In a dynamic DROP SYNONYM statement, the name must identify a synonym that is owned by the SQL authorization ID. Thus, using interactive SQL, a user with SYSADM authority can drop any synonym by first setting CURRENT SQLID to the owner of the synonym.

Dropping a synonym has no effect on any view, materialized query table, or alias that was defined using the synonym, nor does it invalidate any packages that use such views, materialized query tables, or aliases.

If the synonym is referenced in the definition of a row permission or a column mask, it cannot be dropped.

TABLE *table-name* or *alias-name*
Identifies the table to drop. The name must identify a table that exists at the current server. It must not identify any of the following types of tables:

- A catalog table
- A directory table
- A table in a partitioned table space

- A table that is implicitly created for an XML column
- A populated auxiliary table

A table in a partitioned table space can be dropped only by dropping the table space. A populated auxiliary table or a table that is implicitly created for an XML column can be dropped only by dropping the associated base table.

If *alias-name* is specified, the actual table is dropped as if *table-name* were specified. However, the alias is not dropped. It can be dropped by using the DROP ALIAS statement.

When a table is directly or indirectly dropped, the following items are also dropped:

- All privileges on the table
- All referential constraints in which the table is a parent or dependent
- All synonyms, views, and indexes that are defined on the table
- All row permissions (including the default row permission)
- All column masks that are created for the table

If the table space for the table was implicitly created, it is also dropped. However, if the containing database was implicitly created, it is not dropped. Any pending changes to the definitions of the dropped table space and indexes are also dropped.

For more information, see Dropping an implicitly created database.

When a table is directly or indirectly dropped, all materialized query tables that are defined on the table are also dropped. When a materialized query table is directly or indirectly dropped, the following items are also dropped:

- All privileges on the materialized query table
- All synonyms, views, and indexes that are defined on the materialized query table

Any alias that is defined on the materialized query table is not dropped. Any packages that are dependent on the dropped materialized query table are marked invalid.

You cannot use DROP TABLE to drop a clone table. You must use the ALTER TABLE statement with the DROP CLONE clause to drop a clone table. If a base table that is involved in a clone relationship is dropped, the associated clone table is also dropped. You cannot drop an auxiliary table for an object that is involved in a clone relationship.

The table cannot be dropped if it is defined as a history table for a system-period temporal table.

The table cannot be dropped if it is referenced in the definition of a row permission or a column mask.

To drop a system-period temporal table, the privilege set must also contain the authorization that is required to drop the history table. The history table is dropped when a system-period temporal table is dropped.

If a table with LOB columns is dropped, the auxiliary tables that are associated with the table and the indexes on the auxiliary tables are also dropped. Any LOB table spaces that were implicitly created for the auxiliary tables are also dropped.

If a table with XML columns is dropped, all implicitly created objects for all XML columns are also dropped.

If an empty auxiliary table is dropped, the definition of the base table is marked incomplete. If the base table space is implicitly created, the auxiliary table cannot be dropped.

If the table has a security label column, the primary authorization ID of the DROP statement must have a valid security label, and the RACF SECLABEL class must be active.

If a table that uses hash organization is dropped, all catalog entries for the hash organization are cleaned up.

If an archive-enabled table is dropped, the archive table and any indexes that are defined on the archive table are also dropped. To drop an archive-enabled table, the privilege set must also contain

the authorization that is required to drop the archive table. An archive table cannot be explicitly dropped by using the DROP statement.

TABLESPACE ***database-name.table-space-name***
Identifies the table space to drop. The name must identify a table space that exists at the current server. The database name must not be DSNDB01 or DSNDB06. Omission of the database name is an implicit specification of DSNDB04. *table-space-name* must not identify a table space that is implicitly created for an XML column.

Whenever a table space is directly or indirectly dropped, all the tables in the table space are also dropped. The name of a dropped table space cannot be reused until a commit operation is performed. Any pending changes to the definitions of the table space and its indexes are also dropped.

A LOB table space can be dropped only if it does not contain an auxiliary table. If the LOB table space is implicitly created, it cannot be dropped.

Whenever a base table space that contains tables with LOB columns is dropped, all the auxiliary tables and indexes on those auxiliary tables that are associated with the base table space are also dropped.

Whenever a base table space that contains tables with XML columns is dropped, all implicitly created objects for all XML columns are also dropped.

The table space cannot be dropped if it contains a history table, an archive table, or is associated with an accelerator-only table.

TRIGGER ***trigger-name***
Identifies the trigger to drop. The name must identify a trigger that exists at the current server.

Whenever a trigger is directly or indirectly dropped, all privileges on the trigger are also dropped and the associated trigger package is freed. The name of that trigger package is the same as the trigger name and the collection ID is the schema name.

When an INSTEAD OF trigger is dropped, the associated privilege is revoked from anyone that possesses the privilege as a result of an implicit grant that occurred when the trigger is created.

Dropping triggers causes certain packages to be marked invalid. For example, if *trigger-name* specifies an INSTEAD OF trigger on a view V, another trigger might depend on *trigger-name* through an update to the view V, and that trigger package is invalidated.

If a trigger has current, previous, and original copies, the DROP statement will drop all copies.

TRUSTED CONTEXT ***context-name***
Identifies the trusted context to drop. The *context-name* must identify a trusted context that exists at the current server. When a trusted context is dropped, all associations to attributes (IP addresses, job names) and associations to users of the trusted context are dropped. If the trusted context is dropped while trusted connections for the context are active, the connections remain active until they terminate or the next attempt at reuse is made.

TYPE ***type-name***
Identifies the user-defined type to drop. The name must identify a user-defined type that exists at the current server. The default keyword RESTRICT indicates that the user-defined type is not dropped if any of the following dependencies exist:

- The definition of a column of a table uses the user-defined type.
- The definition of an input or result parameter of a user-defined function uses the user-defined type.
- The definition of a parameter of a stored procedure uses the user-defined type.
- The definition of an extended index uses a cast function that is implicitly generated for the user-defined type.
- The definition of an SQL variable in a procedure or function uses the user-defined type.
- The definition of a row permission or a column mask uses the user-defined type.
- A sequence exists for which the data type of the sequence is the user-defined type.

- One of the following dependencies exists on one of the cast functions that are generated for the user-defined type:
  - Another function is sourced from one of the cast functions
  - A view uses one of the cast functions
  - A trigger package uses one of the cast functions
  - The definition of a materialized query table uses one of the cast functions

Whenever a user-defined type is dropped, all privileges on the distinct type are also dropped. In addition, the cast functions that were generated when the user-defined type was created and the privileges on those cast functions are also dropped.

VARIABLE ***variable-name***
Identifies the global variable to drop. The name must identify a global variable that exists at the current server. The name must not identify a built-in global variable. The default keyword RESTRICT indicates that the global variable is not dropped if any of the following dependencies exist:

- The definition of a function, trigger, or view is dependent on the global variable

Packages that are dependent on the global variable are marked invalid when the global variable is dropped. If a statement that is in the dynamic statement cache depends on the global variable and the global variable is dropped, the statement in the dynamic statement cache will be invalidated if it is not in use.

VIEW ***view-name*** **or** ***alias-name***
Identifies the view to drop. The name must identify a view that exists at the current server.

Whenever a view is directly or indirectly dropped, all privileges on the view and all synonyms and views that are defined on the view are also dropped. Whenever a view is directly or indirectly dropped, all materialized query tables defined on the view are also dropped.

If *alias-name* is specified, the actual view will be dropped as if *view-name* were specified. However, the alias is not dropped and can be dropped using the DROP ALIAS statement.

If the view is referenced in the definition of a row permission or a column mask, it cannot be dropped.

Notes

Restrictions on DROP:
DROP is subject to these restrictions:

- DROP DATABASE cannot be performed while a Db2 utility has control of any part of the database.
- DROP INDEX cannot be performed while a Db2 utility has control of the index or its associated table space.
- DROP INDEX cannot be performed if the index is a unique index that is defined on a ROWID column that is defined as GENERATED BY DEFAULT and there are pending changes to the definition of the table space or to any objects within the table space that are explicitly created.
- DROP INDEX cannot be performed if the index is an empty index on an auxiliary table that resides in an explicitly created LOB table space and there are pending changes to the definition of the base table space or to any objects within the base table space.
- DROP INDEX cannot be performed if the index is the hash overflow index for a table that uses hash organization.
- DROP TABLE cannot be performed while a Db2 utility has control of the table space that contains the table.
- DROP TABLE cannot be performed if the table space was explicitly created and there are pending changes to the definition of the table space.
- DROP TABLE cannot be performed if the table is an empty auxiliary table and there are any pending changes to the definition of the base table space or to any objects within the base table space.
- DROP TABLESPACE cannot be performed while a Db2 utility has control of the table space.

In a data sharing environment, the following restrictions also apply:

- If any member has an active resource limit specification table (RLST) you cannot drop the database or table space that contains the table, the table itself, or any index on the table.
- If the member executing the drop cannot access the Db2-managed data sets, only the catalog and directory entries for those data sets are removed.

Objects that have certain dependencies cannot be dropped. For information on these restrictions, see Table 212 on page 1720.

Recreating objects:
After an index or table space is dropped, a commit must be performed before the object can be re-created with the same name. If a table that was created without an IN clause (thereby causing a table space to be implicitly created) is dropped, a table cannot be re-created with the same name until a commit is performed.

Dropping a parent table:
DROP is not DELETE and therefore does not involve delete rules.

Dropping a default storage group:
If you drop the default storage group of a database, the database no longer has a legitimate default. You must then specify USING in any statement that creates a table space or index in the database. You must do this until you either:

- Create another storage group with the same name using the CREATE STOGROUP statement, or
- Designate another default storage group for the database using the ALTER DATABASE statement.

Dropping an accelerator-only table:

- When an accelerator-only table is dropped and the accelerator is not active, use the SYSACCEL_DROP_TABLE procedure to drop the table in the accelerator.
- A DROP TABLE statement that identifies an accelerator-only table should be issued in a separate unit of work from other SQL statements.

Dropping an implicitly created database:
When a table that resides in an implicitly created table space is dropped, the implicitly created table space and related objects are dropped. However, the implicitly created database is not dropped. This can result in a large number of empty databases in a system. These databases might be eventually reused for newly created implicit table spaces. These implicitly created databases can be dropped using DROP DATABASE.

Dropping a table space or index:
To drop a table space or index, the size of the buffer pool associated with the table space or index must not be zero.

Dropping a LOB table space:

If the base table space is explicitly created, both explicitly created LOB table spaces and implicitly created LOB table spaces can be dropped if it does not contain any auxiliary tables. If the LOB table space is implicitly created, it will be dropped automatically when the auxiliary table is dropped. If the LOB table space is explicitly created, it is not dropped when the auxiliary table is dropped, and can be explicitly dropped later.

If the base table space is implicitly created, the LOB table space cannot be dropped. If the LOB table space is explicitly created, it can be dropped when the auxiliary table is dropped. The following table shows the relationship between the base table space, the LOB table space, and the use of DROP for the LOB table space and base table space:

Table 210. Use of DROP for LOB table space

How base table was created	How LOB table space was created	Whether DROP can be used on LOB table space	State of LOB table space if base table space is dropped
Explicitly	Explicitly	Yes	LOB table space remains
Explicitly	Implicitly	Yes	LOB table space is dropped
Implicitly	Explicitly	Yes	LOB table space remains
Implicitly	Implicitly	No	N/A

Dropping a database when data sets for Db2 objects have already been deleted:
When some of the data sets for Db2 objects that associated with the database have already been deleted, DROP DATABASE will perform in the following manner:

For Db2-managed objects:
The DROP DATABASE statement will delete the underlying data sets if they exist. If the data sets do not exist, DROP DATABASE will delete only the catalog entries for those data sets.

For user-managed objects:
The DROP DATABASE statement will delete only the catalog entries for the data sets. The underlying data sets will need to be manually deleted after the DROP DATABASE statement is complete.

Dropping a table space in a work file database:
If one member of a data sharing group drops a table space in a work file database, or an entire work file database, that belongs to another member, Db2-managed data sets that the executing member cannot access are not dropped. However, the catalog and directory entries for those data sets are removed.

Dropping resource limit facility (governor) indexes, tables, and table spaces:
While the RLST is active, you cannot issue a DROP DATABASE, DROP INDEX, DROP TABLE, or DROP TABLESPACE statement for an object associated with an RLST that is active on any member of a data sharing group. See Resource limit facility implications for data sharing (Db2 Data Sharing Planning and Administration) for details.

Dropping a temporary table:
To drop a created temporary table or a declared temporary table, use the DROP TABLE statement.

Dropping a materialized query table:
To drop a materialized query table, use the DROP TABLE statement.

Dropping an alias:
Dropping a table or view does not drop its aliases. However, if you use the DROP TABLE statement and specify an alias for a table or view, the table or view will be dropped. To drop an alias, use the DROP ALIAS statement.

Dropping a table from an implicitly created table space:
If you drop a table from an implicitly created table space, the following related objects are also dropped:

- The enforcing primary and unique key indexes
- Any LOB table spaces, auxiliary tables, and auxiliary indexes
- The ROWID index (if the ROWID column is defined as GENERATED BY DEFAULT)

If any LOB columns are defined on the table, the LOB table space is dropped if it was implicitly created. You can use the DROP statement to drop a LOB table space only if one of the following conditions is true:

- The base table space is explicitly created
- The base table space is implicitly created but the LOB table space is explicitly created

You cannot use the DROP statement to drop a LOB table space if both the base table space and the LOB table space are implicitly created.

Dropping an index on an auxiliary table and an auxiliary table:

You can explicitly drop an empty index on an auxiliary table with the DROP INDEX statement, unless the base table space is implicitly created. An empty or populated index on an auxiliary table is implicitly dropped when:

- The auxiliary table is empty and it is explicitly dropped (empty indexes only).
- The associated base table for the auxiliary table is dropped.
- The base table space that contains the associated base table is dropped.

You can explicitly drop an empty auxiliary table with the DROP TABLE statement, unless the base table space is implicitly created. An empty or populated auxiliary table is implicitly dropped when:

- The associated base table for the auxiliary table is dropped.
- The base table space that contains the associated base table is dropped.

The following table shows which DROP statements implicitly or explicitly cause an auxiliary table and the index on that table to be dropped, as indicated by the 'D' in the column.

Table 211. Effect of various DROP statements on auxiliary tables and indexes that are in explicitly created table spaces

	Auxiliary table		Index on auxiliary table	
Statement	**Populated**	**Empty**	**Populated**	**Empty**
DROP TABLESPACE (base table space)	D	D	D	D
DROP TABLE (base table)	D	D	D	D
DROP TABLE (auxiliary table)		D		D
DROP INDEX (index on auxiliary table)				D

Note: D indicates that the table or index is dropped.

Dropping a migrated index or table space:

Here, "migration" means migrated by the Hierarchical Storage Manager (DFSMShsm). Db2 does not wait for any recall of the migrated data sets. Hence, recall is not a factor in the time it takes to execute the statement.

Dropping a trusted context:

The drop of a trusted context takes effect after the DROP TRUSTED CONTEXT statement is committed. If the DROP TRUSTED CONTEXT statement results in an error or is rolled back, the trusted context is not dropped.

Avoiding DROP failure due to excessive locking

Dropping a table space, database, or index with the COPY YES attribute deletes all corresponding records in the SYSCOPY and SYSLGRNX catalog statistics tables. The DROP fails if the lock structure size cannot accommodate the number of locks obtained during DROP processing. DROP failure is more likely if the SYSCOPY, SYSLGRNX, or other catalog statistics tables contain many entries, especially if the object you are dropping was created long ago or contains many partitions. DROP failure is also more likely if objects are copied frequently while the MODIFY RECOVERY and MODIFY STATISTICS utilities are run relatively infrequently.

To avoid DROP failure, run the MODIFY RECOVERY and MODIFY STATISTICS utilities on objects before dropping them. If you drop a clone table, you need to specify the CLONE keyword to delete recovery and statistics information for the clone objects from the catalog and directory. You can Specify AGE(*) or DATE(*) to remove all recovery and statistics information regardless of past update, copy, or cleanup frequency. Be aware that running the MODIFY utility with AGE(*) or DATE(*) will leave objects unrecoverable after they are dropped unless you make a copy or other form of back-up first.

Also, ensure that your applications commit drops frequently, especially for databases containing multiple table spaces, and table spaces containing multiple tables. You can also increase the size of your lock structures to accommodate the surge in lock requests during this type of activity.

Invalidation of packages:

This statement might invalidate all packages that depend on target objects, and sometimes other related objects through cascading effects, depending on the clauses and keywords specified and other factors. For more information, see Changes that invalidate packages (Db2 Application programming and SQL).

Dependencies when dropping objects:

If other objects depend on the object specified in a DROP statement, the dependent objects might also be dropped, invalidated, or become inoperative, or the DROP statement might fail. These effects also cascade to any objects that depend on the dropped dependent objects. To determine the full indirect effects of a DROP statement, check what happens for any dependent objects, check whether each dependent object has its own dependent objects, and the check the rules for those object types.

The following table indicates the result of DROP statements based on the type of object specified by the DROP statement and the type of dependent object. The letters have the following meanings:

D (cascaded drop)
If any dependent objects of the indicated types exist, they are also dropped. The effect cascades to any objects that depend on the dropped dependent objects.

R (restrict)
If any dependent objects of the indicated types exist, the DROP statement fails. Also, if any dependent object cannot be dropped because of a restrict dependency for its own dependent objects, the DROP statement fails.

V (invalidate)
If dependent packages exist, they become invalidated.

For example, assume that view B is defined on table A and view C is defined on view B. In the following table, the 'D' in the View column of the DROP TABLE row indicates that view B is dropped when table A is dropped. Next, because view C is dependent on view B, check the View column for DROP VIEW. The 'D' in the column indicates that view C will also be dropped.

Table 212. Effect of dropping objects that have dependencies

DROP statement	Dependent object type														
	Alias	Column mask	Function	Global variable	Index	Procedure	Row permission	Sequence	Stogroup	Synonym	Table	Table space	Trigger	Type	View
DROP ALIAS		R	V			V	R						V		
DROP FUNCTION			R "4" on page 1721			R "12" on page 1722							R		R
DROP INDEX "1" on page 1721			V			V							V		
DROP PROCEDURE			R "12" on page 1722			R "12" on page 1722							R		
DROP ROLE	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
DROP SEQUENCE			R "8" on page 1721			R "12" on page 1722							R		
DROP STOGROUP					R "5" on page 1721							R "5" on page 1721			
DROP SYNONYM		R													
DROP TABLE "6" on page 1721		R "16" on page 1722	D "14" on page 1722		D	V	R "16" on page 1722			D	D "15" on page 1722		D "7" on page 1721		D

Table 212. Effect of dropping objects that have dependencies (continued)

	Dependent object type														
DROP statement	**Alias**	**Column mask**	**Function**	**Global variable**	**Index**	**Procedure**	**Row permission**	**Sequence**	**Stogroup**	**Synonym**	**Table**	**Tablespace**	**Trigger**	**Type**	**View**
DROP TABLESPACE			V		D	V					D		V		
DROP TRIGGER			V			V							V		
DROP TYPE		R	R "2" on page 1721		R "9" on page 1722	R "3" on page 1721	R	R			R		V"11" on page 1722		
DROP VARIABLE			R			V							R		R
DROP VIEW		R	D "14" on page 1722			V	R			D	D "15" on page 1722		D "10" on page 1722		D

Table notes:

1. The index space associated with the index is dropped.
2. If a function is dependent on the user-defined type being dropped, the user-defined type cannot be dropped unless the function is one of the cast functions that was created for the user-defined type.
3. If the definition of a parameter of a stored procedure uses the user-defined type, the user-defined type cannot be dropped.
4. If other user-defined functions are sourced on the user-defined function being dropped, the function cannot be dropped.
5. A storage group cannot be dropped if it is used by any table space or index space.
6. If an implicit table space was created when the table was created, the table space is also dropped.
7. When a subject table is dropped, any associated triggers and related trigger packages are also dropped.
8. This restriction is only for SQL functions.

9. The index in this case must be an expression-based index.
10. When a subject view is dropped, any associated triggers and related trigger packages are also dropped.
11. Any packages that have a dependency on an INSTEAD OF trigger will be marked invalid.
12. A routine or sequence that is referenced by a native SQL procedure cannot be dropped.
13. An alias or synonym cannot be dropped if there is a dependent inline SQL table function.
14. When a table or view is dropped, any dependent inline SQL table functions are also dropped.
15. When a table or view is dropped, any dependent materialized query tables are also dropped.
16. When a table is dropped, any row permission or column masks defined directly on the table are also dropped. If any row permissions or column masks reference the table in the body, the table cannot be dropped.

Alternative syntax and synonyms:

To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following keywords:

- DATA TYPE or DISTINCT TYPE as a synonym for TYPE
- PROGRAM as a synonym for PACKAGE
- DROP ALIAS SYSPUBLIC.*name* can be specified as an alternative to DROP PUBLIC ALIAS SYSPUBLIC.*name*

Examples

Example 1: Drop table DSN8B10.DEPT.

```
DROP TABLE DSN8B10.DEPT;
```

Example 2: Drop table space DSN8S11D in database DSN8D11A.

```
DROP TABLESPACE DSN8D11A.DSN8S11D;
```

Example 3: Drop the view DSN8B10.VPROJRE1:

```
DROP VIEW DSN8B10.VPROJRE1;
```

Example 4: Drop the package DSN8CC0 with the version identifier VERSZZZZ. The package is in the collection DSN8CC61. Use the version identifier to distinguish the package to be dropped from another package with the same name in the same collection.

```
DROP PACKAGE DSN8CC61.DSN8CC0 VERSION VERSZZZZ;
```

Example 5: Drop the package DSN8CC0 with the version identifier "1994-07-14-09.56.30.196952". When a version identifier is generated by the VERSION(AUTO) precompiler option, delimit the version identifier.

```
DROP PACKAGE DSN8CC61.DSN8CC0 VERSION "1994-07-14-09.56.30.196952";
```

Example 6: Drop the distinct type DOCUMENT, if it is not currently in use:

```
DROP TYPE DOCUMENT;
```

Example 7: Assume that you are SMITH and that ATOMIC_WEIGHT is the only function with that name in schema CHEM. Drop ATOMIC_WEIGHT.

```
DROP FUNCTION CHEM.ATOMIC_WEIGHT;
```

Example 8: Assume that you are SMITH and that you created the function CENTER in schema SMITH. Drop CENTER, using the function signature to identify the function instance to be dropped.

```
DROP FUNCTION CENTER(INTEGER, FLOAT);
```

Example 9: Assume that you are SMITH and that you created another function named CENTER, which you gave the specific name FOCUS97, in schema JOHNSON. Drop CENTER, using the specific name to identify the function instance to be dropped.

```
DROP SPECIFIC FUNCTION JOHNSON.FOCUS97;
```

Example 10: Assume that you are SMITH and that stored procedure OSMOSIS is in schema BIOLOGY. Drop OSMOSIS.

```
DROP PROCEDURE BIOLOGY.OSMOSIS;
```

Example 11: Assume that you are SMITH and that trigger BONUS is in your schema. Drop BONUS.

```
DROP TRIGGER BONUS;
```

Example 12: Drop the role CTXROLE:

```
DROP ROLE CTXROLE;
```

Example 13: Drop the trusted context CTX1:

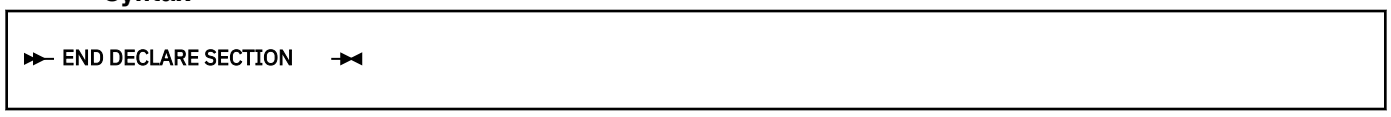
```
DROP TRUSTED CONTEXT CTX1;
```

Example 14: Drop public alias PUBALIAS1:

```
DROP PUBLIC ALIAS PUBALIAS1 FOR SEQUENCE;
```

END DECLARE SECTION

The END DECLARE SECTION statement marks the end of an SQL declare section.



Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java or REXX.

Authorization

None required.

Syntax

Description

The END DECLARE SECTION statement can be coded in the application program wherever declarations can appear in accordance with the rules of the host language. It is used to indicate the end of an SQL declare section. An SQL declare section starts with a BEGIN DECLARE SECTION statement described in “BEGIN DECLARE SECTION” on page 1260.

The following rules are enforced by the precompiler only if the host language is C or the STDSQL(YES) precompiler option is specified:

- A variable referred to in an SQL statement must be declared within an SQL declare section of the source program.
- BEGIN DECLARE SECTION and END DECLARE SECTION statements must be paired and must not be nested.
- SQL declare sections can contain only host variable declarations, SQL INCLUDE statements that include host variable declarations, or DECLARE VARIABLE statements.

Notes

SQL declare sections are only required if the STDSQL(YES) option is specified or the host language is C. However, SQL declare sections can be specified for any host language so that the source program can conform to IBM SQL. If SQL declare sections are used, but not required, variables declared outside an SQL declare section should not have the same name as variables declared within an SQL declare section.

Example

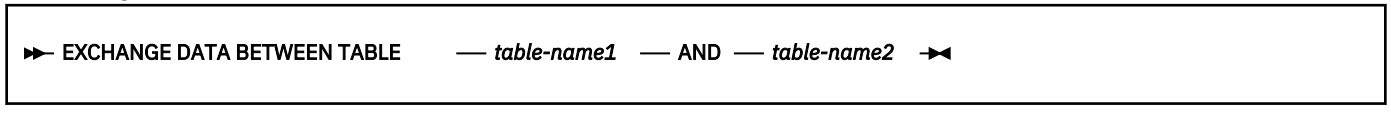
```
EXEC SQL BEGIN DECLARE SECTION;
 -- host variable declarations
EXEC SQL END DECLARE SECTION;
```

EXCHANGE

The EXCHANGE statement switches the content of a base table and its associated clone table.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.



Authorization

The privilege set that is defined below must include at least one of the following privileges:

- The INSERT and DELETE privileges on both the base table and the clone table
- Ownership of the both the base table and the clone table
- DBADM authority for the database
- SYSADM authority
- DATAACCESS authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is the union of the privilege sets that are held by each authorization ID of the process.

Syntax

Description

table-name1* and *table-name2
Identifies the base table and the associated clone table for which the exchange of data will take place. Either *table-name1* or *table-name2* can identify the base table. The other table name must

identify a clone table that is associated with the specified base table. The name of the base table and the name of the clone table remain unchanged after a data exchange.

Notes

Rules and restrictions: Data exchanges cannot be done for a subset of a table's partitions. There must be a commit between consecutive data exchanges using the EXCHANGE statement.

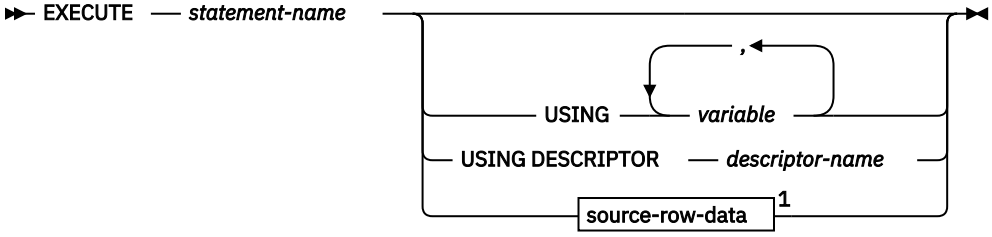
Examples

Example: Exchange the data of the EMPLOYEE table and its clone table, EMPCLONE.

```
EXCHANGE DATA BETWEEN TABLE EMPCLONE AND EMPLOYEE;
```

EXECUTE

The EXECUTE statement executes a prepared SQL statement.

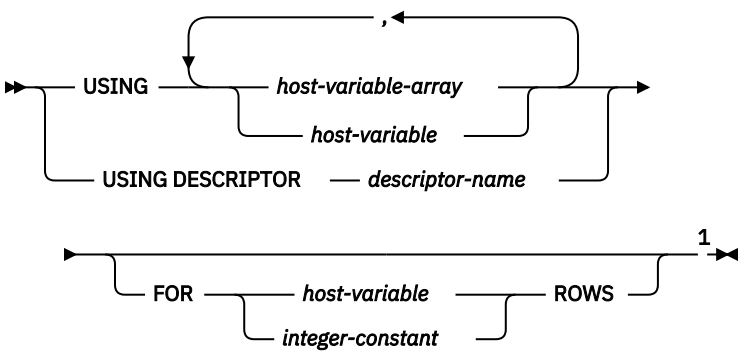


Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

See "PREPARE" on page 1849 for the authorization required to create a prepared statement.



Syntax

Notes:

[1] This option can be specified only when *statement-name* refers to a dynamic INSERT or MERGE statement that is prepared with FOR MULTIPLE ROWS and is specified as part of the ATTRIBUTES clause on the PREPARE statement.

source-row-data:

Notes:

[1] The FOR n ROWS clause is required on the EXECUTE statement if it is not specified as part of the MERGE statement and a host variable array is specified. The FOR n ROWS clause is also required if MERGE is used with multiple rows of source data. For an INSERT statement, the FOR n ROWS clause can only be specified for a dynamic statement that contains only a single multiple-row INSERT statement.

Description

statement-name
Identifies the prepared statement to be executed. *statement-name* must identify a statement that was previously prepared within the unit of work and the prepared statement must not be a *select-statement*.

USING
Introduces a list of variables whose values are substituted for the parameter markers (question marks) in the prepared statement. (For an explanation of parameter markers, see "PREPARE" on page 1849.) If the prepared statement includes parameter markers, you must include USING in the EXECUTE statement. USING is ignored if there are no parameter markers.

The *n*th value corresponds to the *n*th parameter marker in the prepared statement. Where appropriate, locator variables and file reference variables can be provided as the source of values for parameter markers. A global variable must not be specified.

For more on the substitution of values for parameter markers, see Parameter marker replacement.

variable,...
Identifies a variable or a host structure that is declared in the application program in accordance with the rules for declaring variables and host structures. When the statement is executed, a reference to a structure is replaced by a reference to each of its variables. The number of variables must be the same as the number of parameter markers in the prepared statement.

USING DESCRIPTOR *descriptor-name*
Identifies an SQLDA that contains a valid description of the input host variables.

Before invoking the EXECUTE statement, you must set the following fields in the SQLDA:

- SQLN to indicate the number of SQLVAR occurrences that are provided in the SQLDA

  A REXX SQLDA does not contain this field.
- SQLABC to indicate the number of bytes of storage that are allocated for the SQLDA
- SQLD to indicate the number of variables that are used in the SQLDA when processing the statement
- SQLVAR entries to indicate the attributes of the variables

The SQLDA must have enough storage to contain all SQLVAR entries. If an SQLVAR entry includes a LOB value or a distinct type based on a LOB, there must be additional SQLVAR entries for each parameter. For more information on the SQLDA, which includes a description of the SQLVAR and an

explanation on how to determine the number of SQLVAR entries, see "SQL descriptor area (SQLDA)" on page 2095.

SQLD must be set to a value that is greater than or equal to zero and less than or equal to SQLN. It must be the same as the number of parameter markers in the prepared statement. The *n*th variable described by the SQLDA corresponds to the *n*th parameter marker in the prepared statement.

See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

source-row-data
The prepared statement must be an INSERT or MERGE statement for which the FOR MULTIPLE ROWS clause is specified as part of the ATTRIBUTES clause on the PREPARE statement.

USING *host-variable-array* or *host-variable*
Introduces a list of host variables or host variable arrays whose values are substituted for the parameter markers (question marks) in the prepared INSERT or MERGE statement. The number of columns specified in the INSERT or MERGE statement must be less than or equal to the total number of host variables or host variable arrays that are specified.

host-variable-array
Identifies a host-variable array that must be defined in the application program in accordance with the rules for declaring a host variable array. A reference to a structure is replaced by a reference to each of its variables. The number of variables must be the same as the number of parameter markers in the prepared statement. The *n*th variable supplies the value for the *n*th parameter marker in the prepared statement.

host-variable
Identifies a variable that must be described in the application program in accordance with the rules for declaring host variables.

USING DESCRIPTOR *descriptor-name*
Identifies an SQLDA that must contain a valid description of the host variable arrays or host variables that contain the values to insert.

Before invoking the EXECUTE statement for a dynamic INSERT or MERGE statement, you must set the following fields in the SQLDA:

- SQLN to indicate the number of SQLVAR entries that are provided in the SQLDA.
- SQLABC to indicate the number of bytes of storage that are allocated for the SQLDA.
- SQLD to indicate the number of variables, plus one, that are used in the SQLDA that provide values for columns that are the source of the INSERT or MERGE statement. SQLD must be set to a value that is greater than or equal to zero and less than or equal to SQLN.
- SQLVAR entries to indicate the attributes of an element of the host variable array for the SQLVAR entries that correspond to values that are provided for the source columns of the INSERT or MERGE statement. Within each SQLVAR, the following fields are set:
  - SQLTYPE indicates the data type of the elements of the host variable array.
  - SQLDATA points to the corresponding host variable array.
  - SQLLEN and SQLLONGLEN indicate the length of a single element of the array.
- SQLNAME, the fifth and sixth bytes must contain a flag field and the seventh and eighth bytes must contain a binary small integer (halfword) that contains the dimension of the host-variable array and, if specified, the corresponding indicator array.

The SQLDA must have enough storage to contain a SQLVAR entry for each target column for which values are provided, plus an additional SQLVAR entry for the number of rows. The Db2 system generates code to enter the required information for this extra SQLVAR entry. Each SQLVAR entry describes a host variable, host variable array, or buffer that contains the values for a column of the source table. The last SQLVAR entry contains the number of rows of data. For example, if the INSERT or MERGE statement is providing values for five columns of the target table, six SQLVAR entries must be provided. If any value is a LOB value, twice as many SQLVAR entries must be provided, and SQLN must be set to the number of SQLVAR entries. Thus, if the INSERT or MERGE statement is providing

values for five columns of the source table, and some of the values to insert are LOB values, 12 SQLVAR entries must be provided.

The SQLVAR entry for the number of rows must also contain a flag value. See "Field descriptions of an occurrence of a base SQLVAR" on page 2100 for more information.

You set the SQLDATA and SQLIND pointers to the beginning of the corresponding arrays.

FOR *host-variable* or *integer-constant* ROWS
Specifies the number of rows of source data. The values for the insert or merge operation are specified in the USING clause.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with a scale of zero and must not include an indicator variable. *k* must be in the range 0 to 32767.

FOR n ROWS cannot be specified on the EXECUTE statement if the statement being processed is a dynamic INSERT or MERGE statement that includes a FOR n ROWS clause.

Notes

Excessive processor time:
Db2 can stop the execution of a prepared SQL statement if the statement is taking too much processor time to finish. When this happens, an error occurs. The application that issued the statement is not terminated; it is allowed to issue another SQL statement.

Parameter marker replacement:
Before the prepared statement is executed, each parameter marker in the statement is effectively replaced by its corresponding host variable. The replacement is an assignment operation in which the source is the value of the host variable and the target is a variable within Db2. The assignment rules are those described for assignment to a column in "Assignment and comparison" on page 135. For a typed parameter marker, the attributes of the target variable are those specified by the CAST specification. For an untyped parameter marker, the attributes of the target variable are determined according to the context of the parameter marker. For the rules that affect parameter markers, see Parameter markers.

Let V denote a host variable that corresponds to parameter marker P. The value of V is assigned to the target variable for P in accordance with the rules for assigning a value to a column:

- V must be compatible with the target.
- If V is a string, its length must not be greater than the length attribute of the target.
- If V is a number, the absolute value of its integral part must not be greater than the maximum absolute value of the integral part of the target.
- If the attributes of V are not identical to the attributes of the target, the value is converted to conform to the attributes of the target.
- If the target cannot contain nulls, V must not be null.

When the prepared statement is executed, the value used in place of P is the value of the target variable for P. For example, if V is CHAR(6) and the target is CHAR(8), the value used in place of P is the value of V padded on the right with two blanks.

Errors occurring on EXECUTE:
In local and remote processing, the DEFER(PREPARE) and REOPT(ALWAYS)/REOPT(ONCE) bind options can cause some errors that are normally issued during PREPARE processing to be issued on EXECUTE.

Considerations for executing data definition statements written in native SQL language:
A data definition statement written in native SQL language can only be executed one time. To execute the data definition statement multiple times, issue the PREPARE statement prior to each use of the EXECUTE statement for the data definition statement.

Examples

Example 1: In this example, an INSERT statement with parameter markers is prepared and executed. S1 is a structure that corresponds to the format of DSN8B10.DEPT.

```
   EXEC SQL PREPARE DEPT_INSERT FROM
     'INSERT INTO DSN8B10.DEPT VALUES(?,?,?,?)';
   -- Check for successful execution and read values into S1
   EXEC SQL EXECUTE DEPT_INSERT USING :S1;
```

Example 2: Assume that the IWH.PROGPARM table has 9 columns. Prepare and execute a dynamic INSERT statement that inserts 5 rows of data into the IWH.PROGPARM table. The values to be inserted are provided in arrays, where all the values for a column are provided in an host-variable-array with the EXECUTE statement.

```
STMT = 'INSERT INTO IWH.PROGPARM  (IWHID, UPDATE_BY,UPDATE_TS,NAME,
                                   SHORT_DESCRIPTION, ORDERNO, PARMDATA,
                                   PARMDATALONG, VWPROGKEY)
VALUES ( ? , ? , ? , ? , ? , ? , ? , ? , ? )';
ATTRVAR = 'FOR MULTIPLE ROWS';
EXEC SQL PREPARE INS_STMT ATTRIBUTES :ATTRVAR FROM :STMT;
NROWS = 5;
EXEC SQL EXECUTE INS_STMT FOR :NROWS ROWS
           USING :V1, :V2, :V3, :V4, :V5, :V6, :V7, :V8, :V9;
```

In this example, each host variable in the USING clause represents an array of values for the corresponding column of the target of the INSERT statement.

Example 3: Using dynamically supplied values for an employee row, update the master EMPLOYEE table if the data is for an existing employee or insert a new row if the data is for a new employee.

```
hv_stmt =
  "MERGE INTO EMPLOYEE AS T
    USING (VALUES (CAST (? AS CHAR(6)), CAST (? AS VARCHAR(12)),
                   CAST (? AS CHAR(1)), CAST (? AS VARCHAR(15)),
                   CAST (? AS INTEGER)))
    AS S (EMPNO, FIRSTNAME, MI, LASTNAME, SALARY)
    ON T.EMPNO = S.EMPNO
    WHEN MATCHED THEN UPDATE
        SET SALARY = S.SALARY
    WHEN NOT MATCHED THEN INSERT (EMPNO, FIRSTNAME, MI, LASTNAME, SALARY)
        VALUES (S.EMPNO, S.FIRSTNAME, S.MI, S.LASTNAME, S.SALARY)
    NOT ATOMIC CONTINUE ON SQLEXCEPTION";
hv_attr = 'FOR MULTIPLE ROWS';
EXEC SQL
    PREPARE merge_stmt
     ATTRIBUTES :hv_attr FROM :hv_stmt;
hv_nrows = 5;
/* Initialize the hostvar array of hv_empno, hv_firstname... */
EXEC SQL
   EXECUTE merge_stmt
   USING :hv_empno, :hv_firstname, :hv_mi,
         :hv_lastname, :hv_salary
      FOR :hv_nrows ROWS;
```

Example 4: Suppose that the following array type, array variable, and table have been defined.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[100];
CREATE TYPE STRINGARRAY AS VARCHAR(10) ARRAY[100];
CREATE TABLE T1 (COL1 CHAR(10), COL2 INT);
```

Use as an array variable as an input value for an expression in an EXECUTE statement.

```
CREATE PROCEDURE PROCESSPERSONS (OUT WITHO STRINGARRAY, INOUT INT0 INT)
BEGIN
 DECLARE INTA INTARRAY;
 DECLARE STMT CHAR(100);
-- Initialize the array
 SET INTA = ARRAY[1,INTEGER(2),3+0,4,5,6] ;
-- Use dynamic sql with an array parameter marker to
--  provide a value for a dynamic INSERT statement
 SET STMT = 'INSERT INTO T1 VALUES('XYZ', CARDINALITY(CAST(? AS INTARRAY)))';
 PREPARE INS_STMT FROM STMT;
 EXECUTE INS_STMT USING INTA;
```

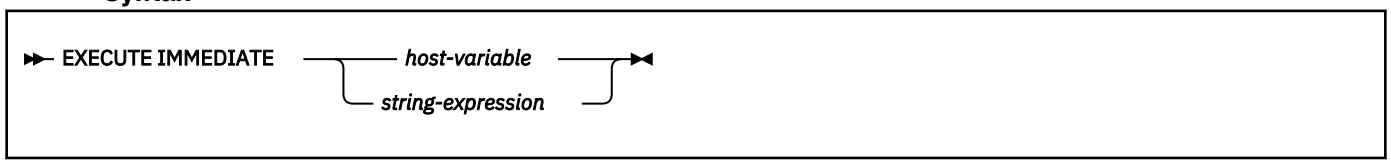
```
-- INTA is an array variable used as input for the
-- INSERT statement
…
END
```

EXECUTE IMMEDIATE

EXECUTE IMMEDIATE combines the basic functions of the PREPARE and EXECUTE statements. It can be used to prepare and execute an SQL statement that contains neither host variables nor parameter markers.

The EXECUTE IMMEDIATE statement:

- Prepares an executable form of an SQL statement from a string form of the statement
- Executes the SQL statement
- Destroys the executable form



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

The authorization rules are those defined for the dynamic preparation of the SQL statement specified by EXECUTE IMMEDIATE. For example, see "INSERT" on page 1809 for the authorization rules that apply when an INSERT statement is executed using EXECUTE IMMEDIATE.

Syntax

Description

host-variable
For languages other than PL/I, *host-variable* must be specified. It must identify a host variable that is described in the application program in accordance with the rules for declaring character or graphic string variables. If the source string is over 32KB in length, the *host-variable* must be a CLOB or DBCLOB variable. The maximum source length is 2MB although the host variable can be declared larger than 2MB. An indicator variable must not be specified. In Assembler, C, COBOL, and PL/I, the host variable must be a varying-length string variable. In C, it must not be a NUL-terminated string. In SQL PL, an SQL variable is used in place of a host variable and the value must not be null.

string-expression
string-expression is any PL/I expression that yields a string. *string-expression* cannot be preceded by a colon. Variables that are within *string-expression* that include operators or functions should not be preceded by a colon. When *string-expression* is specified, the precompiler-generated structures for *string-expression* use an EBCDIC CCSID and an informational message is returned.

Notes

Allowable SQL statements:
The value of the identified host variable or the specified *string-expression* is called the *statement string*.

The statement string must be one of the following SQL statements, and cannot be a *select-statement*:

ALLOCATE CURSOR	REVOKE
ALTER	ROLLBACK
ASSOCIATE LOCATORS	SAVEPOINT
COMMENT	SET CURRENT DEGREE
COMMIT	SET CURRENT DECFLOAT ROUNDING MODE
CREATE	SET CURRENT DEBUG MODE
DECLARE GLOBAL TEMPORARY TABLE	SET CURRENT LOCALE LC_CTYPE
DELETE	SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION
DROP	SET CURRENT OPTIMIZATION HINT
EXPLAIN	SET CURRENT PRECISION
FREE LOCATOR	SET CURRENT QUERY ACCELERATION
GRANT	SET CURRENT REFRESH AGE
HOLD LOCATOR	SET CURRENT ROUTINE VERSION
INSERT	SET CURRENT RULES
LABEL	SET CURRENT SQLID
LOCK TABLE	SET ENCRYPTION PASSWORD
MERGE	SET PATH
REFRESH TABLE	SET SCHEMA
RELEASE SAVEPOINT	SIGNAL
RENAME	TRUNCATE
	UPDATE

The statement string must not:

- Begin with EXEC SQL
- End with END-EXEC or a semicolon
- Include references to variables
- Include parameter markers

Errors and error handling:

When an EXECUTE IMMEDIATE statement is executed, the specified statement string is parsed and checked for errors. If the SQL statement is invalid, it is not executed and the error condition that prevents its execution is reported in the SQLCA. If the SQL statement is valid, but an error occurs during its execution, that error condition is reported in the SQLCA.

Db2 can stop the execution of a prepared SQL statement if the statement is taking too much CPU time to finish. When this happens an error occurs. The application that issued the statement is not terminated; it is allowed to issue another SQL statement.

Effect of the CURRENT EXPLAIN MODE special register:

If the CURRENT EXPLAIN MODE special register is set to EXPLAIN, the statement is prepared for explain only and is not executable, unless the statement is a SET statement. Attempting to execute the prepared statement will return an error. See the “CURRENT EXPLAIN MODE” on page 182 special register for more information.

Performance considerations:

If the same SQL statement is to be executed more than once, it is more efficient to use the PREPARE and EXECUTE statements rather than the EXECUTE IMMEDIATE statement.

Examples

Example 1: In this PL/I example, the EXECUTE IMMEDIATE statement is used to execute a DELETE statement in which the rows to be deleted are determined by a search-condition specified by the value of PREDS.

```
EXEC SQL EXECUTE IMMEDIATE 'DELETE FROM DSN8B10.DEPT
  WHERE' || PREDS;
```

Example 2: Use C to execute the SQL statement in the host variable Qstring.

```
EXEC SQL INCLUDE SQLCA;
void main ()
  {
   EXEC SQL BEGINDECLARE SECTION;
   char Qstring[100M =
     "INSERT INTO WORK_TABLE SELECT * FROM EMPPROJACT WHERE ACTNO >= 100";
   EXEC SQL END DECLARE SECTION;
  .
  .
  .
   EXEC SQL EXECUTE IMMEDIATE :Qstring;
   return;
  }
```

EXPLAIN

The EXPLAIN statement obtains information about access path selection for an *explainable statement*. A statement is explainable if it is a SELECT, MERGE, or INSERT statement, or the searched form of an UPDATE or DELETE statement. The information that is obtained is placed in a set of supplied user tables that are called *EXPLAIN tables*.

PSPI

The *plan table* contains information about the access path for the specified statement or statements. The *statement table* can be populated with information about the estimated cost of executing the explainable statement. The *function table* can be populated with information about how Db2 resolves the user-defined functions that are referred to in the explainable statement. Other EXPLAIN tables can be populated with additional information about the execution of the explainable statement. For a complete list of EXPLAIN tables, see EXPLAIN tables (Db2 Performance).

Using EXPLAIN for queries that reference system-period temporal tables that are enabled for system data versioning, the result will show the system-period temporal tables and the history tables in EXPLAIN output if the query needs to reference both tables to satisfy the query.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

The authorization rules are those defined for the SQL statement specified in the EXPLAIN statement. For example, see the description of the DELETE statement for the authorization rules that apply when EXPLAIN records are captured for DELETE statements.

If the EXPLAIN statement is embedded in an application program, the authorization rules that apply are those defined for embedding the specified SQL statement in an application program. In addition, the owner of the plan or package must also have one of the following characteristics:

- Be the owner of a plan table named PLAN_TABLE
- Have an alias on a plan table named *owner*.PLAN_TABLE and have SELECT and INSERT privileges on the table

If the EXPLAIN statement is dynamically prepared, the authorization rules that apply are those defined for dynamically preparing the specified SQL statement. In addition, the SQL authorization ID of the

process or the role this is associated with the process (if the EXPLAIN statement is running in a trusted context that specifies the ROLE AS OBJECT OWNER AND QUALIFIER clause) must also have one of the following characteristics:

- Be the creator of a plan table named PLAN_TABLE
- Have an alias on a plan table named *creator*.PLAN_TABLE and have SELECT and INSERT privileges on the table

For EXPLAIN statements with the PLAN and ALL keywords, the privilege set that is defined below must include at least one of the following:

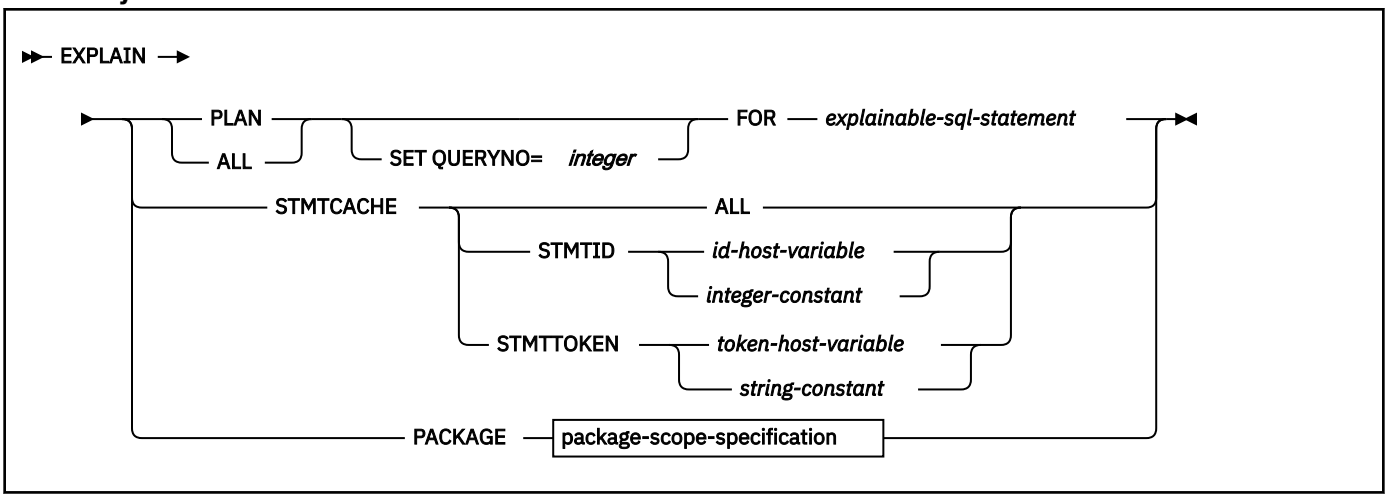
- EXPLAIN
- SQLADM
- System DBADM
- The authorization rules that are defined for the SQL statement specified in the EXPLAIN statement. For example, the authorization rules that apply when EXPLAIN records are captured for a DELETE statement are the authorization rules for the DELETE statement.

The authorization rules are different if the STMTCACHE keyword is specified. The privilege set must include at least one of the following:

- SQLADM authority
- SYSADM authority
- The authority that is required to share the cached statement.
- System DBADM authority

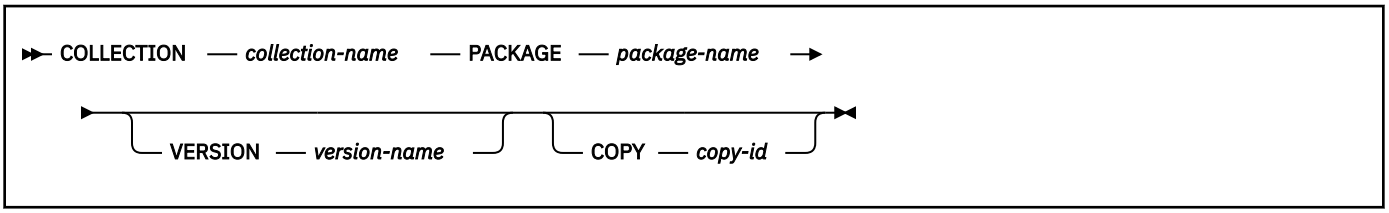
For EXPLAIN statements that contain the STMTCACHE ALL clause, the privilege set must include at least one of the following:

- SQLADM authority
- System DBADM authority
- SYSADM authority



If the privilege set does not have the required authority, EXPLAIN records are captured only those statements that have the same authorization ID as the privilege set.

For the PACKAGE keyword, the privilege set must include at least one of the following:



- SQLADM authority
- SYSADM authority
- SYSOPR authority
- SYSCTRL authority

Privilege set: The privilege set comprises the union of authorities that are held by the authorization IDs of the process. If the process is running in a trusted context with a role, this role would be included as an authorization ID of the process.

Syntax

package-scope-specification:

Description

PLAN

Specifies that access path information is captured for the SQL statement. Under this option, Db2 uses the access path selection process to generate the EXPLAIN records for the statement.

One row is inserted into the PLAN_TABLE for each step used in executing *explainable-sql-statement*. The steps for enforcing referential constraints are not included.

If a statement table exists, one row that provides a cost estimate of processing the explainable statement is inserted into the statement table. If the explainable statement is a SELECT FROM *data-change-statement*, two rows are inserted into the statement table.

If a function table exists, one row is inserted into the function table for each user-defined function that is referred to by the explainable statement.

If additional EXPLAIN tables exist, rows are also inserted into those tables.

Related reference:

EXPLAIN tables (Db2 Performance)
PLAN_TABLE (Db2 Performance)
DSN_STATEMNT_TABLE (Db2 Performance)
DSN_FUNCTION_TABLE (Db2 Performance)

ALL
Has the same effect as PLAN.

SET QUERYNO = *integer*
Associates *integer* with *explainable-sql-statement*. The column QUERYNO is given the value *integer* in every row inserted into the plan table, statement table, or function table by the EXPLAIN statement. If QUERYNO is not specified, Db2 itself assigns a number. For an embedded EXPLAIN statement, the number is the statement number that was assigned by the precompiler and placed in the DBRM.

FOR *explainable-sql-statement*

Specifies the text of an SQL statement for which EXPLAIN records are captured. *explainable-sql-statement* can be any explainable SQL statement. If the EXPLAIN statement is embedded in a program, the statement can contain references to host variables. If EXPLAIN is dynamically prepared, the statement can contain parameter markers. Host variables that appear in the statement must be defined in the statement's program.

The statement must refer to objects at the current server.

explainable-sql-statement must not contain a QUERYNO clause. To specify the value of the QUERYNO column, use the SET QUERYNO = *integer* clause of the EXPLAIN statement.

explainable-sql-statement cannot be a statement-name or a host-variable. To use capture EXPLAIN records for dynamic SQL statements, you must prepare the entire EXPLAIN statement dynamically.

To obtain information about an explainable SQL statement that references a declared temporary table, the EXPLAIN statement must be executed in the same application process in which the table was declared. For static EXPLAIN statements, the information is not obtained at bind-time but at run time when the EXPLAIN statement is incrementally bound.

STMTCACHE

Specifies that EXPLAIN records for the specified dynamic SQL statements in the dynamic statement cache are extracted and written to EXPLAIN tables. Under this option, no new access path selection processing occurs. The EXPLAIN records are extracted from the existing access paths that were selected when the dynamic SQL statements were prepared and entered the statement cache. In a data-sharing environment, the EXPLAIN records are extracted from the dynamic statement cache of the data sharing member where EXPLAIN STMTCACHE statement is executed.

ALL

Specifies that EXPLAIN records are extracted for all cached statements. STMTCACHE ALL returns one row for each cached statement to the DSN_STATEMENT_CACHE_TABLE. These rows contain identifying information about the statements in the cache, as well as statistics that reflect the execution of the statements by all processes that have executed the statement. Records are not returned to other EXPLAIN tables when STMTCACHE ALL is specified.

STMTID *id-host-variable* or *integer-constant*

Specifies that EXPLAIN records are extracted for the cached statement with the specified statement ID. The value contained in *id-host-variable* or specified by *integer-constant* identifies the statement ID. STMTCACHE STMTID returns rows to the following EXPLAIN tables:

- PLAN_TABLE
- DSN_STATEMNT_TABLE
- DSN_FUNCTION_TABLE
- DSN_STATEMENT_CACHE_TABLE

The statement ID is an integer that uniquely identifies a statement that has been cached in the dynamic statement cache. The statement ID of a cached statement can be retrieved through IFI monitor facilities from IFCID 0316 or 0124. Some diagnostic trace records, such as IFCIDs 0173, 0196, and 0337, also show the statement ID.

The QUERYNO column of each EXPLAIN table record that is returned contains the statement ID value.

STMTTOKEN *id-host-variable* or *string-constant*

Specifies that EXPLAIN records are extracted for the cached statements with the specified statement token and written to certain EXPLAIN tables. The value contained in *token-host-variable* or specified by *string-constant* identifies the statement token. STMTCACHE STMTTOKEN writes records to the following EXPLAIN tables:

- PLAN_TABLE
- DSN_STATEMNT_TABLE
- DSN_FUNCTION_TABLE

- DSN_STATEMENT_CACHE_TABLE

The statement token must be a character string that is no longer than 240 bytes. The application program that originally prepares and inserts a statement into the cache associates a statement token with the cached statement. The program can make this association with the RRSAF SET_ID function, or the sqleseti API if the program is connected remotely.

The STMTTOKEN column of each PLAN_TABLE record that is returned contains the statement token value. The QUERYNO column of each EXPLAIN table record that is returned contains the statement ID value.

Related information:

DSN_STATEMENT_CACHE_TABLE (Db2 Performance)
Capturing reoptimized access paths (Db2 Performance)

PACKAGE

Specifies that EXPLAIN records for all static SQL statements in the package that matches the specified scope are extracted and written to EXPLAIN tables. Under this option, no new access path selection processing occurs. The records are extracted from the existing access paths that were selected when the package was bound. The EXPLAIN information is added to the PLAN_TABLE that is owned by the current user. Other EXPLAIN tables are not populated.

No EXPLAIN records are extracted from packages that are bound prior to DB2 Version 9.1 for z/OS.

COLLECTION *collection-name*

Specifies that EXPLAIN records are captured only for statements under the specified *collection-name*. *collection-name* is a string constant or a host variable that represents the collection name.

PACKAGE *package-name*

Specifies that EXPLAIN records are captured only for statements under the specified *package-name*. *package-name* is a string constant or a host variable that represents the package name.

VERSION *version-name*

Specifies that EXPLAIN records are captured only for statements under the specified *version-name*. *version-name* is a string constant or a host variable that represents the version name. If *version-name* is all blanks or an empty string, records are captured only for those versions of the package that contain all blanks for the version name.

If the VERSION clause is not specified, EXPLAIN records are captured for statements in all versions of the package *package-name*.

COPY *copy-id*

Specifies that EXPLAIN records are captured only for statements under the specified *copy-id*. *copy-id* must be one of the following values:

- CURRENT
- PREVIOUS
- ORIGINAL

If the COPYID clause is not specified, statements, EXPLAIN records are captured for all copies that exist for that package (CURRENT, PREVIOUS, and ORIGINAL).

The HINT_USED column in the PLAN_TABLE is populated with `EXPLAIN PACKAGE: copy-id`. *copy-id* in the HINT_USED column will be one of the following values:

- "0" - the current copy
- "1" - the previous copy
- "2" - the original copy

Notes

Output from EXPLAIN:

Db2 inserts one or more rows of data into a plan table and other existing *EXPLAIN tables*.

For a list of all EXPLAIN tables, see EXPLAIN tables (Db2 Performance).

A plan table must exist before the operation that results in EXPLAIN output. You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library.

Unless you need the information that is provided by the additional EXPLAIN tables, it is not necessary to create those tables to use EXPLAIN. However, a statement cache table is required when the STMTCACHE ALL keyword is specified as part of an EXPLAIN statement.

Db2 uses the access path selection process to generate EXPLAIN records only for certain types of EXPLAIN statements, as shown in the following table.

Table 213. Origin of EXPLAIN records for various EXPLAIN statement options

Options Specified	How Db2 Creates EXPLAIN records
`EXPLAIN PLAN FOR` *`explainable-sql-statement`*	Uses the access path selection process to generate the EXPLAIN records
`EXPLAIN PACKAGE ...`	Extracts existing access path information from the package to create the EXPLAIN records.
`EXPLAIN STMTCACHE ...`	Extracts access path information from the dynamic statement cache to create the EXPLAIN records.

Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods.

Instances of these tables might also be created and used by certain optimization tools. For information about the meanings of different values in plan table and other EXPLAIN tables, see .

For information about how to correlate information across EXPLAIN tables, see Correlating information across EXPLAIN tables (Db2 Performance).

EXPLAIN tables might contain names that begin with "DSN" that have been generated by Db2.

Important: Do not manually manipulate the data in EXPLAIN tables that are created by optimization tools.

Column access control or row permissions enforced for EXPLAIN tables:

Column access control and row permissions can be enforced for EXPLAIN tables. However, row permissions and column masks are not applied when Db2 inserts rows into those tables.

If the specified statement references tables for which row or column access control is activated, the following information from row permission and column mask definitions created for the tables might appear in the EXPLAIN tables:

- DSN_FUNCTION_TABLE - user-defined functions
- DSN_PREDICAT_TABLE - predicates (except predicates in CASE WHEN clauses)
- DSN_STRUCT_TABLE - query blocks
- PLAN_TABLE - access path of subqueries

In addition, the complete or partial definition text might appear in EXPLAIN tables like DSN_FUNCTION_TABLE, DSN_PREDICAT_TABLE, DSN_QUERY_TABLE, DSN_SORTKEY_TABLE, DSN_STATEMENT_CACHE_TABLE, and DSN_STATEMENT_RUNTIME_INFO.

Impact to the existing access paths when the table has enforced column access control or row permissions:

The predicates from the row permissions are considered in the access path selection. Therefore, they are shown in the EXPLAIN tables for the performance tuning purpose.

Impact to EXPLAIN tables when referencing a non-existing object in a dynamic SQL statement
In some situations in which EXPLAIN is run on a dynamic SQL statement that references a non-existent object, a SQLCODE -204 is issued to indicate that the object is not defined in the Db2 subsystem. However, changes to the related EXPLAIN tables might not be rolled back.

Considerations when capturing EXPLAIN records for the acceleration of rowset queries:
A rowset query cannot be passed to an accelerator server for processing in the following cases:

- If the rowset query is run remotely
- If the rowset query is declared WITH RETURN
- If the rowset query is run under an SQL PL routine

You cannot use a static EXPLAIN statement to determine whether a rowset query is passed to an accelerator server, because you cannot specify the WITH ROWSET POSITIONING cursor attribute for a static EXPLAIN statement. Instead, you must use a dynamic EXPLAIN statement, where the WITH ROWSET POSITIONING clause is specified in the attribute string. You also can specify the WITH RETURN clause in the attribute string to see the ineligibility of result sets.

Also, the EXPLAIN statement cannot be used to determine that a rowset query cannot be passed to an accelerator server because the query is being run remotely or under an SQL PL routine. If the PREPARE of the EXPLAIN statement is run locally, Db2 determines if the rowset query can be accelerated as a local query offload. However, if the PREPARE of the EXPLAIN statement runs remotely, Db2 indicates that the rowset query cannot be accelerated. Instead, you can use the CURRENT EXPLAIN MODE special register to determine the behavior for eligible dynamic SQL statements during application execution. For more information, see “CURRENT EXPLAIN MODE” on page 182.

EXPLAIN tables

Examples

Example 1: Determine the steps required to execute the query 'SELECT X.ACTNO...'. Assume that no set of rows in the PLAN_TABLE has the value 13 for the QUERYNO column.

```
EXPLAIN PLAN SET QUERYNO = 13
FOR SELECT X.ACTNO, X.PROJNO, X.EMPNO, Y.JOB, Y.EDLEVEL
    FROM DSN8B10.EMPPROJACT X, DSN8B10.EMP Y
       WHERE X.EMPNO = Y.EMPNO
          AND X.EMPTIME > 0.5
          AND (Y.JOB = 'DESIGNER' OR Y.EDLEVEL >= 12)
       ORDER BY X.ACTNO, X.PROJNO;
```

Example 2: Retrieve the information returned in Example 1. Assume that a statement table exists, so also retrieve the estimated cost of processing the query. Use the following query, which joins the plan table and the statement table.

```
SELECT * FROM PLAN_TABLE A, DSN_STATEMNT_TABLE B
  WHERE A.QUERYNO = 13 and B.QUERYNO = 13
  ORDER BY A.QBLOCKNO, A.PLANNO, A.MIXOPSEQ;
```

Example 3: Extract existing access path information to capture EXPLAIN records for the cached statement with statement ID 124. Assume that host variable SID contains 124.

```
EXPLAIN STMTCACHE STMTID :SID;
```

Example 4: Extract existing access path information to capture one row of EXPLAIN data for each statement in the dynamic statement cache. The records are written only to the DSN_STATEMENT_CACHE_TABLE.

```
EXPLAIN STMTCACHE ALL;
```

Example 5: Assume that you want to use the plan table that was created by ADMF001 and your authorization ID is SYSADM. If you have an alias on ADMF001.PLAN_TABLE (CREATE ALIAS SYSADM.PLAN_TABLE FOR ADMF001.PLAN_TABLE) and sufficient INSERT and SELECT privileges on the table, the following EXPLAIN statement will execute and ADMF001.PLAN_TABLE will be populated.

```
EXPLAIN PLAN SET QUERYNO = 101
  FOR SELECT * FROM DSN8B10.EMP;
```

Example 6: Extract existing access path information to capture EXPLAIN records to the current user's PLAN_TABLE for all static SQL statements in the current copy of the package 'COLLA.PACK52604':

```
EXPLAIN PACKAGE COLLECTION 'COLLA' PACKAGE 'PACK52604' COPY 'CURRENT';
```

EXPLAIN bind option (Db2 Commands)

FETCH

The FETCH statement positions a cursor on a row of its result table. It can return zero, one, or multiple rows and assigns the values of the rows to variables if there is a target specification.

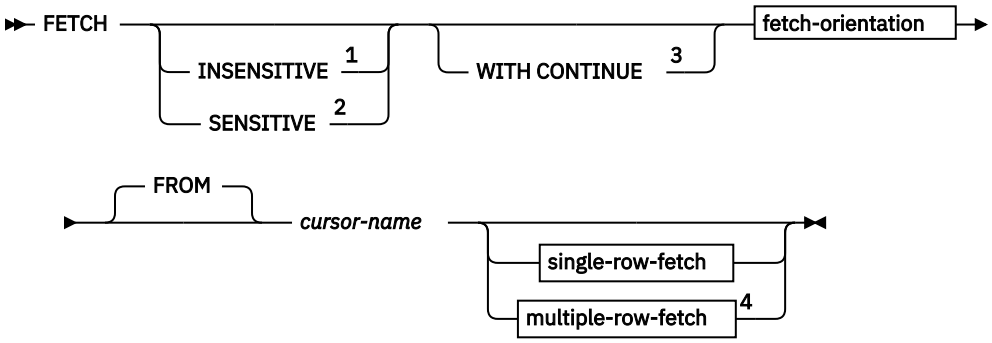
Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. Multiple row fetch is not supported in REXX, Fortran, or SQL Procedure applications[38]. The FETCH statement with the WITH CONTINUE clause is not supported in REXX.

Authorization

See "DECLARE CURSOR" on page 1643 for an explanation of the authorization required to use a cursor.

For an assignment to a global variable, the privilege set must include at least one of the following:



- The WRITE privilege on the variable
- Ownership of the variable
- DATAACCESS authority
- SYSADM authority

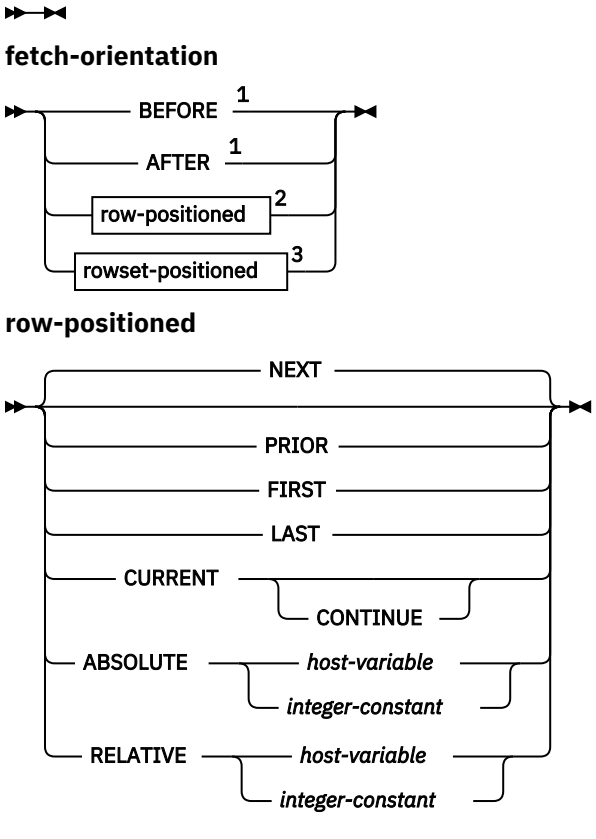
Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in DYNAMICRULES behaviors and authorization checking. For more information on these behaviors,

[38] ASSEMBLER and other languages are supported, but this support is limited to statements that allow USING DESCRIPTOR. The precompiler does not recognize host-variable-arrays except in C/C++, COBOL, and PL/I.

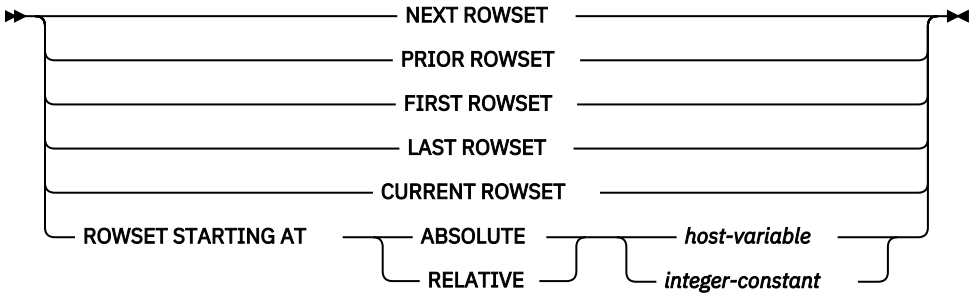
including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.

Syntax

Notes:



[1] The default depends on the sensitivity of the cursor. If INSENSITIVE is specified on the DECLARE CURSOR, then the default is INSENSITIVE and if SENSITIVE is specified on the DECLARE CURSOR, then the default is SENSITIVE.

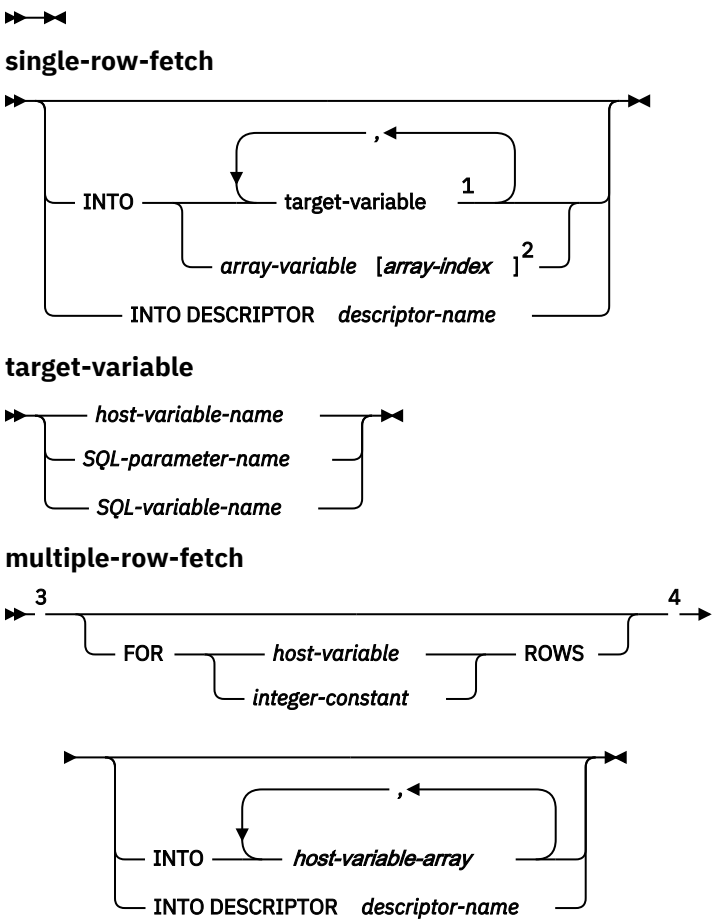


[2] If INSENSITIVE or SENSITIVE is specified, *single-row-fetch* or *multiple-row-fetch* must be specified.

[3] If WITH CONTINUE is specified, *single-row-fetch* must be specified.

[4] If *multiple-row-fetch* is specified, a *rowset-positioned* fetch orientation must also be specified.

fetch-orientation



Notes:

[1] If BEFORE or AFTER is specified, SENSITIVE, INSENSITIVE, *single-row-fetch*, or *multiple-row-fetch* must not be specified.
[2] A row-positioned fetch orientation can be specified only if *multiple-row-fetch* is not specified.
[3] If *multiple-row-fetch* is specified, a rowset-positioned fetch orientation must also be specified.

fetch-type

Notes:

[1] For single-row-fetch, a host-variable-array can be specified instead of a host variable and the descriptor can describe host-variable-arrays. In either case, data is returned only for the first entry of the host-variable-array.
[2] An array element must only be specified in an SQL PL context.
[3] This clause must not be specified if a *row-positioned* fetch orientation or if no fetch orientation was specified.

[4] This clause is optional. If this clause is not specified and either a rowset size has not been established yet or a row positioned FETCH statement was the last type of FETCH statement issued for this cursor, the rowset size is implicitly one. If the last FETCH statement issued for this cursor was a rowset positioned FETCH statement and this clause is not specified, the rowset size is the same size as the previous rowset positioned FETCH.

Description

INSENSITIVE

Returns the row from the result table as it is. If the row has been previously fetched with a FETCH SENSITIVE, it reflects changes made outside this cursor before the FETCH SENSITIVE statement was issued. Positioned updates and deletes are reflected with FETCH INSENSITIVE if the same cursor was used for the positioned update or delete.

INSENSITIVE can only be specified for cursors declared as INSENSITIVE or SENSITIVE STATIC (or if the cursor is declared as ASENSITIVE and Db2 defaults to INSENSITIVE). Otherwise, if the cursor is declared as SENSITIVE DYNAMIC (or if the cursor is declared as ASENSITIVE and Db2 defaults to SENSITIVE DYNAMIC), an error occurs and the FETCH statement has no effect. For an INSENSITIVE cursor, specifying INSENSITIVE is optional because it is the default.

SENSITIVE

Updates the fetched row in the result table from the corresponding row in the base table of the cursor's SELECT statement and returns the current values. Thus, it reflects changes made outside this cursor. SENSITIVE can only be specified for a sensitive cursor. Otherwise, if the cursor is insensitive, an error occurs and the FETCH statement has no effect. For a SENSITIVE cursor, specifying SENSITIVE is optional because it is the default.

When the cursor is declared as SENSITIVE STATIC and a FETCH SENSITIVE is requested, the following steps are taken:

1. Db2 retrieves the row of the database that corresponds to the row of the result table that is about to be fetched.
2. If the corresponding row has been deleted, a "delete hole" occurs in the result table, a warning is issued, the cursor is repositioned on the "hole", and no data is fetched. (Db2 marks a row in the result table as a "delete hole" when the corresponding row in the database is deleted.)
3. If the corresponding row has not been deleted, the predicate of the underlying SELECT statement is re-evaluated. If the row no longer satisfies the predicate, an "update hole" occurs in the result table, a warning is issued, the cursor is repositioned on the "hole," and no data is fetched. (Db2 marks a row in the result table as an "update hole" when an update to the corresponding row in the database causes the row to no longer qualify for the result table.)
4. If the corresponding row does not result in a delete or an update hole in the result table, the cursor is repositioned on the row of the result table and the data is fetched.

WITH CONTINUE

Specifies that the Db2 subsystem should prepare to allow subsequent FETCH CURRENT CONTINUE operations to access any truncated LOB or XML result column following an initial FETCH operation that provides output variables that are not large enough to hold the entire LOB or XML columns. When the WITH CONTINUE clause is specified, the Db2 subsystem takes the following actions that can differ from the case where the FETCH statement does not include the WITH CONTINUE clause:

- If truncation occurs when returning an XML or LOB column, the Db2 subsystem will remember the truncation position and will not discard the remaining data.
- If truncation occurs when returning an XML or LOB column, the Db2 subsystem returns the total length that would have been required to hold all of the data of the LOB or XML column. This will either be in the first four bytes of the LOB host variable structure or in the 4 byte area that is pointed to by the SQLDATALEN pointer in the SQLVAR entry of the SQLDA for that host variable. What is returned depends on the programming method that is used. See “SQL descriptor area (SQLDA)” on page 2095 for details about the SQLDA contents.

- If returning XML data, the result column will be fully materialized in the database before the data is returned.

If the CURRENT CONTINUE clause is specified, the WITH CONTINUE behavior is assumed.

AFTER
Positions the cursor after the last row of the result table. Values are not assigned to host variables. The number of rows of the result table are returned in the SQLERRD1 and SQLERRD2 fields of the SQLCA for cursors with an effective sensitivity of INSENSITIVE or SENSITIVE STATIC.

BEFORE
Positions the cursor before the first row of the result table. Values are not assigned to host variables.

row-positioned
Positioning of the cursor with row-positioned fetch orientations NEXT, PRIOR, CURRENT and RELATIVE is done in relation to the current cursor position. Following a successful row-positioned FETCH statement, the cursor is positioned on a single row of data. If the cursor is enabled for rowsets, positioning is performed relative to the current row or the first row of the current rowset, and the cursor is positioned on a rowset consisting of a single row.

NEXT
Positions the cursor on the next row or rows of the result table relative to the current cursor position, and returns data if a target is specified. NEXT is the only row-positioned fetch operation that can be explicitly specified for cursors that are defined as NO SCROLL. NEXT is the default if no other cursor positioning is specified. If a specified row reflects a hole, a warning is issued and data values are not assigned to host variables for that row.

Table 214 on page 1743 lists situations for different cursor positions and the results when NEXT is used.

Table 214. Results when NEXT is used with different cursor positions

Current state of the cursor	Result of FETCH NEXT
Before the first row	Cursor is positioned on the first row"1" on page 1743 and data is returned if requested.
On the last row or after the last row	A warning occurs, values are not assigned to host variables, and the cursor position is unchanged.
Before a hole	For a SENSITIVE STATIC cursor, a warning occurs for a delete hole or an update hole, values are not assigned to host variables, and the cursor is positioned on the hole.
Unknown	An error occurs, values are not assigned to host variables, and the cursor position remains unknown.

Note:

1. This row is not applicable in the case of a forward-only cursor (that is when NO SCROLL was specified implicitly or explicitly).

PRIOR
Positions the cursor on the previous row or rows of the result table relative to the current cursor position, and returns data if a target is specified. If a specified row reflects a hole, a warning is issued, and data values are not assigned to host variables for that row.

Table 215 on page 1744 lists situations for different cursor positions and the results when PRIOR is used.

Table 215. Results when PRIOR is used with different cursor positions

Current state of the cursor	Result of FETCH PRIOR
Before the first row or on the first row	A warning occurs, values are not assigned to host variables, and the cursor position is unchanged.
After a hole	For a SENSITIVE STATIC cursor, a warning occurs for a delete hole or an update hole, values are not assigned to host variables, and the cursor is positioned on the hole.
After the last row	Cursor is positioned on the last row.
Unknown	An error occurs, values are not assigned to host variables, and the cursor position remains unknown.

FIRST
Positions the cursor on the first row of the result table, and returns data if a target is specified. For a SENSITIVE STATIC cursor, if the first row of the result table is a hole, a warning occurs for a delete hole or an update hole and values are not assigned to host variables.

LAST
Positions the cursor on the last row of the result table, and returns data if a target is specified. The number of rows of the result table is returned in the SQLERRD1 and SQLERRD2 fields of the SQLCA for an insensitive or sensitive static cursor. For a SENSITIVE STATIC cursor, if the last row of the result table is a hole, a warning occurs for a delete hole or an update hole and values are not assigned to host variables.

CURRENT
The cursor position is not changed, data is returned if a target is specified. If the cursor was positioned on a rowset of more than one row, the cursor position is on the first row of the rowset.

Table 216 on page 1744 lists situations in which errors occur with the CURRENT clause.

Table 216. Situations in which errors occur with CURRENT

Current state of the cursor	Result of FETCH CURRENT
Before the first row or after the last row	A warning occurs, values are not assigned to host variables, and the cursor position is unchanged.
On a hole	For a SENSITIVE STATIC, a warning occurs for a delete hole or an update hole, values are not assigned to host variables, and the cursor is positioned on the hole. If the cursor is defined as a rowset cursor, with isolation level UR or a sensitive dynamic scrollable cursor, it is possible that a different row will be returned than the FETCH that established the most recent cursor position. This can occur while fetching a row again when it is determined to not be there anymore. In this case, fetching continues moving forward to get the row of data.
Unknown	An error occurs, values are not assigned to host variables, and the cursor position remains unknown.

CONTINUE

The cursor positioning is not changed, and data is returned if a target is specified. The FETCH CURRENT CONTINUE statement retrieves remaining data for any LOB or XML column result values that were truncated on a previous FETCH or FETCH CURRENT CONTINUE statement. It assigns the remaining data for those truncated columns to the host variables that are referenced in the statement or pointed to by the descriptor. The data that is returned for previously-truncated result values begins at the point of truncation. This form of the CURRENT clause must only be used after a single-row FETCH WITH CONTINUE or FETCH CURRENT CONTINUE statement that has returned partial data for one or more LOB or XML columns. The cursor must be open and positioned on a row.

FETCH CURRENT CONTINUE must pass host variables entries for all columns in the SELECT list, even though the non-LOB columns or non-XML columns will not return any data.

ABSOLUTE

host-variable or *integer-constant* is assigned to an integral value *k*. If a *host-variable* is specified, it must be an exact numeric type with zero scale and must not include an indicator variable. The possible data types for the host variable are DECIMAL(*n*,0) or integer. The DECIMAL data type is limited to DECIMAL(18,0). An *integer-constant* can be up to 31 digits, depending on the application language.

If *k*=0, the cursor is positioned before the first row of the result table. Otherwise, ABSOLUTE positions the cursor to row *k* of the result table if *k*>0, or to *k* rows from the bottom of the table if *k*<0. For example, "ABSOLUTE -1" is the same as "LAST".

Data is returned if the specified position is within the rows of the result table, and a target is specified.

If an absolute position is specified that is before the first row or after the last row of the result table, a warning occurs, values are not assigned to host variables, and the cursor is positioned either before the first row or after the last row. If the resulting cursor position is after the last row for INSENSITIVE and SENSITIVE STATIC scrollable cursors, the number of rows of the result table are returned in the SQLERRD1 and SQLERRD2 fields of the SQLCA. If row *k* of the result table is a hole, a warning occurs and values are not assigned to host variables.

FETCH ABSOLUTE 0 results in positioning before the first row and a warning is issued. FETCH BEFORE results in positioning before the first row and no warning is issued.

Table 217 on page 1745 lists some synonymous specifications.

Table 217. Synonymous scroll specifications for ABSOLUTE

Specification	Alternative
ABSOLUTE 0 (but with a warning)	BEFORE (without a warning)
ABSOLUTE +1	FIRST
ABSOLUTE -1	LAST
ABSOLUTE -*m*, 0<m≤*n*	ABSOLUTE *n*+1-*m*
ABSOLUTE *n*	LAST
ABSOLUTE -*n*	FIRST
ABSOLUTE *x* (with a warning)	AFTER (without a warning)
ABSOLUTE -*x* (with a warning)	BEFORE (without a warning)

Note: Assume: 0<=*m*<=*n*<*x* Where, *n* is the number of rows in the result table.

RELATIVE

host-variable or *integer-constant* is assigned to an integral value *k*. If a *host-variable* is specified, it must be an exact numeric type with zero scale and must not include an indicator variable. The

possible data types for the host variable are DECIMAL(*n*,0) or integer. The DECIMAL data type is limited to DECIMAL(18,0).

If the cursor is positioned before the first row, or after the last row of the result table, the cursor position is determined as follows:

- If *n* is 0, the cursor position is unchanged, values are not assigned to host variables, and a warning occurs
- If *n* is positive, and the cursor is positioned before the first row, the cursor is positioned on a rowset starting at row *n*
- If *n* is positive, and the cursor is positioned after the last row, a warning occurs
- If *n* is negative, and the cursor is positioned before the first row, a warning occurs
- If *n* is negative, and the cursor is positioned after the last row, the cursor is positioned on a rowset starting as row *n* from the end of the result table

An *integer-constant* can be up to 31 digits, depending on the application language.

Data is returned if the specified position is within the rows of the result table, and a target is specified.

RELATIVE positions the cursor to the row in the result table that is either *k* rows after the current row if *k*>0, or ABS*(k)* rows before the current row if *k*<0. For example, "RELATIVE -1" is the same as "PRIOR". If *k*=0, the position of the cursor does not change (that is, "RELATIVE 0" is the same as "CURRENT").

If a relative position is specified that results in positioning before the first row or after the last row, a warning is issued, values are not assigned to host variables, and the cursor is positioned either before the first row or after the last row. If the resulting cursor position is after the last row for INSENSITIVE and SENSITIVE STATIC scrollable cursors, the number of rows of the result table is returned in the SQLERRD1 and SQLERRD2 fields of the SQLCA. If the cursor is positioned on a hole and RELATIVE 0 is specified or if the target row is a hole, a warning occurs and values are not assigned to host variables.

If the cursor is defined as a rowset cursor, with isolation level UR or a sensitive dynamic scrollable cursor, it is possible that a different row will be returned than the FETCH that established the most recent cursor position. This can occur while fetching a row again when it is determined to not be there anymore. In this case, fetching continues moving forward to get the row data.

If the cursor position is unknown and RELATIVE 0 is specified, an error occurs.

Table 218 on page 1746 lists some synonymous specifications.

Table 218. Synonymous Scroll Specifications for RELATIVE

Specification	Alternative
RELATIVE +1	NEXT
RELATIVE -1	PRIOR
RELATIVE 0	CURRENT
RELATIVE +*r* (with a warning)	AFTER (without a warning)
RELATIVE -*r* (with a warning)	BEFORE (without a warning)

Note: *r* has to be large enough to position the cursor beyond either end of the result table.

rowset-positioned

Positioning of the cursor with rowset-positioned fetch orientations NEXT ROWSET, PRIOR ROWSET, CURRENT ROWSET, and ROWSET STARTING AT RELATIVE is done in relation to the current cursor position. Following a successful *rowset-positioned* FETCH statement, the cursor is positioned on a

rowset of data. The number of rows in the rowset is determined either explicitly or implicitly. The FOR *n* ROWS clause in the multiple-row-fetch clause is used to explicitly specify the size of the rowset. Positioning is performed relative to the current row or first row of the current rowset, and the cursor is positioned on all rows of the rowset.

A rowset-positioned fetch orientation must not be specified if the current cursor position is not defined to access rowsets. NEXT ROWSET is the only rowset-positioned fetch orientation that can be specified for cursors that are defined as NO SCROLL.

If a row of the rowset reflects a hole, a warning is returned, data values are not assigned to host variable arrays for that row (that is, the corresponding positions in the target host variable arrays are untouched), and -3 is returned in all provided indicator variables for that row. If a hole is detected, and at least one indicator variable is not provided, an error occurs.

NEXT ROWSET

Positions the cursor on the next rowset of the result table relative to the current cursor position, and returns data if a target is specified. The next rowset is logically obtained by fetching the row that follows the current rowset and fetching additional rows until the number of rows that is specified implicitly or explicitly in the FOR n ROWS clause is obtained or the last row of the result table is reached.

If the cursor is positioned before the first row of the result table, the cursor is positioned on the first rowset.

If the cursor is positioned on the last row or after the last row of the result table, the cursor position is unchanged, values are not assigned to host variable arrays, and a warning occurs.

If a row of the rowset reflects a hole, the following actions occur:

- A warning is returned.
- Data values are not assigned to the host-variable-arrays for that row (that is, the corresponding positions in the target host-variable-arrays are untouched).
- A value of -3 is returned in all of the indicator variables that are provided for the row.

If a hole is detected and at least one indicator variable is not provided, an error is returned.

If the cursor is not positioned because of a prior error, values are not assigned to the host-variable-array, and an error is returned. If a row of the rowset would be after the last row of the result table, values are not assigned to host-variable-arrays for that row and any subsequent requested rows of the rowset, and a warning is returned.

NEXT ROWSET is the only rowset positioned fetch orientation that can be explicitly be specified for cursors that are defined as NO SCROLL.

PRIOR ROWSET

Positions the cursor on the previous rowset of the result table relative to the current position, and returns data if a target is specified.

The prior rowset is logically obtained by fetching the row that precedes the current rowset and fetching additional rows until the number of rows that is specified implicitly or explicitly in the FOR n ROWS clause is obtained or the last row of the result table is reached.

If the cursor is positioned after the last row of the result table, the cursor is positioned on the last rowset.

If the cursor is positioned before the first row or on the first row of the result table, the cursor position is unchanged, values are not assigned to host variable arrays, and a warning occurs.

If a row would be before the first row of the result table, the cursor is positioned on a partial rowset that consists of only those rows that are prior to the current position of the cursor starting with the first row of the result table, and a warning is returned. Values are not assigned to the host-variable-arrays for the rows in the rowset for which the warning is returned.

Although the rowset is logically obtained by fetching backwards from before the current rowset, the data is returned to the application starting with the first row of the rowset, to the end of the rowset.

If a row of the rowset reflects a hole, the following actions occur:

- A warning is returned.
- Data values are not assigned to the host-variable-arrays for that row (that is, the corresponding positions in the target host-variable-arrays are untouched).
- A value of -3 is returned in all of the indicator variables that are provided for the row.

If a hole is detected and at least one indicator variable is not provided, an error is returned.

If the cursor is not positioned because of a prior error, values are not assigned to the host-variable-array, and an error is returned.

FIRST ROWSET
Positions the cursor on the first rowset of the result table, and returns data if a target is specified.

If a row of the rowset reflects a hole, the following actions occur:

- A warning is returned.
- Data values are not assigned to the host-variable-arrays for that row (that is, the corresponding positions in the target host-variable-arrays are untouched).
- A value of -3 is returned in all of the indicator variables that are provided for the row.

If a hole is detected and at least one indicator variable is not provided, an error is returned.

If the result table contains fewer rows than specified implicitly or explicitly in the FOR *n* ROWS clause, values are not assigned to host-variable-arrays after the last row of the result table, and a warning is returned.

LAST ROWSET
Positions the cursor on the last rowset of the result table and returns data if a target is specified. The last rowset is logically obtained by fetching the last row of the result table and fetching prior rows until the number of rows in the rowset is obtained or the first row of the result table is reached. Although the rowset is logically obtained by fetching backwards from the bottom of the result table, the data is returned to the application starting with the first row of the rowset, to the end of the rowset, which is also the end of the result table.

If a row of the rowset reflects a hole, the following actions occur:

- A warning is returned.
- Data values are not assigned to the host-variable-arrays for that row (that is, the corresponding positions in the target host-variable-arrays are untouched).
- A value of -3 is returned in all of the indicator variables that are provided for the row.

If a hole is detected and at least one indicator variable is not provided, an error is returned.

If the result table contains fewer rows than specified implicitly or explicitly in the FOR *n* ROWS clause, the last rowset is the same as the first rowset, values are not assigned to host-variable-arrays after the last row of the result table, and a warning is returned.

CURRENT ROWSET
If the FOR *n* ROWS clause specifies a number different from the number of rows specified implicitly or explicitly in the FOR *n* ROWS clause on the most recent FETCH statement for this cursor, the cursor is repositioned on the specified number of rows, starting with the first row of the current rowset. If the cursor is positioned before the first row, or after the last row of the result table, the cursor position is unchanged, values are not assigned to host variable arrays, and a warning occurs. If the FOR *n* ROWS clause is not specified, it is possible that the FETCH statement will position the cursor on a partial rowset when the FETCH CURRENT ROWSET statement is processed. In this case, Db2 attempts to position the cursor on a full rowset starting

with the first row of the current rowset. Otherwise, the position of the cursor on the current rowset is unchanged. Data is returned if a target is specified.

With isolation level UR or a sensitive dynamic scrollable cursor, it is possible that different rows will be returned than the FETCH that established the most recent rowset cursor position. This can occur while refetching the first row of the rowset when it is determined to not be there anymore. In this case, fetching continues moving forward to get the first row of data for the rowset. This can also occur when changes have been made to other rows in the current rowset such that they no longer exist or have been logically moved within (or out of) the result table of the cursor.

If the cursor is not positioned because of a prior error, values are not assigned to the host-variable-array, and an error occurs.

If the current rowset contains fewer rows than specified implicitly or explicitly in the FOR *n* ROWS clause, values are not assigned to host-variable-arrays after the last row, and a warning is returned.

ROWSET STARTING AT ABSOLUTE or RELATIVE *host-variable* or *integer-constant*

Positions the cursor on the rowset beginning at the row of the result table that is indicated by the ABSOLUTE or RELATIVE specification, and returns data if a target is specified.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with scale zero, and must not include an indicator variable. The possible data types for the host variable are DECIMAL(n,0) or integer, where the DECIMAL data type is limited to DECIMAL(18,0). If a constant is specified, the value must be an integer.

If a row of the result table would be after the last row or before the first row of the result table, values are not assigned to host-variable-arrays for that row and a warning is returned.

ABSOLUTE

If k=0, an error occurs. If k>0, the first row of the rowset is row k. If k<0, the rowset is positioned on the ABS(k) rows from the bottom of the result table. Assume that ABS(k) is equal to the number of rows for the rowset and that there are enough row to return a complete rowset:

- FETCH ROWSET STARTING AT ABSOLUTE -k is the same as FETCH LAST ROWSET.
- FETCH ROWSET STARTING AT ABSOLUTE 1 is the same as FETCH FIRST ROWSET.

RELATIVE

If k=0 and the FOR *n* ROWS clause does not specify a number different from the number most recently specified implicitly or explicitly for this cursor, then the position of the cursor does not change (that is, "RELATIVE ROWSET 0" is the same as "CURRENT ROWSET"). If k=0 and the FOR *n* ROWS clause specifies a number different from the number most recently specified implicitly or explicitly for this cursor, then the cursor is repositioned on the specified number of rows, starting with the first row of the current rowset.

If the cursor is positioned before the first row, or after the last row of the result table, the cursor position is determined as follows:

- If n is 0, the cursor position is unchanged, values are not assigned to host variables, and a warning occurs. This is the same as FETCH CURRENT ROWSET.
- If *n* is positive, and the cursor is positioned before the first row, the cursor is positioned on a rowset starting a row *n*.
- If *n* is positive, and the cursor is positioned after the last row, a warning occurs.
- If *n* is negative, and the cursor is positioned before the first row, a warning occurs.
- If *n* is negative, and the cursor is positioned after the last row, the cursor is positioned on a rowset starting at row *n* from the bottom of the result table.

Otherwise, RELATIVE repositions the cursor so that the first row of the new rowset cursor position is on the row in the result table that is either k rows after the first row of the current rowset cursor position if k>0, or ABS(k) rows before the first row of the current rowset cursor position if k<0. Assume that ABS(k) is equal to the number of rows for the resulting rowset

- FETCH ROWSET STARTING AT RELATIVE -k is the same as FETCH PRIOR ROWSET.
- FETCH ROWSET STARTING AT RELATIVE k is the same as FETCH NEXT ROWSET.
- FETCH ROWSET STARTING AT RELATIVE 0 is the same as FETCH CURRENT ROWSET.

When ROWSET STARTING AT RELATIVE -n is specified and there are not enough rows between the current position of the cursor and the beginning of the result table to return a complete rowset:

- A warning is returned.
- Values are not assigned to the host-variable-arrays.
- The cursor is positioned before the first row.

If a row of the rowset reflects a hole, If a row of the rowset reflects a hole, the following actions occur:

- A warning is returned.
- Data values are not assigned to the host-variable-arrays for that row (that is, the corresponding positions in the target host-variable-arrays are untouched).
- A value of -3 is returned in all of the indicator variables that are provided for the row.

If a hole is detected and at least one indicator variable is not provided, an error is returned. If a row of the rowset is unknown, values are not assigned to host variable arrays for that row, and an error is returned. If a row of the rowset would be after the last row or before the first row of the result table, values are not assigned to host-variable-arrays for that row, and a warning is returned.

cursor-name
Identifies the cursor to be used in the fetch operation. The cursor name must identify a declared cursor, as explained in the description of the DECLARE CURSOR statement in "DECLARE CURSOR" on page 1643, or an allocated cursor, as explained in "ALLOCATE CURSOR" on page 1012. When the FETCH statement is executed, the cursor must be in the open state.

If a single-row-fetch or multiple-row-fetch clause is not specified, the cursor position is adjusted as specified, but no data is returned to the user.

single-row-fetch
When *single-row-fetch* is specified, SENSITIVE or INSENSITIVE can be specified though there is a default. The default depends on the sensitivity of the cursor. If the sensitivity of the cursor is INSENSITIVE, then the default is INSENSITIVE. If the effective sensitivity of the cursor is SENSITIVE DYNAMIC or SENSITIVE STATIC, then the default is SENSITIVE. The single-row-fetch or multiple-row-fetch clause must not be specified when the FETCH BEFORE or FETCH AFTER option is specified. They are required when FETCH BEFORE or FETCH AFTER is not specified. If an individual fetch operation causes the cursor to be positioned or to remain positioned on a row if there is a target specification, the values of the result table are assigned to host variables as specified by the single-fetch-clause.

INTO *target-variable* or *array-variable*[*array-index*]
Identifies one or more targets for the assignment of output values. The number of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list according to the rules described in "Assignment and comparison" on page 135.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

***array-variable* [*array-index*]**
Specifies an array element that is the target of the assignment.

array-variable
Specifies and array variable.

[*array-index*]
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

INTO DESCRIPTOR *descriptor-name*
Identifies an SQLDA that contains a valid description of the host output variables. Result values from the associated SELECT statement are returned to the application program in the output host variables.

Before the FETCH statement is processed, you must set the following fields in the SQLDA:

- SQLN to indicate the number of SQLVAR occurrences provided in the SQLDA

  A REXX SQLDA does not contain this field.
- SQLABC to indicate the number of bytes of storage allocated in the SQLDA
- SQLD to indicate the number of variables used in the SQLDA when processing the statement
- SQLVAR occurrences to indicate the attributes of the variables

The SQLDA must have enough storage to contain all SQLVAR occurrences. Each SQLVAR occurrence describes a host variable or buffer into which a value in the result table is to be assigned. If LOBs are present in the results, there must be additional SQLVAR entries for each column of the result table. If the result table contains only base types and distinct types, multiple SQLVAR entries are not needed for each column. However, extra SQLVAR entries are needed for distinct types as well as for LOBs in DESCRIBE and PREPARE INTO statements. For more information on the SQLDA, which includes a description of the SQLVAR and an explanation on how to determine the number of SQLVAR occurrences, see "SQL descriptor area (SQLDA)" on page 2095.

SQLD must be set to a value greater than or equal to zero and less than or equal to SQLN.

See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

multiple-row-fetch

Retrieves multiple rows of data from the result table of a query. The FOR *n* ROWS clause of the FETCH statement controls how many rows are returned on a single FETCH statement. The fetch orientation determines whether the resulting cursor position (for example, on a single row, rowset, before, or after the result table). Fetching stops when an error is returned, all requested rows are fetched, or the end of data condition is reached.

Fetching multiple rows of data can be done with scrollable or non-scrollable cursors. The operations used to define, open, and close a cursor used for fetching multiple rows of data are the same as for those used for single row FETCH statements.

If the BEFORE or AFTER option is specified, neither single-row-fetch or multiple-row-fetch can be specified.

FOR *host-variable* or *integer-constant* ROWS

host-variable or *integer-constant* is assigned to an integral value *k*. If a host variable is specified, it must be an exact numeric type with a scale of zero and must not include an indicator variable. Furthermore, *k* must be in the range, 0<k<=32767.

This clause must not be specified if a row-positioned fetch-orientation clause was specified. This clause must also not be specified for a cursor that is defined without rowset access.

If a rowset fetch orientation is specified and this clause is not specified, the number of rows in the resulting rowset is determined as follows:

- If the most recent FETCH statement for this cursor was a rowset-positioned FETCH, the number of rows of the rowset is implicitly determined by the number of rows that was most recently specified (implicitly or explicitly) for this cursor.
- When the most recent FETCH statement for this cursor was either FETCH BEFORE or FETCH AFTER and the most recent FETCH statement for this cursor prior to that was a rowset-positioned FETCH, the number of rows of the rowset is implicitly determined by the number of rows that were most recently specified (implicitly or explicitly) for this cursor.
- Otherwise, the rowset consists of a single row.

For result set cursors, the number of rows for a rowset cursor position, established in the procedure that defined the rowset, is not inherited by the caller when the rowset is returned. Use the FOR *n* ROWS clause on the first rowset FETCH statement for the result set in the calling program to establish the number of rows for the cursor. Otherwise, the rowset consists of a single row.

The cursor is positioned on the row or rowset that is specified by the orientation clause (for example, NEXT ROWSET), and those rows are fetched if a target is specified. After the cursor is positioned on the first row being fetched, the next k-1 rows are fetched. Fetching moves forward from the cursor position in the result table and continues until the end of data condition is returned, k-1 rows have been fetched, or an assignment error is returned.

The resulting cursor position depends on the fetch orientation that is specified:

- For a row-positioned fetch orientation, the cursor is positioned at the last row successfully retrieved.
- For a rowset-positioned fetch orientation, the cursor is positioned on all the rows retrieved.

The values from each individual fetch are placed in data areas that are described in the INTO or USING clause. If a target specification is provided for a rowset-positioned FETCH, the host variable arrays must be specified as the target specification, and the arrays must be defined with a dimension of 1 or greater. The target specification must be defined as an array for a rowset-positioned FETCH even if the number of rows that is specified implicitly or explicitly is one. See Diagnostics information for rowset positioned FETCH statements.

INTO *host-variable-array*

Identifies for each column of the result table a host-variable-array to receive the data that is retrieved with this FETCH statement. If the number of host-variable-arrays is less than the

number of columns of the result table, the SQLWARN3 field of the SQLCA is set to 'W'. No warning is given if there are more host-variable-arrays than the number of columns in the result table.

Each host-variable-array must be defined in the application program in accordance with the rules for declaring an array. A host-variable-array is used to return the values for a column of the result table. The number of rows to be fetched must be less than or equal to the dimension of each of the host-variable-arrays.

An optional indicator array can be specified for a host-variable-array. It should be specified if the SQLTYPE of any SQLVAR occurrence indicates that the column of the result table is nullable. Additionally, if an operation may result in null values, such as an UPDATE operation that results in a hole, is performed in the application, an indicator array should be specified. Otherwise an error occurs if null values are encountered. The indicators are returned as small integers.

INTO DESCRIPTOR *descriptor-name*

Identifies an SQLDA that must contain a valid description of zero or more host-variable-arrays or buffers into which the values for a column of the result table are to be returned.

Before the FETCH statement is processed, you must set the following fields in the SQLDA:

- SQLN to indicate the number of SQLVAR occurrences provided in the SQLDA.
- SQLABC to indicate the number of bytes of storage allocated for the SQLDA.
- SQLD to indicate the number of variables used in the SQLDA when processing the statement.
- SQLVAR occurrences to indicate the attributes of an element of the host-variable-array. Within each SQLVAR representing an array:
  - SQLTYPE indicates the data type of the elements of the host-variable-array.
  - SQLDATA field points to the first element of the host-variable-array.
  - The length fields (SQLLEN and SQLLONGLEN) are set to indicate the maximum length of a single element of the array.
  - SQLNAME - The length of SQLNAME must be set to 8, and the first two bytes of the data portion of SQLNAME must be initialized to X'0000'. The fifth and sixth bytes must contain a flag field and the seventh and eighth bytes must be initialized to a binary small integer (half word) representation of the dimension of the host-variable-array, and the corresponding indicator array, if one is specified.

  The SQLVAR entry for the number of rows must also contain a flag value. The number of rows to be fetched must be less than or equal to the dimension of each of the host variable arrays.

You set the SQLDATA and SQLIND pointers to the beginning of the corresponding arrays. The SQLDA must have enough storage to contain all SQLVAR occurrences. Each SQLVAR occurrence describes a host-variable-array or buffer into which the values for a column in the result table are to be returned. If any column of the result table is a LOB, two SQLVAR entries must be provided for each SQLVAR, and SQLN must be set to two times the number of SQLVARS. SQLD must be set to a value greater than or equal to zero and less than or equal to SQLN.

Notes

Assignment to targets:

The *n*th target identified by the INTO clause or described in the SQLDA corresponds to the *n*th column of the result table of the cursor. The data type of target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in “String representations of datetime values” on page 115. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, “Language elements,” on page 73. If the number of targets is less than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable

and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (Db2 Application programming and SQL).

A timestamp without time zone value must not be assigned to a timestamp with time zone target.

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Restrictions on using the WITH CONTINUE and CURRENT CONTINUE clauses:

When using the WITH CONTINUE clause, the Db2 system will only reserve truncated data for result set columns of the BLOB, CLOB, DBCLOB, or XML data type, and only when the output host variable data type is the appropriate LOB data type.

If an application uses FETCH WITH CONTINUE, and truncated data remains after the FETCH operation, the application cannot perform any intervening operation on that cursor before performing the FETCH CURRENT CONTINUE. If intervening operations on that cursor are performed, the truncated data is lost.

FETCH CURRENT CONTINUE is not supported with multi-row fetch. Also, FETCH CURRENT CONTINUE is not supported for non-LOB and non-XML columns that have been truncated. If truncation occurs for these non-LOB and non-XML columns, the truncated data will be discarded as usual.

Result column evaluation considerations:

If an error occurs as the result of an arithmetic expression in the SELECT list of an outer SELECT statement (division by zero, or overflow) or a numeric conversion error occurs, the result is the null value. As in any other case of a null value, an indicator variable must be provided and the main variable is unchanged. In this case, however, the indicator variable is set to -2. Processing of the statement continues as if the error had not occurred. (However, this error causes a positive SQLCODE.) If you do not provide an indicator variable, a negative value is returned in the SQLCODE field of the SQLCA. Processing of the statement terminates when the error is encountered. No value is assigned to the host variable or to later variables, though any values that have already been assigned to variables remain assigned.

If the specified host variable is not large enough to contain the result, a warning is returned and W is assigned to SQLWARN1 in the SQLCA. The actual length of the result is returned in the indicator variable associated with the host-variable, if an indicator is provided. It is possible that a warning may not be returned on a FETCH operation. This occurs as a result of optimizations, such as the use of system temporary tables or blocking. It is also possible that the returned warning applies to a previously fetched row. When a datetime value is returned, the length of the variable must be large enough to store the complete value. Otherwise, a warning or an error is returned.

Considerations when using the FETCH statement for a rowset cursor that was passed to an accelerator server for processing:

Db2 provides limited support for rowset queries that are passed to an accelerator server for processing. Db2 supports only high performance access to accelerated query data. The data is pre-fetched in rowsets and returned by using *multiple-row-fetch* statements, returning multiple rows of data in one FETCH statement. The following restrictions apply to FETCH statements that are executed against a rowset cursor that was accelerated:

- All FETCH requests must be rowset fetches.
- All FETCH requests must specify a FOR *n* ROWS clause.
- All FETCH requests must specify the same rowset size.
- All FETCH requests must specify target host variables. (The FETCH operation must have a target for positioning.)

Cursor positioning:

An open cursor has three possible positions:

- Before a row
- On a row or rowset
- After the last row

When a scrollable or non-scrollable cursor is opened, it is positioned before the first row in the result table. If a cursor is on a row, that row is called the current row of the cursor. If a cursor is on a rowset, the rows are called the current rowset of the cursor.

A cursor referred to in an UPDATE or DELETE statement must be positioned on a row or rowset. A cursor can only be on a row or rowset as a result of a FETCH statement.

If the cursor was declared SENSITIVE STATIC SCROLL, a row may be a *hole*, from which no values may be fetched, updated, or deleted. Holes do not exist with sensitive dynamic cursors because there is no temporary result table. For information about holes in the result table of a cursor, see *Db2 Application Programming and SQL Guide*.

For scrollable cursors, the cursor position after an error varies depending on the type of error:

- When an operation is attempted against an update or delete hole, or when an update or delete hole is detected, the cursor is positioned on the hole.
- When a FETCH operation is attempted past the end of file, the cursor is positioned after the last row.
- When a FETCH operation is attempted before the beginning of file, the cursor is positioned before the first row.
- When an error causes the cursor position to be invalid such as when a single row positioned update or positioned delete error occurs that causes a rollback, the cursor is closed.

Cursor position after exception condition:

If an error occurs during the execution of a fetch operation, the position of the cursor and the result of any later fetch is unpredictable. It is possible for an error to occur that makes the position of the cursor invalid, in which case the cursor is closed.

If an individual fetch operation specifies a destination that is outside the range of the cursor, a warning is issued (except for FETCH BEFORE or FETCH AFTER), the cursor is positioned before or after the result table, and values are not assigned to host variables.

Concurrency and scrollability:

The current row of a cursor cannot be updated or deleted by another application process if it is locked. Unless it is already locked because it was inserted or updated by the application process during the current unit of work, the current row of a cursor is not locked if:

- The isolation level is UR, or
- The isolation level is CS, and
  - The result table of the cursor is read-only
  - The bind option CURRENTDATA(NO) is in effect

A dynamic scrollable cursor is useful when it is more important to the application to see updated rows and newly inserted rows and there is no need to see deleted rows. The isolation level of CS should be used for maximum concurrency with dynamic scrollable cursors. Specifying an isolation level of RR or RS severely restricts the update of the table, thus defeating the purpose of a SENSITIVE DYNAMIC scrollable cursor. If the application needs a constant result table, a SENSITIVE STATIC scrollable cursor with an isolation level of CS should be used.

Sensitivity of SENSITIVE STATIC SCROLL cursors to database changes:

When SENSITIVE STATIC SCROLL has been declared, the following rules apply:

- For the result of an update operation to be visible within a cursor after "open," the update operation must be a positioned update executed against the cursor, or a FETCH SENSITIVE in a STATIC cursor must be executed against a row which has been updated by some other means (that is, a searched update, committed updates of others, or an update with another cursor in the same process).
- Another process can update the base table of the SELECT statement so that the current values no longer satisfy the WHERE clause. In this case, an "update hole" effectively exists during the time the values in the base table do not satisfy the WHERE clause, and the row is no longer accessible through the cursor. When an attempt is made to fetch a row that has been identified as an update hole, no values are returned, and a warning is issued.

  Under SENSITIVE STATIC SCROLL cursors, update holes are only identified during positioned update, positioned delete, and FETCH SENSITIVE operations. Each positioned update, positioned delete, and FETCH SENSITIVE operation does the necessary tests to determine if an update hole exists.
- For the result of a delete operation to be visible within a SENSITIVE STATIC SCROLL cursor, the delete operation must be a positioned delete executed against the cursor or a FETCH SENSITIVE in a STATIC cursor must be executed against a row that has been deleted by some other means (that is, a searched delete, committed deletes of others, or a delete with another cursor in the same process).
- Another process, or the even the same process, may delete a row in the base table of the SELECT statement so that a row of the cursor no longer has a corresponding row in the base table. In this case, a "delete hole" effectively exists, and that row is no longer accessible through the cursor. When an attempt is made to fetch a row that has been identified as a delete hole, no values are returned, and a warning is issued.

  Under SENSITIVE STATIC SCROLL cursors, delete holes are identified during positioned update, positioned delete, and FETCH SENSITIVE operations.
- Inserts into the base table or tables of SENSITIVE STATIC SCROLL cursors are not seen after the cursor is opened.

LOB locators:

When information is retrieved into LOB locators and it is not necessary to retain the locator across FETCH statements, it is a good practice to issue a FREE LOCATOR statement before issuing another FETCH statement because locator resources are limited.

Isolation level considerations:

The isolation level of the statement (specified implicitly or explicitly) can affect the result of a rowset-positioned FETCH statement. This is possible when changes are made to the tables underlying the cursor when isolation level UR is used with a dynamic scrollable cursor, or with other isolation levels when rows have been added by the application fetching from the cursor. These situations can occur with the following fetch orientations:

PRIOR ROWSET

With a dynamic scrollable cursor and isolation level UR, the content of a prior rowset can be affected by other activity within the table. It is possible that a row that previously qualified for the cursor, and was included as a member of the "prior" rowset, has since been deleted or modified before it is actually returned as part of the rowset for the current statement. To avoid this behavior, use an isolation level other than UR.

CURRENT ROWSET

With a dynamic scrollable cursor, additional rows can be added between rows that form the rowset that was returned to the user. With isolation level RR, these rows can only be added by the application fetching from the cursor. For isolation levels other than RR, other applications can insert rows that can affect the results of a subsequent FETCH CURRENT ROWSET. To avoid this behavior, use a static scrollable cursor instead of a dynamic scrollable cursor.

LAST ROWSET
With a dynamic scrollable cursor and isolation level UR, the content of the last rowset can be affected by other activity within the table. It is possible that a row that previously qualified for the cursor, and was included as a member of the "last" rowset, has since been deleted or modified before it is actually returned as part of the rowset for the current statement. To avoid this behavior, use an isolation level other than UR.

ROWSET STARTING AT RELATIVE -*n* (where -*n* is a negative number)
With a dynamic scrollable cursor and isolation level UR, the content of a prior rowset can be affected by other activity within the table. It is possible that a row that previously qualified for the cursor, and was included as a member of the "prior" rowset, has since been deleted or modified before it is actually returned as part of the rowset for the current statement. To avoid this behavior, use an isolation level other than UR.

Row positioned and rowset positioned FETCH statement interaction:
The following table demonstrates the interaction between row positioned and rowset positioned FETCH statements. The table is based on the following assumptions:

- TABLE T1 has 15 rows
- CURSOR CS1 is declared as follows:

```
DECLARE CS1 SCROLL CURSOR WITH ROWSET POSITIONING FOR
SELECT * FROM T1;
```

- An OPEN CURSOR statement has been successfully executed for CURSOR CS1 and the FETCH statements in the table are executed in the order that they appear in the table.

Table 219. Interaction between row positioned and rowset positioned FETCH statements

FETCH Statement	Cursor Position
FETCH FIRST	Cursor is positioned on row 1.
FETCH FIRST ROWSET	Cursor is positioned on a rowset of size 1, consisting of row 1.
FETCH FIRST ROWSET FOR 5 ROWS	Cursor is positioned on a rowset of size 5, consisting of rows 1, 2, 3, 4, and 5.
FETCH CURRENT ROWSET	Cursor is positioned on a rowset of size 5, consisting of rows 1, 2, 3, 4, and 5.
FETCH CURRENT	Cursor is positioned on row 1
FETCH FIRST ROWSET FOR 5 ROWS	Cursor is positioned on a rowset of size 5, consisting of rows 1, 2, 3, 4, and 5.
FETCH **or** FETCH NEXT	Cursor is positioned on row 2.
FETCH NEXT ROWSET	Cursor is positioned on a rowset of size 1, consisting of row 3.
FETCH NEXT ROWSET FOR 3 ROWS	Cursor is positioned on a rowset of size 3, consisting of rows 4,5, and 6.
FETCH NEXT ROWSET	Cursor is positioned on a rowset of size 3, consisting of rows 7,8, and 9.
FETCH LAST	Cursor is positioned on row 15.
FETCH LAST ROWSET FOR 2 ROWS	Cursor is positioned on a rowset of size 2, consisting of rows 14 and 15.
FETCH PRIOR ROWSET	Cursor is positioned on a rowset of size 2, consisting of rows 12 and 13.

Table 219. Interaction between row positioned and rowset positioned FETCH statements (continued)

FETCH Statement	Cursor Position
FETCH ABSOLUTE 2	Cursor is positioned on row 2.
FETCH ROWSET STARTING AT ABSOLUTE 2 FOR 3 ROWS	Cursor is positioned on a rowset of size 3, consisting of rows 2, 3, and 4.
FETCH RELATIVE 2	Cursor is positioned on row 4.
FETCH ROWSET STARTING AT ABSOLUTE 2 FOR 4 ROWS	Cursor is positioned on a rowset of size 4, consisting of rows 2, 3, 4, and 5.
FETCH RELATIVE -1	Cursor is positioned on row 1.
FETCH ROWSET STARTING AT ABSOLUTE 3 FOR 2 ROWS	Cursor is positioned on a rowset of size 2, consisting of rows 3 and 4.
FETCH ROWSET STARTING AT RELATIVE 4	Cursor is positioned on a rowset of size 2, consisting of rows 7 and 8.
FETCH PRIOR	Cursor is positioned on row 6.
FETCH ROWSET STARTING AT ABSOLUTE 13 FOR 5 ROWS	Cursor is positioned on a rowset of size 3, consisting of rows 13, 14, and 15.
FETCH FIRST ROWSET	Cursor is positioned on a rowset of size 5, consisting of rows 1, 2, 3, 4, and 5. **Note:** Even though the previous FETCH statement returned only 3 rows because EOF was encountered, Db2 will remember that 5 rows were requested by the previous FETCH statement.

Considerations for using the FOR n ROWS clause with the FETCH FIRST n ROWS ONLY clause:

A clause specifying the number of rows that you want can be specified in the SELECT statement of a cursor, the FETCH statement for a cursor, or both. However, these clauses have different effects:

- In the SELECT statement, a FETCH FIRST *n* ROWS ONLY clause controls the maximum number of rows that can be accessed with the cursor. When a FETCH statement attempts to retrieve a row beyond the number specified in the FETCH FIRST n ROWS ONLY clause of the SELECT statement, an end-of-data condition occurs.
- In a FETCH statement, a FOR *n* ROWS clause controls the number of rows that are returned for a single FETCH statement.

Both of these clauses can be specified.

Diagnostics information for rowset positioned FETCH statements:

A single FETCH statement from a rowset cursor might encounter zero, one, or more conditions. If the current cursor position is not valid for the fetch orientation, a warning occurs and the statement terminates. If a warning or non-terminating error (such as a bind out error) occurs during the fetch of a row, processing continues. In this case, a summary message is returned for the FETCH statement, and additional information about each fetched row is available with the GET DIAGNOSTICS statement. Use the GET DIAGNOSTICS statement to obtain information about all of the conditions that are encountered for one of these FETCH statements. See “GET DIAGNOSTICS” on page 1763 for more information.

The SQLCA returns some information about errors and warnings that are found while fetching from a rowset cursor. Processing stops when the end of data is encountered, or when a terminating condition occurs. After each FETCH statement from a rowset cursor, information is returned to the program through the SQLCA. The SQLCA is set as follows:

- SQLCODE contains the SQLCODE.

- SQLSTATE contains the SQLSTATE.
- SQLERRD1 and SQLERRD2 contain the number of rows of the result table if the cursor is positioned on the last row of the result table.
- SQLERRD3 contains the actual number of rows returned. If SQLERRD3 is less than the number of rows requested, an error or end-of-data condition occurred.
- SQLWARN flags are set to represent all the warnings that were accumulated while processing the FETCH statement.

Consider the following examples, where 10 rows are fetched with a single FETCH statement.

- **Example 1:** Assume that an error is detected on the 5th row. SQLERRD3 is set to 4 for the 4 returned rows, SQLSTATE is set to 22537, and SQLCODE is set to -354. This information is also available from the GET DIAGNOSTICS statement (the information that is returned is generated from connected server, which may differ across different servers). For example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
-- Results of the statement:
-- num_rows = 4 and num_cond = 1 (1 condition)
```

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 22537, sqlcode = -354, and row_num = 5
```

- **Example 2:** Assume that an end-of-data condition is detected on the 6th row and that the cursor does not have immediate sensitivity to updates. SQLERRD3 is set to 5 for the 5 returned rows, SQLSTATE is set to 02000, and SQLCODE is set to +100. This information is also available from the GET DIAGNOSTICS statement. For example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
-- Results of the statement:
-- num_rows = 5 and num_cond = 1 (1 condition)
```

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 02000, sqlcode = 100, and row_num = 6
```

- **Example 3:** Assume that a bind error condition is detected on the 5th row, the condition is recorded, and processing continues. Also, assume that an end-of-data condition is detected on the 8th row. SQLERRD3 is set to 7 for the 7 returned rows, SQLSTATE is set to 02000, and SQLCODE is set to +100. Processing to complete the FETCH statement is performed, and the bind out error that occurred is noted. An additional SQLCODE is recorded for the bind out error. SQLCODE is set to –354, and SQLSTATE is set to 01668. Use the GET DIAGNOSTICS statement to determine what went on. For example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
-- Results of the statement:
-- num_rows = 7 and num_cond = 3 (3 conditions)
```

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 01668, sqlcode = -354, and row_num = 0
```

```
GET DIAGNOSTICS CONDITION 2 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 02000, sqlcode = 100, and row_num = 0
```

```
GET DIAGNOSTICS CONDITION 3 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 22003, sqlcode = -302, and row_num = 5
```

In some cases, Db2 returns a warning if indicator variables are provided, or an error if indicator variables are not provided. These errors can be thought of as data mapping errors that result in a warning if indicator variables are provided.

- If indicator variables are provided, Db2 returns all rows to the user, marking the errors in the indicator variables. The SQLCODE and SQLSTATE contain the warning from the last data mapping error. The GET DIAGNOSTICS statement can be used to retrieve information about all the data mapping errors that have occurred.
- If some or no indicator variables are provided, all rows are returned as above until the first data mapping error that does not have indicator variables is detected. The rows successfully fetched are returned and the SQLSTATE, SQLCODE, and SQLWARN flags are set, if necessary. (The SQLCODE may be 0 or a positive value).

It is possible, if a data mapping error occurs, for the positioning of the cursor to be successful. In this case, the cursor is positioned on the rowset that encountered the data mapping error.

Consider the following examples, which try to fetch 10 rows with a single FETCH statement.

- **Example 1:** Assume that indicators have been provided for values returned for column 1, but not for column 2. The 5th row has a data mapping error (+802) for column 1, and the 7th row has a data mapping error for column 2 (-802 is returned because an indicator was not provided for column 2). SQLERRD3 is set to 6 for the 6 returned rows, SQLSTATE and SQLCODE are set to the error from the 7th row fetched. The indicator variable for the 5th row column 1 indicates that a data mapping error was found. This information is also available from the GET DIAGNOSTICS statement, for example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
-- Results of the statement:
-- num_rows = 6 and num_cond = 2 (2 conditions)
```

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 01519, sqlcode = +802, and row_num = 5
```

```
GET DIAGNOSTICS CONDITION 2 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 22003, sqlcode = -802, and row_num = 7
```

  The resulting cursor position is unknown.

- **Example 2:** Assume that null indicators are provided, that rows 3 and 5 are holes, and that data exists for the other requested rows. SQLERRD3 is set to 10 to reflect that 10 fetches were completed and that information has been returned for the 10 requested rows. Eight rows actually contain data. For two rows, indicator variables are set to indicate no data was returned for those rows. SQLSTATE is set to 02502, SQLCODE is set to +222, and all null indicators for rows 3 and 5 are set to -3 to indicate that a hole was detected. This information is also available from the GET DIAGNOSTICS statement, for example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
-- Results of the statement:
-- num_rows = 10 and num_cond = 2 (2 conditions)
```

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 02502, sqlcode = +222, and row_num = 3
```

```
GET DIAGNOSTICS CONDITION 2 :sqlstate = RETURNED_SQLSTATE,
:sqlcode = DB2_RETURNED_SQLCODE, :row_num = DB2_ROW_NUMBER;
-- Results of the statement:
-- sqlstate = 02502, sqlcode = +222, and row_num = 5
```

  If a null indicator was not provided for any variable in a row that was a hole, an error occurs.

SQLCA usage summary:

For multiple-row-fetch, the fields of the SQLCA are set as follows:

Condition		Action: Resulting Values Stored in the SQLCA Fields		
Errors	**Data**	**SQLSTATE**	**SQLCODE**	**SQLERRD3**
No[1]	Return all requested rows	00000	0	Number of rows requested
No[1]	Return data for subset of requested rows, end of data	02000	+100	Number of rows
No[1]	Return all requested rows	sqlstate(2)	sqlcode(2)	Number of rows requested
Yes[1]	Return successfully fetched rows	sqlstate(3)	sqlcode(3)	Number of rows
Yes[1]	Return successfully fetched rows	sqlstate(4)	sqlcode(4)	Number of rows

Notes:

1. SQLWARN flags may be set in all cases, even if there are no other warnings or errors indicated. The warning flags are an accumulation of all warning flags set while processing the multiple-row-fetch.
2. sqlcode is the last positive SQLCODE, and sqlstate is the corresponding SQLSTATE value.
3. Database Server detected error. sqlcode is the first negative SQLCODE encountered, sqlstate is the corresponding SQLSTATE value.
4. Client detected error. sqlcode is the first negative SQLCODE encountered, sqlstate is one of the following SQLSTATEs: 22002, 22008, 22509, 22518, or 55021.

Providing indicator variables for error conditions:

If an error occurs as the result of an arithmetic expression in the SELECT list of an outer SELECT statement (division by zero or overflow) or a numeric conversion error occurs, the result is the null value. As in any other case of a null value, an indicator variable must be provided and the main variable is unchanged. In this case, however, the indicator variable is set to -2. Processing of the statement continues as if the error had not occurred. (However, this error causes a positive SQLCODE.)

If you do not provide an indicator variable, a negative value is returned in the SQLCODE field of the SQLCA. Processing of the statement terminates when the error is encountered. No value is assigned to the host variable or to later variables, though any values that have already been assigned to variables remain assigned. Additionally, a -3 is returned in all indicators provided by the application when a hole was detected for the row on a rowset positioned FETCH, and values were not returned for the row. Processing of the statement terminates if a hole is detected and at least one indicator variable was not provided by the application.

Alternative syntax and synonyms:

USING DESCRIPTOR can be specified as a synonym for INTO DESCRIPTOR.

Example

Example 1: The FETCH statement fetches the results of the SELECT statement into the application program variables DNUM, DNAME, and MNUM. When no more rows remain to be fetched, the not found condition is returned.

```
EXEC SQL DECLARE C1 CURSOR FOR
  SELECT DEPTNO, DEPTNAME, MGRNO FROM DSN8B10.DEPT
  WHERE ADMRDEPT = 'A00';
 EXEC SQL OPEN C1;
```

```
    DO WHILE (SQLCODE = 0);
     EXEC SQL FETCH C1 INTO :DNUM, :DNAME, :MNUM;
    END;
    EXEC SQL CLOSE C1;
```

Example 2: For an example of FETCH statements with a dynamic scrollable cursor, see Example 8.

Example 3: Fetch the last 5 rows of the result table C1 using cursor C1:

```
FETCH ROWSET STARTING AT ABSOLUTE -5
   FROM C1 FOR 5 ROWS INTO DESCRIPTOR :MYDESCR;
```

Example 4: Fetch 6 rows starting at row 10 for cursor CURS1, and fetch the data into three host-variable-arrays:

```
FETCH ROWSET STARTING AT ABSOLUTE 10
   FROM CURS1 FOR 6 ROWS
   INTO :hav1, :hva2, :hva3;
```

Alternatively, a descriptor could have been specified in an INTO DESCRIPTOR clause where the information in the SQLDA reflects the data types of the host-variable-arrays:

```
FETCH ROWSET STARTING AT ABSOLUTE 10
   FROM CURS1 FOR 6 ROWS
   INTO DESCRIPTOR :MYDESCR;
```

Example 5: Suppose that the following array type, array variable, and table have been defined.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[100];
CREATE TABLE T1 (COL1 CHAR(10), COL2 INT);
```

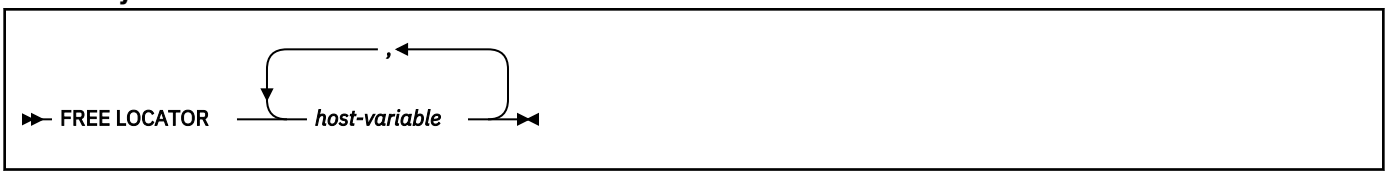
Use an array variable as an output target for a FETCH statement. The array variable is specified in the INTO clause of the FETCH statement.

```
CREATE PROCEDURE PROCESSINTARRAY (OUT INTOUTARRAY INTARRAY)
BEGIN
 DECLARE INTA INTARRAY;
 DECLARE INTB INTARRAY;
 DECLARE INTV INTEGER DEFAULT 1;
 DECLARE STMT CHAR(100);
 DECLARE C2 CURSOR FOR S1;
--
-- Initialize the array
--
 SET INTA = ARRAY[1,INTEGER(2),3+0,4,5,6] ;
--
-- Use dynamic SQL with an array parameter marker and a parameter marker
-- containing the index to retrieve the value from the array parameter.
-- The array is referenced in a predicate.
--
 SET STMT = 'SELECT COL1 FROM T1 WHERE COL2 = CAST(? AS INTARRAY)[?]';
 PREPARE S1 FROM STMT;
 OPEN C2 USING INTA, INTV;
 FETCH C2 INTO INTB ; -- INTB is an array variable that is used
                      -- as a target for the fetch statement.
 CLOSE C2;
SET INTOUTARRAY=INTB;
END
```

FREE LOCATOR

The FREE LOCATOR statement removes the association between a LOB locator variable and its value.

Invocation



This statement can only be embedded in an application program. It cannot be issued interactively. It is an executable statement that can be dynamically prepared. However, the EXECUTE statement with the

USING clause must be used to execute the prepared statement. FREE LOCATOR cannot be used with the EXECUTE IMMEDIATE statement. It must not be specified in Java.

Authorization

None required.

Syntax

Description

host-variable, ...

Identifies one or more locator variables that must be declared in accordance with the rules for declaring locator variables. The locator variable type must be a binary large object locator, a character large object locator, or a double-byte character large object locator.

The *host-variable* must currently have a locator assigned to it. That is, a locator must have been assigned during this unit of work (by a FETCH, SELECT INTO, assignment statement, SET *host-variable* statement, or VALUES INTO statement) and must not subsequently have been freed (by a FREE LOCATOR statement); otherwise, an error is returned.

If more than one locator is specified and an error is returned on one of the locators, it is possible that some locators have been freed and others have not been freed.

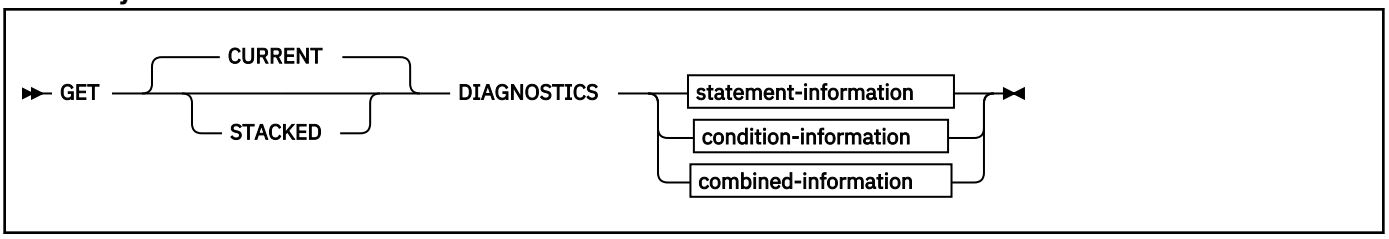
Example

Assume that the employee table contains columns RESUME, HISTORY, and PICTURE and that locators have been established in a program to represent the column values. Free the CLOB locator variables LOCRES and LOCHIST, and the BLOB locator variable LOCPIC.

```
EXEC SQL FREE LOCATOR :LOCRES, :LOCHIST, :LOCPIC
```

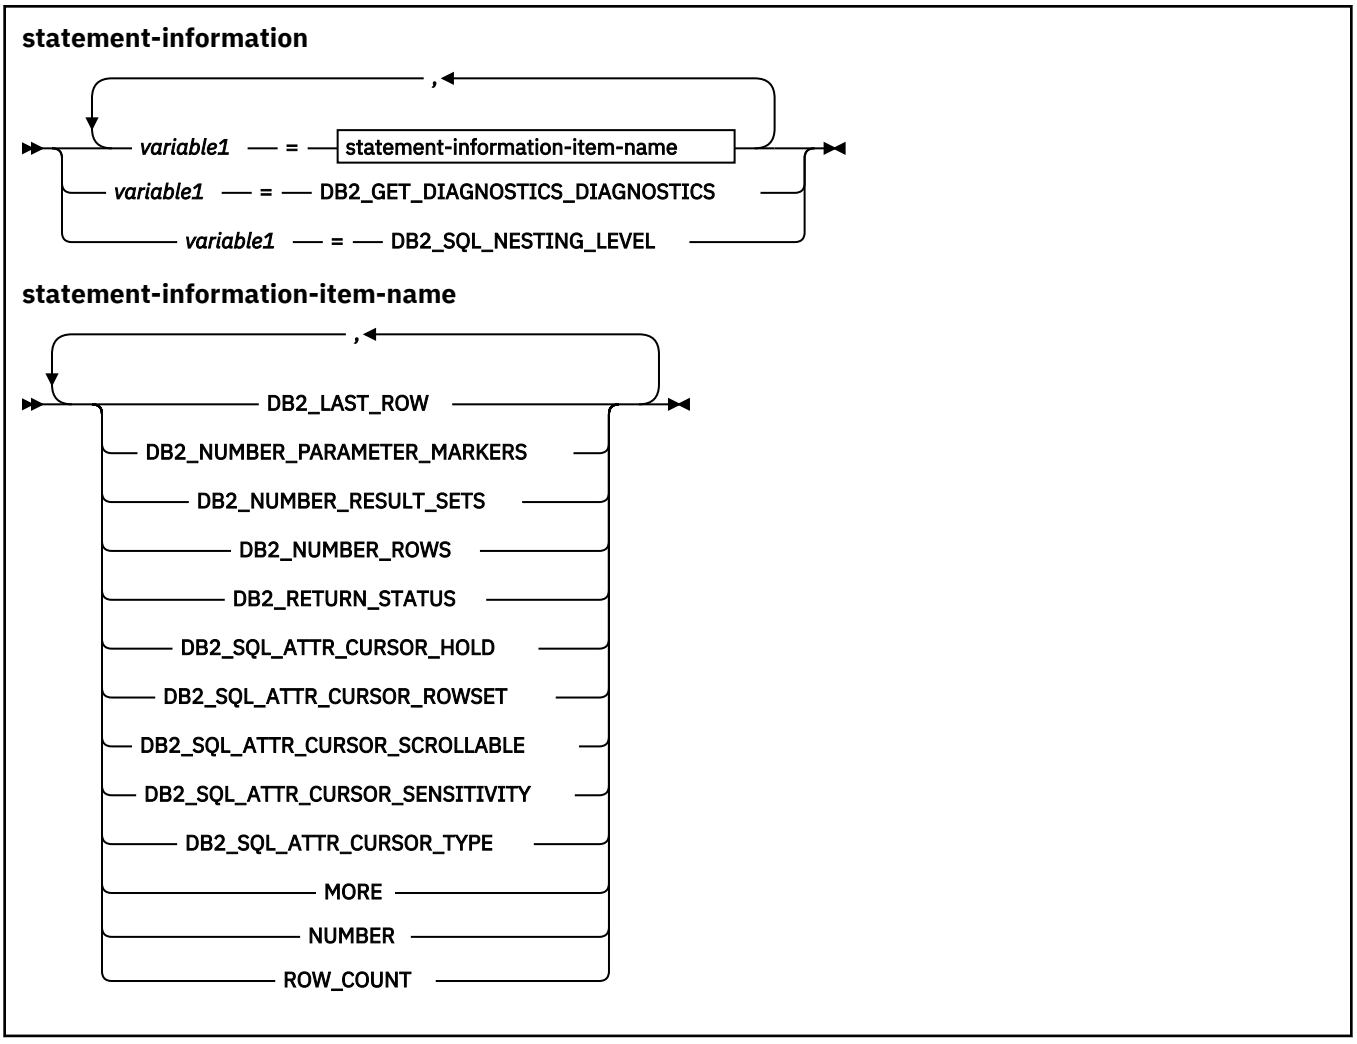
GET DIAGNOSTICS

The GET DIAGNOSTICS statement provides diagnostic information about the last SQL statement (other than a GET DIAGNOSTICS statement) that was executed. This diagnostic information is gathered as the previous SQL statement is executed. Some of the information available through the GET DIAGNOSTICS statement is also available in the SQLCA.



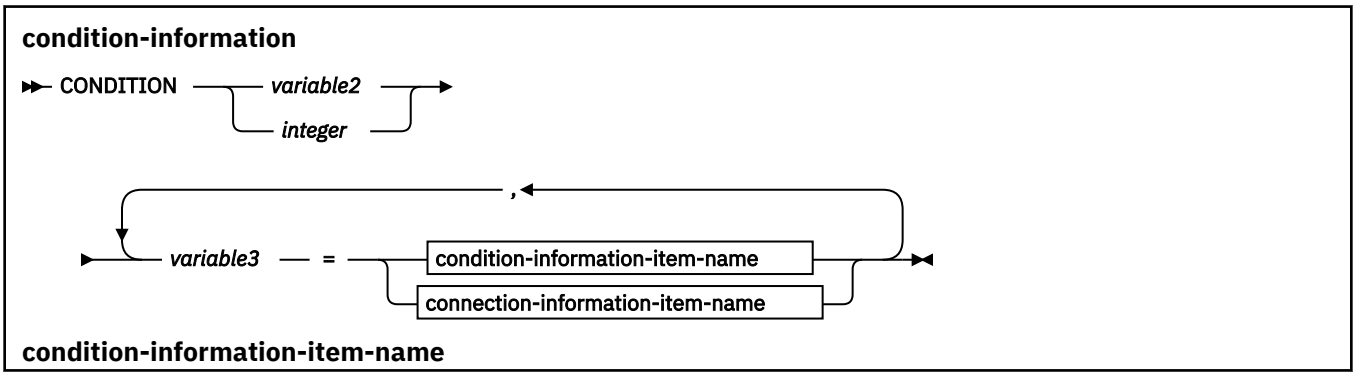
Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

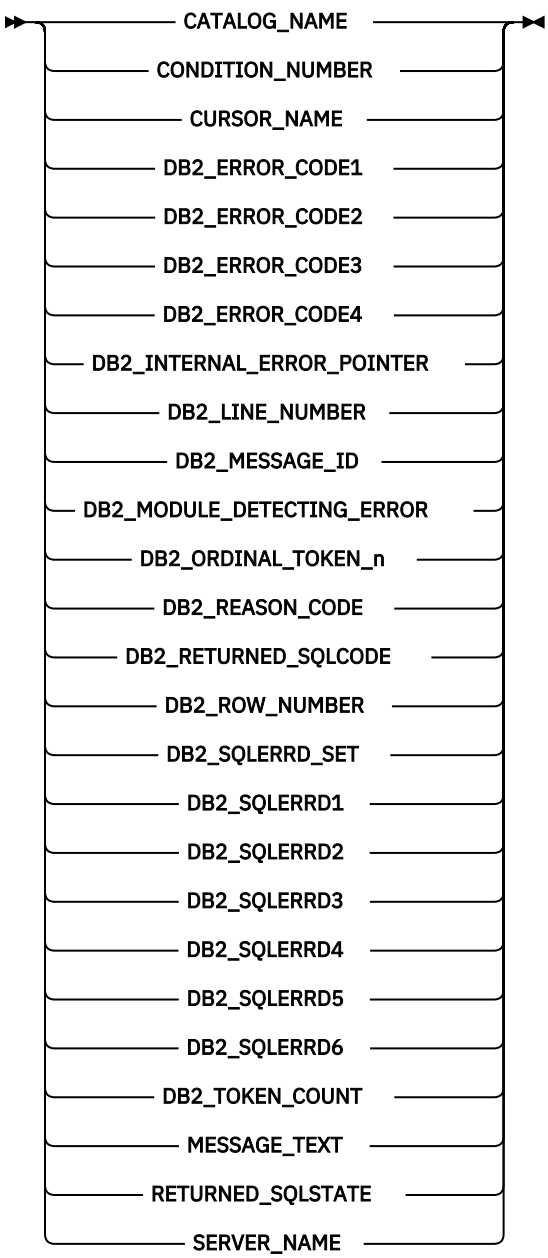


Authorization

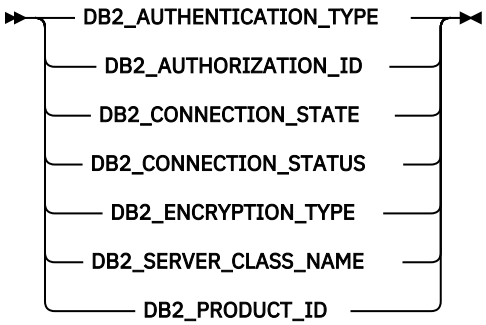
None required.



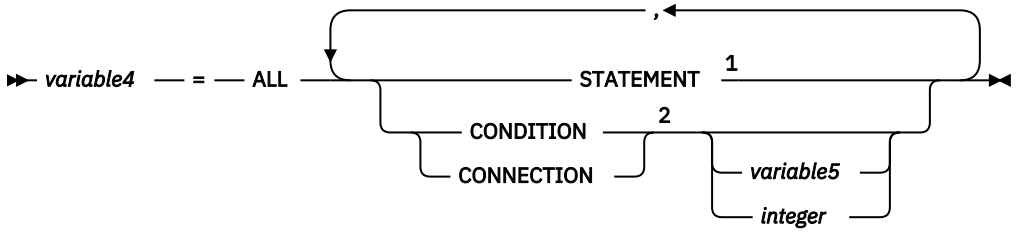
Syntax



statement-information:



condition-information:



connection-information-item-name

combined-information:

combined-information

Notes:

[1] STATEMENT can only be specified once.
[2] CONDITION and CONNECTION can only be specified once if variable5 or integer is not also specified.

Description

Diagnostic information is provided in three main areas: statement information, condition information, and combined information. After the execution of an SQL statement, information about the execution of the statement is provided as statement information, and at least one instance of condition information is provided. The number of instances of the condition information is indicated by the NUMBER item that is available in the statement information. Combined information contains a text representation of all the information gathered about the execution of the SQL statement.

The diagnostic information that is provided is specific to the server. If you are connected to a server other than Db2 for z/OS, see that product's documentation for the diagnostic information that is returned.

CURRENT
Specifies that information is to be returned from the first diagnostics area. It corresponds to the previous SQL statement that was executed that was not a GET DIAGNOSTICS or compound statement. CURRENT is the default.

STACKED
Specifies that information is to be returned from the stacked diagnostics area. The stacked diagnostics area is only available within a handler in a native SQL procedure and compiled SQL functions. The stacked diagnostics area corresponds to the previous SQL statement (that was not a GET DIAGNOSTICS or compound statement) that was executed before the handler was entered. If the GET DIAGNOSTICS statement is the first statement within a handler, the current diagnostics area and the stacked diagnostics area contain the same diagnostics information.

statement-information
Provides information about the last SQL statement executed.

variable1
Identifies a variable described in the program in accordance with the rules for declaring variables. The data type of the variable must be the data type as specified in Data types for GET DIAGNOSTICS items.

The variable is assigned the value of the specified statement information item. If the value is truncated when assigning it to the variable, a warning is returned and the GET_DIAGNOSTICS_DIAGNOSTICS item of the diagnostics area is updated with the details of this condition. If a DIAGNOSTICS item is not set, the variable is set to a default value, based on its data type: 0 for an exact numeric field, an empty string for a VARCHAR field, and blanks for a CHAR field.

DB2_GET_DIAGNOSTICS_DIAGNOSTICS
Contains textual information about errors or warnings that might have occurred in the execution of the GET DIAGNOSTICS statement. The format of the information is similar to what would be returned by a GET DIAGNOSTICS :hv = ALL statement.

DB2_SQL_NESTING_LEVEL
Identifies the current level of nesting or recursion that is in effect when the GET DIAGNOSTICS statement was executed. Each level of nesting corresponds to a nested or recursive invocation of a

compiled SQL function, native SQL procedure, or trigger. If the GET DIAGNOSTICS statement is executed outside of a level of nesting, the value of zero is returned.

***statement-information-item-name*:**

DB2_LAST_ROW
For a multiple-row FETCH statement, contains a value of +100 if the last row currently in the table is in the set of rows that have been fetched. For cursors that are not sensitive to updates, there would be no need to do a subsequent FETCH, because the result would be an end-of-data indication. For cursors that are sensitive to updates, a subsequent FETCH may return more data if a row had been inserted before the FETCH was executed. For statements other than multiple-row FETCH statements, or for multiple-row FETCH statements that do not contain the last row, this variable contains the value 0.

An end of data warning might not occur and DB2_LAST_ROW might not contain +100 when the number of rows returned is equal to the number of rows requested and the last row of data returned is the last row of data.

DB2_NUMBER_PARAMETER_MARKERS
For a PREPARE statement, contains the number of parameter markers in the prepared statement. Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_NUMBER_RESULT_SETS
For a CALL statement, contains the actual number of result sets returned by the procedure. Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_NUMBER_ROWS
If the previous SQL statement was an OPEN or a FETCH that caused the size of the result table to be known, returns the number of rows in the result table. For SENSITIVE DYNAMIC cursors, this value can be thought of as an approximation because rows that are inserted and deleted will affect the next retrieval of this value. If the previous SQL statement was a PREPARE statement, returns the estimated number of rows in the result table for the prepared statement. Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_RETURN_STATUS
Identifies the status value returned from the stored procedure associated with the previously executed SQL statement, provided that the statement was a CALL statement that invoked a procedure that returns a status. Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_SQL_ATTR_CURSOR_HOLD
For an ALLOCATE or OPEN statement, indicates whether a cursor can be held open across multiple units of work.

- N indicates that this cursor does not remain open across multiple units of work.
- Y indicates that this cursor remains open across multiple units of work.

Otherwise, a blank is returned.

DB2_SQL_ATTR_CURSOR_ROWSET
For an ALLOCATE or OPEN statement, indicates whether or not a cursor can be accesses using rowset positioning.

- N indicates that this cursor supports only row positioned operations.
- Y indicates that this cursor supports rowset positioned operations.

Otherwise, a blank is returned.

DB2_SQL_ATTR_CURSOR_SCROLLABLE
For an ALLOCATE or OPEN statement, indicates whether or not a cursor can be scrolled forward and backward.

- N indicates that this cursor is not scrollable.
- Y indicates that this cursor is scrollable.

Otherwise, a blank is returned.

DB2_SQL_ATTR_CURSOR_SENSITIVITY
For an ALLOCATE or OPEN statement, indicates whether or not a cursor does or does not show updates to cursor rows made by other connections.

- I indicates insensitive.
- S indicates sensitive.

Otherwise, a blank is returned.

DB2_SQL_ATTR_CURSOR_TYPE
For an ALLOCATE or OPEN statement, indicates the type of cursor, whether a cursor type is forward-only, static, or dynamic.

- F indicates a forward cursor.
- D indicates a dynamic cursor.
- S indicates a static cursor.

Otherwise, a blank is returned.

MORE
Indicates whether some of the warning and errors from the previous SQL statement were stored or discarded.

- N indicates that all the warnings and errors from the previous SQL statement are stored in the diagnostic area.
- Y indicates that some of the warnings and errors from the previous SQL statement were discarded because the amount of storage needed to record warnings and errors exceeded 65535 bytes.

NUMBER
Returns the number of errors and warnings detected by the execution of the previous SQL statement, other than a GET DIAGNOSTICS statement, that have been stored in the diagnostics area. If the previous SQL statement returned an SQLSTATE of 00000 or no previous SQL statement has been executed, the number returned is one.

The GET DIAGNOSTICS statement itself may return information via the SQLSTATE parameter, but does not modify the previous contents of the diagnostics area, except for the DB2_GET_DIAGNOSTICS_DIAGNOSTICS item.

ROW_COUNT
Identifies the number of rows associated with the previous SQL statement that was executed.

If the previous SQL statement is a DELETE, INSERT, UPDATE, or MERGE statement, ROW_COUNT indicates the number of rows that are qualified to be deleted, inserted, or updated by that statement, excluding rows that are affected by triggers or referential integrity constraints. The count does not include rows that are inserted as a result of processing a FOR PORTION OF clause for in an SQL data change statement.

For the OPEN of a cursor for a SELECT with a data change statement, or a SELECT INTO statement, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled.

A value of -1 indicates a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria, or a truncate operation. If the delete was against a view, then neither the DELETE statement nor the definition of the view included selection criteria.

For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table.

If the previous SQL statement is a multiple-row FETCH, ROW_COUNT identifies the number of rows fetched.

Otherwise, or if the server only returns an SQLCA, the value zero is returned.

condition-information

Assigns the values of the specified condition information to the associated variables. The variable specified must be of the data type that is compatible with the data type of the specified diagnostic-ID or an error occurs. If the value of the condition is truncated when assigning it to the variable, an error occurs. If an indicator variable was provided, the length of the value is returned in the indicator variable.

If a DIAGNOSTICS item is not set, then the variable is set to a default value, based on the data type of the item. The specific value will be 0 for a numeric field, an empty string for a VARCHAR field, and blanks for a CHAR field.

variable2* or *integer

Identifies a variable described in the program in accordance with the rules for declaring variables. The value identifies the diagnostic for which information is requested. Each diagnostic that occurs while executing an SQL statement is assigned an integer. The value 1 indicates the first diagnostic, 2 indicates the second diagnostic, and so on. If the value is 1, the diagnostic information that is retrieved corresponds to the condition that is indicated by the SQLSTATE value actually returned by the execution of the previous SQL statement (other than a GET DIAGNOSTICS statement). The variable specified must be an integer data type, or an error occurs. An indicator variable is not allowed when this is a host variable; an error occurs. If a value is specified that is less than or equal to zero, or greater than the number of available diagnostics, an error occurs.

variable3

Identifies a variable described in the program in accordance with the rules for declaring variables. The data type of the variable must be the data type as specified in Data types for GET DIAGNOSTICS items for the indicated condition-information item.

condition-information-item-name

CATALOG_NAME

If the returned SQLSTATE is any one of the following values, the constraint that caused the error is a referential, check, or unique constraint. The location (RDB) name of the server that generated the condition is returned.

- Class 09 (Triggered Action Exception),
- Class 23 (Integrity Constraint Violation)
- Class 27 (Triggered Data Change Violation)
- 40002 (Transaction Rollback - Integrity Constraint Violation)
- 40004 (Transaction Rollback - Triggered Action Exception)

If the returned SQLSTATE is class 42 (Syntax Error or Access Rule Violation), the server name of the table that caused the error is returned.

If the returned SQLSTATE is class 44 (WITH CHECK OPTION Violation), the server name of the view that caused the error is returned.

Otherwise, the empty string is returned.

The actual server name may be different than the server name specified, either implicitly or explicitly, on the CONNECT statement because of the use of aliases or synonyms.

CONDITION_NUMBER

Returns the number of the diagnostic returned.

CURSOR_NAME

If the returned SQLSTATE is class 24 (Invalid Cursor State), the name of the cursor is returned. Otherwise, the empty string is returned.

DB2_ERROR_CODE1

Returns an internal error code. Otherwise, or if the server only returns an SQLCA, the value 0 is returned.

DB2_ERROR_CODE2
Returns an internal error code. Otherwise, or if the server only returns an SQLCA, the value 0 is returned.

DB2_ERROR_CODE3
Returns an internal error code. Otherwise, or if the server only returns an SQLCA, the value 0 is returned.

DB2_ERROR_CODE4
Returns an internal error code. Otherwise, or if the server only returns an SQLCA, the value 0 is returned.

DB2_INTERNAL_ERROR_POINTER
For some errors, this is a negative value that is an internal error pointer. Otherwise, the value 0 is returned.

DB2_LINE_NUMBER
Returns the line number where an error is encountered in parsing a dynamic statement. Also returns the line number where an error is encountered in parsing, binding, or executing a CREATE or ALTER statement for a native SQL procedure or compiled SQL function. DB2_LINE_NUMBER also returns the line number when a CALL statement invokes a native SQL procedure and the procedure returns with an error. This information is not returned for an external SQL procedure.

This value will only be meaningful if the statement source contains new line control characters.

DB2_MESSAGE_ID
Corresponds to the message that is contained in the MESSAGE_TEXT diagnostic item (for example, DSNT102I or DSNU180I).

DB2_MODULE_DETECTING_ERROR
Returns an identifier indicating which module detected the error. For a SIGNAL statement that is issued from a routine, the value 'ROUTINE' is returned. Otherwise, the string 'DSN ' is returned.

DB2_ORDINAL_TOKEN_n
Returns the *n*th token. *n* must be a value from 1 to 100. For example, DB2_ORDINAL_TOKEN_1 would return the value of the first token, DB2_ORDINAL_TOKEN_2 the second token, and so on. A numeric value for a token is converted to characters before being returned. If there is no value for the token, or if the server only returns an SQLCA, an empty string is returned.

DB2_REASON_CODE
Contains the reason code for errors that have a reason code token in the message text. Otherwise, the value zero is returned.

DB2_RETURNED_SQLCODE
Returns the SQLCODE for the specified diagnostic.

DB2_ROW_NUMBER
Returns the number of the row where the condition was encountered, when such information is available and applicable. If SQLCODE +1– or +20237 is returned, DB2_ROW_NUMBER returns a value of 0.

DB2_SQLERRD_SET
A value of Y indicates that the DB2_SQLERRD1 through DB2_SQLERRD items might be set. These items are set only when communicating with a server that returns the SQLCA SQL communications area and not the new diagnostics area. Otherwise, a blank is returned.

DB2_SQLERRD1
Returns the value of sqlerrd(1) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_SQLERRD2
Returns the value of sqlerrd(2) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_SQLERRD3
Returns the value of sqlerrd(3) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_SQLERRD4
Returns the value of sqlerrd(4) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_SQLERRD5
Returns the value of sqlerrd(5) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_SQLERRD6
Returns the value of sqlerrd(6) from the SQLCA that is returned by the server. Otherwise, the value zero is returned.

DB2_TOKEN_COUNT
Returns the number of tokens available for the specified diagnostic ID.

MESSAGE_TEXT
Returns the message text that is associated with the SQLCODE. This is the short text, including substituted tokens. The message text does not contain the message number. When the SQLCODE is 0, the empty string is returned, even if the RETURNED_SQLSTATE value indicates a warning condition.

RETURNED_SQLSTATE
Returns the SQLSTATE for the specified diagnostic.

SERVER_NAME
If the previous SQL statement is a CONNECT, DISCONNECT, or SET CONNECTION statement, returns the name of the server specified in the previous statement is returned. Otherwise, the name of the server where the statement executes is returned.

connection-information-item-name
Provides information about the last SQL statement executed if it was a CONNECT statement.

DB2_AUTHENTICATION_TYPE
Contains an authentication type value of:

- 'S' for a server authentication
- 'C' for client authentication
- 'T' for trusted server authentication
- Otherwise, or if the server only returns an SQLCA, a blank is returned

DB2_AUTHORIZATION_ID
Authorization ID used by connected server. Because of user ID translation and authorization exits, the local user ID may not be the authorized ID used by the server.

DB2_CONNECTION_STATE
Contains the connection state:

- -1 if the connection is unconnected
- 1 if the connection is connected

Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_CONNECTION_STATUS
Contains a value of:

- 1 if committable updates can be performed on the connection for this unit of work
- 2 if no committable updates can be performed on the connection for this unit of work

Otherwise, or if the server only returns an SQLCA, the value zero is returned.

DB2_SERVER_CLASS_NAME
For a CONNECT or SET CONNECTION statement, contains one of the following values:

- QAS for DB2 for i
- QDB2 forDb2 for z/OS
- QDB2/2 for Db2 for OS/2

- QDB2/6000 for Db2 for AIX®
- QDB2/6000 PE for Db2 for AIX Parallel Edition

- QSQLDS/VSE for DB2 Server for VSE & VM

Otherwise, the empty string is returned.

DB2_ENCRYPTION_TYPE
The level of encryption for the connection:

- A indicates only the authentication tokens (authid and password) are encrypted.
- D indicates all data is encrypted for the connection.
- Otherwise, a blank is returned.

DB2_PRODUCT_ID
Returns a product signature. If the application server is an IBM relational database product, the form is *pppvvrrm*.

combined-information
Provides a text representation of all the information gathered about the execution of the SQL statement.

ALL
Indicates that all diagnostic items that are set for the last SQL statement executed are to be combined into one string. The format of the string is a semicolon separated list of all of the available diagnostic information in the form: *item-name*[(*condition-number*)]=*value-converted-to-character*...; as shown in the following example:

```
NUMBER=1;RETURNED_SQLSTATE=02000;DB2_RETURNED_SQLCODE=+100;
```

variable4
Identifies a variable described in the program in accordance with the rules for declaring variables. The data type of the variable must be VARCHAR. If the length of *variable4* is not sufficient to hold the full returned diagnostic string, the string is truncated, a warning is returned, and the GET_DIAGNOSTICS_DIAGNOSTICS item of the diagnostics area is updated with the details of this condition.

STATEMENT
Indicates that all statement-information-item-name diagnostic items that are set for the last SQL statement executed should be combined into one string. The format is the same as described for the ALL option.

CONDITION
Indicates that all condition-information-item-name diagnostic items that are set for the last SQL statement executed should be combined into one string. If *variable5* or integer is supplied after CONDITION, the format is the same as described above for the ALL option. If *variable5* or integer is not supplied, the format includes a condition number entry at the beginning of the information for that condition in the form:

CONDITION_NUMBER=*x*;*item-name*=*value-converted-to-character*;... where *x* is the number of the condition, as shown in the following example:

```
CONDITION_NUMBER=1;RETURNED_SQLSTATE=02000;RETURNED_SQLCODE=100;
   CONDITION_NUMBER=2;RETURNED_SQLSTATE=01004;
```

CONNECTION
Indicates that all connection-information-item-name diagnostic items that are set for the last SQL statement executed should be combined into one string. If *variable5* or integer is supplied after CONNECTION, the format is the same as described for the ALL option. If *variable5* or integer is not supplied, then the format includes a condition number entry at the beginning of the information for that condition in the form:

CONNECTION_NUMBER=*x*;*item-name*=*value-converted-to-character*;... where *x* is the number of the connection, as shown in the following example:

```
CONNECTION_NUMBER=1;CONNECTION_NAME=SVL1;DB2_PRODUCT_ID=DSN11015;
```

variable5* or *integer
Identifies a variable described in the program in accordance with the rules for declaring variables. The value identifies the diagnostic for which ALL CONDITION or ALL CONNECTION information is requested. The variable specified must be an integer data type or an error occurs. An indicator variable is not allowed when this is a host variable; an error occurs. If a value is specified that is less than or equal to zero or greater than the number of available diagnostics, an error occurs.

Notes

Effect of the statement in a native SQL routine:
A successful GET DIAGNOSTICS statement does not change the contents of the diagnostics area, except for DB2_GET_DIAGNOSTICS_DIAGNOSTICS.

If you want information about an error, the GET DIAGNOSTICS statement must be the first executable statement specified in the handler that will handle the error condition.

If you want information about a warning and a handler will get control for the warning condition, the GET DIAGNOSTICS statement must be the first executable statement specified in that handler.

If you want information about a warning and a handler will not get control for the warning condition, the GET DIAGNOSTICS statement must be the next statement executed after that previous statement.

Considerations for the SQLSTATE and SQLCODE SQL variables:
A successful GET DIAGNOSTICS statement does not change the value of the SQLSTATE and SQLCODE SQL variables (as used in SQL functions and SQL procedures).

Data types for items:
When a diagnostic item is assigned to a variable, SQL variable, or SQL parameter, the data type of the target must be compatible with the data type of the requested diagnostic item.

Data types for GET DIAGNOSTICS items

Table 220. Data types for GET DIAGNOSTICS items

Type of information	Item	Data type
Statement Information	DB2_GET_DIAGNOSTICS_DIAGNOSTICS	VARCHAR(32672)
	DB2_LAST_ROW	INTEGER
	DB2_NUMBER_PARAMETER_MARKERS	INTEGER
	DB2_NUMBER_RESULT_SETS	INTEGER

	DB2_ENCRYPTION_TYPE	CHAR(1)
	DB2_PRODUCT_ID	VARCHAR(8)
	DB2_SERVER_CLASS_NAME	CHAR(128)
Combined Information	ALL	VARCHAR(32672)

DRDA considerations

The GET DIAGNOSTICS statement is supported from a current Db2 for z/OS client, regardless of the level of the server (a Db2 for z/OS Version 7 or a Db2 for Windows Version 7, for example). When the application is connected to servers that do not support the Open Group Version 3 DRDA standard, the diagnostic information that is returned by the servers is available in the condition information.

Alternative syntax and synonyms:

To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports the following keywords:

- RETURN_STATUS as a synonym for DB2_RETURN_STATUS
- EXCEPTION as a synonym for CONDITION

Examples

Example 1: In an application, use the GET DIAGNOSTICS statement to determine how many rows were updated.

```
long rcount;
EXEC SQL UPDATE T1 SET C1 = C1 + 1;
EXEC SQL GET DIAGNOSTICS :rcount = ROW_COUNT;
```

After execution of this code segment, *rcount* will contain the number of rows that were updated.

Example 2: In an application, use the GET DIAGNOSTICS statement to handle multiple SQL Errors.

```
long numerrors, counter;
char retsqlstate[5];
long hva[5];
EXEC SQL INSERT INTO T1 FOR 5 ROWS VALUES (:hva) NOT ATOMIC
  CONTINUE ON SQLEXCEPTION;
EXEC SQL GET DIAGNOSTICS :numerrors = NUMBER;
for ( i=1;i < numerrors;i++)
    {
    EXEC SQL GET DIAGNOSTICS CONDITION :i :retsqlstate = RETURNED_SQLSTATE;
...
```

Execution of this code segment sets and prints *retsqlstate* with the SQLSTATE for each error that was encountered in the previous SQL statement.

Example 3: Retrieve information about a connection.

```
EXEC SQL GET DIAGNOSTICS CONDITION :HV_PRODUCT_ID = DB2_PRODUCT_ID;
```

Example 4: Use the GET DIAGNOSTICS statement to retrieve information that is similar to what is returned in the SQLCA:

```
EXEC SQL GET DIAGNOSTICS CONDITION 1
     :dasqlcode   = DB2_RETURNED_SQLCODE,
     :datokencnt  = DB2_TOKEN_COUNT,
     :datoken1    = DB2_ORDINAL_TOKEN_1,
     :datoken2    = DB2_ORDINAL_TOKEN_2,
     :datoken3    = DB2_ORDINAL_TOKEN_3,
     :datoken4    = DB2_ORDINAL_TOKEN_4,
     :datoken5    = DB2_ORDINAL_TOKEN_5,
     :dasqlerrd1b = DB2_MESSAGE_ID,
     :damsgtext   = MESSAGE_TEXT,
     :dasqlerrp   = DB2_MODULE_DETECTING_ERROR,
     :dasqlstate  = RETURNED_SQLSTATE;
```

Example 5: Specify the STACKED keyword on a GET DIAGNOSTICS statement that is used within a handler to access information in the diagnostics area that caused the handler to be activated:

```
  CREATE PROCEDURE divide2 ( IN numerator INTEGER,
                             IN denominator INTEGER,
                               OUT divide_result INTEGER,
                             OUT divide_error VARCHAR(70))
              LANGUAGE SQL
    BEGIN
        DECLARE msg_text        CHAR(70) DEFAULT '';
```

```
        DECLARE divide_error    CHAR(70) DEFAULT '';

        DECLARE CONTINUE HANDLER FOR SQLEXCEPTION
           BEGIN
              INSERT .....;   -- insert row into a log table

                -- get diagnostic information for the INSERT statement
              GET CURRENT DIAGNOSTICS CONDITION 1 msg_text = MESSAGE_TEXT;

                -- get information about condition that activated the handler
              GET STACKED DIAGNOSTICS CONDITION 1 divide_error = MESSAGE_TEXT;
           END;

         SET divide_result = numerator/denominator;
    END;
```

The first GET DIAGNOSTICS statement obtains diagnostic information about the INSERT statement.

The second GET DIAGNOSTICS statement specifies the STACKED keyword. The use of the STACKED keyword allows access the stacked diagnostics area which contains the diagnostic information for the condition that caused the handler to be activated. The information about the original condition is still accessible within the handler even after another statement has been issued, such as the INSERT statement in the example.

Example 6: The following application logs information whenever a routine is invoked directly by an application rather than indirectly by another routine. The application uses the GET DIAGNOSTICS statement that specifies DB2_SQL_NESTING_LEVEL to obtain the current nesting level, and invokes the LOG_INVOCATION procedure if the nesting level is 1:

```
CREATE PROCEDURE TEST
    MODIFIES SQL DATA
    LANGUAGE SQL
    BEGIN
    DECLARE NESTING_LEVEL  INT     DEFAULT 0;

    GET DIAGNOSTICS NESTING_LEVEL = DB2_SQL_NESTING_LEVEL;

    --
    -- If routine is invoked at nesting level 1,
    -- invoke a routine to log the invocation.
    --
    IF (NESTING_LEVEL = 1) THEN
       CALL LOG_INVOCATION();
    END IF;

    --
    -- Remainder of procedure logic
    --
    ...
END
```

GRANT

The Db2 GRANT statement grants privileges to authorization IDs. There is a separate form of the statement for each of these classes of privilege:

- Collection
- Database
- Function or stored procedure
- Package
- Plan
- Schema
- Sequence
- System
- Table or view

- Type or JAR
- Variable
- Use

The applicable objects are always at the current server. The grants are recorded in the current server's catalog.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

If the authorization mechanism was not activated when the Db2 subsystem was installed, an error condition occurs.

Authorization

To grant a privilege P, the privilege set must include one of the following:

- The privilege P WITH GRANT OPTION
- Ownership of the object on which P is a privilege
- SECADM authority

  Note: If installation parameter SEPARATE SECURITY is NO, SYSADM authority has implicit SECADM authority.
- ACCESSCTRL authority

  The presence of ACCESSCTRL authority in the privilege set allows the granting of all authorities except:

  – System DBADM
  – CREATE_SECURE_OBJECT privilege
  – DATAACCESS
  – ACCESSCTRL

    Note: If installation parameter SEPARATE SECURITY is NO, SYSCTRL authority has implicit ACCESSCTRL authority that allows the granting of all privileges except:

    - DBADM on databases
    - DELETE, INSERT, SELECT, and UPDATE on user tables or views
    - EXECUTE on plans, packages, functions, or stored procedures
    - PACKADM on collections
    - SYSADM authority
    - USAGE on distinct types, JARs, and sequences
    - READ, WRITE on global variables

To grant the CREATE_SECURE_OBJECT system privilege, the privileges that are held by the authorization ID of the statement must include SECADM authority.

Except for views, the GRANT option for privileges on a table is also inherent in DBADM authority for its database, provided DBADM authority was acquired with the GRANT option. See “CREATE VIEW” on page 1636 for a description of the rules that apply to views.

If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. The owner can be a role. If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process. However, if the process is running in a trusted context that is defined with the ROLE AS OBJECT OWNER CLAUSE, the privilege set is the privileges that are held by the role in effect.

Syntax

Description

authorization-specification
Specifies one or more privileges for the class of privilege. The same privilege must not be specified more than once.

TO
Specifies to what authorization IDs the privileges are granted.

authorization-name,...
Lists one or more authorization IDs.

ROLE *role-name*
Lists one or more role names. Each name must identify a role that exists at the current server.

The value of the CURRENT RULES special register determines whether you can use the ID or role of the GRANT statement itself (to grant privileges to yourself). When CURRENT RULES is:

Db2
You cannot use the ID or role of the GRANT statement.

STD
You can use the ID or role of the GRANT statement.

PUBLIC
Grants the privileges to all users at the current server, including database requesters using DRDA access.

CREATE_SECURE_OBJECT must not be granted to PUBLIC.

ACCESSCTRL, DATAACCESS and system DBADM authorities cannot be granted to PUBLIC.

WITH GRANT OPTION
Allows the named users to grant the privileges to others. Granting an administrative authority with this option allows the user to specifically grant any privilege belonging to that authority. If you omit WITH GRANT OPTION, the named users cannot grant the privileges to others unless they have that authority from some other source.

GRANT authority cannot be passed to PUBLIC. When WITH GRANT OPTION is used with PUBLIC, a warning is issued, and the named privileges are granted, but without GRANT authority.

If you grant the CREATE_SECURE_OBJECT system privilege, the WITH GRANT OPTION clause is ignored because the CREATE_SECURE_OBJECT system privilege cannot be granted to others.

GRANT ACCESSCTRL, DATAACCESS and system DBADM authorities cannot be passed to others. If WITH GRANT OPTION is used when granting these authorities, a warning is issued and the named authorities are granted, but without GRANT authority.

Notes

A *grant* is the granting of a specific privilege by a specific grantor to a specific grantee. The grantor for a given GRANT statement is the authorization ID for the privilege set; that is, the SQL authorization ID of the

process or a role, or the authorization ID of the owner of the plan or package. Grant statements that are made in a trusted context that is defined with the ROLE AS OBJECT OWNER clause result in the grantor being the role that is in effect. If the statement is prepared dynamically, the grantor is the role that is associated with the ID that is running the statement. If the statement is embedded in an application program that was bound in a trusted context that was defined with the ROLE AS OBJECT OWNER clause the owner of the plan or package is a role which is the grantor. If the ROLE AS OBJECT OWNER clause is not specified for the trusted context, the grantor is the authorization ID of the process.

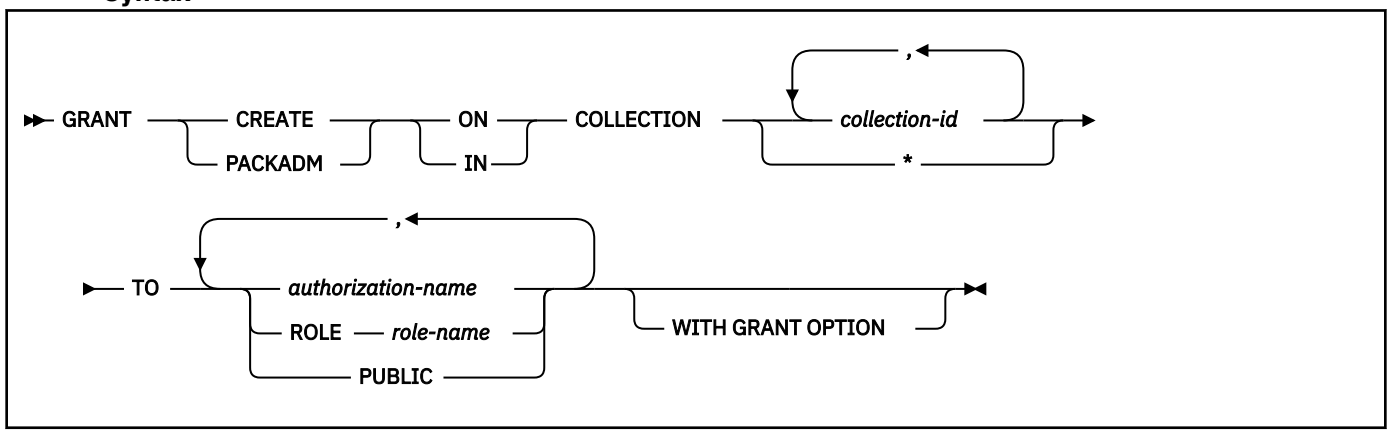
The grantee, as recorded in the catalog, is an authorization ID or PUBLIC. Any instances of PUBLIC* in the catalog mean the same as PUBLIC.

Duplicate grants from the same grantor are not recorded in the catalog. Otherwise, the result of executing a GRANT statement is recorded as one or more grants in the current server's catalog.

If more than one privilege or *authorization-name* is specified after the TO keyword and one of the grants is in error, execution of the statement is stopped and no grants are made. The status of the privilege or privileges granted is recorded in the catalog for each *authorization-name*.

Different grantors can grant the same privilege to a single grantee. The grantee retains that privilege as long as one or more of those grants are recorded in the catalog. Privileges that imply other privileges are also termed *authorities*. Grants are removed from the catalog by executing SQL REVOKE statements.

Whenever a grant is made for a database, distinct type, package, plan, schema, stored procedure, table, trigger, user-defined function, view, or USE privilege for an object that does not exist, an SQL return code is issued and the grant is not made.



Related tasks

Granting privileges with the GRANT statement (Managing Security)

GRANT (collection privileges)

This form of the GRANT statement grants privileges on collections.

Syntax

Description

CREATE IN

Grants the privilege to use the BIND subcommand to create packages in the designated collections.

The word ON can be used instead of IN.

PACKADM ON

Grants package administrator authority for the designated collections.

The word IN can be used instead of ON.

COLLECTION *collection-id,...*
Identifies the collections on which the specified privilege is granted. The collections do not have to exist.

COLLECTION *
Indicates that the specified privilege is granted on all collections including those that do not currently exist.

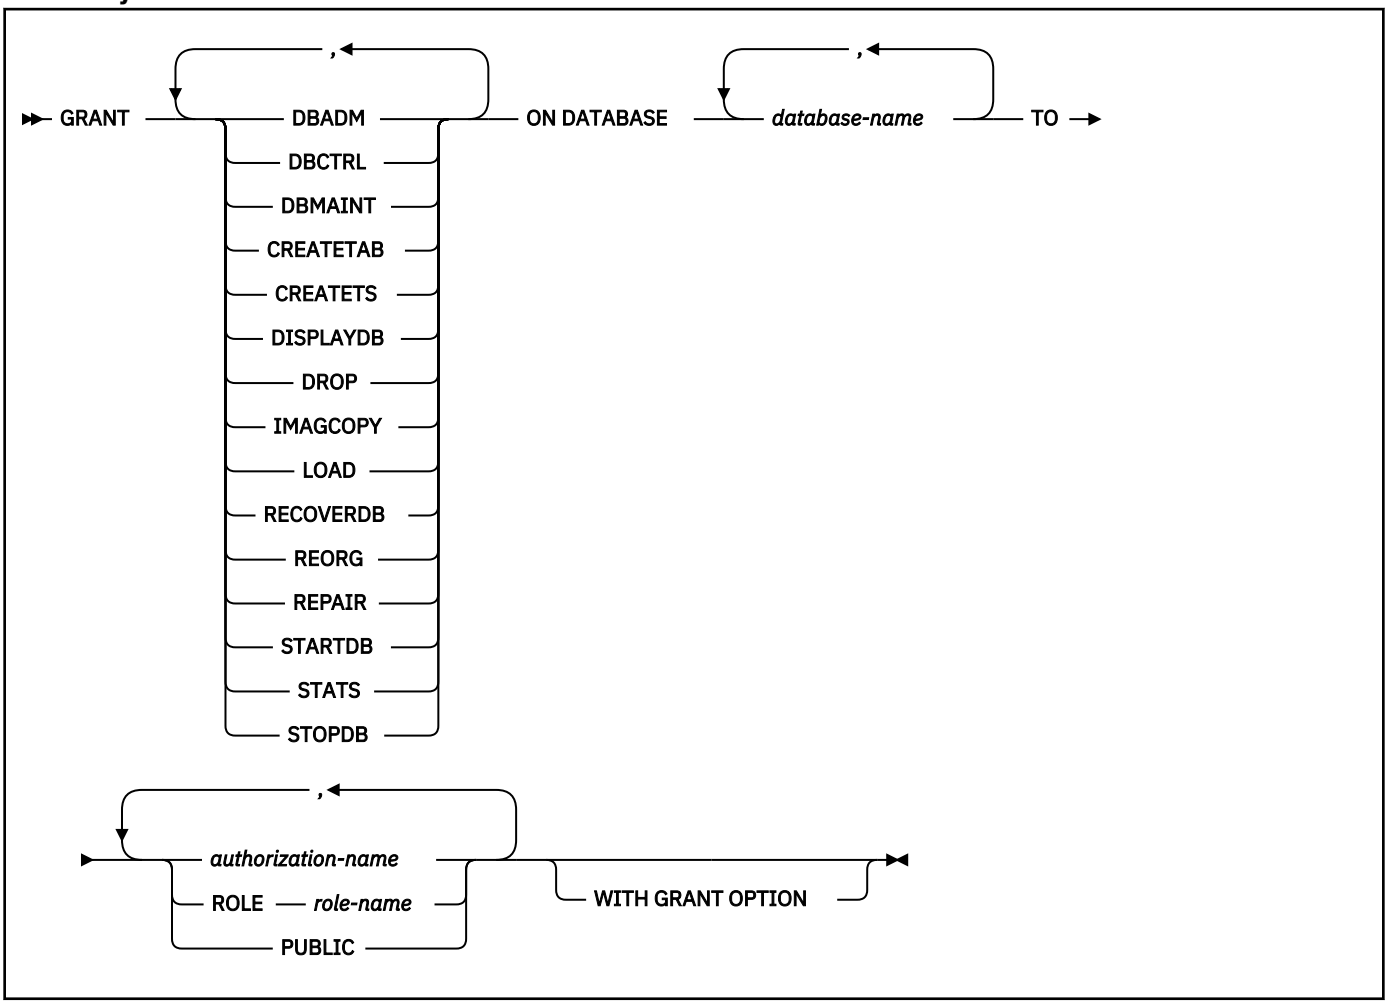
TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Examples

Example 1: Grant the privilege to create new packages in collections QAACLONE and DSN8CC61 to CLARK.

```
GRANT CREATE IN COLLECTION QAACLONE, DSN8CC61 TO CLARK;
```



Example 2: Grant the privileges to create new packages in collection DSN8CC91 to role ROLE1:

```
GRANT CREATE IN COLLECTION DSN8CC91 TO ROLE ROLE1;
```

GRANT (database privileges)

This form of the GRANT statement grants privileges on databases.

Syntax

Description

Each keyword listed grants the privilege described, but only as it applies to or within the databases named in the statement.

DBADM
Grants the database administrator authority.

DBCTRL
Grants the database control authority.

DBMAINT
Grants the database maintenance authority.

CREATETAB
Grants the privilege to create new tables. To create tables in an implicitly created database, CREATETAB privileges are needed on the DSNDB04 database. For a work file database, PUBLIC implicitly has the CREATETAB privilege (without GRANT authority) to define declared temporary tables; this privilege is not recorded in the Db2 catalog, and it cannot be revoked.

CREATETS
Grants the privilege to create new table spaces.

DISPLAYDB
Grants the privilege to issue the DISPLAY DATABASE command.

DROP
Grants the privilege to issue the DROP or ALTER DATABASE statements for the designated databases.

IMAGCOPY
Grants the privilege to run the COPY, MERGECOPY, and QUIESCE utilities against table spaces of the specified databases, and to run the MODIFY RECOVERY utility.

LOAD
Grants the privilege to use the LOAD utility to load tables.

RECOVERDB
Grants the privilege to use the RECOVER and REPORT utilities to recover table spaces and indexes.

REORG
Grants the privilege to use the REORG utility to reorganize table spaces and indexes.

REPAIR
Grants the privilege to use the REPAIR and DIAGNOSE utilities.

STARTDB
Grants the privilege to issue the START DATABASE command.

STATS
Grants the privilege to use the RUNSTATS utility to update statistics, the CHECK utility to test whether indexes are consistent with the data they index, and the MODIFY STATISTICS utility to delete unwanted statistics history records from the corresponding catalog tables.

STOPDB
Grants the privilege to issue the STOP DATABASE command.

ON DATABASE *database-name,...*
Identifies databases on which privileges are to be granted. For each named database, the grantor must have all the specified privileges with the GRANT option. Each name must identify a database that exists at the current server. DSNDB01 must not be identified; however, a grant of a privilege on DSNDB06 implies the granting of the same privilege on DSNDB01 for utility operations only.

Database privileges granted on DSNDB04 are applicable to all implicitly created databases. This means that a user with the STOPDB privilege on DSNDB04 can also stop database objects in any implicitly created database. Similarly, having DBADM on DSNDB04 allows access to all tables in all implicitly created databases. However, having a database privilege on DSNDB04 does not allow granting of this privilege on an implicitly created database to others.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Examples

Example 1: Grant drop privileges on database DSN8D11A to user PEREZ.

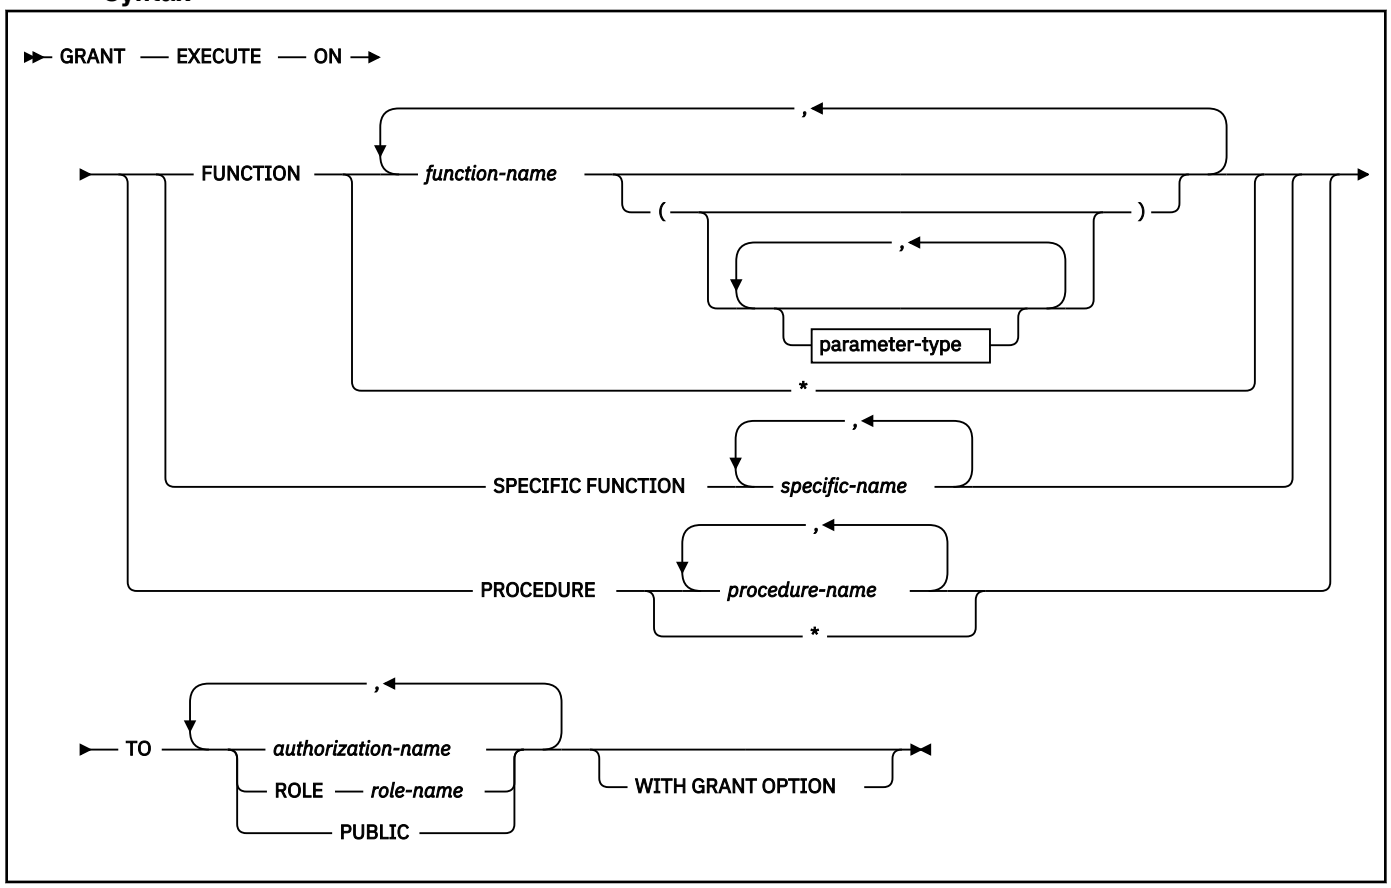
```
GRANT DROP
  ON DATABASE DSN8D11A
  TO PEREZ;
```

Example 2: Grant repair privileges on database DSN8D11A to all local users.

```
GRANT REPAIR
  ON DATABASE DSN8D11A
  TO PUBLIC;
```

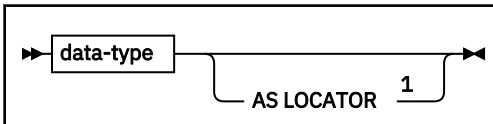
Example 3: Grant authority to create new tables and load tables in database DSN8D11A to users WALKER, PIANKA, and FUJIMOTO, and give them grant privileges.

```
GRANT CREATETAB,LOAD
  ON DATABASE DSN8D11A
  TO WALKER,PIANKA,FUJIMOTO
  WITH GRANT OPTION;
```



Example 4: Grant load privileges to database DSN9D91A to role ROLE1:

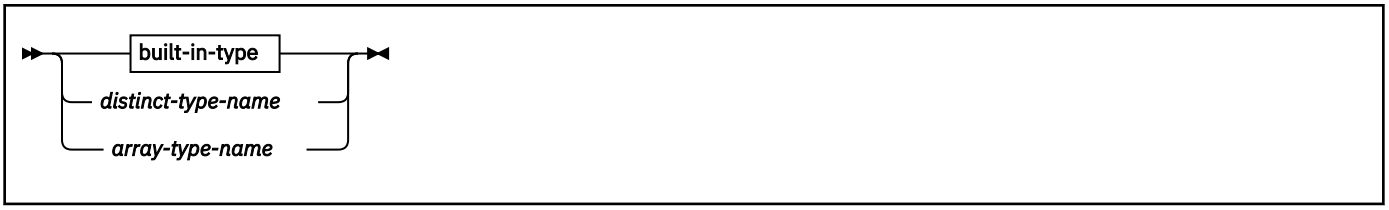
```
GRANT LOAD
  ON DATABASE DSN9D91A
  TO ROLE ROLE1;
```



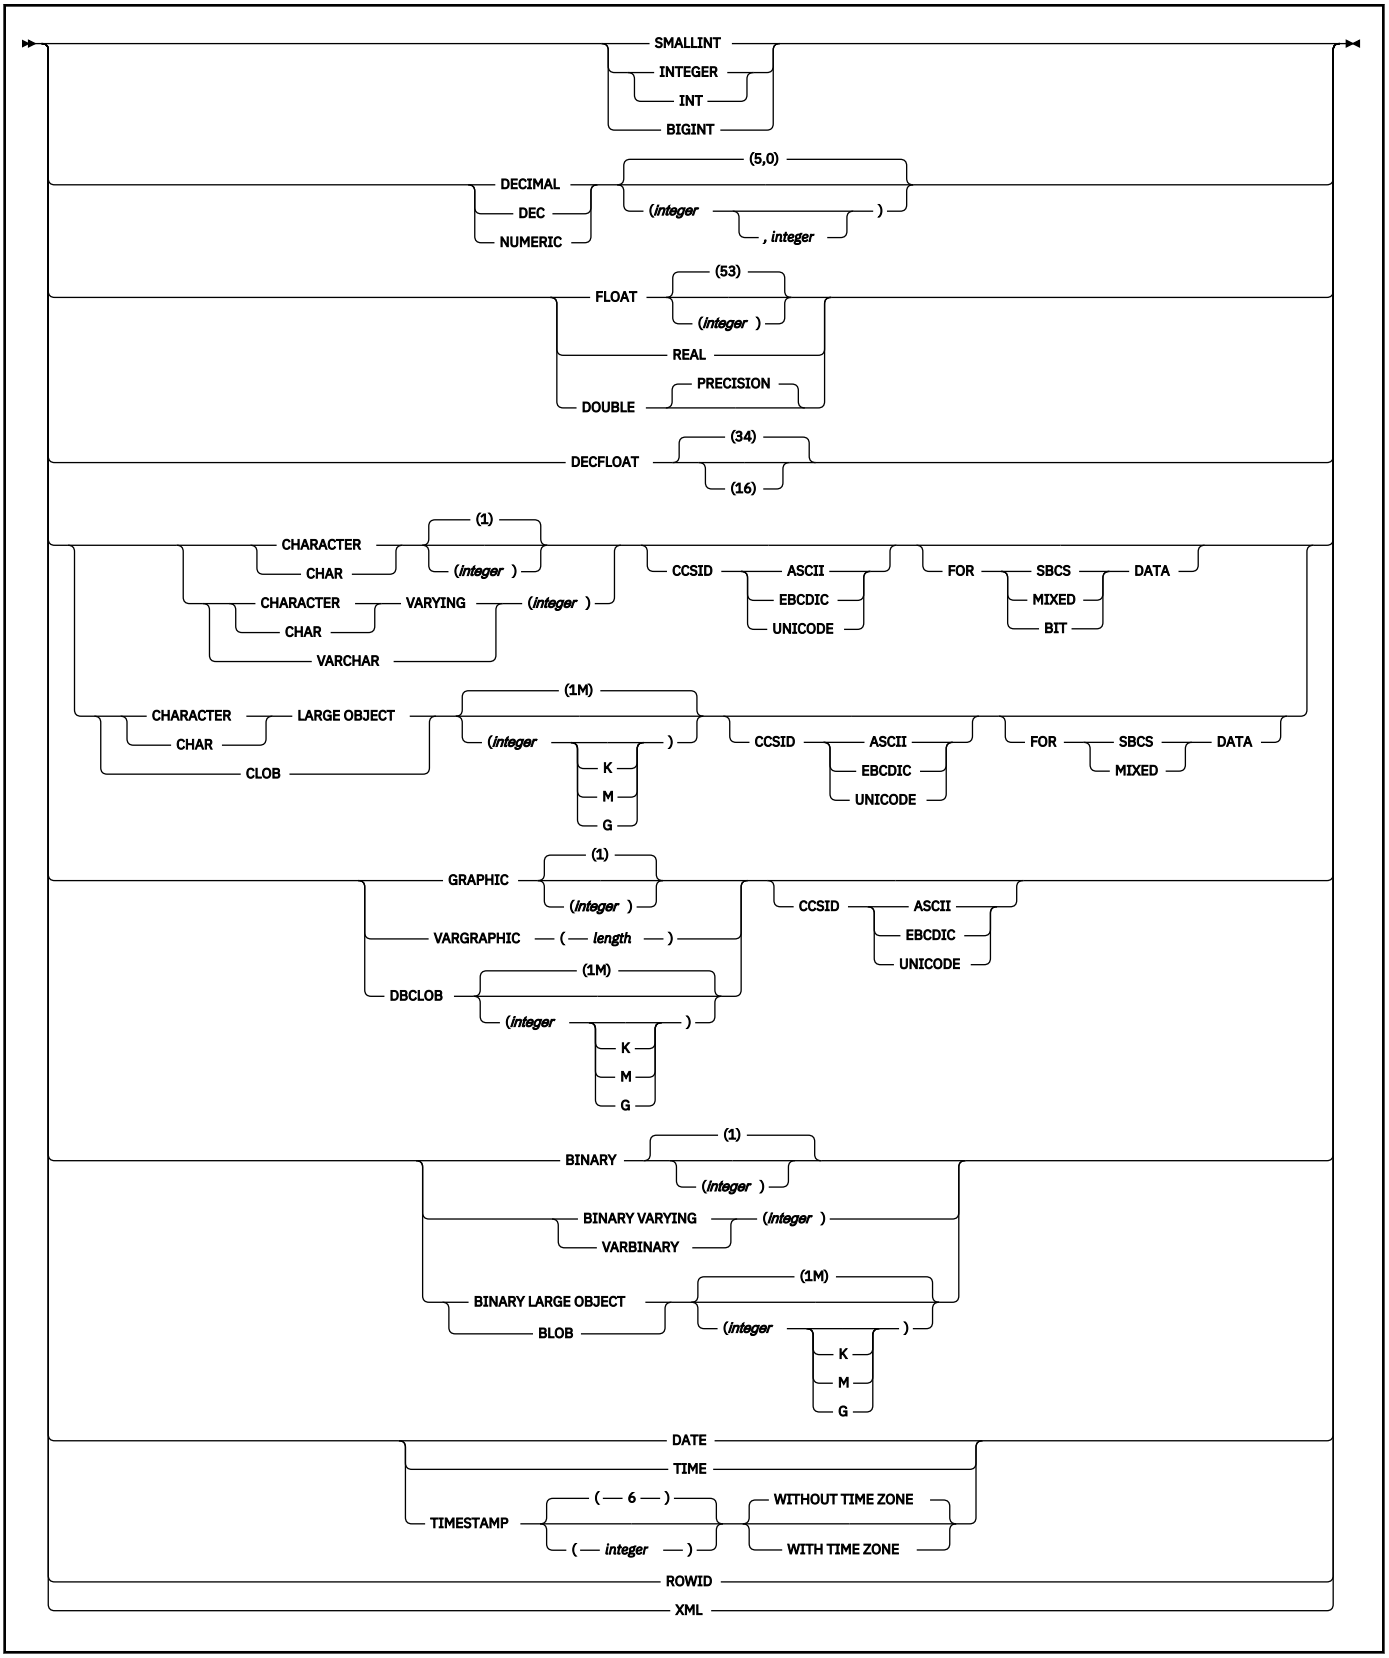
GRANT (function or procedure privileges)

This form of the GRANT statement grants privileges on user-defined functions, cast functions that are generated for distinct types, array types, and stored procedures.

Syntax



parameter-type:



Notes:

[1] AS LOCATOR can be specified only for a LOB data type or a distinct type based on a LOB data type.

data-type:

built-in-type:

Description

EXECUTE

Grants the privilege to run the identified user-defined function, cast function that was generated for a distinct type, or stored procedure.

FUNCTION or SPECIFIC FUNCTION

Identifies the function on which the privilege is granted. The function must exist at the current server, and it must be a function that was defined with the CREATE FUNCTION statement or a cast function that was generated by a CREATE TYPE statement. The function can be identified by name, function signature, or specific name.

If the function was defined with a table parameter (the LIKE TABLE was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to identify the function. Instead, identify the function with its function name, if unique, or with its specific name.

FUNCTION *function-name*

Identifies the function by its name. The *function-name* must identify exactly one function. The function can have any number of parameters defined for it. If there is more than one function of the specified name in the specified or implicit schema, an error is returned.

An asterisk (*) can be specified for an unqualified function name. The function can be identified as a qualified or unqualified *function-name*. For example, * indicates that the privilege is granted on all the functions in the default schema, including those that do not currently exist. *schema-name*.* indicates that the privilege is granted on all the functions in the specified schema, including those that do not currently exist. SYSADM authority is required if * or *schema-name*.* is specified. Specifying an asterisk does not affect any EXECUTE privileges that are already granted on a function.

FUNCTION *function-name (parameter-type,...)*

Identifies the function by its function signature, which uniquely identifies the function. The *function-name (parameter-type, ...)* must identify a function with the specified function signature. The specified parameters must match the data types in the corresponding position that were specified when the function was created. The number of data types, and the logical concatenation of the data types is used to identify the specific function instance on which the privilege is to be granted. Synonyms for data types are considered a match.

If the function was defined with a table parameter (the LIKE TABLE *name* AS LOCATOR clause was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to uniquely identify the function. Instead, use one of the other syntax variations to identify the function with its function name, if unique, or its specific name.

If *function-name ()* is specified, the function identified must have zero parameters.

function-name

Identifies the name of the function. If you do not explicitly qualify the function name with a schema name, the function name is implicitly qualified with a schema name as described in the preceding description for FUNCTION *function-name*.

(parameter-type,...)

Identifies the parameters of the function.

If an unqualified distinct type name is specified, Db2 searches the SQL path to resolve the schema name for the distinct type.

For data types that have a length, precision, or scale attribute, use one of the following:

- Empty parentheses indicate that the database manager ignores the attribute when determining whether the data types match. For example, DEC() will be considered a match for a parameter of a function defined with a data type of DEC(7,2). Similarly, DECFLOAT() will be considered a match for DECFLOAT(16) or DECFLOAT(34). However, FLOAT cannot be specified with empty parenthesis because its parameter value indicates a specific data type (REAL or DOUBLE).
- If a specific value for a length, precision, or scale attribute is specified, the value must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement. If the data type is FLOAT, the precision does not have to exactly match the value that was specified because matching is based on the data type (REAL or DOUBLE).

- If length, precision, or scale is not explicitly specified, and empty parentheses are not specified, the default attributes of the data type are implied. The implicit length must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement.

For data types with a subtype or encoding scheme attribute, specifying the FOR *subtype* DATA clause or the CCSID clause is optional. Omission of either clause indicates that Db2 ignores the attribute when determining whether the data types match. If you specify either clause, it must match the value that was implicitly or explicitly specified in the CREATE FUNCTION statement.

AS LOCATOR
Specifies that the function is defined to receive a locator for this parameter. If AS LOCATOR is specified, the data type must be a LOB or a distinct type based on a LOB.

SPECIFIC FUNCTION *specific-name*
Identifies the function by its specific name. The *specific-name* must identify a specific function that exists at the current server.

PROCEDURE *procedure-name*
Identifies a stored procedure that is defined at the current server. The name, including the implicit or explicit schema name, must identify a stored procedure that exists at the current server.

An asterisk (*) can be specified for an unqualified procedure name. The procedure can be identified as a qualified or unqualified *procedure-name*. For example, * indicates that the privilege is granted on all the procedures in the default schema, including those that do not currently exist. *schema-name*.* indicates that the privilege is granted on all the procedures in the specified schema, including those that do not currently exist. SYSADM authority is required if * or *schema-name*.* is specified. Specifying an asterisk does not affect any EXECUTE privileges that are already granted on a procedure.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Examples

Example 1: Grant the EXECUTE privilege on function CALC_SALARY to user JONES. Assume that there is only one function in the schema with function name CALC_SALARY.

```
GRANT EXECUTE ON FUNCTION CALC_SALARY TO JONES;
```

Example 2: Grant the EXECUTE privilege on procedure VACATION_ACCR to all users at the current server.

```
GRANT EXECUTE ON PROCEDURE VACATION_ACCR TO PUBLIC;
```

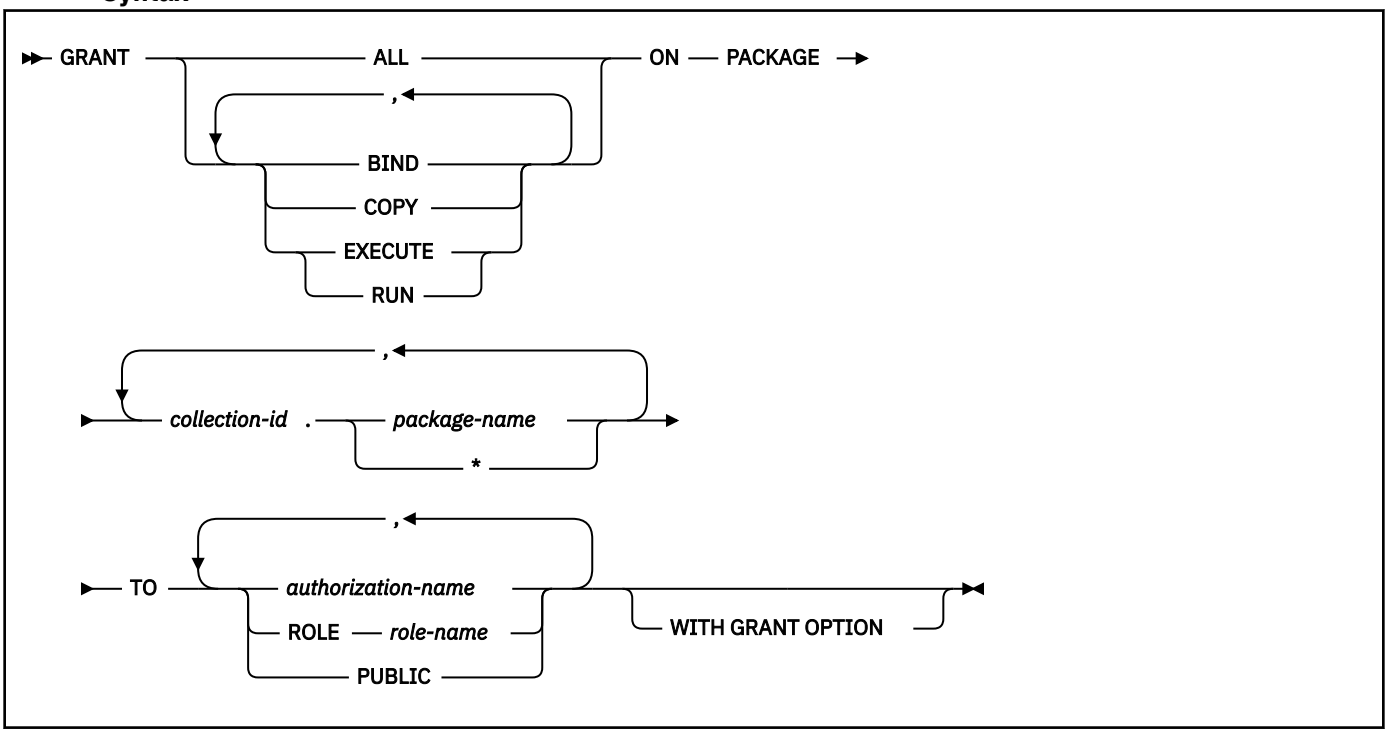
Example 3: Grant the EXECUTE privilege on function DEPT_TOTALS to the administrative assistant and give the assistant the ability to grant the EXECUTE privilege on this function to others. The function has the specific name DEPT85_TOT. Assume that the schema has more than one function that is named DEPT_TOTALS.

```
GRANT EXECUTE ON SPECIFIC FUNCTION DEPT85_TOT TO ADMIN_A
      WITH GRANT OPTION;
```

Example 4: Grant the EXECUTE privilege on function NEW_DEPT_HIRES to HR (Human Resources). The function has two input parameters with data types of INTEGER and CHAR(10), respectively. Assume that the schema has more than one function that is named NEW_DEPT_HIRES.

```
GRANT EXECUTE ON FUNCTION NEW_DEPT_HIRES (INTEGER, CHAR(10))
      TO HR;
```

You can also code the CHAR(10) data type as CHAR().



Example 5: Grant the EXECUTE privilege on function FIND_EMPDEPT to role ROLE1:

```
GRANT EXECUTE ON FUNCTION FIND_EMPDEPT TO ROLE ROLE1;
```

GRANT (package privileges)

This form of the GRANT statement grants privileges on packages.

Syntax

Description

BIND
Grants the privilege to use the BIND and REBIND subcommands for the designated packages.

The BIND package privilege can also be used to allow a user to add a new version of an existing package. For details on the authorization required to create new packages and new versions of existing packages, see “Notes” on page 1790.

COPY
Grants the privilege to use the COPY option of the BIND subcommand for the designated packages.

EXECUTE
Grants the privilege to run application programs that use the designated packages and to specify the packages following PKLIST for the BIND PLAN and REBIND PLAN commands. RUN is an alternate name for the same privilege.

ALL
Grants all package privileges for which you have GRANT authority for the packages named in the ON clause.

ON PACKAGE *collection-id.package-name,...*
Identifies packages for which you are granting privileges. The granting of a package privilege applies to all versions of a package. The list can simultaneously contain items of the following two forms:

- *collection-id.package-name* explicitly identifies a single package. The name must identify a package that exists at the current server.

- *collection-id.** applies to every package in the indicated collection. This includes packages that currently exist and future packages. The grant applies to a collection at the current server, but the *collection-id* does not have to identify a collection that exists when the grant is made.

  To grant a privilege in this form requires PACKADM with the WITH GRANT OPTION over the collection or all collections, SYSADM, or SYSCTRL authority. Because of this fact, WITH GRANT OPTION, if included in the statement, is ignored for grants of this form, but not for grants for specific packages.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Notes

The authorization required to add a new package or a new version of an existing package depends on the value of field BIND NEW PACKAGE on installation panel DSNTIPP. The default value is BINDADD.

If the value of BIND NEW PACKAGE is BINDADD, the owner must have one of the following to add a new package or a new version of an existing package to a collection:

- The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority for the collection or for all collections
- SYSADM or SYSCTRL authority

If the value of BIND NEW PACKAGE is BIND, the owner must have one of the following to add a new package or a new version of an existing package to a collection:

- The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority for the collection or for all collections
- SYSADM or SYSCTRL authority
- PACKADM authority for the collection or for all collections
- Users with the BIND package privilege can also add a new version of an existing package

Alternative syntax and synonyms: To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports specifying PROGRAM as a synonym for PACKAGE.

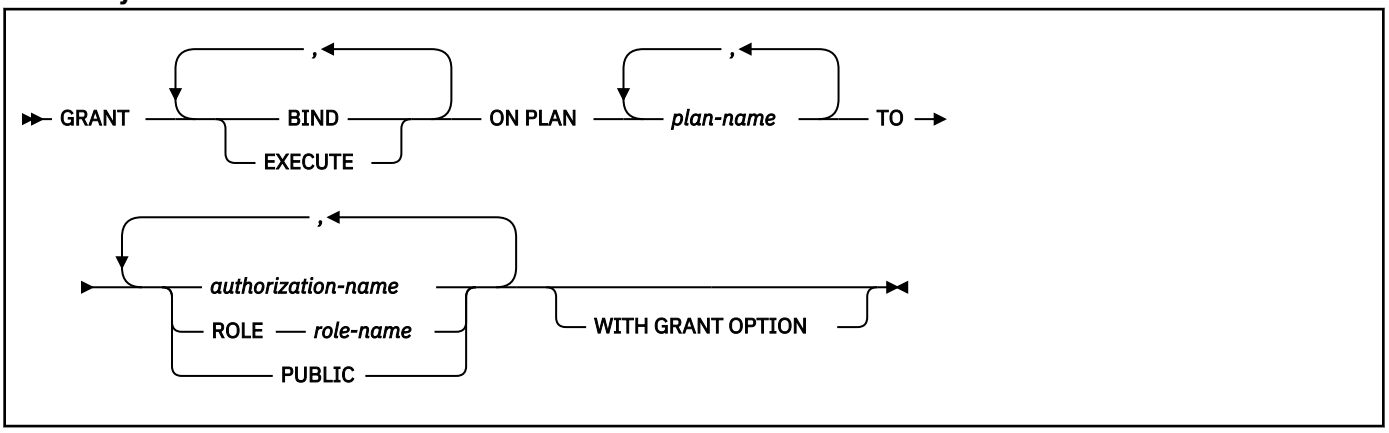
Examples

Example 1: Grant the privilege to copy all packages in collection DSN8CC61 to LEWIS.

```
GRANT COPY ON PACKAGE DSN8CC61.* TO LEWIS;
```

Example 2: You have the BIND privilege with GRANT authority over the package CLCT1.PKG1. You have the EXECUTE privilege with GRANT authority over the package CLCT2.PKG2. You have no other privileges with GRANT authority over any package in the collections CLCT1 AND CLCT2. Hence, the following statement, when executed by you, grants LEWIS the BIND privilege on CLCT1.PKG1 and the EXECUTE privilege on CLCT2.PKG2, and makes no other grant. The privileges granted include no GRANT authority.

```
GRANT ALL ON PACKAGE CLCT1.PKG1, CLCT2.PKG2 TO JONES;
```



Example 3: Grant the privileges to run all packages in collection DSN9CC13 to role ROLE1:

```
GRANT EXECUTE ON PACKAGE DSN9CC13.* TO ROLE ROLE1;
```

GRANT (plan privileges)

This form of the GRANT statement grants privileges on plans.

Syntax

Description

BIND
Grants the privilege to use the BIND, REBIND, and FREE subcommands for the identified plans. (The authority to create new plans using BIND ADD is a system privilege.)

EXECUTE
Grants the privilege to run programs that use the identified plans.

ON PLAN *plan-name,...*
Identifies the application plans on which the privileges are granted. For each identified plan, you must have all specified privileges with the GRANT option.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Examples

Example 1: Grant the privilege to bind plan DSN8IP11 to user JONES.

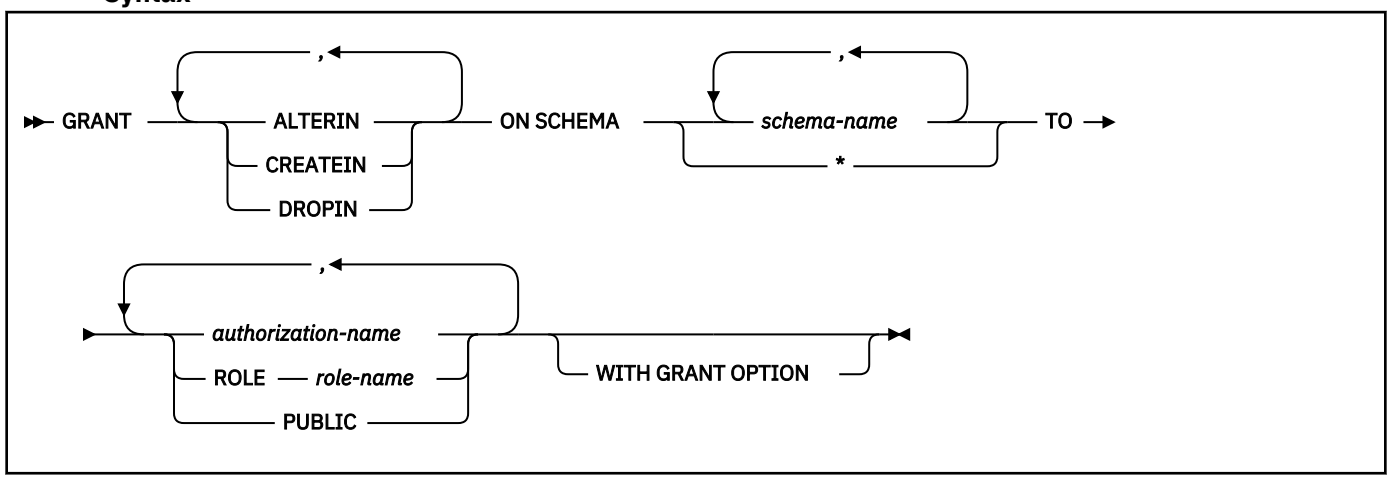
```
GRANT BIND ON PLAN DSN8IP11 TO JONES;
```

Example 2: Grant privileges to bind and execute plan DSN8CP11 to all users at the current server.

```
GRANT BIND,EXECUTE ON PLAN DSN8CP11 TO PUBLIC;
```

Example 3: Grant the privilege to execute plan DSN8CP11 to users ADAMSON and BROWN with grant option.

```
GRANT EXECUTE ON PLAN DSN8CP11 TO ADAMSON,BROWN WITH GRANT OPTION;
```



Example 4: Grant the privileges to bind the DSN91PLN plan to role ROLE1:

```
GRANT BIND ON PLAN DSN91PLN TO ROLE ROLE1;
```

GRANT (schema privileges)

This form of the GRANT statement grants privileges on schemas.

Syntax

Description

ALTERIN
Grants the privilege to alter stored procedures and user-defined functions, or specify a comment for distinct types, cast functions that are generated for distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

CREATEIN
Grants the privilege to create distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

DROPIN
Grants the privilege to drop distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

SCHEMA *schema-name*
Identifies the schemas on which the privilege is granted. The schemas do not need to exist when the privilege is granted.

SCHEMA *
Indicates that the specified privilege is granted on all schemas including those that do not currently exist.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Notes

Grant on SYSPUBLIC:
Privileges can be granted on the reserved schema SYSPUBLIC. Granting CREATEIN privilege allows the user to create a public alias and granting DROPIN privilege allows the user to drop any public alias.

Examples

Example 1: Grant the CREATEIN privilege on schema T_SCORES to user JONES.

```
GRANT CREATEIN ON SCHEMA T_SCORES TO JONES;
```

Example 2: Grant the CREATEIN privilege on schema VAC to all users at the current server.

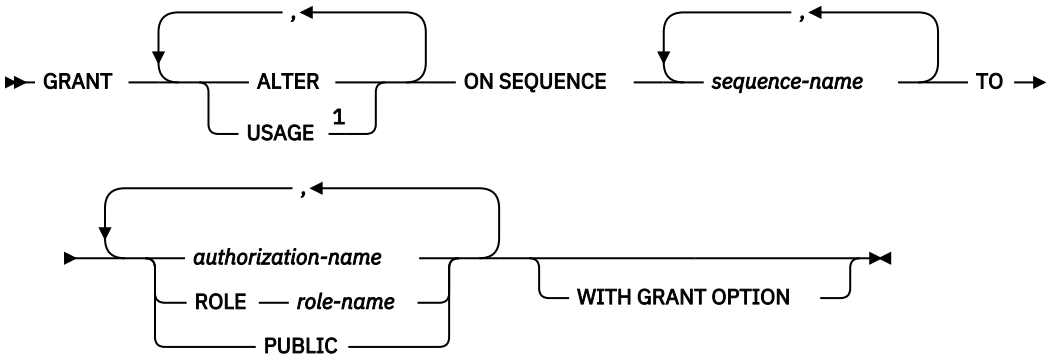
```
GRANT CREATEIN ON SCHEMA VAC TO PUBLIC;
```

Example 3: Grant the ALTERIN privilege on schema DEPT to the administrative assistant and give the grantee the ability to grant ALTERIN privileges on this schema to others.

```
GRANT ALTERIN ON SCHEMA DEPT TO ADMIN_A
      WITH GRANT OPTION;
```

Example 4: Grant the CREATEIN, ALTERIN, and DROPIN privileges on schemas NEW_HIRE, PROMO, and RESIGN to HR (Human Resources).

```
GRANT CREATEIN, ALTERIN, DROPIN ON SCHEMA NEW_HIRE, PROMO, RESIGN TO HR;
```



Example 5: Grant the ALTERIN privileges on the EMPLOYEE schema to role ROLE1:

```
GRANT ALTERIN ON SCHEMA EMPLOYEE TO ROLE ROLE1;
```

GRANT (sequence privileges)

This form of the GRANT statement grants privileges on a user-defined sequence.

Syntax

Notes:

1 The keyword SELECT is an alternative keyword for USAGE.

Description

ALTER
Grants the privilege to alter a sequence or record a comment on a sequence.

USAGE
Grants the USAGE privilege to use a sequence. This privilege is needed when the NEXT VALUE or PREVIOUS VALUE expression is invoked for a sequence name.

SEQUENCE *sequence-name*
Identifies the sequence. The name, including the implicit or explicit schema qualifier, must uniquely identify an existing sequence at the current server. If no sequence by this name exists in the explicitly or implicitly specified schema, an error occurs. *sequence-name* must not be the name of an internal sequence object that is used by Db2.

TO
Refer to “GRANT” on page 1777 for a description of the TO clause.

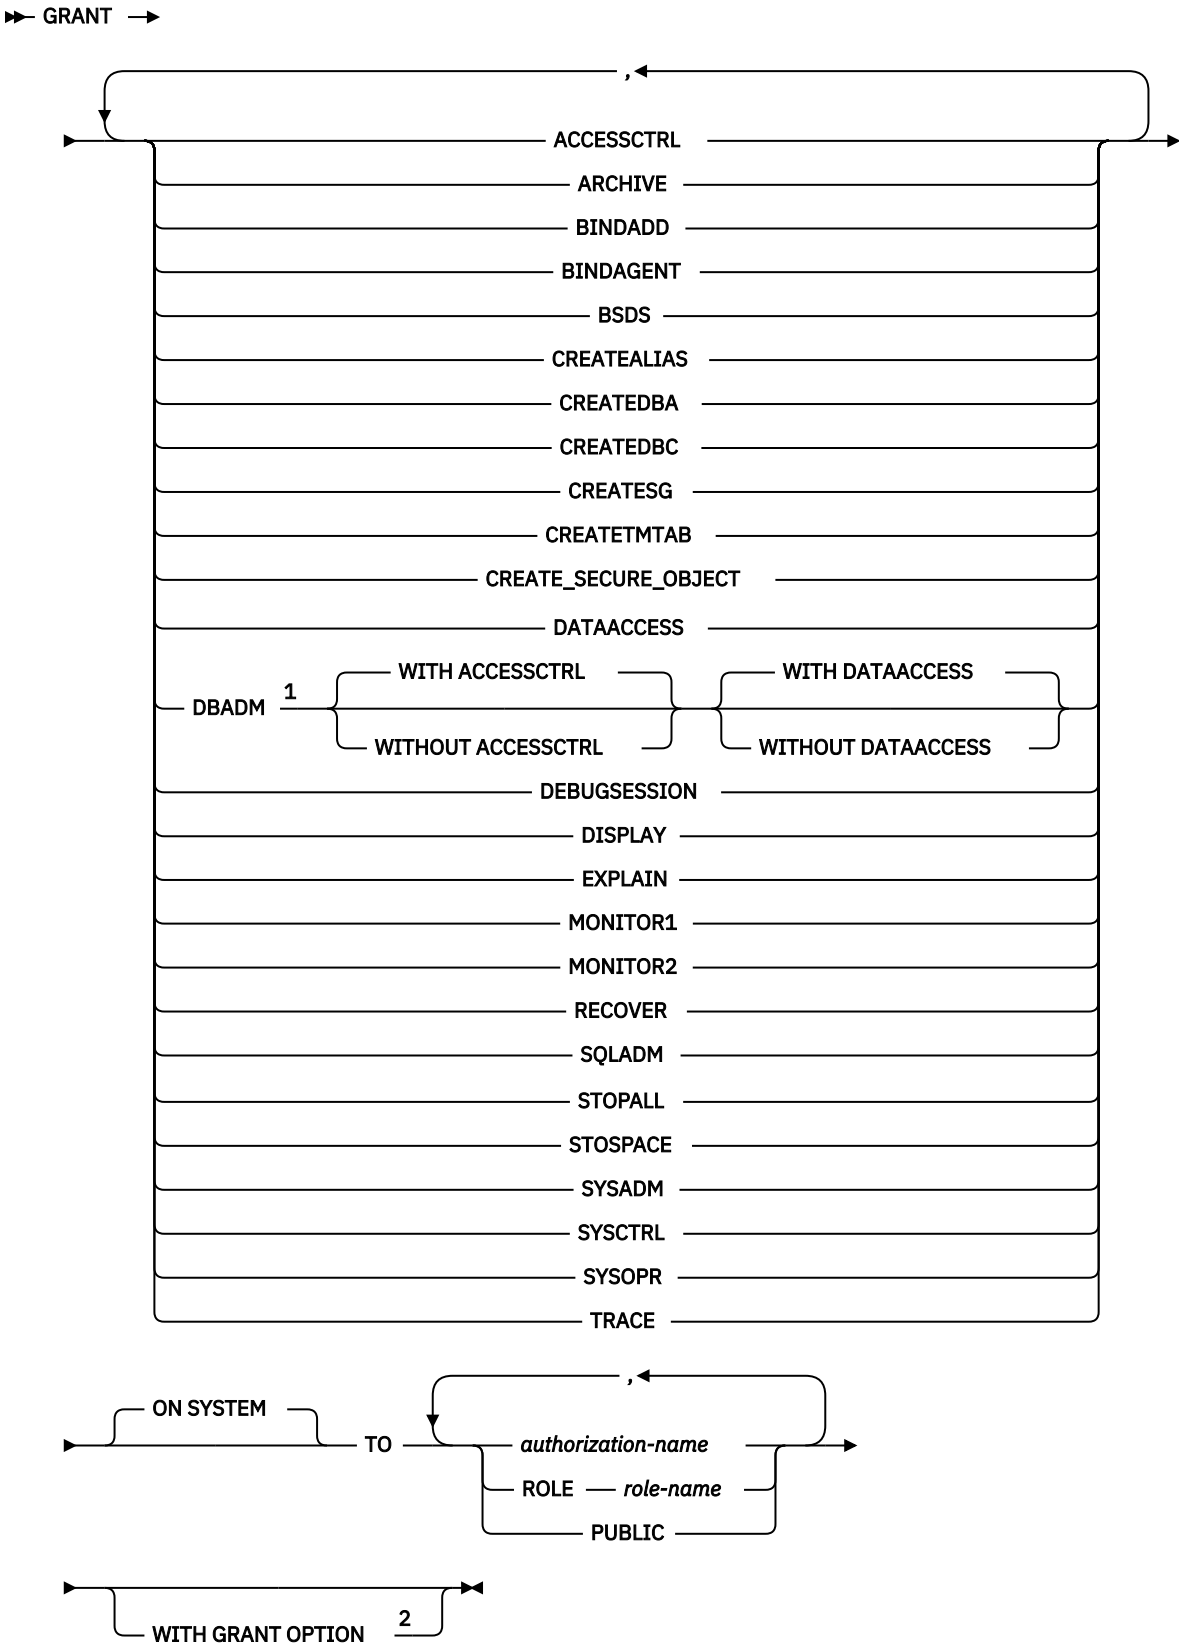
WITH GRANT OPTION

Refer to “GRANT” on page 1777 for a description of the WITH GRANT OPTION clause.

Examples

Example 1: Grant USAGE privilege on sequence MYNUM to user JONES.

```
GRANT USAGE
  ON SEQUENCE MYNUM
  TO JONES;
```



Example 2: Grant USAGE privileges on sequence ORDER_SEQ to role ROLE1:

```
GRANT USAGE ON SEQUENCE ORDER_SEQ TO ROLE ROLE1;
```

GRANT (system privileges)

This form of the GRANT statement grants system privileges.

Syntax

Notes:

[1] The ACCESSCTRL and DATAACCESS clauses can be specified in any order.

[2] The WITH GRANT OPTION can be specified but is ignored for DBADM, DATAACCESS, and ACCESSCTRL.

Description

ACCESSCTRL
Grants the ACCESSCTRL authority. ACCESSCTRL allows the user to grant all authorities and privileges, except system DBADM, DATAACCESS, ACCESSCTRL, and privileges on security related objects.

A warning is issued if the WITH GRANT OPTION is specified when granting this authority.

ACCESSCTRL cannot be granted to PUBLIC.

ARCHIVE
Grants the privilege to use the ARCHIVE LOG and SET LOG commands.

BINDADD
Grants the privilege to create plans and packages by using the BIND subcommand with the ADD option.

BINDAGENT
Grants the privilege to issue the BIND, FREE PACKAGE, or REBIND commands for plans and packages and the DROP PACKAGE statement on behalf of the grantor. The privilege also allows the holder to copy and replace plans and packages on behalf of the grantor.

A warning is issued if WITH GRANT OPTION is specified when granting this privilege.

BSDS
Grants the privilege to issue the RECOVER BSDS command.

CREATEALIAS
Grants the privilege to use the CREATE ALIAS statement.

CREATEDBA
Grants the privilege to issue the CREATE DATABASE statement and acquire DBADM authority over those databases.

CREATEDBC
Grants the privilege to issue the CREATE DATABASE statement and acquire DBCTRL authority over those databases.

CREATESG
Grants the privilege to create new storage groups.

CREATETMTAB
Grants the privilege to use the CREATE GLOBAL TEMPORARY TABLE statement.

CREATE_SECURE_OBJECT
Grants the privilege to create a secure object.

DATAACCESS
Grants the DATAACCESS authority. DATAACCESS allows the user to access data in all user tables, views, and materialized query tables in a Db2 subsystem and allows the user to execute plans, packages, functions, and procedures.

A warning is issued if the WITH GRANT OPTION is specified when granting this authority.

DATAACCESS cannot be granted to PUBLIC.

DBADM
Grants the DBADM authority. DBADM allows the user to manage all objects in the Db2 subsystem, except security objects.

A warning is issued if the WITH GRANT OPTION is specified when granting this authority.

DBADM cannot be granted to PUBLIC.

WITH ACCESSCTRL
Specifies that the ACCESSCTRL authority is granted along with the system DBADM authority. ACCESSCTRL allows system DBADM to grant all authorities and privileges, except system DBADM, DATAACCESS, ACCESSCTRL authorities and privileges on security related objects. ACCESSCTRL can be used to REVOKE privileges using the BY clause.

WITH ACCESSCTRL is the default.

WITHOUT ACCESSCTRL
Specifies that system DBADM authority is not granted the ACCESSCTRL authority.

WITH DATAACCESS
Specifies that the DATAACCESS authority is granted along with the system DBADM authority. DATAACCESS allows the system DBADM to access data in all user tables, views, and materialized query tables in a Db2 subsystem and allows the user to execute plans, packages, functions, and procedures.

WITH DATAACCESS is the default.

WITHOUT DATAACCESS
Specifies that system DBADM authority is not granted the DATAACCESS authority.

DISPLAY
Grants the privilege to use most of the DISPLAY commands except DISPLAY PROFILE and DISPLAY RLIMIT. No authorization is required for the DISPLAY UTILITY command.

DEBUGSESSION
Grants the privilege to attach a debug client to the current application process connection, which enables client application debugging of native SQL or Java procedures that are executed within the session.

EXPLAIN
Grants the privilege to issue the following without requiring the privileges needed to execute the statement:

- EXPLAIN statement with the options:
  - PLAN
  - ALL
- PREPARE statement
- DESCRIBE TABLE statement
- Explain dynamic SQL statements that execute under the special register CURRENT EXPLAIN MODE, when CURRENT EXPLAIN MODE = EXPLAIN
- BIND options: EXPLAIN(ONLY) and SQLERROR(CHECK)

  EXPLAIN(ONLY) allows to explain the statements.

  SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements that are being bound.

MONITOR1
Grants the privilege to obtain IFC data classified as serviceability data, statistics, accounting, and other performance data that does not contain potentially secure data.

MONITOR2
Grants the privilege to obtain IFC data classified as containing potentially sensitive data such as SQL statement text and audit data. Users with MONITOR2 privileges have MONITOR1 privileges.

RECOVER
Grants the privilege to issue the RECOVER INDOUBT command.

SQLADM
Grants the authority to perform the following actions without requiring any additional privileges:

- DESCRIBE TABLE statement

- EXPLAIN statement with the following options:
  - PLAN
  - ALL
  - STMTCACHE ALL
  - STMTID
  - STMTTOKEN
  - MONITORED STMTS
- PREPARE statement
- Explain dynamic SQL statements that execute under the special register CURRENT EXPLAIN MODE, when CURRENT EXPLAIN MODE = EXPLAIN
- BIND options: EXPLAIN(ONLY) and SQLERROR(CHECK)

  EXPLAIN(ONLY) allows to explain the statements.

  SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements that are being bound.
- START command
- STOP command
- DISPLAY PROFILE command
- Execute the RUNSTATS utility and the MODIFY STATISTICS utility in any database.
- MONITOR2 privilege to obtain IFC data classified as containing potentially sensitive data, such as SQL statement text and audit data, as well as IFC data classified as serviceability data, statistics, accounting, and other performance data.

STOPALL
Grants the privilege to issue the STOP DB2 command.

STOSPACE
Grants the privilege to use the STOSPACE utility.

SYSADM
Grants all Db2 privileges except for a few reserved for installation SYSADM authority. The privileges the user possesses are all grantable, including the SYSADM authority itself. The privileges the user lacks restrict what the user can do with the directory and the catalog. Using WITH GRANT OPTION when granting SYSADM is redundant but valid. For more on SYSADM and installation SYSADM authority, see *Db2 Administration Guide*.

SYSCTRL
Grants the system control authority, which allows the user to have most of the privileges of a system administrator but excludes the privileges to read or change user data. Using WITH GRANT OPTION when granting SYSCTRL is redundant but valid. For more information on SYSCTRL authority, see *Db2 Administration Guide*.

SYSOPR
Grants the privilege to have system operator authority.

TRACE
Grants the privilege to issue the MODIFY TRACE, START TRACE, and STOP TRACE commands.

ON SYSTEM
Identifies that the system privilege is granted for the entire Db2 subsystem.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
If you grant the SYSADM or SYSCTRL system privilege, WITH GRANT OPTION is valid but unnecessary. It is unnecessary because whoever is granted SYSADM or SYSCTRL has that authority and all the privileges it implies, with the GRANT option.

Examples

Example 1: Grant DISPLAY privileges to user LUTZ.

```
GRANT DISPLAY
  TO LUTZ;
```

Example 2: Grant BSDS and RECOVER privileges to users PARKER and SETRIGHT, with the WITH GRANT OPTION.

```
GRANT BSDS,RECOVER
  TO PARKER,SETRIGHT
  WITH GRANT OPTION;
```

Example 3: Grant TRACE privileges to all local users.

```
GRANT TRACE
  TO PUBLIC;
```

Example 4: Grant ARCHIVE privileges to role ROLE1:

```
GRANT ARCHIVE TO ROLE ROLE1;
```

Example 5: SECADM Linda grants the privilege to Steve to create a secure object:

```
GRANT CREATE_SECURE_OBJECT
     TO STEVE;
```

Example 6: Grant system DBADM with ACCESSCTRL and with DATAACCESS to role, ADMINROLE and authid, SALLY. Since GRANT system DBADM also grants ACCESSCTRL and DATAACCESS by default, WITH ACCESSCTRL and WITH DATAACCESS clauses need not be specified explicitly.

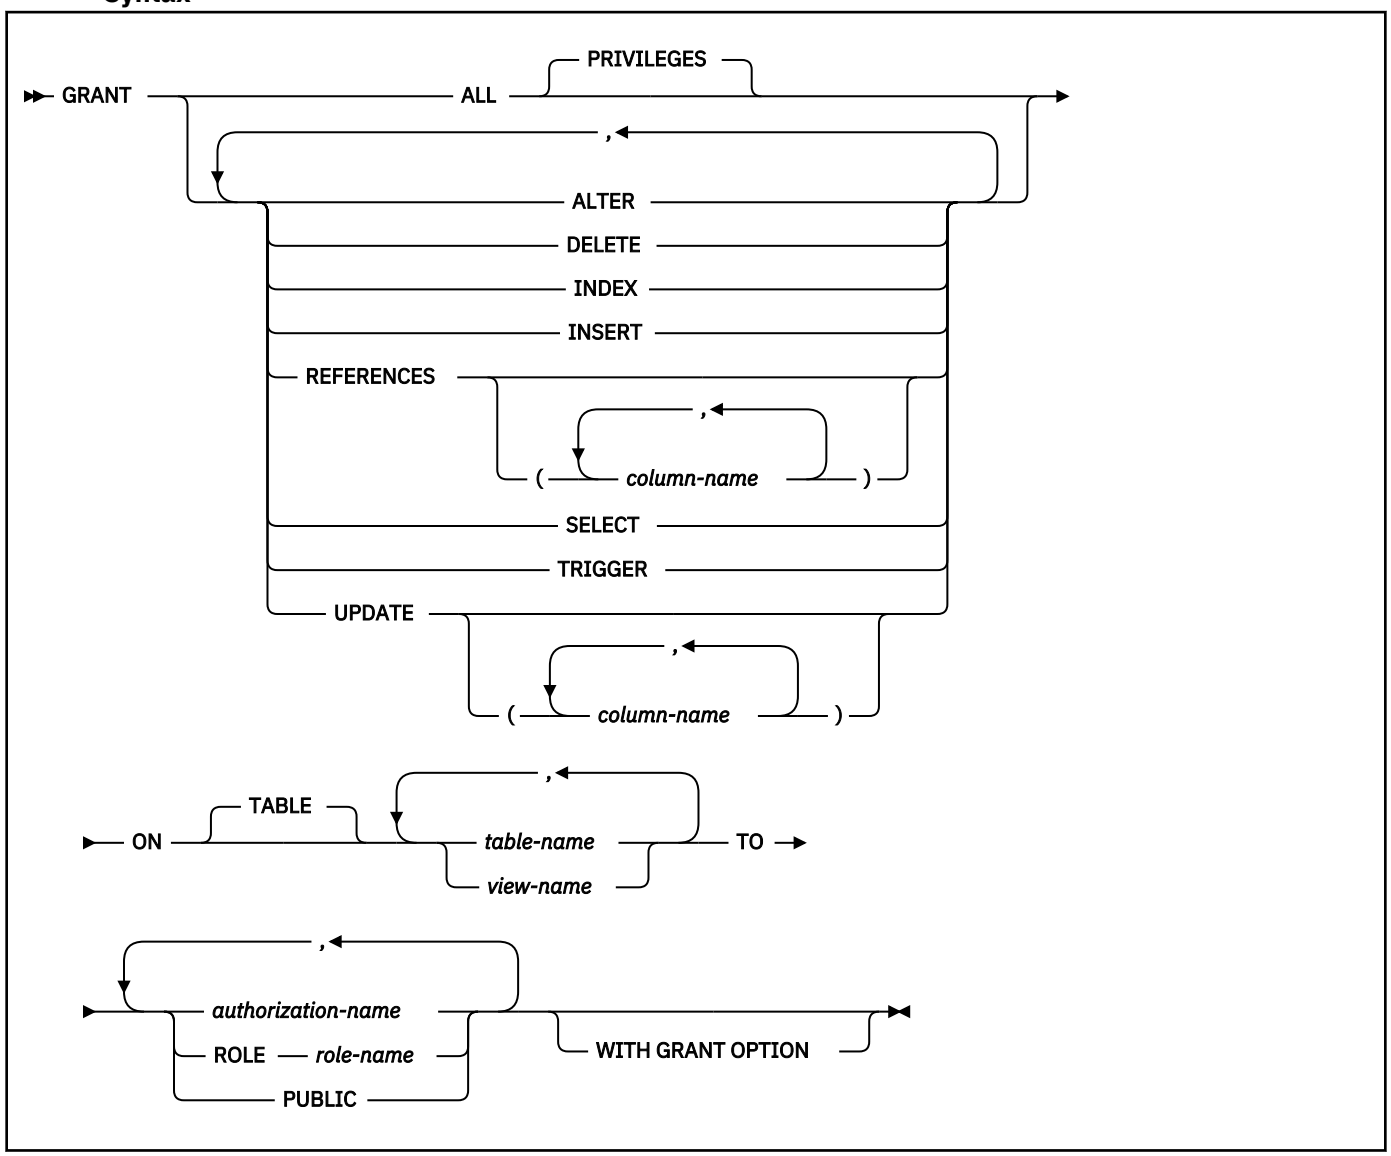
```
GRANT DBADM ON SYSTEM
     TO ROLE ADMINROLE;
 GRANT DBADM, ACCESSCTRL, DATAACCESS
     ON SYSTEM
     TO SALLY;
```

Example 7: Grant system DBADM without ACCESSCTRL and without DATAACCESS to John. The WITHOUT ACCESSCTRL and WITHOUT DATAACCESS clauses need to be specified explicitly.

```
GRANT DBADM WITHOUT ACCESSCTRL
     WITHOUT DATAACCESS
     ON SYSTEM
     TO JOHN;
```

Related tasks

Managing explicit privileges (Managing Security)



Related reference

Explicit system privileges (Managing Security)

GRANT (table or view privileges)

This form of the GRANT statement grants privileges on tables and views.

Syntax

Description

ALL or ALL PRIVILEGES

Grants all table or view privileges for which you have GRANT authority, for the tables and views named in the ON clause.

If you do not use ALL, you must use one or more of the keywords in the following list. For each keyword that you use, you must have GRANT authority for that privilege on every table or view identified in the ON clause.

ALTER

Grants the privilege to alter the specified table or create a trigger on the specified table. ALTER cannot be used if the statement identifies an auxiliary table or a view.

DELETE

Grants the privilege to delete rows in the specified table or view. DELETE cannot be granted on an auxiliary table.

INDEX
Grants the privilege to create an index on the specified table. INDEX cannot be granted on a view.

INSERT
Grants the privilege to insert rows into the specified table or view. INSERT cannot be granted on an auxiliary table.

REFERENCES
Grants the privilege to add a referential constraint in which the specified table is a parent. If a list of column names is not specified or if REFERENCES is granted via the specification of ALL PRIVILEGES, the grantee can define referential constraints using all columns of the table as a parent key, even those added later via the ALTER TABLE statement. This privilege cannot be granted on a view or auxiliary table.

REFERENCES(*column-name,...*)
Grants the privilege to add or drop a referential constraint in which the specified table is a parent using only those columns that are specified in the column list as a parent key. Each *column-name* must be an unqualified name that identifies a column of the table identified in the ON clause. This privilege cannot be granted on a view or auxiliary table.

SELECT
Grants the privilege to create a view or read data from the specified table or view. SELECT cannot be granted on an auxiliary table.

TRIGGER
Grants the privilege to create a trigger on the specified table. TRIGGER cannot be granted on an auxiliary table or a view.

UPDATE
Grants the privilege to update rows in the specified table or view. UPDATE cannot be granted on an auxiliary table.

UPDATE(*column-name,...*)
Grants the privilege to update only the columns named. Each *column-name* must be the unqualified name of a column of every table or view identified in the ON clause. Each *column-name* must not identify a column of an auxiliary table.

ON *table-name* or *view-name*
Specifies the tables or views on which you are granting the privileges. The list can be a list of table names or view names, or a combination of the two. A declared temporary table and a table that is implicitly created for an XML column must not be identified.

If you use GRANT ALL, then for each named table or view, the privilege set (described in ""“Authorization” on page 1778" in “GRANT” on page 1777) must include at least one privilege with the GRANT option.

TO
Refer to “GRANT” on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to “GRANT” on page 1777 for a description of the WITH GRANT OPTION clause.

Notes

The REFERENCES privilege does not replace the ALTER privilege. It was added to conform to the SQL standard. To define a foreign key that references a parent table, you must have either the REFERENCES or the ALTER privilege, or both.

For a created temporary table, only ALL or ALL PRIVILEGES can be granted. Specific table privileges cannot be granted. In addition, only the ALTER, DELETE, INSERT, and SELECT privileges apply to a created temporary table.

For a view of a created temporary table, either ALL or the specific UPDATE, DELETE, INSERT and SELECT privileges can be granted. When ALL is specified only the UPDATE, DELETE, INSERT, and SELECT privileges apply to a view on created temporary table. However, the UPDATE operation of the view is not allowed.

To grant table privileges on a created temporary table, the privilege set must include one of the following:

- SYSADM
- DBADM on DSNDB06
- Ownership of the created temporary table

To grant table privileges on a view of a created temporary table, the privilege set must include one of the following:

- SYSADM
- ownership of the created temporary table

For a declared temporary table, no privileges can be granted. When a declared temporary table is defined, PUBLIC implicitly receives all table privileges (without GRANT authority) for the table. These privileges are not recorded in the Db2 catalog, and they cannot be revoked.

For an auxiliary table, only the INDEX privilege can be granted. DELETE, INSERT, SELECT, and UPDATE privileges on the base table that is associated with the auxiliary table extend to the auxiliary table.

- ALTER
- INDEX
- REFERENCES
- TRIGGER

Examples

Example 1: Grant SELECT privileges on table DSN8B10.EMP to user PULASKI.

```
GRANT SELECT ON DSN8B10.EMP TO PULASKI;
```

Example 2: Grant UPDATE privileges on columns EMPNO and WORKDEPT in table DSN8B10.EMP to all users at the current server.

```
GRANT UPDATE (EMPNO,WORKDEPT) ON TABLE DSN8B10.EMP TO PUBLIC;
```

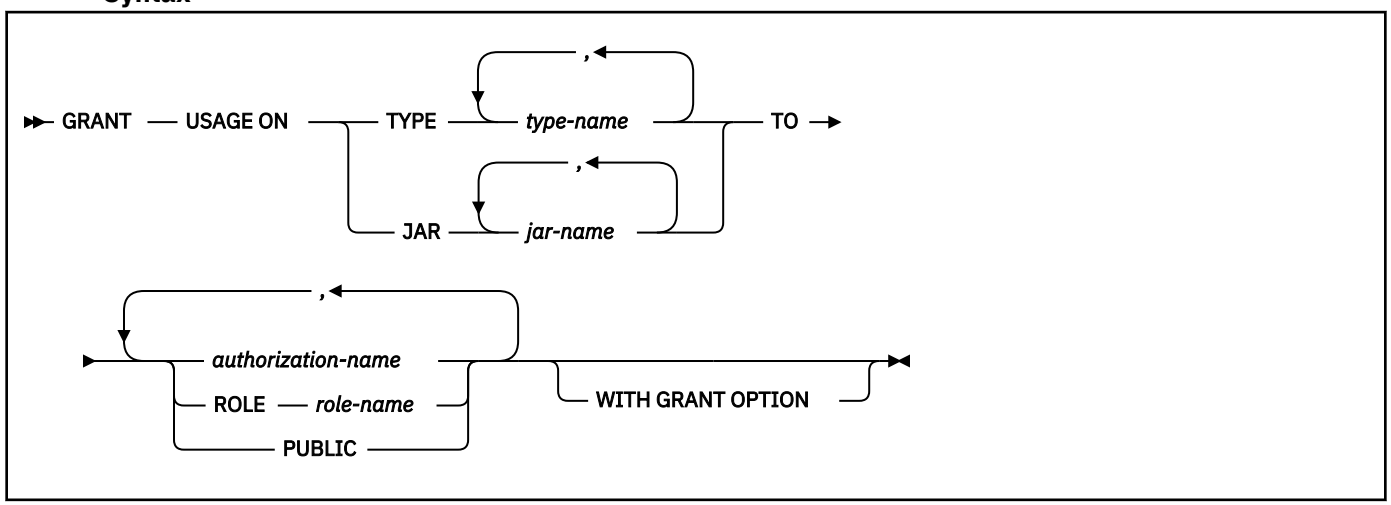
Example 3: Grant all privileges on table DSN8B10.EMP to users KWAN and THOMPSON, with the WITH GRANT OPTION.

```
GRANT ALL ON TABLE DSN8B10.EMP TO KWAN,THOMPSON WITH GRANT OPTION;
```

Example 4: Grant the SELECT and UPDATE privileges on the table DSN8B10.DEPT to every user in the network.

```
GRANT SELECT, UPDATE ON TABLE DSN8B10.DEPT
  TO PUBLIC;
```

Even with this grant, it is possible that some network users do not have access to the table at all, or to any other object at the subsystem where the table exists. Controlling access to the subsystem involves the communications databases at the subsystems in the network. The tables for the communication databases are described in “Db2 catalog tables” on page 2115. Controlling access is described in Securing Db2 ().



Example 5: Grant ALTER privileges on table DSN9910.EMP to role ROLE1:

```
GRANT ALTER ON TABLE DSN9910.EMP TO ROLE ROLE1;
```

GRANT (type or JAR file privileges)

This form of the GRANT statement grants the privilege to use distinct types, array types, or JAR files.

Syntax

Description

USAGE
Grants the privilege to use the distinct type in tables, functions procedures, or the privilege to use the JAR file.

TYPE *type-name*
Identifies the user-defined type. The name, including the implicit or explicit schema name, must identify a unique user-defined type that exists at the current server.

JAR *jar-name*
Identifies the JAR file. The name, including the implicit or explicit schema name, must identify a unique JAR file that exists at the current server.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Notes

Alternative syntax and synonyms: To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports DATA TYPE or DISTINCT TYPE as a synonym for TYPE.

Examples

Example 1: Grant the USAGE privilege on distinct type SHOE_SIZE to user JONES. This GRANT statement does not give JONES the privilege to execute the cast functions that are associated with the distinct type SHOE_SIZE.

```
GRANT USAGE ON TYPE SHOE_SIZE TO JONES;
```

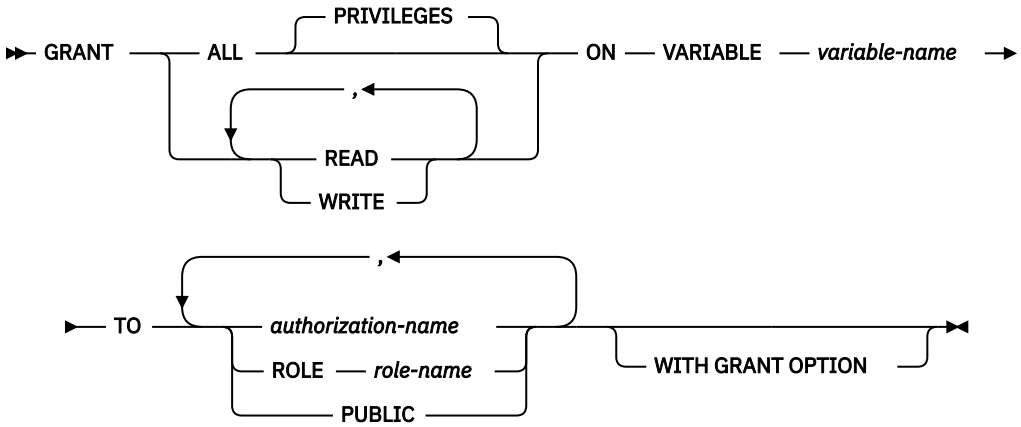
Example 2: Grant the USAGE privilege on distinct type US_DOLLAR to all users at the current server.

```
GRANT USAGE ON TYPE US_DOLLAR TO PUBLIC;
```

Example 3: Grant the USAGE privilege on distinct type CANADIAN_DOLLAR to the administrative assistant (ADMIN_A), and give this user the ability to grant the USAGE privilege on the distinct type to others. The

administrative assistant cannot grant the privilege to execute the cast functions that are associated with the distinct type CANADIAN_DOLLAR because WITH GRANT OPTION does not give the administrative assistant the EXECUTE authority on these cast functions.

```
GRANT USAGE ON TYPE CANADIAN_DOLLAR TO ADMIN_A
      WITH GRANT OPTION;
```



Example 4: Grant the USAGE privilege on the distinct type MILES to role ROLE1 at the current server:

```
GRANT USAGE ON TYPE MILES
    TO ROLE ROLE1;
```

GRANT (variable privileges)

This form of the GRANT statement grants privileges on global variables.

Syntax

Description

ALL PRIVILEGES
Grants both READ and WRITE privileges on the specified global variable.

READ
Grants the privilege to access the content of the specified global variable.

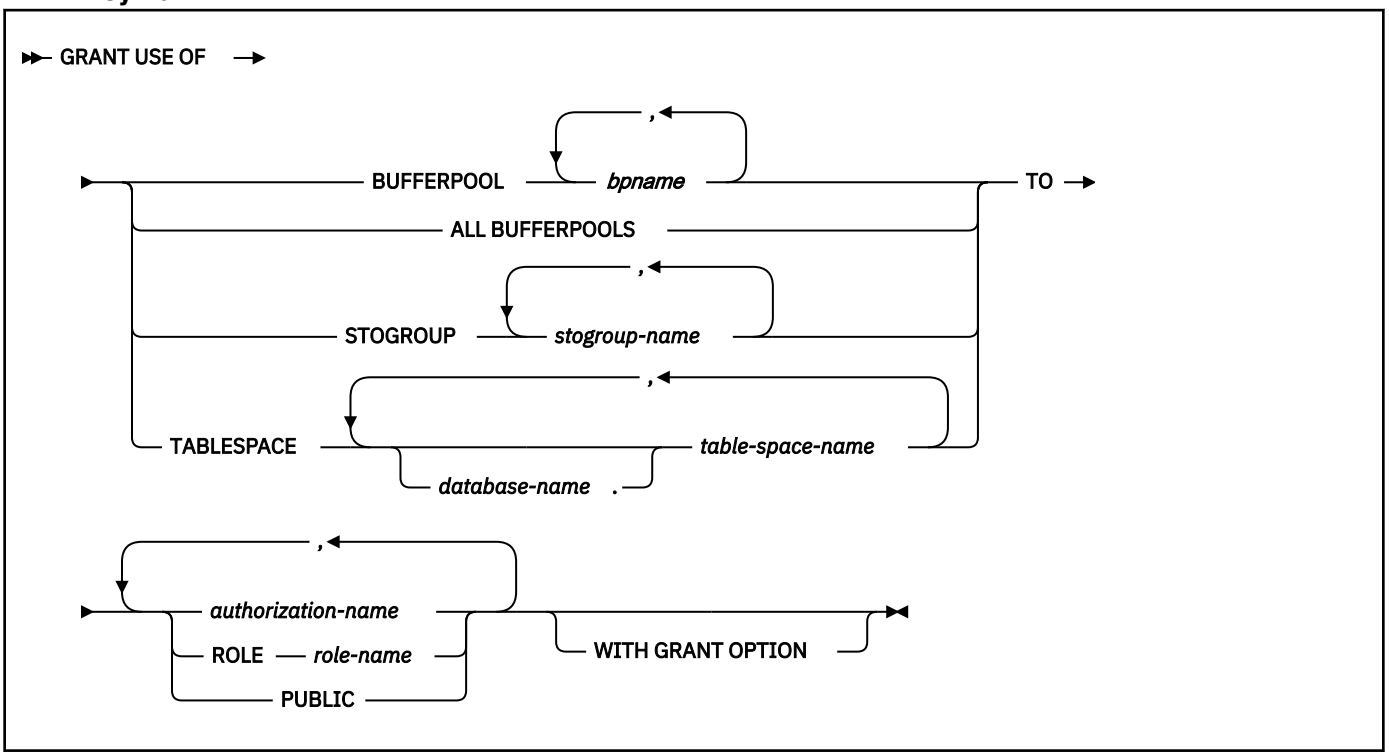
WRITE
Grants the privilege to modify the content of the specified global variable.

ON VARIABLE *variable-name*
Identifies the global variable for which you are granting privileges. *variable-name*, including an implicit or explicit qualifier, must identify a global variable that exists at the current server.

TO
Refer to “GRANT” on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to “GRANT” on page 1777 for a description of the WITH GRANT OPTION clause.

Examples



Example 1: Grant the read privilege on the ACCOUNTNO variable on the current server to user Jones:

```
GRANT READ ON VARIABLE ACCOUNTNO TO JONES;
```

GRANT (use privileges)

This form of the GRANT statement grants authority to use particular buffer pools, storage groups, or table spaces.

Syntax

Description

BUFFERPOOL *bpname,...*
Grants the privilege to refer to any of the identified buffer pools in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement. See "Naming conventions" on page 77 for more details about *bpname*.

ALL BUFFERPOOLS
Grants the privilege to refer to any buffer pool in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

STOGROUP *stogroup-name,...*
Grants the privilege to refer to any of the identified storage groups in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

TABLESPACE *database-name.table-space-name,...*
Grants the privilege to refer to any of the identified table spaces in a CREATE TABLE statement. The default for *database-name* is DSNDB04.

You cannot grant the privilege for table spaces that are for declared temporary tables (table spaces in a work file database). For these table spaces, PUBLIC implicitly has the TABLESPACE privilege (without GRANT authority); this privilege is not recorded in the Db2 catalog, and it cannot be revoked.

TO
Refer to "GRANT" on page 1777 for a description of the TO clause.

WITH GRANT OPTION
Refer to "GRANT" on page 1777 for a description of the WITH GRANT OPTION clause.

Notes

You can grant privileges for only one type of object with each statement. Thus, you can grant the use of several table spaces with one statement, but not the use of a table space and a storage group. For each object you identify, you must have the USE privilege with GRANT authority.

Examples

Example 1: Grant authority to use buffer pools BP1 and BP2 to user MARINO.

```
GRANT USE OF BUFFERPOOL BP1,BP2
  TO MARINO;
```

Example 2: Grant to all local users the authority to use table space DSN8S11D in database DSN8D11A.

```
GRANT USE OF TABLESPACE
  DSN8D11A.DSN8S11D
  TO PUBLIC;
```

Example 3: Grant authority to use storage group SG1 to role ROLE1:

```
GRANT USE OF STOGROUP SG1
   TO ROLE ROLE1;
```

HOLD LOCATOR

The HOLD LOCATOR statement allows a LOB locator variable to retain its association with a value beyond a unit of work.

Invocation

This statement can only be embedded in an application program. It cannot be issued interactively. It is an executable statement that can be dynamically prepared. However, the EXECUTE statement with the USING clause must be used to execute the prepared statement. HOLD LOCATOR cannot be used with the EXECUTE IMMEDIATE statement.

Authorization

None required.

Syntax

Description

host-variable, ...

Identifies one or more locator variables that must be declared in accordance with the rules for declaring locator variables. The locator variable type must be a binary large object locator, a character large object locator, or a double-byte character large object locator.

The *host-variable* must currently have a locator assigned to it. That is, a locator must have been assigned during this unit of work (by a FETCH, SELECT INTO, assignment statement, SET *host-variable* statement, or VALUES INTO statement); otherwise, an error is returned.

If more than one locator is specified and an error is returned on one of the locators, it is possible that some locators have been held and others have not been held.

Notes

A host-variable LOB locator variable that has the hold property is freed (has its association between it and its value removed) when:

- The SQL FREE LOCATOR statement is executed for the locator variable.
- The SQL ROLLBACK statement is executed.
- The SQL session is terminated.

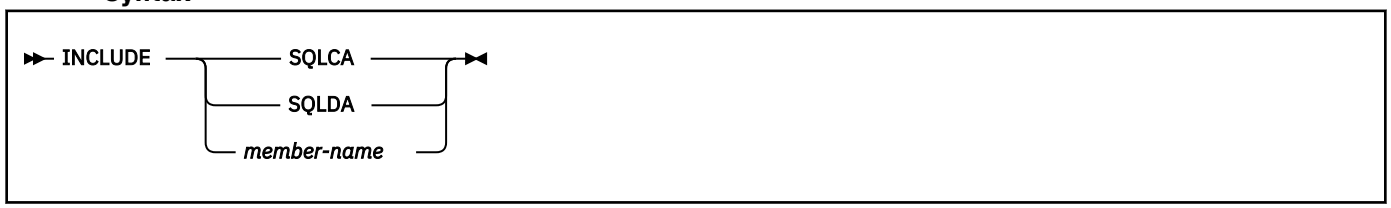
Example

Assume that the employee table contains columns RESUME, HISTORY, and PICTURE and that locators have been established in a program to represent the values represented by the columns. Give the CLOB locator variables LOCRES and LOCHIST, and the BLOB locator variable LOCPIC the hold property.

```
EXEC SQL HOLD LOCATOR :LOCRES, :LOCHIST, :LOCPIC
```

INCLUDE

The INCLUDE statement inserts application code, including declarations and statements, into a source program.



Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java or REXX.

Authorization

None required.

Syntax

Description

SQLCA
Indicates that the description of an SQL communication area (SQLCA) is to be included. INCLUDE SQLCA must not be specified more than once in the same application program. In COBOL, INCLUDE SQLCA must be specified in the Working-Storage Section or the Linkage Section. INCLUDE SQLCA must not be specified if the program is prepared (either with the Db2 precompiler or coprocessor) with the STDSQL(YES) SQL processing option.

For a description of the SQLCA, see "SQL communication area (SQLCA)" on page 2086.

SQLDA
Indicates that the description of an SQL descriptor area (SQLDA) is to be included. It must not be specified in a Fortran. For a description of the SQLDA, see "SQL descriptor area (SQLDA)" on page 2095.

member-name
Names a member of the partitioned data set to be the library input when your application program is prepared (either with the Db2 precompiler or coprocessor). It must be an SQL identifier.

The member can contain any host language source statements and any SQL statements other than an INCLUDE statement. In COBOL, INCLUDE *member-name* must not be specified in other than the Data Division or the Procedure Division.

Notes

When your application program is prepared (either with the Db2 precompiler or coprocessor), the INCLUDE statement is replaced by source statements. Thus, the INCLUDE statement must be specified at a point in your application program where the resulting source statements are acceptable to the compiler.

The INCLUDE statement cannot refer to source statements that themselves contain INCLUDE statements.

The declarations that are generated by DCLGEN can be used in an application program by specifying the same member in the INCLUDE statement as in the DCLGEN LIBRARY parameter.

Example

Include an SQL communications area in a PL/I program.

```
EXEC SQL INCLUDE SQLCA;
```

INSERT

The INSERT statement inserts rows into a table or view. Inserting a row into a view inserts the row into the table on which the view is based if no INSTEAD OF INSERT trigger is defined for this view. If such a trigger is defined, the trigger is activated instead.

The table or view can be at the current server or any Db2 subsystem with which the current server can establish a connection.

There are three forms of this statement:

- The INSERT via VALUES form is used to insert a single row into the table or view using the values provided or referenced.
- The INSERT via SELECT form is used to insert one or more rows into the table or view using values from other tables, or views, or both.
- The INSERT via FOR *n* ROWS form is used to insert multiple rows into the table or view using values provided or referenced. Although not required, the values can come from *host-variable arrays*. This form of INSERT is supported in SQL procedure applications. However, since host-variable arrays are not supported in SQL procedure applications, the support is limited to insertion of scalar values.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

Authority requirements depend on whether the object identified in the statement is a user-defined table, a catalog table for which inserts are allowed, or a view:

When a user-defined table is identified: The privilege set must include at least one of the following:

- The INSERT privilege on the table
- Ownership of the table
- DBADM authority on the database that contains the table
- SYSADM authority

- DATAACCESS authority

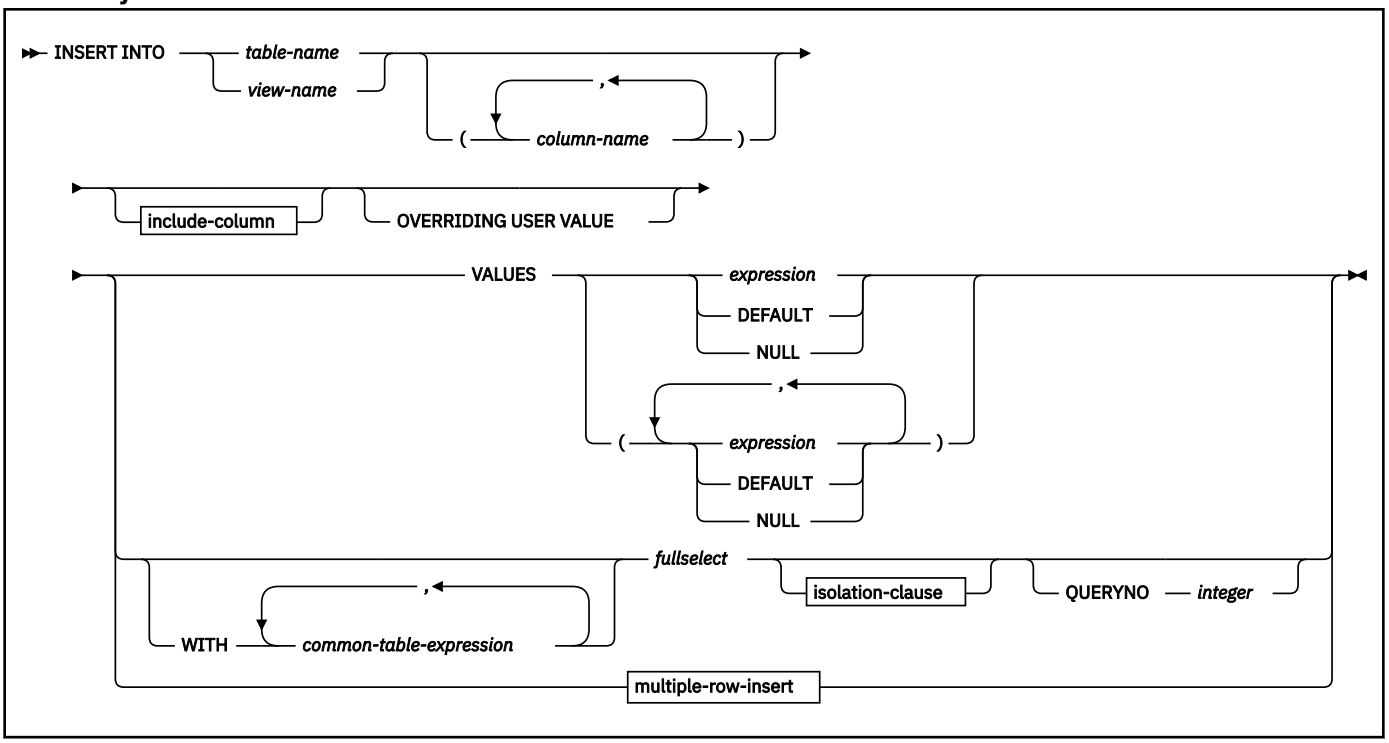
If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

When a catalog table is identified: The privilege set must include at least one of the following:

- ACCESSCTRL authority
- DATAACCESS authority
- DBADM authority on the catalog database
- SQLADM authority
- SYSCTRL authority
- SYSADM authority
- System DBADM authority

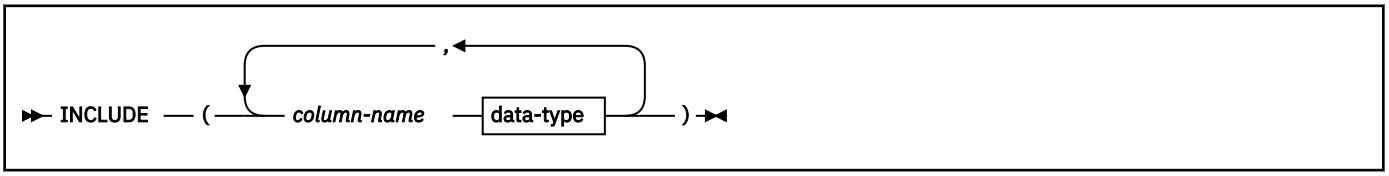
When a view is identified: The privilege set must include at least one of the following:

- DATAACCESS authority
- INSERT privilege on the view
- SYSADM authority



The owner of a view, unlike the owner of a table, might not have INSERT authority on the view (or can have INSERT authority without being able to grant it to others). The nature of the view itself can preclude its use for INSERT. For more information, see the discussion of authority in "CREATE VIEW" on page 1636.

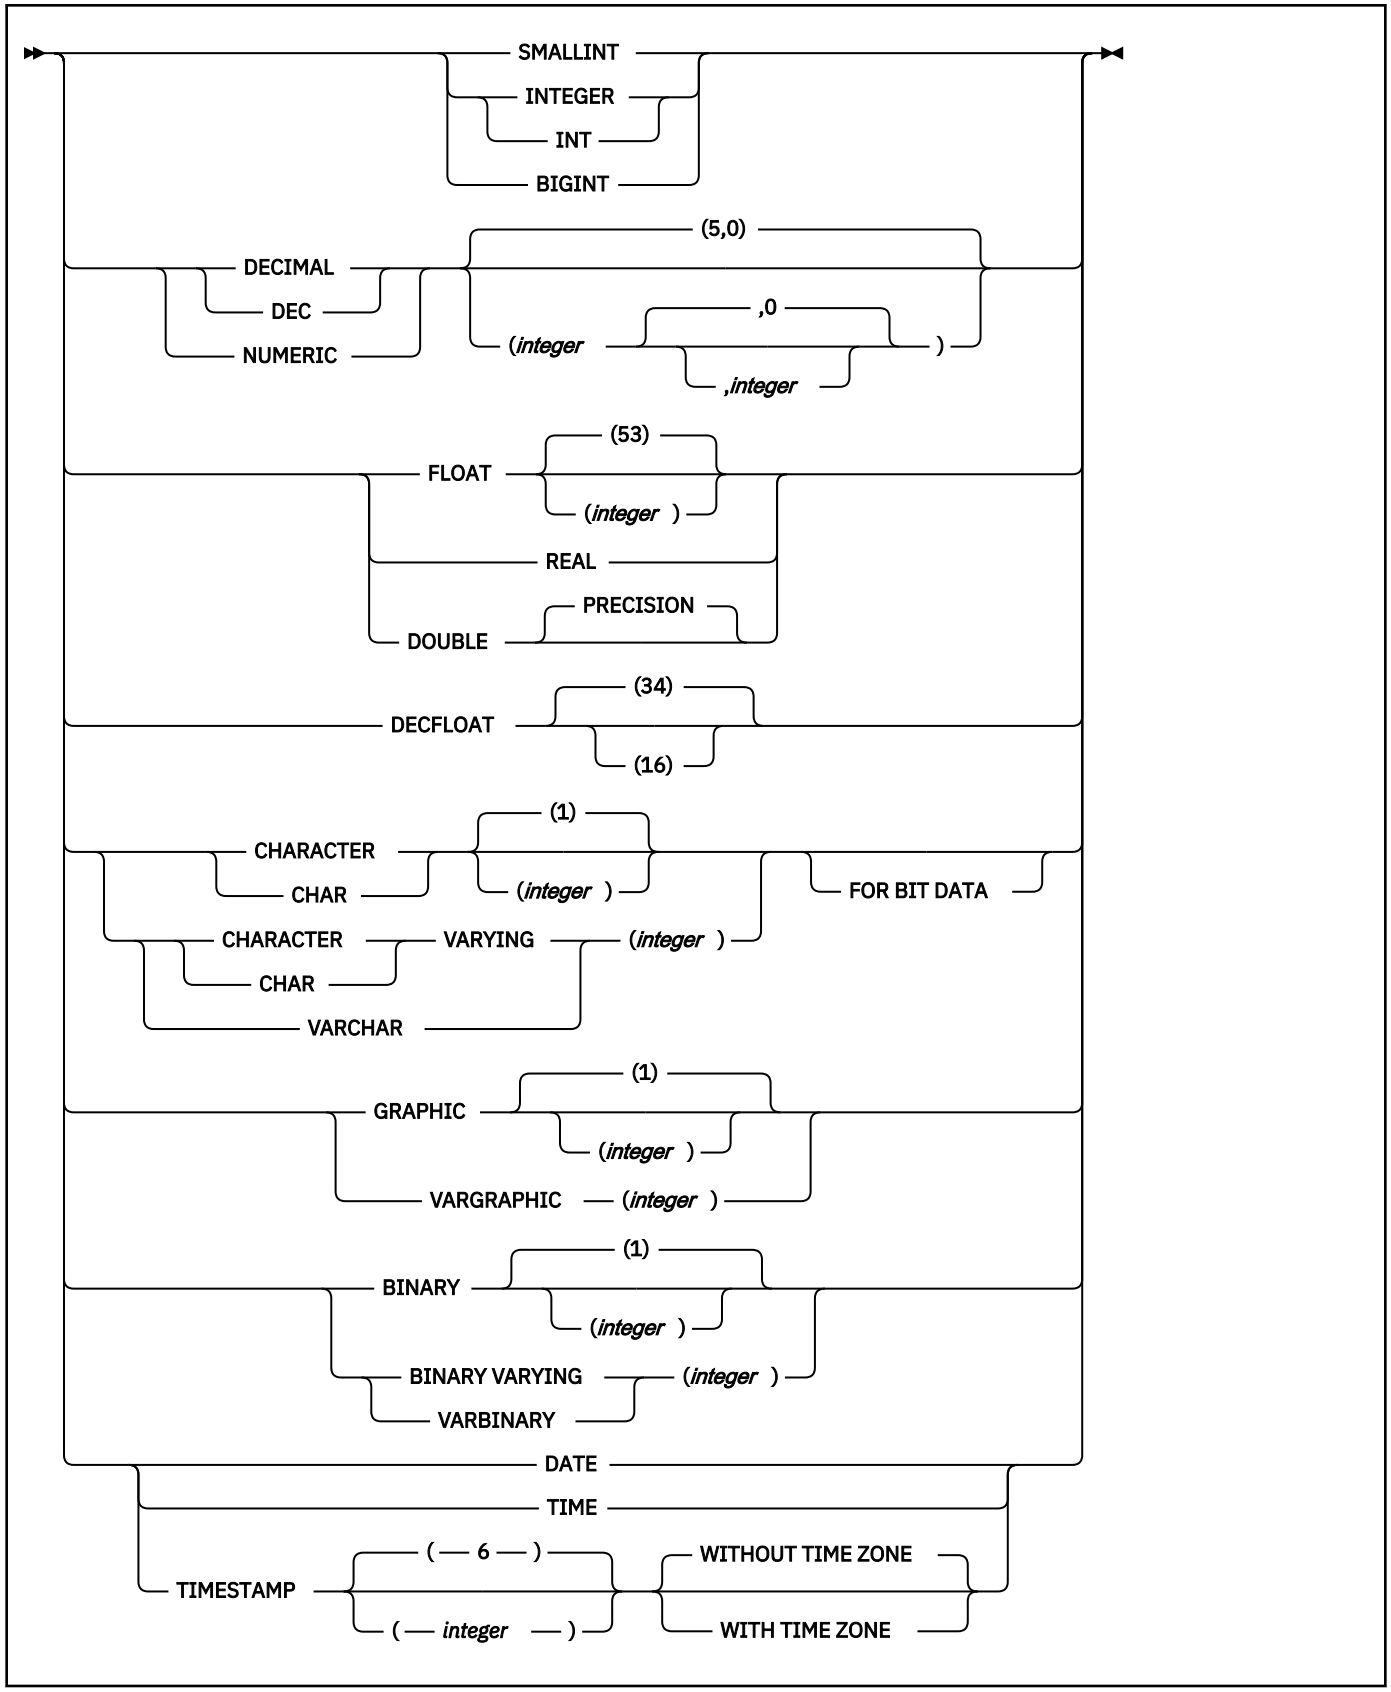
If the INSERT statement is embedded in a SELECT statement, the privilege set must include the SELECT privilege on the table or view.



If a fullselect is specified, the privilege set must include authority to execute the fullselect. For more information about the authorization rules, see "Authorization" on page 931.

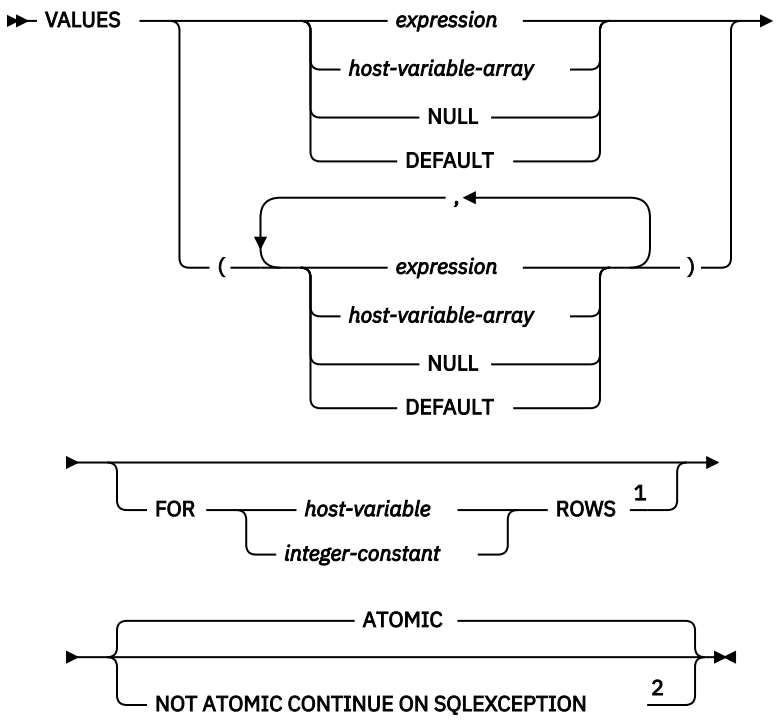
If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.)

Syntax



include-column:

data-type:



built-in-type:

isolation-clause:

multiple-row-insert:

Notes:

[1] The FOR *n* ROWS clause must be specified for a static multiple-row-insert. However, this clause is optional for a dynamic INSERT statement. For a dynamic statement, the FOR *n* ROWS clause is specified on the EXECUTE statement.

[2] The ATOMIC or NOT ATOMIC CONTINUE ON SQLEXCEPTION clauses can be specified for a static multiple-row-insert. However, this clause must not be specified for a dynamic INSERT statement. For a dynamic statement, the ATOMIC or NOT ATOMIC CONTINUE ON SQLEXCEPTION clause is specified as an attribute on the PREPARE statement.

Description

INTO *table-name* or *view-name*

Identifies the object of the INSERT statement. The name must identify a table or view that exists at the current server. The name must not identify:

- An auxiliary table
- A catalog table
- A directory table
- A read-only view unless an instead of trigger is defined for the insert operation on the view. (For a description of a read-only view, see "CREATE VIEW" on page 1636.)
- A view column that is derived from a constant, expression, or scalar function
- A view column that is derived from the base table column as some other column of the view
- A materialized query table

- A table that is implicitly created for an XML column

In an IMS or CICS application, the Db2 subsystem that contains the identified table or view must be a remote server that supports two-phase commit.

column-name,...
Specifies the columns for which insert values are provided. Each name must identify a column of the table or view. The columns can be identified in any order, but the same column must not be identified more than one time. A view column that cannot accept insert values must not be identified. If the object of the INSERT statement is a view with columns that cannot accept insert values, a list of column names must be specified, and the list must not identify these columns. If a qualifier is specified, it must be valid (that is, the table name must be the table or view name specified after the INTO keyword, and if a qualifier is specified for the table name, it must match the default qualifier).

Omission of the column list is an implicit specification of a list in which every column of the table (that is not defined as implicitly hidden) or view is identified in left-to-right order. This list is established when the statement is prepared and therefore does not include columns that were added to the table after the statement was prepared.

The effect of a rebind on INSERT statements that do not include a column list is that the implicit list of names is re-established. Therefore, the number of columns into which data is inserted can change and cause an error.

include-column
Specifies a set of columns that are included, along with the columns of *table-name* or *view-name*, in the result table of the INSERT statement when it is nested in the FROM clause of the outer fullselect that is used in a subselect, a SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that is identified by *table-name* or *view-name*.

INCLUDE
Introduces a list of columns that is to be included in the result table of the INSERT statement. The included columns are only available if the INSERT statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

column-name
Specifies the name for a column of the result table of the INSERT statement that is not the same name as another included column nor a column in the table or view that is specified in *table-name* or *view-name*.

data-type
Specifies the data type of the included column. The included columns are nullable.

built-in-type
Specifies a built-in data type. See “CREATE TABLE” on page 1509 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an INCLUDE column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

OVERRIDING USER VALUE
Specifies that the value specified in the VALUES clause or produced by a fullselect for a column that is defined as either GENERATED ALWAYS or GENERATED BY DEFAULT is ignored. Instead, a system-generated value is inserted, overriding the user-specified value.

If OVERRIDING USER VALUE is specified, the implicit or explicit list of column must include a column that is defined as either GENERATED ALWAYS or GENERATED BY DEFAULT. For example, a ROWID column, an identity column, or a row change timestamp column.

VALUES
Specifies one new row in the form of a list of values. The number of values in the VALUES clause must be equal to the number of names in the column list and the columns that are identified in the INCLUDE clause. The first value is inserted in the first column in the list, the second value in the

second column, and so on. If more than one value is specified, the list of values must be enclosed in parentheses. Assignments to included columns are only processed when the INSERT statement is nested in the FROM clause in a SELECT statement or a SELECT INTO statement.

expression
Any expression of the type described in "Expressions" on page 229. The expression must not include a column name. If *expression* is a host variable, the host variable can identify a structure. Any host variable or structure that is specified must be described in the application program according to the rules for declaring host structures and variables.

If *expression* is a host variable, it can include an indicator variable or an indicator array (in the case of a host structure). When extended indicator variables are enabled, an expression must not be more complex than a reference to a single host variable if the indicator is set to an extended indicator value of default (-5) or unassigned (-7). In addition:

- A CAST specification can be used if either of the following is true:
  - The target column is defined as nullable.
  - The target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.
- A scalar fullselect can be used if either of the following is true for each expression in the select list of the fullselect:
  - The target column that corresponds to the expression is defined as nullable.
  - The expression is not more complex than a reference to a single host variable for which the indicator is set to an extended indicator value of default (-5) or unassigned (-7), or the expression is a CAST specification which would have been valid as a stand-alone expression.

DEFAULT
Specifies the default value for the column. If the column is a generated column, Db2 will generate a value for the column.

For information on default values of data types, see the description of the DEFAULT clause for "CREATE TABLE" on page 1509.

NULL
Specifies the null value as the value of the column. Specify NULL only for nullable columns.

If the implicit or explicit list of columns includes a ROWID, an identity column, or a row change timestamp column that was defined as GENERATED ALWAYS, you must specify DEFAULT unless you specify the OVERRIDING USER VALUE clause to indicate that any user-specified value will be ignored and a unique system-generated value will be inserted.

For a ROWID or identity column that is defined as GENERATED BY DEFAULT, you can specify a value. However, a value can be inserted into ROWID column defined BY DEFAULT only if a single-column unique index is defined on the ROWID column and the specified value is a valid row ID value that was previously generated by Db2. When a value is inserted into an identity column defined BY DEFAULT, Db2 does not verify that the specified value is a unique value for the column unless the identity column has a single-column unique index.

Although an implicitly hidden DOCID column for XML values is defined as `GENERATED ALWAYS`, you can include the DOCID column in the explicit list of columns and specify a value for it. However, Db2 will ignore the value.

WITH *common-table-expression*
Specifies a common table expression. For an explanation of common table expression, see "common-table-expression" on page 988.

fullselect
Specifies a set of new rows in the form of the result table of a fullselect. If the result table is empty, SQLCODE is set to +100, and SQLSTATE is set to '02000'.

The base object of the INSERT statement and the base object of the fullselect or any subquery of the fullselect can be the same table. In this case, the fullselect is evaluated completely before any rows are inserted.

For an explanation of fullselect, see "fullselect" on page 982.

The number of columns in the result table must be equal to the number of names in the column list and the columns that are identified in the INCLUDE clause. The value of the first column of the result is inserted in the first column in the list, the second value in the second column, and so on. Any values that are produced for a generated column must conform to the rules that are described for those columns under the VALUES clause. Assignments to included columns are only processed when the INSERT statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

If the expression that specifies the value of a result column is a variable, the host variable can include an indicator variable. When extended indicator variables are enabled, the target column that corresponds to an expression in the select list of the fullselect that involves a host variable with an extended indicator value of default (-5) or unassigned (-7), must be defined as nullable and either of the following expressions:

- The expression must not be more complex than a reference to a single host variable.
- The expression must be a CAST specification with the following characteristics:
  - The source of the CAST specification must be a single host variable.
  - The data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

If the object table is self-referencing, the fullselect must not return more than one row.

isolation-clause
Specifies the isolation level that is used when the fullselect is executed.

WITH
Introduces the isolation level, which can be one of the following values:

RR
Repeatable read

RS
Read stability

CS
Cursor stability

The default isolation level of the statement is the isolation level of the package or plan in which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number that is associated with the SQL statement is the statement number that is assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the QUERYNO clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information about using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information about accessing the plan table, see *Managing Performance*.

multiple-row-insert

VALUES

Specifies the items for the rows to be inserted. The number of items in the VALUES clause must equal the number of names in the implicit or explicit column list. The first item in the list provides the value (or values) for the first column in the list. The second item in the list provides the value (or values) for the second column, and so on.

expression

Any expression of the type described in "Expressions" on page 229. The expression must not include a column name. For each row that is inserted, the corresponding column is assigned the value of the expression.

host-variable-array

Each host-variable array must be defined in the application program in accordance with the rules for declaring an array. A host-variable array contains the data for a column of table that is a target of the INSERT. The number of rows to be inserted must be less than or equal to the dimension of each of the host-variable arrays.

An optional indicator array can be specified for each host-variable array. It should be specified if the SQLTYPE of any SQLVAR occurrence indicates that the SQLVAR is nullable. The indicators must be small integers. The indicator array must be large enough to contain an indicator for each row of input data.

If extended indicator variables are enabled, the extended indicator variable values of DEFAULT or UNASSIGNED can be used inside the indicator array.

DEFAULT

Specifies the default value for the column. If the column is a generated column, Db2 will generate a value for the column.

For information on default values of data types, see the description of the DEFAULT clause for "CREATE TABLE" on page 1509.

NULL

Specifies the null value as the value of the column in each row inserted. For each row inserted, the corresponding column is assigned the NULL value. Specify NULL only for nullable columns.

FOR *host-variable* or *integer-constant* ROWS

Specifies the number of rows to be inserted. For a dynamic INSERT statement, this clause can be specified on the EXECUTE statement. For more information, see the EXECUTE statement. However, this clause is required when a dynamic SELECT statement contains more than one multiple-row INSERT statement.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with scale zero, and must not include an indicator variable. Furthermore, *k* must be in the range, 0<k<=32767. *k* rows are inserted into the target table from the specified source data.

If a parameter marker is specified in this clause, a value must be provided with the USING clause of the associated EXECUTE or OPEN statement.

ATOMIC or NOT ATOMIC CONTINUE ON SQLEXCEPTION

Specifies whether all of the rows should be inserted as an atomic operation or not.

ATOMIC

Specifies that if the insert for any row fails, all changes made to the database by any of the inserts, including changes made by successful inserts, are undone. This is the default.

NOT ATOMIC CONTINUE ON SQLEXCEPTION

Specifies that, regardless of the failure of any particular insert of a row, the INSERT statement will not undo any changes made to the database by the successful inserts of other rows, and inserting will be attempted for subsequent rows. However, the minimum level of atomicity is at least that of a single insert (that is, it is not possible for a partial insert to complete), including any triggers that might have been executed as a result of the INSERT statement.

This clause is only valid for a static INSERT statement. This clause must also not be specified if the INSERT statement is contained within a SELECT statement. For a dynamic INSERT statement, specify the clause on the PREPARE statement. For more information, see "PREPARE" on page 1849.

Notes

Insert rules:

Insert values must satisfy the following rules. If they do not, or if any other errors occur during the execution of the INSERT statement, no rows are inserted and the position of the cursors are not changed.

- *Default values*. The value inserted in any column that is not in the column list is the default value of the column. Columns without a default value must be included in the column list. Similarly, if you insert into a view, the default value is inserted into any column of the base table that is not included in the view. Hence, all columns of the base table that are not in the view must have a default value.
- *Length*. If the insert value of a column is a number, the column must be a numeric column with the capacity to represent the integral part of the number. If the insert value of a column is a string, the column must be either a string column with a length attribute at least as great as the length of the string, or a datetime column if the string represents a date, time, or timestamp.
- *Assignment*. Insert values are assigned to columns in accordance with the assignment rules described in Chapter 2, "Language elements," on page 73.
- *Uniqueness constraints*. If the identified table or the base table of the identified view has one or more unique indexes, each row inserted into the table must conform to the constraints imposed by those indexes.
- *Referential constraints*. Each nonnull insert value of a foreign key must be equal to some value of the parent key of the parent table in the relationship.
- *Check constraints*. The identified table or the base table of the identified view might have one or more check constraints. Each row inserted must conform to the conditions imposed by those constraints. Thus, each check condition must be true or unknown.
- *Field and validation procedures*. If the identified table or the base table of the identified view has a field or validation procedure, each row inserted must conform to the constraints imposed by that procedure.
- *Indexes with VARBINARY columns*. If the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.
- *Views and the WITH CHECK OPTION*. For views defined with WITH CHECK OPTION, each row you insert into the view must conform to the definition of the view. If the view you name is dependent on other views whose definitions include WITH CHECK OPTION, the inserted rows must also conform to the definitions of those views. For an explanation of the rules governing this situation, see "CREATE VIEW" on page 1636.

  For views that are not defined with WITH CHECK OPTION, you can insert rows that do not conform to the definition of the view. Those rows cannot appear in the view but are inserted into the base table of the view.
- *Omitting the column list*. When you omit the column list, you must specify a value for every column that was present in the table when the INSERT statement was bound or (for dynamic execution) prepared.
- *Triggers*. An INSERT statement might cause triggers to be activated. A trigger might cause other statements to be executed or raise error conditions based on the insert values. If an INSERT statement for a view activates an INSTEAD OF trigger, the validity, referential integrity, and check constraints are checked against the data changes that are performed in the trigger, and not against the definition of the view that activates the trigger or the definition of the underlying tables or views.

When triggers are processed for an INSERT statement that inserts multiple rows depends on the atomicity option that is in effect for the INSERT statement:

- **ATOMIC**. The inserts are processed as a single statement. Any statement level triggers are activated one time for the statement, and the transition tables will include all of the rows that were inserted.
- **NOT ATOMIC CONTINUE ON SQLEXCEPTION**. The inserts are processed separately. Any statement level triggers are processed for each row that is inserted, and the transition table includes the individual row that is inserted. When errors are encountered with this option in effect, processing continues, and some of the specified rows will not be inserted. In this case, if an insert trigger is defined on the underlying base table, the statement level triggers will only be activated for rows that were successfully inserted.

  Regardless of the failure of any particular source row, the INSERT statement will not undo any changes that are made to the database by the statement. Insert will be attempted for rows that follow the failed row. However, the minimum level of atomicity is at least that of a single source row (that is, it is not possible for a partial insert operation to complete), including any triggers that might have been activated as a result of the INSERT statement.

Inserting XML documents:

When XML documents are inserted into a table that contains an XML index, the XML values that are inserted into the index are cast to the data type that is specified on the CREATE INDEX statement. If the XML value cannot be cast to the specified data type, the XML value is ignored for the XML index but the document is still inserted into the table. If the data type that is specified for casting is DECFLOAT, values can be rounded when they are inserted into the index. If the index is unique, the rounding that happens during the cast can result in duplicate values.

Number of rows inserted:

Normally, after an INSERT statement completes execution, the value of SQLERRD(3) in the SQLCA is the number of rows inserted. The value in SQLERRD(3) does not include the number of rows that were inserted as the result of a trigger.

For a complete description of the SQLCA, including exceptions to the above statement, see "SQL communication area (SQLCA)" on page 2086.

Nesting user-defined functions or stored procedures:

An INSERT statement can implicitly or explicitly refer to user-defined functions or stored procedures. This is known as *nesting* of SQL statements. A user-defined function or stored procedure that is nested within the INSERT must not access the table into which you are inserting values.

Locking:

Unless appropriate locks already exist, one or more exclusive locks are acquired at the execution of a successful insert operation. Until a commit or rollback operation releases the locks, only the application process that performed the insert can access the inserted row. If LOBs are not inserted into the row, application processes that are running with uncommitted read can also access the inserted row. The locks can also prevent other application processes from performing operations on the table. However, application processes that are running with uncommitted read can access locked pages and rows.

Locks are not acquired on declared temporary tables.

Inserting rows into a table with multilevel security :

When you insert rows into a table with multilevel security, Db2 determines the value for the security label column of the row according to the following rules:

- If the user (the primary authorization ID) has write-down privilege or write-down control is not enabled, the user can set the security label for the row to any valid security label. The value that is specified must be assignable to a column that is defined as CHAR(8) FOR SBCS DATA NOT NULL. If the user does not specify a value for the security label or specifies DEFAULT, the security label of the row becomes the same as the security label of the user.
- If the user does not have write-down privilege and write-down control is enabled, the security label of the row becomes the same as the security label of the user.

Inserting rows into a table for which row or column access control is enforced:

When an INSERT statement is issued for a table for which row or column access control is enforced, the rules specified in the enabled row permissions or column masks determine whether the row can be inserted. Typically those rules are based on the authorization ID or role of the process. The following rules describe how the enabled row permissions and column masks are used during INSERT:

- A row to be inserted must not be effected by enabled column masks whose columns are referenced while deriving the source values for the row.

  When a column is referenced while deriving the values of a new row, if the column has an enabled column mask, the masked value is used to derive the new values. If the object table is also column access control activated, the column mask that is applied to derive the new values must ensure that the evaluation of the access control rules defined in the column mask resolves the column to itself, not to a constant or to an expression. If the column mask does not mask the column to itself, the new value cannot be used for insert and an error is returned at run time.

  If the OVERRIDING USER VALUE clause is specified, the corresponding values in the new row are ignored, and the above rule for column masks is not applicable to those values.
- If the row can be inserted, and there is a BEFORE INSERT trigger for the table, the trigger is activated.

  Within the trigger actions, the new values for insert can be modified in the transition variables. When the values return from the trigger, the final values for the new values are the ones for insert.
- A row to be inserted must conform to the enabled row permissions.

  When multiple enabled row permissions are defined for a table, a row access control search condition is derived by application of the logical OR operator to the search condition in each enabled row permission. A row that conforms to the enabled row permissions is a row that if the row is inserted it can be retrieved back using the row access control search condition.

  Column masks are not applicable in this process.
- If the rows can be inserted, and there is an AFTER INSERT trigger for the table, the trigger is activated.

The preceding rules are not applicable to the *include-columns*. The *include-columns* are subject to the rules for the select list because they are not the columns of the object table of the INSERT statement.

Extended indicator variable usage:

When extended indicator variables are enabled, negative indicator values that are outside the range of -1 through -7 must not be specified, and the default and unassigned extended indicator values must not be specified in contexts in which they are not supported.

Extended indicator variables:

In an INSERT statement, a value of unassigned has the effect of setting the column to its default value.

Extended indicator variables and insert triggers:

The activation of insert triggers is not affected by the use of extended indicator variables. If all columns in the implicit or explicit column list have been assigned an extended indicator value of unassigned or default, an insert where all columns have their respective default values is attempted, and, if successful, the insert trigger is activated.

Table space data compression during an insert operation:

If the table space is defined with the COMPRESS YES option, and data is inserted into a table in the table space, the first rows are stored uncompressed. When a Db2-determined amount of data has been inserted into the table, a compression dictionary is created and stored in the table space. The rows that are inserted into the table after the dictionary is created are stored compressed using the compression dictionary.

Generated columns:

A generated column that is defined as GENERATED ALWAYS should not be specified in the *column-list* unless the corresponding entry in the VALUES list is DEFAULT or an extended indicator that specifies

that a default value is to be assigned. Specify the OVERRIDING USER VALUE clause to indicate that any user-specified value should be ignored and Db2 should assign the default value when a row is inserted.

Inserting rows into system-period temporal tables:
When a row is inserted into a system-period temporal table, Db2 assigns values to the following columns as indicated:

- A *row-begin* column is assigned a value that is generated by reading the time-of-day clock during execution of the first data change statement in the transaction that requires a value to be assigned to a *row-begin* column or a *transaction-start-ID* column in a table. This also occurs when a row in a system-period temporal table is deleted. Db2 ensures the uniqueness of the generated values for a *row-begin* column across transactions. If multiple rows are inserted within a single SQL transaction, the values for the *row-begin* column are the same for all of the rows and are unique from the values that are generated for the column by another transaction.
- A *row-end* column is assigned a value for the data type of the column.
- A *transaction-start-ID* column is assigned a unique value per unit of work or the null value. The null value is assigned to the *transaction-start-ID* column if the column is nullable. Otherwise, the value is generated by reading the time-of-day clock during execution of the first data change statement in the unit of work that requires a value to be assigned to a *row-begin* column or *transaction-start-ID* column in a table. This also occurs when a row in a system-period temporal table is deleted. If multiple rows are inserted within a single SQL transaction, the values for the *transaction-start-ID* column are the same for all the rows and are unique from the values that are generated for the column by another unit of work.

If the CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value, the underlying target of the INSERT statement cannot be a system-period temporal table. This restriction applies regardless of whether the system-period temporal table is directly or indirectly referenced.

Inserting rows into application-period temporal tables:
When a row is inserted into an application-period temporal table, an error is returned if the period that is defined by the begin column and end column of the application period overlap with the period that is defined by the begin column and end column of the application period for another row in the table.

Inserting rows into archive-enabled tables:
You cannot insert rows into an archive-enabled table if the value of the SYSIBMADM.MOVE_TO_ARCHIVE global variable is Y. Otherwise, if this global variable is not set to Y, you can specify an archive-enabled table as the target of the INSERT statement. In this case, the content of the associated archive table is not affected.

A data change statement must not reference an archive-enabled table when a system-period temporal table or application-period temporal table is also referenced.

INSERT without a column list:
An INSERT statement without a column list does not include implicitly hidden columns, so columns that are defined as implicitly hidden must have a defined default value.

Inserting a row into catalog table SYSIBM.SYSSTRINGS:
If the object table is SYSIBM.SYSSTRINGS, only certain values can be specified, as described in Specifying conversion procedures (Db2 Administration Guide).

Datetime representation when using datetime registers:
As explained in Datetime special registers, when two or more datetime registers are implicitly or explicitly specified in a single SQL statement, they represent the same point in time. This is also true when multiple rows are inserted. When ATOMIC is in effect for the INSERT statement, the special registers are evaluated one time for the processing of the statement. If NOT ATOMIC is in effect, the special registers are evaluated as each row of source data is processed.

Non-atomic processing of an INSERT statement:
When NOT ATOMIC is specified the rows of source data are processed separately. Any references to special registers, sequence expressions, and functions in the INSERT statement are evaluated as each row of source data is processed, Statement level triggers are activated as each row of source data is processed.

If one or more errors occur during the execution of an insert of a row, processing continues. The row that was being inserted at the time of the error is not inserted. Execution continues with the next row to be inserted, and any other changes made during the execution of the multiple-row INSERT statement are not backed out. However, the insert of an individual row is an atomic action.

Diagnostics information for a multiple-row INSERT statement:

A single multiple-row INSERT statement might encounter multiple conditions. These conditions can be errors or warnings. Use the GET DIAGNOSTICS statement to obtain information about all of the conditions that are encountered for one of these INSERT statements. See "GET DIAGNOSTICS" on page 1763 for more information.

If a warning occurs during the execution of an insert of a row, processing continues.

When multiple errors or warnings occur with a non-atomic INSERT statement, diagnostic information for each row is available using the GET DIAGNOSTICS statement. The SQLSTATE and SQLCODE reflect a summary of what happened during the INSERT statement:

- **SQLSTATE 01659, SQLCODE +252.** All rows were inserted, but one or more warnings occurred.
- **SQLSTATE 22529, SQLCODE -253.** At least one row was successfully inserted, but one or more errors occurred. Some warnings might also have occurred.
- **SQLSTATE 22530, SQLCODE -254.** No row was inserted. One or more errors occurred while trying to insert multiple rows of data.
- **SQLSTATE 429BI, SQLCODE -20252.** More errors occurred that Db2 is capable of recording. Statement processing is terminated.

When ATOMIC is in effect, if an insert value violates any constraints or if any other error occurs during the execution of an insert of a row, all changes made during the execution of the multiple-row INSERT statement are backed out. The SQLCA reflects the last warning encountered.

After an INSERT statement that inserts multiple rows of data, both atomic and non-atomic, information is returned to the program through the SQLCA. The SQLCA is set as follows:

- SQLCODE contains the SQLCODE.
- SQLSTATE contains the SQLSTATE.
- SQLERRD3 contains the number of rows actually inserted. SQLERRD3 is the number of rows inserted, if this is less than the number of rows requested, then an error occurred.
- SQLWARN flags are set if they were set during any single insert operation.

The SQLCA is used to return information on errors and warnings found during a multiple-row insert. If indicator arrays are provided, the indicator variable values are used to determine if the value from the host-variable array, or NULL, will be used. The SQLSTATE contains the warning from the last data mapping error.

Specifying the number of rows for a dynamic multiple-row INSERT statement:

Be aware of these considerations when specifying the number of rows to be inserted with a dynamic multiple-row INSERT statement that uses host-variable arrays:

- The FOR n ROWS clause can be specified as part of an INSERT statement or as part of an EXECUTE statement, but not both
- In the INSERT statement, you can specify a numeric constant in the FOR n ROWS clause to indicate the number of rows to be inserted or specify a parameter marker to indicate that the number of rows will be specified with the associated EXECUTE or OPEN statement. A multiple-row INSERT statement that is contained within a SELECT statement must include a FOR n ROWS clause.
- In an EXECUTE statement, when a dynamic INSERT statement is not contained within a SELECT statement, the number of rows can be specified with either the FOR n ROWS clause or the USING clause of the EXECUTE statement:
  - If the INSERT statement did not contain a FOR n ROWS clause, a value for the number of rows to be inserted can be specified in the FOR n ROWS clause of the EXECUTE statement with a numeric constant or host variable.

  - If a parameter marker was specified as part of a FOR n ROWS clause in the INSERT statement, a value for the number of rows must be specified with the USING clause of the EXECUTE statement.
- In an OPEN statement, when a dynamic SELECT statement contains one or more INSERT statements that have FOR n ROWS clauses with parameter markers, the values for the number of rows to be inserted (that is, the values for the parameter markers) must be specified with the USING clause of the OPEN statement.

DRDA considerations for a multiple-row INSERT statement:

Db2 for z/OS limits the size of user data and control information to 10M (except for LOBs, which are processed in a different data stream) for a single multiple-row INSERT statement using host-variable arrays.

Multiple-row insert and fetch statements are supported by any requester or server that supports the DRDA Version 3 protocols. If an attempt is made to issue a multiple-row INSERT or FETCH statement on a server that does not support DRDA Version 3 protocols, an error occurs.

When a multiple-row INSERT statement is executed at a Db2 for z/OS requester, the number of rows being inserted at the requester might not be known in some cases. These cases include:

- The FOR *n* ROWS clause contains a constant value for *n* for either a static or dynamic INSERT statement.
- Host variables are specified on the USING clause of an EXECUTE statement for a dynamic INSERT statement.

In either case, if the number of rows that is being inserted is not known, the requester might flow more data than is required to the server. The number of rows that is actually inserted will be correct because the server knows the correct number of rows to insert. However, performance can be adversely affected. Consider the following scenario:

```
...
long serial_num [10];
struct {
short len;
char data [18];
}name [20]
...
EXEC SQL INSERT INTO T1 VALUES (:serial_num, :name) FOR 5 ROWS
```

At the requester, when this statement is executed, the number of rows being inserted, 5, is not known. As a result, the requester will flow 10 values for serial_num and 10 values for name to the server (because the maximum number of rows that can be inserted without error is 10, which is the size of the smallest host-variable array).

Use the following programming techniques to avoid or minimize problems:

- Avoid using constant values for *n* in the FOR *n* ROWS clause of INSERT statements. For static INSERT statements, this technique ensures that the value for *n* will be known at the requester.
- For dynamic INSERT statements, use the USING DESCRIPTOR clause instead of the USING *host-variables* clause on the EXECUTE statement. If a USING DESCRIPTOR clause is used on the EXECUTE statement, the value for 'n' must be indicated in the DESCRIPTOR.
- If neither of the above methods can be used:
  - Declare your host-variable arrays as small as possible, or indicate that the size of your host-variable arrays are the size of 'n' in your descriptor. This avoids sending large numbers of host-variable-array entries that will not be used to the server.
  - Ensure that varying length string arrays are initialized to a length of 0 (zero). This minimizes the amount of data that is sent to the server.
  - Ensure that decimal host-variable arrays are initialized to valid values. This avoids a negative SQLCODE from being returned if the requester encounters invalid decimal data.

Other SQL statements in the same unit of work:

The following statements cannot follow an INSERT statement in the same unit of work:

- An ALTER TABLE statement that changes the data type of a column (ALTER COLUMN SET DATA TYPE)
- An ALTER INDEX statement that changes the padding attribute of an index with varying-length columns (PADDED to NOT PADDED or vice versa)
- A CREATE TABLE statement that creates an accelerator-only table.
- An INSERT, UPDATE, or DELETE statement that updates accelerator-only tables from a different accelerator.

Examples

Example 1: Insert values into sample table DSN8B10.EMP.

```
INSERT INTO DSN8B10.EMP
  VALUES ('000205','MARY','T','SMITH','D11','2866',
          '1981-08-10','ANALYST',16,'F','1956-05-22',
         16345,500,2300);
```

Example 2: Assume that SMITH.TEMPEMPL is a created temporary table. Populate the table with data from sample table DSN8B10.EMP.

```
INSERT INTO SMITH.TEMPEMPL
  SELECT *
  FROM DSN8B10.EMP;
```

Example 3: Assume that SESSION.TEMPEMPL is a declared temporary table. Populate the table with data from department D11 in sample table DSN8B10.EMP.

```
INSERT INTO SESSION.TEMPEMPL
  SELECT *
  FROM DSN8B10.EMP
  WHERE WORKDEPT='D11';
```

Example 4: Insert a row into sample table DSN8B10.EMP_PHOTO_RESUME. Set the value for column EMPNO to the value in host variable HV_ENUM. Let the value for column EMP_ROWID be generated because it was defined with a row ID data type and with clause GENERATED ALWAYS.

```
INSERT INTO DSN8B10.EMP_PHOTO_RESUME(EMPNO, EMP_ROWID)
  VALUES (:HV_ENUM, DEFAULT);
```

You can only insert user-specified values into ROWID columns that are defined as GENERATED BY DEFAULT and not as GENERATED ALWAYS. Therefore, in the above example, if you were to try to insert a value into EMP_ROWID instead of specifying DEFAULT, the statement would fail unless you also specify OVERRIDING USER VALUE. For columns that are defined as GENERATED ALWAYS, the OVERRIDING USER VALUE clause causes Db2 to ignore any user-specified value and generate a value instead.

For example, assume that you want to copy the rows in DSN8B10.EMP_PHOTO_RESUME to another table that has a similar definition (both tables have a ROWID columns defined as GENERATED ALWAYS). For the following INSERT statement, the OVERRIDING USER VALUE clause causes Db2 to ignore the EMP_ROWID column values from DSN8B10.EMP_PHOTO_RESUME and generate values for the corresponding ROWID column in B.EMP_PHOTO_RESUME.

```
INSERT INTO B.EMP_PHOTO_RESUME
  OVERRIDING USER VALUE
  SELECT * FROM DSN8B10.EMP_PHOTO_RESUME;
```

Example 5: Assume that the T1 table has one column. Insert a variable (:hv) number of rows of data into the T1 table. The values to be inserted are provided in a host-variable array (:hva).

```
EXEC SQL INSERT INTO T1 FOR :hv ROWS VALUES (:hva:hvind) ATOMIC;
```

In this example, :hva represents the host-variable array and :hvind represents the array of indicator variables.

Example 6: Assume that the T2 table has 2 columns, C1 is a SMALL INTEGER column, and C2 is an INTEGER column. Insert 10 rows of data into the T2 table. The values to be inserted are provided in host-variable arrays :hva1 (an array of INTEGERS) and :hva2 (an array of DECIMAL(15,0) values). The data values for :hva1 and :hva2 are represented in Table 221 on page 1825:

Table 221. Data values for :hva1 and :hva2

Array entry	:hva1	:hva2
1	1	32768
2	-12	90000
3	79	2
4	32768	19
5	8	36
6	5	24
7	400	36
8	73	4000000000
9	-200	2000000000
10	35	88

```
EXEC SQL INSERT INTO T2 (C1, C2)
  FOR 10 ROWS VALUES (:hva1:hvind1, :hva2:hvind2)
  NOT ATOMIC CONTINUE ON SQLEXCEPTION;
```

After execution of the INSERT statement, the following information will be in the SQLCA:

```
SQLCODE = -253
SQLSTATE = 22529
SQLERRD3 = 8
```

Although an attempt was made to insert 10 rows, only 8 rows of data were inserted. Processing continued after the first failed insert because NOT ATOMIC CONTINUE ON SQLEXCEPTION was specified. You can use the GET DIAGNOSTICS statement to find further information, for example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
```

The result of this statement is num_rows = 8 and num_cond = 2 (2 conditions).

```
GET DIAGNOSTICS CONDITION 2 :sqlstate = RETURNED_SQLSTATE,
                            :sqlcode = DB2_RETURNED_SQLCODE,
                            :row_num = DB2_ROW_NUMBER;
```

The result of this statement is sqlstate = 22003, sqlcode = -302, and row_num = 4.

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
                            :sqlcode = DB2_RETURNED_SQLCODE,
                            :row_num = DB2_ROW_NUMBER;
```

The result of this statement is sqlstate = 22003, sqlcode = -302, and row_num = 8.

Example 7: Assume the above table T2 with two columns. C1 is a SMALL INTEGER column, and C2 is an INTEGER column. Insert 8 rows of data into the T2 table. The values to be inserted are provided in host-variable arrays :hva1 (an array of INTEGERS) and :hva2 (an array of DECIMAL(15,0) values.) The data values for :hva1 and :hva2 are represented in Table 221 on page 1825.

```
EXEC SQL INSERT INTO T2 (C1, C2)
  FOR 8 ROWS VALUES (:hva1:hvind1, :hva2:hvind2)
  NOT ATOMIC CONTINUE ON SQLEXCEPTION;
```

After execution of the INSERT statement, the following information will be in the SQLCA:

```
SQLCODE = -253
SQLSTATE = 22529
SQLERRD3 = 6
```

Although an attempt was made to insert 8 rows, only 6 rows of data were inserted. Processing continued after the first failed insert because NOT ATOMIC CONTINUE ON SQLEXCEPTION was specified. You can use the GET DIAGNOSTICS statement to find further information, for example:

```
GET DIAGNOSTICS :num_rows = ROW_COUNT, :num_cond = NUMBER;
```

The result of this statement is num_rows = 68 and num_cond = 2 (2 conditions).

```
GET DIAGNOSTICS CONDITION 2 :sqlstate = RETURNED_SQLSTATE,
                            :sqlcode = DB2_RETURNED_SQLCODE,
                            :row_num = DB2_ROW_NUMBER;
```

The result of this statement is sqlstate = 22003, sqlcode = -302, and row_num = 4.

```
GET DIAGNOSTICS CONDITION 1 :sqlstate = RETURNED_SQLSTATE,
                            :sqlcode = DB2_RETURNED_SQLCODE,
                            :row_num = DB2_ROW_NUMBER;
```

The result of this statement is sqlstate = 22003, sqlcode = -302, and row_num = 8.

Example 8: Assume that table T1 has two columns. Insert a variable number (:hvn) or rows into T1. The values to be inserted are in host-variable arrays :hva and :hvb. In this example, the INSERT statement is contained within the SELECT statement of cursor CS1. The SELECT statement makes use of two other input host variables (:hv1 and :hv2) in the WHERE clause. Either a static or dynamic INSERT statement can be used.

```
-- Static INSERT statement:
DECLARE CS1 CURSOR WITH ROWSET POSITIONING FOR
   SELECT *
      FROM FINAL TABLE
         (INSERT INTO T1 VALUES (:hva, :hvb) FOR :hvn ROWS)
      WHERE C1 > :hv1 AND C2 < :hv2;
OPEN CS1;
-- Dynamic INSERT statement:
PREPARE INSSTMT FROM
   'SELECT *
      FROM FINAL TABLE
         (INSERT INTO T1 VALUES ( ? , ? ) FOR ? ROWS)
      WHERE C1 > ? AND C2 < ?';
DECLARE CS1 CURSOR WITH ROWSET POSITIONING FOR :INSSTMT;
OPEN CS1 USING :hva, :hvb, :hvn, :hv1, :hv2; (or OPEN CS1 USING DESCRIPTOR ...)
```

If the host-variable arrays for the multiple-row INSERT statement were to be specified using a descriptor, that descriptor (SQLDA) would have to describe all input host variables in the statement, and the order of the entries in the SQLDA should be the same as the order of the order of the host variables, host-variable arrays, and values for the FOR n ROWS clauses in the statement. For example, given the statement above, the SQLVAR entries in the descriptor must be assigned in the following order: :hvn, :hva, :hvb, :hv1, hv2. In addition, the SQLVAR entries for host-variable arrays must be tagged in the SQLDA as column arrays (by specifying a special value in part of the SQLNAME field for a host variable), and the SQLVAR entry for the number of rows value must be tagged in the SQLDA (by specifying another special value in part of the SQLNAME field for the host variable).

Example 9: Insert a row into table T1. The row contains the value 'xyz' for column COL1, and the cardinality of array INTA for column COL2.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY [6];
DECLARE INTA AS INTARRAY;
SET INTA = ARRAY [ 1, 2, 3, 4, 5 ];
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
INSERT INTO T1 VALUES ('xyz', CARDINALITY(INTA));
```

Example 10: Insert the values from arrays CHARA and INTA into table T1. For a row of T1, a value of the CHARA array is used for column COL1, and the value of the INTA array with the same array index is used for column COL2.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[10];
CREATE TYPE CHARARRAY AS CHAR(7) ARRAY[10];
DECLARE INTA AS INTARRAY;
DECLARE CHARA AS CHARARRAY;
SET INTA = ARRAY[1, 2, 3, 4, 5];
SET CHARA = ARRAY['a', 'b', 'c', 'd'];
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
INSERT INTO T1
 SELECT *
 FROM UNNEST(CHARA, INTA) AS (COL1, COL2);
```

Example 11: Insert three rows of data into table T1. For each inserted row, assign the value of the tenth element in the INTA array variable to the COL1 column.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[10];
DECLARE INTA AS INTARRAY;
CREATE VARIABLE VAR1 AS INTEGER;
CREATE VARIABLE VAR2 AS INTEGER;
SET INTA = ARRAY[10, 20, 30, 40, 50, 60, 70, 80, 90, 100];
CREATE TABLE T1 (COL1 INT, COL2 CHAR(10));
SET VAR1 = 10;
SET VAR2 = 3;
-- Perform a multiple row insert (specifying a FOR n ROWS clause).
-- The value to be inserted is specified by a reference to an array element.
INSERT INTO T1 (COL1) VALUES(INTA[VAR1]) FOR VAR2 ROWS;
```

The result of the these operations is that a value of 100 is assigned to column COL1 for three rows.

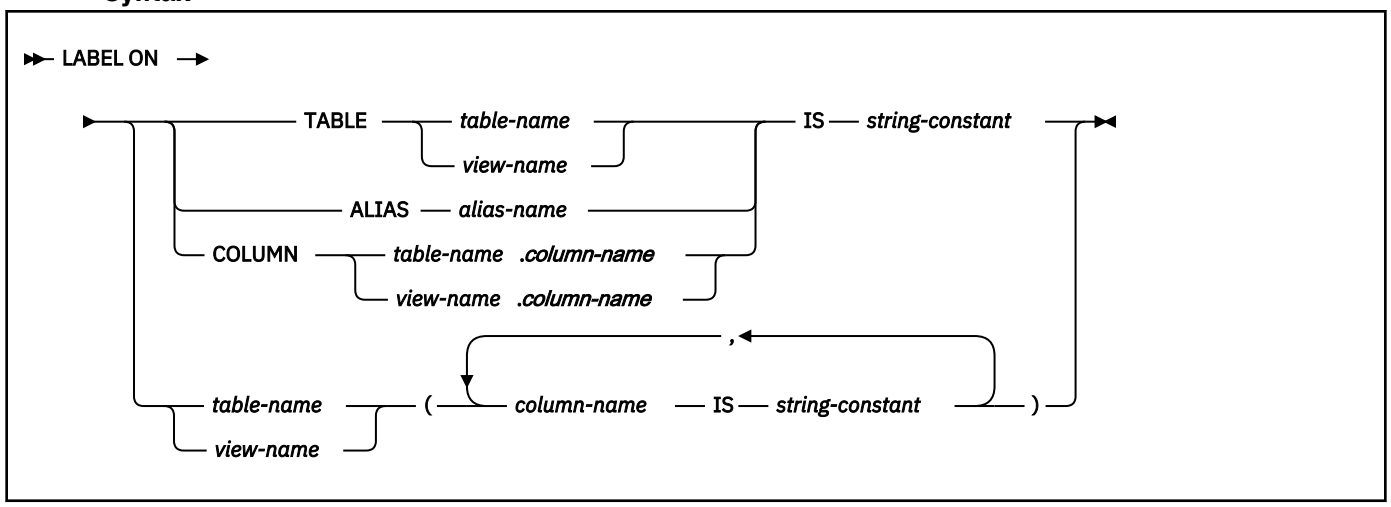
LABEL

The LABEL statement adds or replaces labels in the descriptions of tables, views, aliases, or columns in the catalog at the current server.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization



The privilege set that is defined below must include at least one of the following:

- Ownership of the table, view, or alias
- DBADM authority for its database (tables only)
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more details on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see “Authorization IDs and dynamic SQL” on page 91.)

Syntax

Description

TABLE *table-name* or *view-name*
Identifies the table or view to which the label applies. The name must identify a table or view that exists at the current server. *table-name* must not identify a declared temporary table. The label is placed into the LABEL column of the SYSIBM.SYSTABLES catalog table for the row that describes the table or view.

ALIAS *alias-name*
Identifies the alias to which the label applies. The name must identify an alias for a table or view that exists at the current server. The label is placed in the LABEL column of the SYSIBM.SYSTABLES catalog table for the row that describes the alias.

COLUMN *table-name.column-name* or *view-name.column-name*
Identifies the column to which the label applies. The name must identify a column of a table or view that exists at the current server. The name must not identify a column of a declared temporary table. The label is placed in the LABEL column of the SYSIBM.SYSCOLUMNS catalog table in the row that describes the column.

Do not use TABLE or COLUMN to define a label for more than one column in a table or view. Give the table or view name and then, in parentheses, a list in the form:

```
column-name IS string-constant,
column-name IS string-constant,...
```

See Example 2 below.

The column names must not be qualified, each name must identify a column of the specified table or view, and that table or view must exist at the current server.

IS
Introduces the label you want to provide.

string-constant
Can be any SQL character string constant of up to 30 bytes in length.

Examples

Example 1: Enter a label on the DEPTNO column of table DSN8B10.DEPT.

```
LABEL ON COLUMN DSN8B10.DEPT.DEPTNO
  IS 'DEPARTMENT NUMBER';
```

Example 2: Enter labels on two columns in table DSN8B10.DEPT.

```
LABEL ON DSN8B10.DEPT
 (MGRNO IS 'EMPLOYEE NUMBER FOR THE MANAGER',
  ADMRDEPT IS 'ADMINISTERING DEPARTMENT');
```

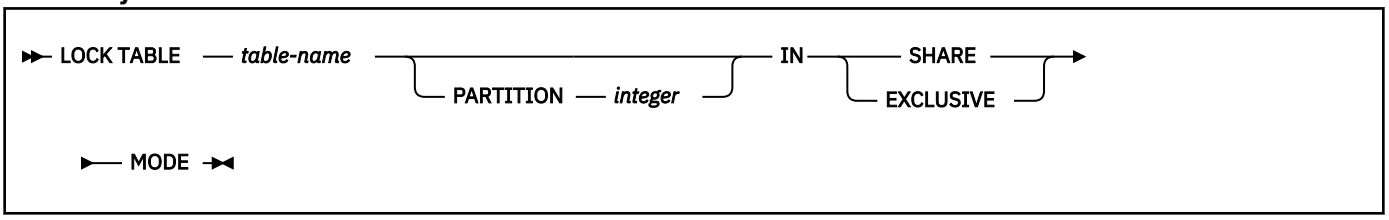
LOCK TABLE

The LOCK TABLE statement requests a lock on a table or table space at the current server. The lock is not acquired if the process already holds an appropriate lock.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization



The privilege set that is defined below must include at least one of the following:

- The SELECT privilege on the identified table (the SELECT privilege does not apply to the auxiliary table)
- Ownership of the table
- DBADM authority for the database
- SYSADM or SYSCTRL authority
- DATAACCESS authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more details on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see “Authorization IDs and dynamic SQL” on page 91.)

Syntax

Description

table-name

Identifies the table to be locked. The name must identify a table that exists at the current server. It must not identify a view, a temporary table (created or declared), an accelerator-only table, a catalog table, or a directory table. The lock might or might not apply exclusively to the table. The effect of locking an auxiliary table is to lock the LOB table space that contains the auxiliary table.

PARTITION *integer*

Identifies the partition of a partitioned table space to lock. The table identified by *table-name* must belong to a partitioned table space. The value specified for *integer* must be an integer that is no greater than the number of partitions in the table space.

IN SHARE MODE
For a lock on a table that is not an auxiliary table, requests the acquisition of a lock that prevents other processes from executing anything but read-only operations on the table. For a lock on a LOB table space, IN SHARE mode requests a lock that prevents storage from being reallocated. When a LOB table space is locked, other processes can delete LOBs or update them to a null value, but they cannot insert LOBs with a nonnull value. The type of lock that the process holds after execution of the statement depends on what lock, if any, the process already holds.

IN EXCLUSIVE MODE
Requests the acquisition of an exclusive lock for the application process. Until the lock is released, it prevents concurrent processes from executing any operations on the table.

Exceptions: Unless the lock is on a LOB table space, a partitioned (non-UTS) table space, or a universal table space (UTS), concurrent processes that are running with an isolation level of uncommitted read (UR) can execute read-only operations on the table. Concurrent processes that are running with an isolation level of cursor stability (CS) with CURRENTDATA(NO) can execute read-only operations on the table when lock avoidance is used to read data that is already committed.

Be aware that an exclusive lock on a table space, table, or partition does not prevent other transactions from holding claims on the locked object.

Notes

Releasing locks:
If LOCK TABLE is a static SQL statement, the RELEASE option of bind determines when Db2 releases a lock. For RELEASE(COMMIT), Db2 releases the lock at the next commit point. For RELEASE(DEALLOCATE), Db2 releases the lock when the plan is deallocated (the application ends).

If LOCK TABLE is a dynamic SQL statement, Db2 uses RELEASE(COMMIT) and releases the lock at the next commit point, unless the table or table space is referenced by cached dynamic statements. Caching allows Db2 to keep prepared statements in memory past commit points. In this case, Db2 holds the lock until deallocation or until the commit after the prepared statements are freed from memory. Under some conditions, if a lock is held past a commit point, Db2 demotes the lock state of a segmented table or a nonsegmented table space to an intent lock at the commit point.

When you issue the MODIFY DDF PKGREL(BNDOPT) or MODIFY DDF PKGREL command, the use of processor resources for package allocation and deallocation are minimized for packages that use database access threads and are bound with RELEASE(DEALLOCATE). When the MODIFY DDF PKGREL(BNDOPT) command has been issued, Db2 honors the RELEASE bind option even for dynamic SQL statements.

Syntax alternatives and synonyms:
For compatibility with previous releases of Db2, PART can be specified as a synonym for PARTITION.

Example

Obtain a lock on the sample table named DSN8B10.EMP, which resides in a partitioned table space. The lock obtained applies to every partition and prevents other application programs from either reading or updating the table. However, under one of the conditions that are noted above under **Exceptions**, Db2 might allow read-only operations on the table.

```
LOCK TABLE DSN8B10.EMP IN EXCLUSIVE MODE;
```

MERGE

The MERGE statement updates a target (a table or view, or the underlying tables or views of a fullselect) using the specified input data. Rows in the target that match the input data are updated as specified, and rows that do not exist in the target are inserted. Updating or inserting a row into a view updates or inserts the row into the tables on which the view is based, if no INSTEAD OF trigger is defined on this view.

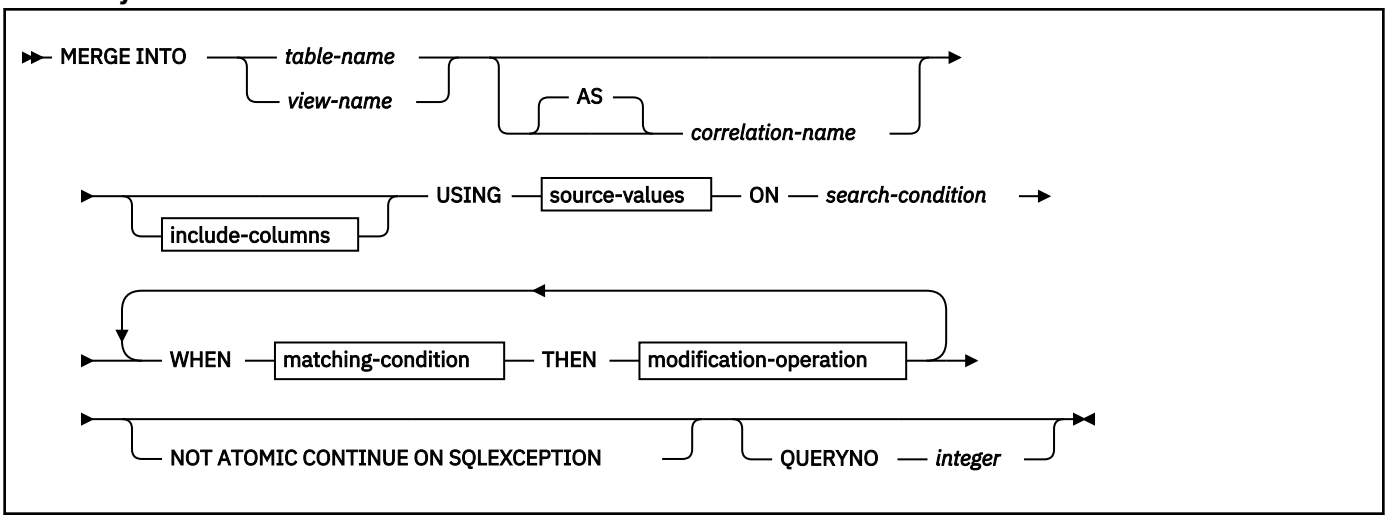
Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

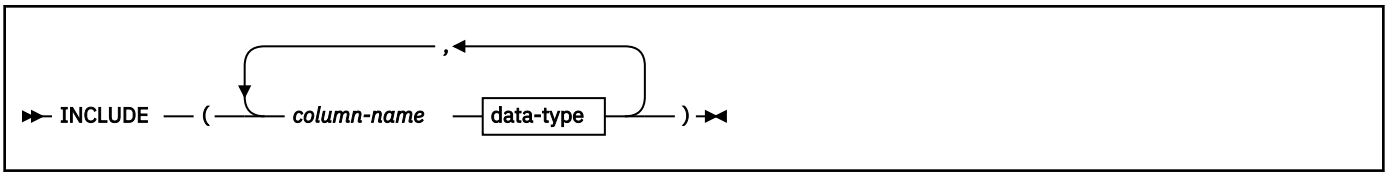
The privileges that are held by the privilege set that is defined below must include at least one of the following privileges:

- SYSADM authority
- Ownership of the table
- DATAACCESS authority
- If the search condition contains a reference to a column of the table or view, the SELECT privilege for the referenced table or view
- If the delete operation is specified, the DELETE privilege for the table or view
- If the insert operation is specified, the INSERT privilege for the table or view
- If the update operation is specified, at least one of the following privileges is required:
  - the UPDATE privilege for the table or view
  - the UPDATE privilege on each column that is updated
  - If the right side of the assignment clause contains a reference to a column of the table or view, the SELECT privilege for the referenced table or view



If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

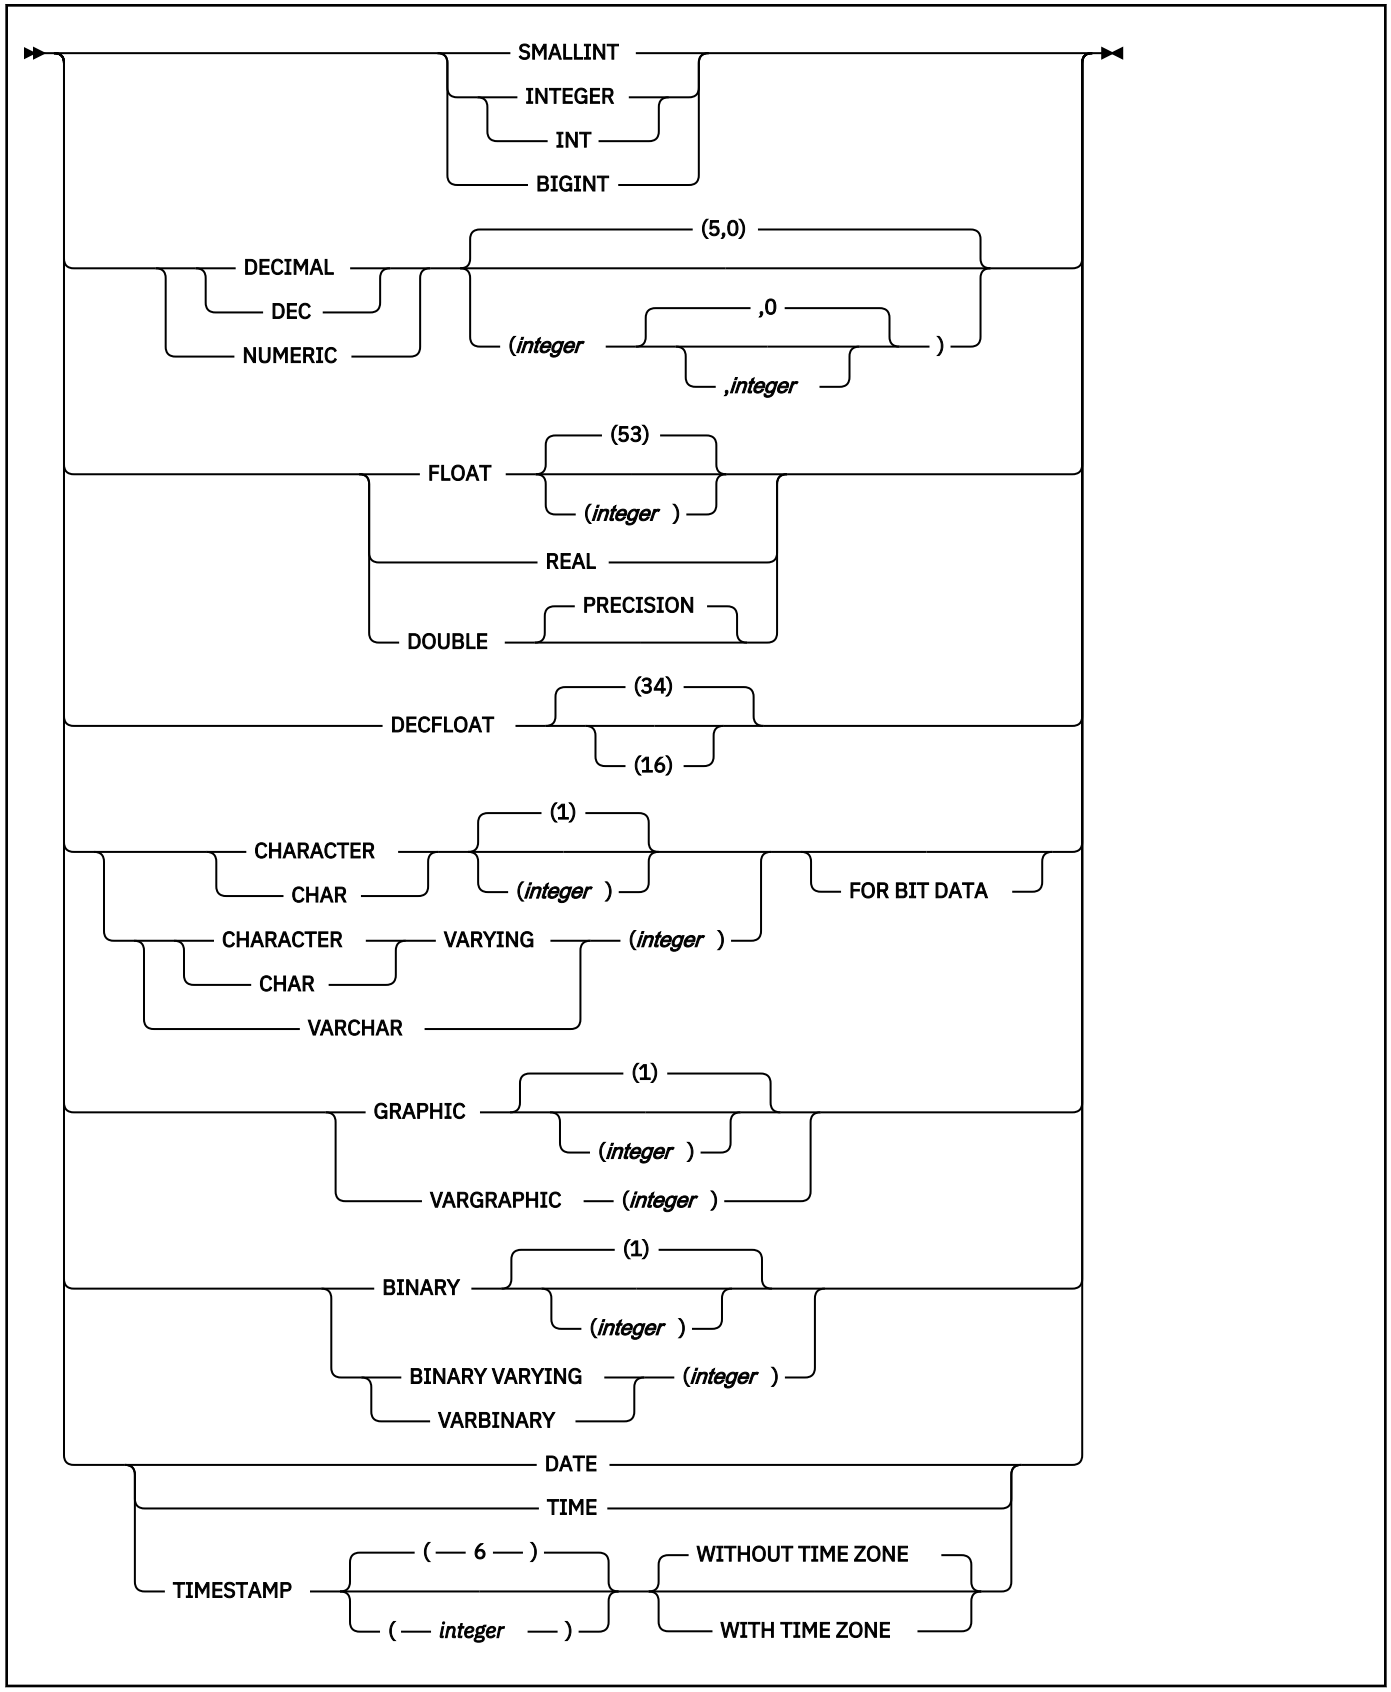
If the insert operation or assignment clause includes a subquery, the privileges that are held by the privilege set must also include at least one of the following privileges:



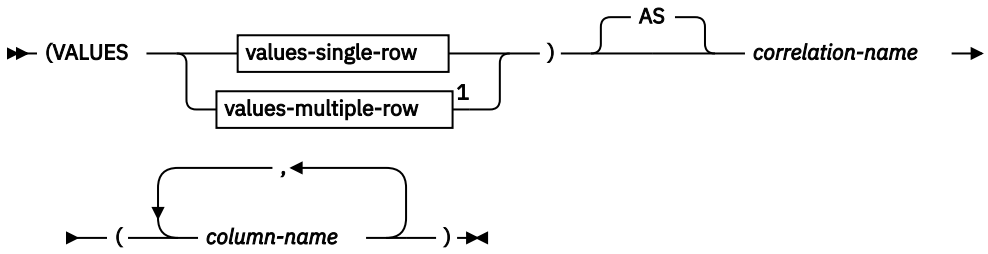
- SYSADM authority
- The SELECT privilege on every table or view that is identified in the subquery
- Ownership of the tables or views that are identified in the subquery
- DATAACCESS authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in Table 159 on page 1008. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see “Authorization IDs and dynamic SQL” on page 91.)

Syntax

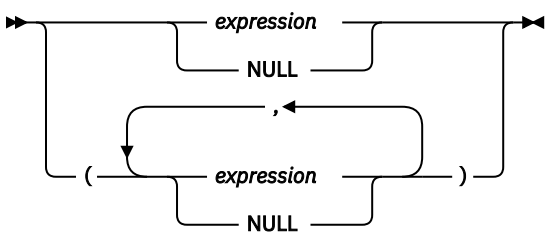


include-columns:

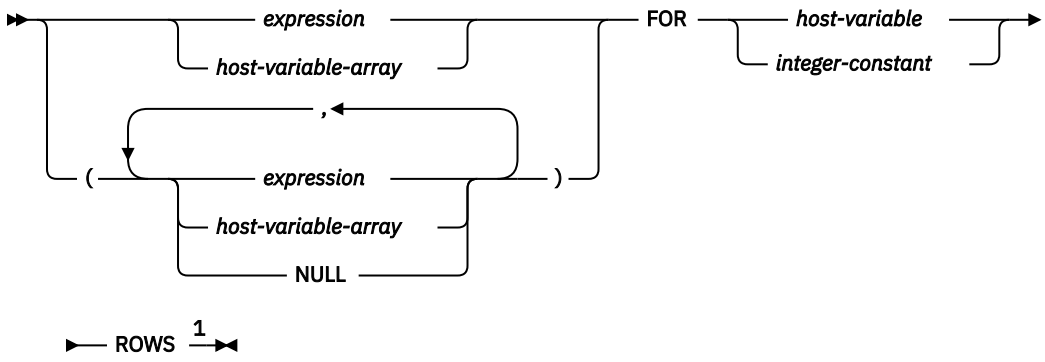


data-type:

built-in-type:



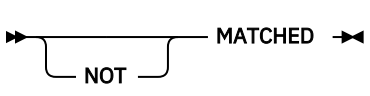
source-values:



Notes:

[1] The NOT ATOMIC clause must be specified when *values-multiple-row* is specified.

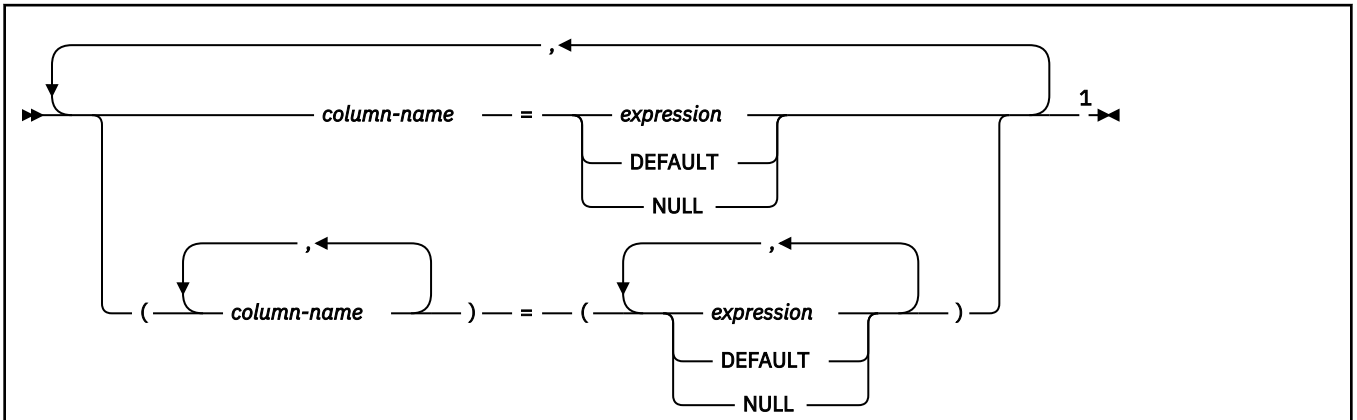
values-single-row:



values-multiple-row:

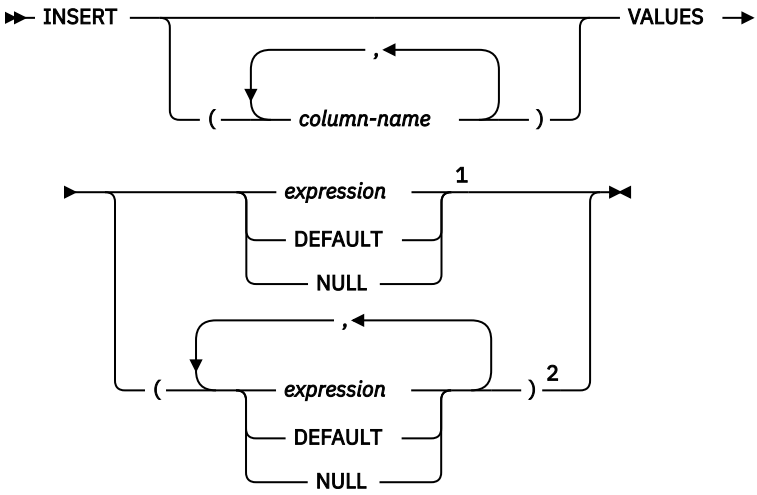
Notes:

[1] For a static MERGE statement, if FOR n ROWS is not specified, *values-multiple-row* is treated as *values-single-row*. For a dynamic MERGE statement, FOR n ROWS does not need to be specified in the MERGE statement. It can be specified in the EXECUTE statement, but cannot be specified in both the MERGE and EXECUTE statements.



matching-condition:

modification-operation:



assignment-clause:

Notes:

[1] The number of expressions, DEFAULT, and NULL keywords must match the number of column-names.

insert-operation:

Notes:

[1] The number of expressions, DEFAULT, and NULL keywords must match the number of *column-names*.

[2] The number of columns in the SELECT list must match the number of *column-names*.

Description

INTO *table-name* or *view-name*

Identifies the target of the insert or update operations of the MERGE statement. The name must identify a table or view that exists at the current server. The name must not identify:

- A catalog table
- A directory table
- A created global temporary table

- A read-only view
- A system-maintained materialized query table
- A table that is implicitly created for an XML column
- An accelerator-only table

If a view is specified as the target of the MERGE statement, the view must not be defined with any INSTEAD OF triggers.

AS *correlation-name*
correlation-name provides an alternate name that can be used when referencing columns of the intermediate result table. If no *correlation-name* is specified, the name of the intermediate result table is the name of the target table or view of the MERGE statement. Otherwise, the name is the *correlation-name*. If *correlation-name* includes a column list, the number of columns specified must not exceed 749.

include-columns
Specifies a set of columns that are included, along with the columns of the specified table or view, in the result table of the MERGE statement when it is nested in the FROM clause of the outer fullselect that is used in a SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that are identified by *table-name* or *view-name*. If a value is not specified for an included column, a null value is returned for that column.

INCLUDE
Introduces a list of columns that is to be included in the result table of the MERGE statement. The included columns are only available if the MERGE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. INCLUDE can only be specified when the MERGE statement is nested in the FROM clause of a SELECT statement.

column-name
Specifies the name for a column of the result table of the MERGE statement that is not the same name as another included column or a column in the table or view that is specified in *table-name* or *view-name*.

data-type
Specifies the data type of the included column. The included columns are nullable.

Columns with the following data types can not be used as INCLUDE columns:

- LONG VARCHAR,
- LONG VARGRAPHIC,
- XML
- LOBs
- distinct types that are based on any of the listed data types.

built-in-type
Specifies a built-in data type. See "CREATE TABLE" on page 1509 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an INCLUDE column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

USING *source-values*
Specifies the row or rows to be merged into the target table or view. VALUES *values-single-row* specifies a single row of source data. VALUES *values-multiple-row* specifies multiple rows of source data. The number of values must not exceed 750.

expression
Specifies an expression of the type that is described in "Expressions" on page 229. The expression must not include a column name. The expression must not reference a NEXT VALUE or

PREVIOUS VALUE expression. If the expression is a single host variable, the host variable can identify a structure. Any host variable or structure that is specified must be described in the application program according to the rules for declaring host structures and variables.

If the expression is a host variable, or if a host variable is being explicitly cast, the host variable can include an indicator variable or an indicator array (in the case of a host structure). Either indicator variables or indicator arrays can be enabled for extended indicator variables.

To provide a null value, specify the NULL keyword on a CAST specification.

NULL
Specifies a null value.

The column of the *source-table* corresponding to the NULL keyword is used to determine the data type of the null value. The column of the *source-table* must be referenced elsewhere in the MERGE statement such that its data type can be determined from the context in which it is used, and all such references must resolve to the same data type. References to date-time data types and CHAR or VARCHAR are considered the same type.

host-variable-array
Specifies a host variable array. Each host variable array must be defined in the application program in accordance with the rules for declaring an array. A host variable array contains the data to merge into a target column. The number of rows must be less than or equal to the dimension of each of the host variable arrays. An optional indicator array can be specified for each host variable array. An indicator array should be specified if the SQLTYPE of any SQLVAR occurrence indicates that a column is nullable. The indicator array can be enabled for extended indicator variables. The dimension of the indicator array must be large enough to contain an indicator for each row of input data.

A host structure is not supported in *host-variable-array*.

host-variable-array is supported in C/C++, COBOL, and PL/I.

FOR *host-variable* or *integer-constant* ROWS
Specifies the number of rows to merge. For a dynamic MERGE statement, this clause can be specified on the EXECUTE statement. *host-variable* or *integer-constant* is assigned to a value *k*. If *host-variable* is specified, it must be an exact numeric type with a scale of zero and must not include an indicator variable. *k* must be in the range of 1 to 32767. *k* rows are merged into the target from the specified source data.

If a parameter marker is specified in FOR *n* ROWS, a value must be provided with the USING clause of the associated EXECUTE statement.

AS *correlation-name*
Specifies a correlation name for the *source-values*.

column-name
Specifies a column name to associate the input data to the SET *assignment-clause* for an update operation or the VALUES clause for an insert operation.

ON *search-condition*
Specifies the predicates that are used to determine whether a row from *table-reference* or *source-values* matches rows in the target table.

Each *column-name* in the search condition must name a column of the target table or view, or *table-reference* or *source-values*. If a *column-name* exists in both the target and the *source-values*, the column name must be qualified.

Logically, a right join is performed between the target table and the *table-reference* (or *source-values*) using the ON *search-condition*. For those rows of the join result table where the search condition is true, the specified update or delete operation is performed. For those rows of the join result table where the result of the search condition is not true, the specified insert operation is performed.

A subquery is not allowed in the *search-condition* of the ON clause. The *search-condition* of the ON clause cannot contain expressions that use aggregate functions or non-deterministic scalar functions.

The *search-condition* of the ON clause must not include an IN predicate that includes a fullselect, or a quantified predicate that includes a fullselect.

WHEN MATCHED or WHEN NOT MATCHED
Specifies the condition under which the *modification-operation* is run.

WHEN MATCHED
Specifies the operation to perform on the rows where the ON *search-condition* is true and the target is not empty. Only UPDATE can be specified after the THEN clause. WHEN MATCHED must not be specified more than one time.

WHEN NOT MATCHED
Specifies the operation to perform on the rows where the ON *search-condition* is false or unknown, or the target is empty. Only INSERT can be specified after the THEN clause. WHEN NOT MATCHED must not be specified more than one time.

THEN *update-operation* or THEN *insert-operation*
Specifies the operation to run when the *matching-condition* evaluates to true.

UPDATE SET
Specifies the update operation to run when the *matching-condition* evaluates to true.

When extended indicator variables are enabled, a column of the source table must not be referenced multiple times in a single modification-operation. Extended indicator variables are enabled when EXTENDEDINDICATOR(YES) is used, or when the WITH EXTENDED INDICATORS prepare attribute has been specified for the MERGE statement.

The rows that are updated from a *source-row* are subject to more updates by subsequent *source-rows* in the same statement. The update is cumulative.

An update-operation in a MERGE statement will not rest the AREO* status on a table.

assignment-clause
Specifies a list of column updates.

column-name
Identifies a column to update. *column-name* must identify a column of the specified table or view, and that column must be updatable. The column must not be a generated column, or a column of a view that is derived from a scalar function, a constant, or an expression. *column-name* can also identify an included column. The same *column-name* must not be specified more than one time. A view column that is derived from the same column as another column of the view can be updated, but both columns cannot be updated in the same MERGE statement.

Assignments to included columns are only processed when the MERGE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. There must be at least one assignment clause that specifies a *column-name* that is not an included column.

expression
Specifies the new value of the column. The expression is any expression of the type that is described in “Expressions” on page 229. The expression must not include an aggregate function.

An expression can contain references to columns of *source-values* or target table or view. A column name is first checked as a column of the target, and then checked as a column of the source table. For each row that is updated, the value of a target column in an expression is the value of the column in the row before the row is updated. *expression* cannot contain references to an included column.

If *expression* is a reference to a single column of the *source-values*, the *source-values* column value might have been specified with an extended indicator variable value. The effects of such indicator variables apply to the corresponding target columns of the *assignment-clause*.

When extended indicator variables are enabled, an expression must not be more complex than a reference to a single column of the source table, or a single host variable if the indicator

is set to an extended indicator value of default (-5) or unassigned (-7). In addition, a CAST specification can be used if either:

- The target column is defined as nullable.
- the target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

DEFAULT
Specifies the default value for the column. DEFAULT can be specified only for columns that have a default value. The value that is assigned depends on how the column is defined. For more information about default values, see the description of the DEFAULT clause in "CREATE TABLE" on page 1509.

DEFAULT must be specified for a column that was defined as GENERATED ALWAYS, and was not defined as a row-begin, row-end, or transaction-start-ID column. . A valid value can be specified for a column that was defined as GENERATED BY DEFAULT.

NULL
Specifies the null value as the new value of the column. Specify NULL only for nullable columns.

insert-operation
Specifies the insert operation that is to be executed for the rows where the *matching-condition* evaluates to true.

The rows that are inserted from a *source-row* are immediately subject for update by subsequent *source-row* in the same statement.

INSERT
Specifies a list of column names and row value expressions to use for the insert operation.

The number of values for the row in the row-value expression must be equal to the number of names in the insert column list. The first value is inserted into the first column in the list, the second value into the second column, and so on.

column-name
Specifies the columns for which the insert values are provided. Each name must identify a column of the table or view.

If an included column is not specified in the list of column names, the value of the included column is set to null. The column list cannot contain only included columns.

The same column must not be specified more than one time. A view column that cannot accept insert values must not be specified. A view column that cannot accept insert values must not be specified.

If the object of the operation is a view that contains columns that cannot accept insert values, a list of column names must be specified and the list must not specify these columns.

Omission of the column list is an implicit specification of a list in which every column of the table (that is not defined as implicitly hidden) or view is identified in left-to-right order. This list is established when the statement is prepared and therefore does not include columns that were added to the table after the statement was prepared.

VALUES
Introduces one or more rows of values to insert.

expression
Specifies an expression of the type that does not include a column name of the target. If *expression* is a host variable, the host variable can include an indicator variable, or in the case of a host structure, an indicator array. When extended indicator variables are enabled, an expression must not be more complex than a reference to a single host

variable if the indicator is set to an extended indicator value of default (-5) or unassigned (-7).

In addition, a CAST specification can be used if either:

- The target column is defined as nullable.
- the target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

DEFAULT
Specifies to assign the default value to the column. DEFAULT must only be specified for columns that have a default value. If the column is specified in the INCLUDE column list, the column value is set to null.

DEFAULT must be specified for a column that is defined as GENERATED ALWAYS. A valid value can be specified for a column that is defined as GENERATED BY DEFAULT.

NULL
Specifies the null value as the value of the column. Specify NULL only for nullable columns.

NOT ATOMIC CONTINUE ON SQLEXCEPTION

The rows of input data are processed separately. Any statement level triggers are processed for each row of source data that is processed, and the transition table includes the individual row that was processed. When errors are encountered and this option is in effect, processing continues, and some of the specified rows will not be processed. In this case, if an appropriate trigger is defined on the underlying base table, the statement level trigger will only be activated for rows that were successfully processed.

Regardless of the failure of any particular source row, the MERGE statement will not undo any changes that are made to the database by the statement. Merge will be attempted for rows that follow the failed row. However, the minimum level of atomicity is at least that of a single source row (that is, it is not possible for a partial merge to complete), including any triggers that might have been activated as a result of the MERGE statement.

QUERYNO *integer*
Specifies the number for this SQL statement that is used in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If QUERYNO is not specified, the number that is associated with the SQL statement is the statement number that is assigned during precompilation. Thus, if the application program is changed and then precompiled, the statement number might change.

Notes

Trigger considerations:
A MERGE statement might cause triggers to be activated. A trigger might cause other statements to be executed or raise error conditions depending on the source data values. A before-update or before-insert trigger processes immediately before the update or insert operation.

If a source row results in an insert, any after-insert triggers are activated after the insert operation completes.

If a source row results in updates, any after-update triggers are activated after all of the update operations complete.

SQLCA and GET DIAGNOSTICS considerations:

The GET DIAGNOSTICS statement can be used immediately after the MERGE statement to check which input rows fail during the merge operation. The GET DIAGNOSTICS statement information item, NUMBER, indicates the number of conditions that are raised. The GET DIAGNOSTICS condition information item, DB2_ROW_NUMBER, indicates the input source rows that cause an error.

Indexes with VARBINARY columns:

Suppose that the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type. In that case, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.

Considerations for a MERGE without a column list in *insert-operation*:

A MERGE statement without a specified column list as part of *insert-operation* does not include implicitly hidden columns. Therefore, such columns must have a defined default value.

Considerations for non-atomic processing of a MERGE statement:

When NOT ATOMIC is specified, the rows of source data are processed separately. Any references to special registers, sequence expressions, and functions in the MERGE statement are evaluated as each row of source data is processed. Statement level triggers are activated as each row of source data is processed.

If one or more errors occur during the operation for a row of source data, processing continues. The row that was being processed at the time of the error is not inserted or updated. Execution continues with the next row to be processed, and any other changes that are made during the execution of the multiple-row MERGE statement are not backed out. However, the processing of an individual row is an atomic action.

DRDA considerations:

Db2 Connect Version 9.1 and subsequent releases support the MERGE statement. The support is for CLI only, with no embedded static SQL support.

When you run a MERGE statement at a Db2 for z/OS requester, cases might exist where the requestor does not know the number of rows in the source table. This situation includes the following cases:

- For static or dynamic MERGE statements, of the FOR *n* ROWS clause contains a constant value for *n*.
- For dynamic MERGE statements, of host variables are specified on the USING clause of an EXECUTE statement.

For both of these cases, if the number of rows in the source table is not known, the requester might send more data than is required to the server. The number of rows that are processed is correct because the server knows the correct numbers of rows to process. However, performance might be adversely affected. Consider the following example:

```
...long serial num [10];
struct { short len;
char data [18];
       }
name[20]...
EXEC SQL
MERGE INTO T1
  USING (VALUES (:serial_num, :name))
  FOR 5 ROWS...
```

When this statement is run at the requester, the number of rows to merge (five) is not known. As a result, the requester sends 10 values for `serial-name` and `name` to the server because 10 is the size of the smallest host variable array and is, therefore, the maximum number of rows that can merge without causing an error.

Do the following to help minimize performance problems:

- Avoid using numeric constants in the FOR *n* ROWS clause of the MERGE statement. For static MERGE statements, avoiding numeric constants ensures that the values for *n* are known at the requester.

- For dynamic MERGE statements, use the USING DESCRIPTOR clause instead of the USING *host-variable* clause on the EXECUTE statement. If a USING DESCRIPTOR clause is used on the EXECUTE statement, the value for n must be indicated in the descriptor.
- If either of the previous methods cannot be used, perform the following actions:
  - Make your host variable arrays as small as possible, or declare that the size of your host variable arrays are the size of n in the descriptor. This action avoids sending many unused host variable array entries to the server.
  - Ensure that varying length string arrays are initialized to a length of 0 (zero). Doing so minimizes the amount of data that is sent to the server.
  - Ensure that decimal host variable arrays are initialized to valid values. Doing so causes the requester to avoid sending a negative SQLCODE if the requester encounters invalid decimal data.

Extended indicator variable usage:
If enabled, indicator variable values other than positive values and 0 (zero) through -7 must not be set. The DEFAULT and UNASSIGNED extended indicator variable values must not appear in contexts where they are not supported.

Extended indicator variables:
In an update operation of the MERGE statement:

- An extended indicator value of unassigned has the same effect as if it had not been specified in the statement.
- An extended indicator value of default must not be specified for a row-begin, row-end, transaction-start-ID, or generated expression column.
- An extended indicator value of unassigned must not be assigned to all of the target columns.

In an insert operation of the MERGE statement, an extended indicator value of unassigned has the effect of setting the column to its default value.

Extended indicator variables and update triggers:
If a target column is assigned an extended indicator value of unassigned, that column is not considered to have been updated. That column is treated as if it had not been specified in the 0F *column-name* list of any update trigger that is defined on the target table.

Extended indicator variables and insert triggers:
The activation of insert triggers is not affected by the use of extended indicator variables. Suppose that all columns in the implicit or explicit column list are assigned an extended indicator value of unassigned or default. Then, assume that an insert operation where all columns are assigned to the respective default values is attempted. If that operation is successful, the insert trigger is activated.

Table space data compression during an insert operation:
If the table space is defined with the COMPRESS YES option, and data is inserted into a table in the table space, the first rows are stored uncompressed. When a amount of data that is determined by Db2 is inserted into the table, a compression dictionary is created and stored in the table space. The rows that are inserted into the table after the dictionary is created are stored compressed by using the compression dictionary.

System-period temporal tables:
When a MERGE statement is processed for a system-period temporal table, the rows are affected in the same way as if the specific data change operation was invoked.

Archive-enabled tables:
Consider the case when the target of a MERGE statement is an archive-enabled table, and the merge operation includes an insert or update operation. In this case, the involved rows are affected in the same way as if the insert or update operation was directly invoked on the table.

Tables with enforced row and column access controls:
For information about how enabled row permissions and column masks affect the update and insert operations in the MERGE statement, see the INSERT and UPDATE statement information.

Examples

Example 1: Update the descriptions for activities that exist in the RECORDS table. Otherwise, insert the activity and its description into the RECORDS table.

```
MERGE INTO RECORDS AR
  USING (VALUES (:hv_activity, :hv_description)
    FOR :hv_nrows ROWS)
    AS AC (ACTIVITY, DESCRIPTION)
  ON (AR.ACTIVITY = AC.ACTIVITY)
  WHEN MATCHED THEN UPDATE SET DESCRIPTION = AC.DESCRIPTION
  WHEN NOT MATCHED THEN INSERT (ACTIVITY, DESCRIPTION)
     VALUES (AC.ACTIVITY, AC.DESCRIPTION)
  NOT ATOMIC CONTINUE ON SQLEXCEPTION;
```

Example 2: Use the transaction data to merge rows into the account table. Update the balance from the transaction data against an account ID and insert new accounts from the transaction data where the accounts do not already exist.

```
MERGE INTO ACCOUNT AS A
  USING (VALUES (:hv_id, :hv_amount)
    FOR 3 ROWS)
    AS T (ID, AMOUNT)
  ON (A.ID = T.ID)
  WHEN MATCHED THEN UPDATE SET BALANCE = A.BALANCE + T.AMOUNT
  WHEN NOT MATCHED THEN INSERT (ID, BALANCE)
      VALUES (T.ID, T.AMOUNT)
  NOT ATOMIC CONTINUE ON SQLEXCEPTION;
```

Example 3: Update the list of activities that are organized by group A in the RECORDS table. Update the activities information (description and date when last modified) in the RECORDS table if the activities exist in the RECORDS table and are also organized by group A. Insert new activities into the RECORDS table.

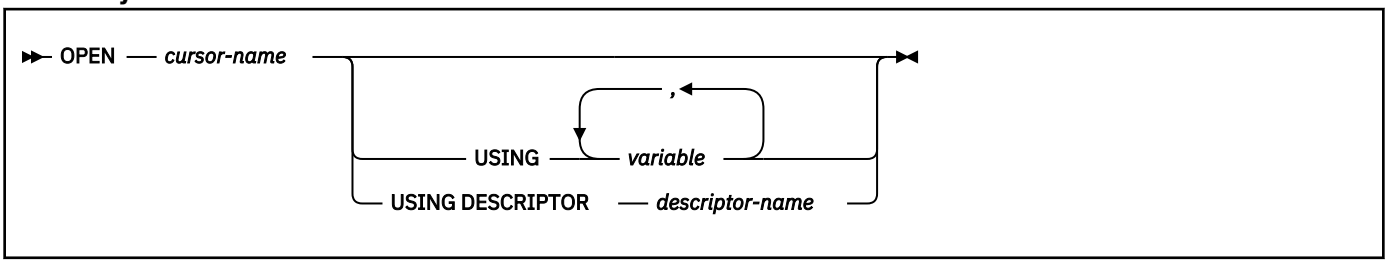
```
-- hv_nrows = 3
-- hv_activity(1) = 'D'; hv_description(1) = 'Dance'; hv_date(1) = '03/01/07'
-- hv_activity(2) = 'S'; hv_description(2) = 'Singing'; hv_date(2) = '03/17/07'
-- hv_activity(3) = 'T'; hv_description(3) = 'Tai-chi'; hv_date(3) = '05/01/07'
-- hv_group = 'A';
-- note that hv_group is not an array. All 3 values contain the same values
MERGE INTO RECORDS AR
  USING (VALUES (:hv_activity, :hv_description, :hv_date, :hv_group)
     FOR :hv_nrows ROWS)
     AS AC (ACTIVITY, DESCRIPTION, DATE, GROUP)
  ON AR.ACTIVITY = AC.ACTIVITY AND AR.GROUP = AC.GROUP
  WHEN MATCHED
  THEN UPDATE SET (DESCRIPTION, DATE, LAST_MODIFIED)
                = (AC.DESCRIPTION, AC.DATE, CURRENT TIMESTAMP)
  WHEN NOT MATCHED
  THEN INSERT (GROUP, ACTIVITY, DESCRIPTION, DATE, LAST_MODIFIED)
     VALUES (AC.GROUP, AC.ACTIVITY, AC.DESCRIPTION, AC.DATE, CURRENT TIMESTAMP)
  NOT ATOMIC CONTINUE ON SQLEXCEPTION;
```

Example 4: Use two arrays, CHARA and INTA, as input to a MERGE statement. Column COL2 is set to the cardinality of CHARA for matching rows, and COL2 is set to the cardinality of INTA for non-matching rows.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[6];
CREATE TYPE CHARARRAY AS CHAR(20) ARRAY[7];
DECLARE INTA AS INTARRAY;
DECLARE CHARA AS CHARARRAY;
CREATE VARIABLE SI INT;
SET CHARA = ARRAY['a', 'b', 'c'];
SET INTA = ARRAY [1, 2, 3, 4, 5];
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
INSERT INTO T1 VALUES ('abc', 10);
MERGE INTO T1 AS A
 USING TABLE (VALUES ('rsk', 3 ) ) AS T (ID, AMOUNT)
 ON A.COL1 = T.ID
 WHEN MATCHED
  THEN UPDATE SET COL2 = CARDINALITY(CHARA)
 WHEN NOT MATCHED
  THEN INSERT (COL1, COL2 ) VALUES (T.ID, CARDINALITY(INTA));
```

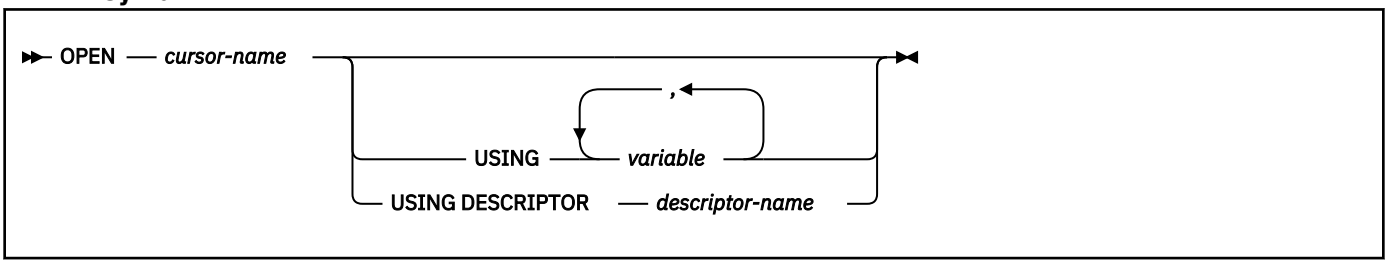
OPEN

The OPEN statement opens a cursor so that it can be used to process rows from its result table.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.



Authorization

See "DECLARE CURSOR" on page 1643 for the authorization required to use a cursor.

Syntax

Syntax

Description

cursor-name

Identifies the cursor to be opened. The *cursor-name* must identify a declared cursor as explained in "DECLARE CURSOR" on page 1643. When the OPEN statement is executed, the cursor must be in the closed state.

The SELECT statement of the cursor is either one of the following types of SELECT statements:

- The *select-statement* that is specified in the DECLARE CURSOR statement
- The prepared *select-statement* that is identified by the *statement-name* that is specified in the DECLARE CURSOR statement.

If the statement has not been successfully prepared, or is not a *select-statement*, the cursor cannot be successfully opened.

The result table of the cursor is derived by evaluating the SELECT statement. The evaluation uses the current values of any special registers or PREVIOUS VALUE expressions that are specified in the SELECT statement, and the current values of any host variables that are specified in the SELECT statement or the USING clause of the OPEN statement. The rows of the result table can be derived during the execution of the OPEN statement, and a temporary copy of a result table can be created to hold those rows. They can be derived during the execution of later FETCH statements. In either case, the cursor is placed in the open state and positioned before the first row of its result table.

If the table is empty, the position of the cursor is effectively “after the last row.” The Db2 system does not indicate an empty table when the OPEN statement is executed. A subsequent fetch for the cursor might return the SQLSTATE warning of '02000'.

USING
Introduces a list of variables whose values are substituted for the parameter markers (question marks) or host variables in the statement of the cursor, depending on the declaration of the cursor:

- If the DECLARE CURSOR statement included *statement-name*, the statement was prepared with a PREPARE statement. The variables specified in the USING clause of the OPEN statement replace any parameter markers in the prepared statement. This reflects the typical use of the USING clause of the OPEN statement. For an explanation of parameter marker replacement, see “PREPARE” on page 1849.

  If the prepared statement includes parameter markers, you must use USING. If the prepared statement does not include parameter markers, USING is ignored.
- If the DECLARE CURSOR statement included *select-statement* and the SELECT statement included variables, the USING clause of the OPEN statement can be used to specify variables that are to override the values that were specified when the cursor was defined. In this case, the OPEN statement is executed as if each variable in the SELECT statement were a parameter marker except that the attributes of the target variable are the same as the variables in the SELECT statement. The effect is to override the values of the variables in the SELECT statement of the cursor with the values of the variables specified in the USING clause. The overriding value is always the value of the main variable because indicator variables are ignored in this context without warning.

The *n*th variable corresponds to the *n*th parameter marker in the prepared statement. Where appropriate, locator variables and file reference variables can be provided as the source of values for parameter markers.

variable
Identifies a variable or a host structure that is declared in the application program in accordance with the rules for declaring variables and host structures. When the statement is executed, a reference to a structure is replaced by a reference to each of its variables. The number of variables must be the same as the number of parameter markers in the prepared statement.

***array-variable* [*array-index*]**
Identifies an array element. An array element must only be specified if the OPEN statement is issued in SQL PL.

array-variable
Specifies an array variable.

[*array-index*]
An expression that specifies which element in the array to use.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

DESCRIPTOR *descriptor-name*
Identifies an SQLDA that contains a valid description of the input host variables.

Before the OPEN statement is processed, the user must set the following fields in the SQLDA:

- SQLN to indicate the number of SQLVAR occurrences provided in the SQLDA

  A REXX SQLDA does not contain this field.
- SQLABC to indicate the number of bytes of storage allocated for the SQLDA
- SQLD to indicate the number of variables used in the SQLDA when processing the statement
- SQLVAR occurrences to indicate the attributes of the variables

The SQLDA must have enough storage to contain all SQLVAR occurrences. If LOBs or distinct types are present in the result table, there must be additional SQLVAR entries for each input host variable. For more information on the SQLDA, which includes a description of the SQLVAR and an explanation on how to determine the number of SQLVAR occurrences, see "SQL descriptor area (SQLDA)" on page 2095.

SQLD must be set to a value greater than or equal to zero and less than or equal to SQLN. It must be the same as the number of parameter markers in the prepared statement.

See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

Notes

Errors occurring on OPEN: In local and remote processing, the DEFER(PREPARE) and REOPT(ALWAYS)/ REOPT(ONCE) bind options can cause some SQL statements to receive "delayed" errors. For example, an OPEN statement might receive an SQLCODE that normally occurs during PREPARE processing. Or a FETCH statement might receive an SQLCODE that normally occurs at OPEN time.

Closed state of cursors: All cursors in an application process are in the closed state when:

- The application process is started.
- A new unit of work is started for the application process unless the WITH HOLD option has been used in the DECLARE CURSOR statement.
- The application was precompiled with the CONNECT(1) option (which implicitly closes any open cursors).

A cursor can also be in the closed state because:

- A CLOSE statement was executed.
- An error was detected that made the position of the cursor unpredictable.

To retrieve rows from the result table of a cursor, you must execute a FETCH statement when the cursor is open. The only way to change the state of a cursor from closed to open is to execute an OPEN statement.

Effect of a temporary copy of a result table: Db2 can process a cursor in two different ways:

- It can create a temporary copy of the result table during the execution of the OPEN statement. You can specify INSENSITIVE SCROLL on the cursor to force the use of a temporary copy of the result table.
- It can derive the result table rows as they are needed during the execution of later FETCH statements.

If the result table is not read-only, Db2 uses the latter method. If the result table is read-only, either method could be used. The results produced by these two methods could differ in the following respects:

When a temporary copy of the result table is used: An error can occur that would otherwise not occur until some later FETCH statement. insert operations that are executed while the cursor is open cannot affect the result table once all the rows have been materialized in the temporary copy of the result table. For a scrollable insensitive cursor, update and delete operations that are executed while the cursor is open cannot affect the result table. For a scrollable sensitive static cursor, update and delete operations can affect the result table if the rows are subsequently fetched with sensitive FETCH statements.

When a temporary copy of the result table is not used: Insert, update, and delete operations that are executed while the cursor is open can affect the result table. The effect of such operations is not always predictable.

For example, if cursor C is positioned on a row of its result table defined as SELECT * FROM T, and you insert a row into T, the effect of that insert on the result table is not predictable because its rows are not ordered. A later FETCH C might or might not retrieve the new row of T. To avoid these changes, you can specify INSENSITIVE SCROLL for the cursor to force the use of a temporary copy of the result table.

Parameter marker replacement: Before the OPEN statement is executed, each parameter marker in the query is effectively replaced by its corresponding host variable. The replacement is an assignment operation in which the source is the value of the host variable and the target is a variable within Db2. The assignment rules are those described for assignment to a column in "Assignment and comparison" on page 135. For a typed parameter marker, the attributes of the target variable are those specified by the CAST specification. For an untyped parameter marker, the attributes of the target variable are determined according to the context of the parameter marker. For the rules that affect parameter markers, see Parameter markers.

Let V denote a host variable that corresponds to parameter marker P. The value of V is assigned to the target variable for P in accordance with the rules for assigning a value to a column:

- V must be compatible with the target.
- If V is a string, its length (excluding trailing blanks) must not be greater than the length attribute of the target.
- If V is a number, the absolute value of its integral part must not be greater than the maximum absolute value of the integral part of the target.
- If the attributes of V are not identical to the attributes of the target, the value is converted to conform to the attributes of the target.
- If the target cannot contain nulls, V must not be null.

When the SELECT statement of the cursor is evaluated, each parameter marker in the statement is effectively replaced by the value of its corresponding host variable. For example, if V is CHAR(6) and the target is CHAR(8), the value used in place of P is the value of V padded on the right with two blanks. For more on the process of replacement, see Parameter marker replacement.

Considerations for scrollable cursors: Following an OPEN *cursor* statement, a GET DIAGNOSTICS statement can be used to get the attributes of the cursor such as the following information (for more information, see "GET DIAGNOSTICS" on page 1763):

- DB2_SQL_ATTR_CURSOR _HOLD. Whether the cursor was defined with the WITH HOLD attribute.
- DB2_SQL_ATTR_CURSOR_SCROLLABLE. Scrollability of the cursor.
- DB2_SQL_ATTR_CURSOR_SENSITIVITY. Effective sensitivity of the cursor.

  The sensitivity information can be used by applications (such as an ODBC driver) to determine what type of FETCH (INSENSITIVE or SENSITIVE) to issue for a cursor defined as ASENSITIVE.
- DB2_SQL_ATTR_CURSOR_ROWSET. Whether the cursor can be used to access rowsets.
- DB2_SQL_ATTR_CURSOR_TYPE. Whether a cursor type is forward-only, static, or dynamic.
- The scrollability of the cursor is in SQLWARN1.
- The sensitivity of the cursor is in SQLWARN4.
- The effective capability of the cursor is in SQLWARN5.

Number of rows inserted: SQL data change statements and routines that modify SQL data embedded in the cursor definition are completely executed, and the result table is stored in a temporary table when the cursor opens. If statement execution is successful, the SQLERRD(3) field contains the sum of the number of rows that qualified for insert, update, and delete operations. If an error occurs during execution of an OPEN statement that involves a cursor that contains a data change statement within a fullselect, the results of that data change statement are rolled back.

Materialization of the rows of the result table and NEXT VALUE expressions: If the rows of the result table of a cursor are materialized when the cursor is opened and the SELECT statement of the cursor contains NEXT VALUE expressions, the expressions are processed when the cursor is opened. Otherwise, the NEXT VALUE expressions are evaluated as the rows of the result table are retrieved.

Opening the same cursor multiple times: A cursor in an SQL procedure that is declared as WITH RETURN TO CLIENT can be opened even when a cursor with the same name is already in the open state. In this case, the existing open cursor becomes a result set cursor and is no longer accessible by its cursor name. A new cursor is opened and becomes accessible by the cursor name. Closing the new cursor does not make the cursor that was previously accessible by that name accessible by the cursor name again. Cursors that become result set cursors in this way cannot be accessed at the server and can be processed only at the client.

Examples

Example 1: Execute an OPEN statement, which places the cursor at the beginning of the rows to be fetched.

```
   EXEC SQL DECLARE C1 CURSOR FOR
     SELECT DEPTNO, DEPTNAME, MGRNO FROM DSN8B10.DEPT
     WHERE ADMRDEPT = 'A00';
   EXEC SQL OPEN C1;
    DO WHILE (SQLCODE = 0);
     EXEC SQL FETCH C1 INTO :DNUM, :DNAME, :MNUM;
   END;
    EXEC SQL CLOSE C1;
```

Example 2: Suppose that the following array type, array variable, and table have been defined.

```
CREATE TYPE INTARRAY AS INTEGER ARRAY[100];
CREATE TYPE STRINGARRAY AS VARCHAR(10) ARRAY[100];
CREATE TABLE T1 (COL1 CHAR(10), COL2 INT);
```

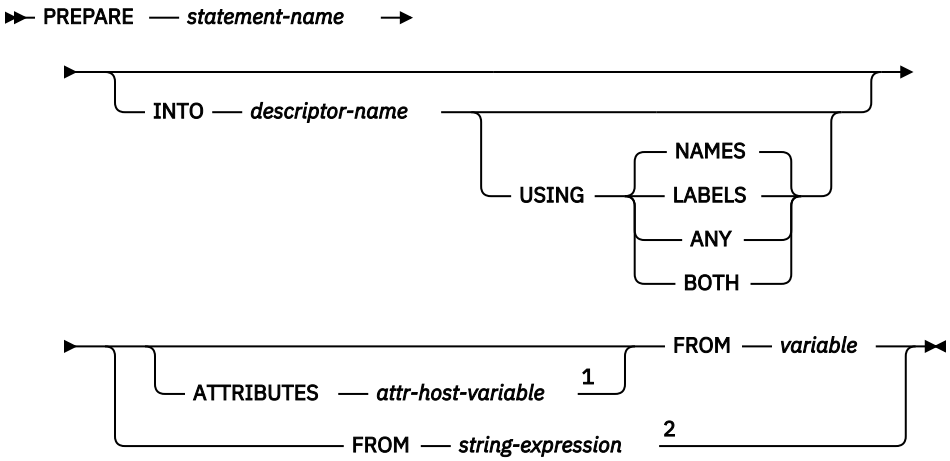
Use an array variable as input for a dynamic SQL statement. The dynamic statement references an array element in the array variable. The dynamic statement contains two parameter markers, one for the array variable and one for the index of the array element. The OPEN statement provides two input values in the USING clause: the array variable, and a variable that contains the index for the array element.

```
CREATE PROCEDURE PROCESSPERSONS (OUT WITHO STRINGARRAY, INOUT INT0 INT)
BEGIN
 DECLARE INTA INTARRAY;
 DECLARE INTB INTARRAY;
 DECLARE INTV INTEGER;
 DECLARE STMT CHAR(100);
 DECLARE C2 CURSOR FOR S1;
--
-- Initialize the array
--
 SET INTA = ARRAY[1,INTEGER(2),3+0,4,5,6] ;
--
-- Use dynamic SQL with an array parameter marker and a parameter marker
-- containing the index to retrieve the value from the array parameter.
-- The array is referenced in a predicate.
--
 SET STMT = 'SELECT COL1 FROM T1 WHERE COL2 = CAST(? AS INTARRAY)[?]';
 PREPARE S1 FROM STMT;
 OPEN C2 USING INTA, INTV; -- Input: INTA is an array, and INTV is the
                           -- index for the array element
 FETCH C2 INTO INTB ;      -- Output: INTB is an array variable
…
 CLOSE C2;
…
END
```

PREPARE

The PREPARE statement creates an executable SQL statement from a string form of the statement. The character-string form is called a *statement string*. The executable form is called a *prepared statement*.

Invocation



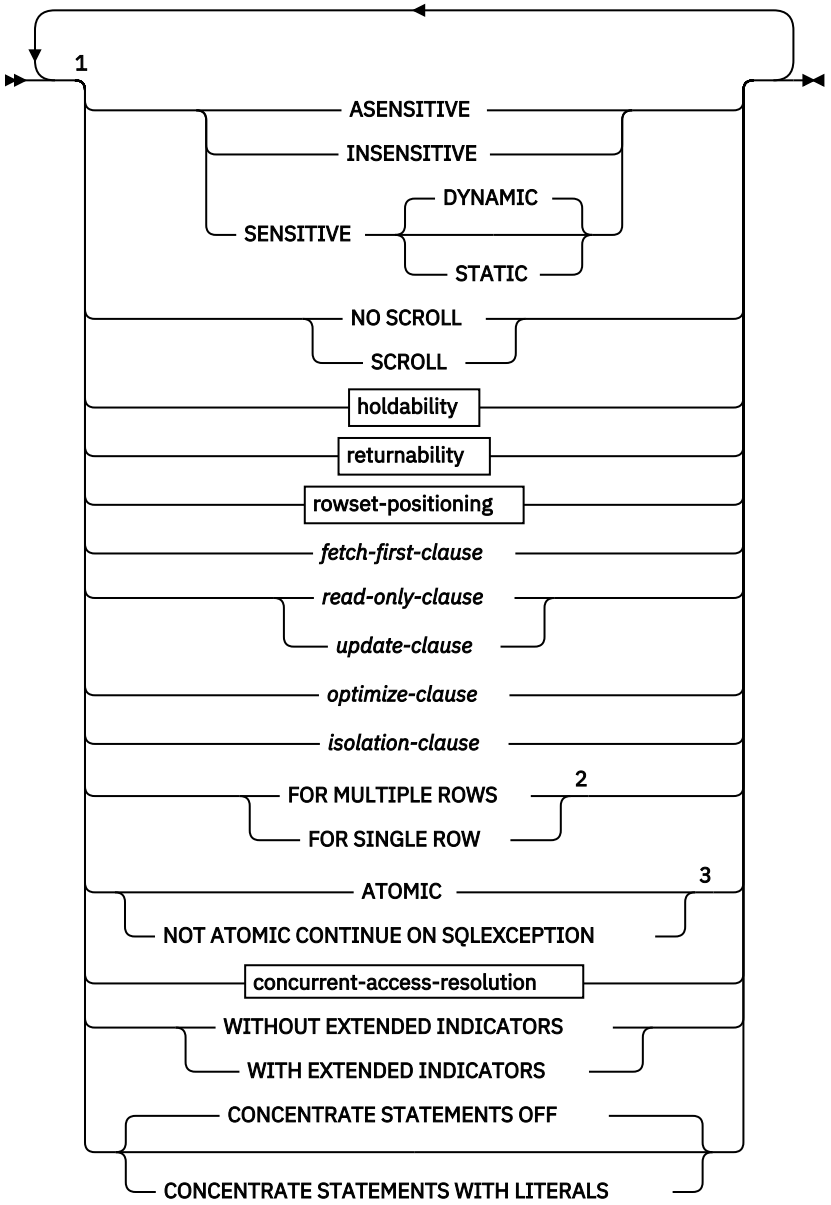
This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

The authorization rules are those defined for the dynamic preparation of the SQL statement specified by the PREPARE statement. For example, see Chapter 6, “Queries,” on page 931 for the authorization rules that apply when a SELECT statement is prepared.

The statement that is prepared using only the EXPLAIN privilege cannot be executed, and only the descriptive information can be obtained for that statement.

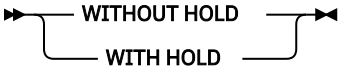
Syntax



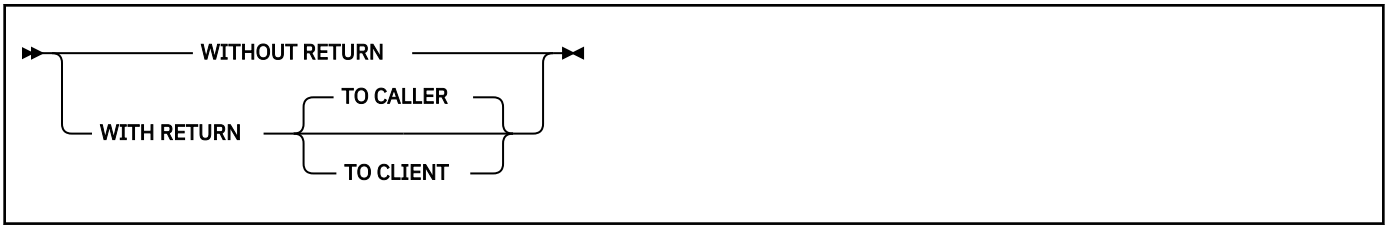
Notes:

1 *attr-host-variable* must be a string host variable and the content must conform to the rules for attribute-string. The ATTRIBUTES clause can only be specified before *variable*.

2 *string-expression* is only supported for PLI.



attribute-string



Notes:

[1] The same clause must not be specified more than one time. If the options are not specified, their defaults are whatever was specified for the corresponding option in an associated statement.
[2] The FOR SINGLE ROW or FOR MULTIPLE ROWS clause must only be specified for an INSERT or a MERGE statement.
[3] The ATOMIC or NOT ATOMIC CONTINUE ON SQLEXCEPTION clause must only be specified for an INSERT statement.

holdability:

returnability:

rowset-positioning:

concurrent-access-resolution

Description

statement-name
Names the prepared statement. If the name identifies an existing prepared statement, that prepared statement is destroyed. The name must not identify a prepared statement that is the SELECT statement of an open cursor.

INTO
If you use INTO, and the PREPARE statement is successfully executed, information about the prepared statement is placed in the SQLDA specified by the descriptor name. Thus, the PREPARE statement:

```
EXEC SQL PREPARE S1 INTO :SQLDA FROM :V1;
```

is equivalent to:

```
EXEC SQL PREPARE S1 FROM :V1;
EXEC SQL DESCRIBE S1 INTO :SQLDA;
```

descriptor-name
Identifies the SQLDA. For languages other than REXX, SQLN must be set to indicate the number of SQLVAR occurrences. See "DESCRIBE" on page 1689 for information about how to determine the number of SQLVAR occurrences to use and for an explanation of the information that is placed in the SQLDA.

See "Identifying an SQLDA in C or C++" on page 2113 for how to represent *descriptor-name* in C.

USING
Indicates what value to assign to each SQLNAME variable in the SQLDA when INTO is used. If the requested value does not exist, SQLNAME is set to length 0.

NAMES
Assigns the name of the column. This is the default.

LABELS
Assigns the label of the column. (Column labels are defined by the LABEL statement.)

ANY
Assigns the column label, and, if the column has no label, the column name.

BOTH
Assigns both the label and name of the column. In this case, two or three occurrences of SQLVAR per column, depending on whether the result table contains distinct types, are needed to accommodate the additional information. To specify this expansion of the SQLVAR array, set SQLN to 2×*n* or 3×*n*, where *n* is the number of columns in the object being described. For each of the columns, the first *n* occurrences of SQLVAR, which are the base SQLVAR entries, contain the column names. Either the second or third *n* occurrences of SQLVAR, which are the extended SQLVAR entries, contain the column labels. If there are no distinct types, the labels are returned in the second set of SQLVAR entries. Otherwise, the labels are returned in the third set of SQLVAR entries.

A REXX SQLDA does not include the SQLN field, so you do not need to set SQLN for REXX programs.

ATTRIBUTES *attr-host-variable*
Specifies the attributes that are in effect if a corresponding attribute has not been specified as part of the associated statement. If attributes are specified as part of the associated statement, they are used instead of the corresponding attributes specified on the PREPARE statement. In turn, if attributes are specified in the PREPARE of a SELECT statement, they are used instead of the corresponding attributes specified on a DECLARE CURSOR statement.

attr-host-variable must identify a host variable that is described in the program in accordance with the rules for declaring string variables. *attr-host-variable* must be a string variable (either fixed-length or varying-length) that has a length attribute that does not exceed 32758 bytes. Leading and trailing blanks are removed from the value of the host variable. The host variable must contain a valid *attribute-string*.

An indicator variable can be used to indicate whether or not attributes are actually provided on the PREPARE statement. Thus, applications can use the same PREPARE statement regardless of whether attributes need to be specified or not.

The options that can be specified as part of the *attribute-string* are as follows:

ASENSITIVE, INSENSITIVE, SENSITIVE STATIC, or SENSITIVE DYNAMIC
Specifies the sensitivity of the cursor to inserts, updates, or deletes that made to the rows underlying the result table. The sensitivity of the cursor determines whether Db2 can materialize the rows of the result into a temporary table. The default is ASENSITIVE.

ASENSITIVE
Specifies that the cursor should be as sensitive as possible. A cursor that defined as ASENSITIVE will be either insensitive or sensitive dynamic; it will not be sensitive static. For information about how the effective sensitivity of the cursor is returned to the application with the GET DIAGNOSTICS statement or in the SQLCA, see “OPEN” on page 1844.

The sensitivity of a cursor is a factor in the choice of access path. Explicitly specify the sensitivity level that you need, instead of specifying ASENSITIVE.

INSENSITIVE
Specifies that the cursor does not have sensitivity to inserts, updates, or deletes that are made to the rows underlying the result table. As a result, the size of the result table, the order of the rows, and the values for each row do not change after the cursor is opened. In addition, the cursor is read-only. The SELECT statement or *attribute-string* of the PREPARE statement cannot contain a FOR UPDATE clause, and the cursor cannot be used for positioned updates or deletes.

SENSITIVE
Specifies that the cursor has sensitivity to changes made to the database after the result table is materialized. The cursor is always sensitive to positioned updates and deletes that are made using the same cursor. However, the *select-statement* of the cursor must not contain an

[39] The scrollability and sensitivity of the cursor are independent and do not have to be specified together. Thus, the cursor might be defined as SCROLL INSENSITIVE, but the PREPARE statement might specify SENSITIVE STATIC as an override for the sensitivity.

SQL data change statement if the cursor is defined as either SENSITIVE DYNAMIC or SENSITIVE STATIC. When the current value of a row no longer satisfies the *select-statement* or *statement-name*, that row is no longer visible through the cursor. When a row of the result table is deleted from the underlying base table, the row is no longer visible through the cursor.

In addition, the cursor has sensitivity to changes made to values outside the cursor (that is, by other cursors or committed changes by other application processes). If Db2 can not make changes made outside the cursor visible to the cursor, an error is issued at OPEN CURSOR. Whether the cursor is sensitive to changes made outside this cursor depends on whether DYNAMIC or STATIC is in effect for the cursor and whether SENSITIVE or INSENSITIVE FETCH statements are used.

Whether the cursor is sensitive to newly inserted rows depends on whether DYNAMIC or STATIC is in effect for the cursor. The default is DYNAMIC.

DYNAMIC
Specifies that the result table of the cursor is dynamic in that the size of the result table can change after the cursor is opened as rows are inserted into or deleted from the underlying table, and the order of the rows can change. Inserts, deletes, and updates that are made by the same application process are immediately visible. Inserts, deletes, and updates that are made by other application processes are visible after they are committed.

All FETCH statements for sensitive dynamic cursors are sensitive to changes made by this cursor, changes made by other cursors in the same application process, and committed changes made by other application processes.

If a SENSITIVE DYNAMIC cursor is not possible, an error is returned The FETCH FIRST *n* ROWS ONLY clause must not be specified for the outermost fullselect for a sensitive dynamic cursor.

STATIC
Specifies that the order of the rows and size of the result table is static. The size of the result table does not grow after the cursor is opened and the rows are materialized. The order of the rows is established as the result table is materialized. Rows that are inserted into the underlying table are not added to the result table of the cursor regardless of how the rows were inserted. Rows in the result table do not move if columns in the ORDER BY clause are updated in rows that have already been materialized.

Whether the changes that are made outside the cursor are visible to the cursor depends on the type of FETCH that is used with a SENSITIVE STATIC cursor. For more information, see Considerations for FETCH statements used with a sensitive static cursor.

Using a function that is not deterministic (built-in or user-defined) in the WHERE clause of *select-statement* or *statement-name* of a SENSITIVE STATIC cursor can cause misleading results. This occurs because Db2 constructs a temporary result table and retrieves rows from this table for INSENSITIVE FETCH statements. When Db2 processes a SENSITIVE FETCH statement, rows are fetched from the underlying table and predicates are re-evaluated if they contain non-correlated subqueries. Using a function that is not deterministic can yield a different result for the re-evaluated query causing the row to no longer be considered a match.

If SENSITIVE STATIC is specified and a sensitive static cursor is not possible, then an error is returned.

If ASENSITIVE, INSENSITIVE, SENSITIVE DYNAMIC, or SENSITIVE STATIC is specified as part of the ATTRIBUTES clause, SCROLL must be specified.

SCROLL or NO SCROLL
Specifies whether the cursor is scrollable.

SCROLL
Specifies that the cursor is scrollable.

NO SCROLL
Specifies that the cursor is not scrollable.

WITHOUT RETURN or WITH RETURN
Specifies whether the result table of the cursor is intended to be used as a result set that will be returned from a procedure. If *statement-name* is specified, the default is the corresponding prepare attribute of the statement. Otherwise, the default is `WITHOUT RETURN`.

WITHOUT RETURN
Specifies that the result table of the cursor is not intended to be used as a result set that will be returned from a procedure.

WITH RETURN
Specifies that the result table of the cursor is intended to be used as a result set that will be returned from a procedure. WITH RETURN is relevant only if the PREPARE statement is contained within the source code for a procedure. In other cases, the precompiler might accept the clause, but it has not effect.

When a cursor that is declared using the WITH RETURN TO CALLER clause remains open at the end of a program or routine, that cursor defines a result set from the program or routine. Use the CLOSE statement to close a cursor that is not intended to be a result set from the program or routine. Although Db2 will automatically close any cursors that are not declared using with a WITH RETURN clause, the use of the CLOSE statement is recommended to increase the portability of applications.

For non-scrollable cursors, the result set consists of all rows from the current cursor position to the end of the result table. For scrollable cursors, the result set consists of all rows of the result table.

TO CALLER
Specifies that the cursor can return a result set to the caller of the procedure. The caller is the program or routine that executed the SQL CALL statement that invokes the procedure that contains the PREPARE statement. For example, if the caller is a procedure, the result set, is returned to the procedure. If the caller is a client application, the result set is returned to the client application.

If the statement is contained within the source code for a procedure, WITH RETURN TO CALLER specifies that the cursor can be used as a result set cursor. A result set cursor is used when the result table of a cursor is to be returned from a procedure. Specifying TO CALLER is optional.

In other cases, the clause is ignored and the cursor cannot be used as a result set cursor.

TO CLIENT
Specifies that the cursor can return a result set to the client application. This cursor is invisible to any intermediate nested procedures. If a function or trigger calls the procedure (either directly or indirectly), the result set cannot be returned to the client and the cursor will be closed after the procedure finishes.

rowset-positioning
Specifies whether rows of data can be accessed as a rowset on a single FETCH statement for this cursor.

WITHOUT ROWSET POSITIONING
Specifies that the cursor can only be used with row positioned FETCH statements.

WITH ROWSET POSITIONING
Specifies that this cursor can be used with rowset positioned or row positioned FETCH statements

fetch-first-clause
Limits the number of rows that can be fetched. It improves the performance of queries with potentially large result sets when only a limited number of rows are needed. If the clause is specified, the number of rows retrieved will not exceed *n*, where *n* is the value of the integer. An

attempt to fetch n+1 rows is handled the same way as normal end of date. The value of integer must be positive and non-zero. The default is 1.

If the OPTIMIZE FOR clause is not specified, a default of OPTIMIZE FOR *integer* ROWS is assumed. If both the FETCH FIRST and OPTIMIZE FOR clauses are specified, the lower of the integer values from these clauses is used to influence optimization and the communications buffer size.

The FETCH FIRST clause must not be specified for the outermost fullselect for a sensitive dynamic cursor.

read-only-clause
Declares that the result table is read-only and therefore the cursor cannot be referred to in positioned UPDATE and DELETE statements.

update-clause
Identifies the columns that can updated in a later positioned UPDATE statement. Each column must be unqualified and must identify a column of the table or view identified in the first FROM clause of the fullselect. The clause must not be specified if the result table of the fullselect is read-only. The clause must also not be specified if a created temporary table is referenced in the first FROM clause of the select-statement.

If the clause is specified without a list of columns, the columns that can be updated include all the updatable columns of the table or view that is identified in the first FROM clause of the fullselect.

optimize-clause
Requests special optimization of the *select-statement*. If the clause is omitted, optimization is based on the assumption that all rows of the result table will be retrieved. If the clause is specified, optimization is based on the assumption that the number of rows retrieved will not exceed *n*, where *n* is the value of the integer. The clause does not limit the number of rows that can be fetched or affect the result in any way other than performance.

isolation-clause
Specifies the isolation level at which the select statement is executed. See "isolation-clause" on page 992.

concurrent-access-resolution
Specifies the type concurrent access resolution to use for the select statement. Each clause in *concurrent-access-resolution* can only be specified one time. Only one of the clauses can be specified for each PREPARE statement. If none of the clauses is specified, the locking semantic depends on other attributes of the statement.

SKIP LOCKED DATA
Specifies to skip data on which incompatible locks are held by other transactions. See "SKIP LOCKED DATA" on page 995.

USE CURRENTLY COMMITTED
Specifies that Db2 can use the currently committed version of the data when the data is in the process of being updated. USE CURRENTLY COMMITTED only applies in the following cases:

- The table that is being accessed is defined in a universal table space
- The access is for a select-statement with an isolation level of cursor stability (CS) or read stability (RS) specified in the isolation-clause:
  - When a read transaction accesses a record that is locked by an insert transaction, both ISOLATION(CS) and ISOLATION(RS) are applicable.
  - When a read transaction accesses a record that is locked by a delete transaction only ISOLATION(CS) is applicable and only when CURRENTDATA(NO) is in effect.

USE CURRENTLY COMMITTED is ignored if used in any other context.

When this clause is specified, the setting of the subsystem parameter EVALUNC applies. If the row qualifies, this clause determines if the row is accessed or skipped.

When this clause is specified and the subsystem parameter SKIPUNCI is in effect, PREPARE uses the specification of this clause. See the Notes section for more information.

When this clause is specified and XML data that does not support multiple XML versions is being selected, Db2 cannot determine whether the data has been committed. In this case, Db2 uses WAIT FOR OUTCOME behavior when accessing the data.

WAIT FOR OUTCOME
Specifies that Db2 waits for the commit or rollback when encountering data that is in the process of being updated or deleted. Rows that are in the process of being inserted are not skipped.

FOR MULTIPLE ROWS or FOR SINGLE ROW
Specifies if a variable number of rows will be provided for a dynamic INSERT or MERGE statement.

FOR MULTIPLE ROWS
Specifies that multiple rows can be provided with host variable arrays on an EXECUTE statement for the statement that is being prepared. FOR MULTIPLE ROWS must only be specified for an INSERT or a MERGE statement.

FOR SINGLE ROW
Specifies that multiple rows must not be provided with host variable arrays on an EXECUTE statement for the statement that is being prepared. FOR SINGLE ROW must only be specified for an INSERT or a MERGE statement.

ATOMIC or NOT ATOMIC CONTINUE ON SQLEXCEPTION
Specifies if all rows are inserted as an atomic operation. This clause can only be specified for dynamic INSERT statements.

ATOMIC
Specifies that if the insert for any row fails, all changes that are made to the database by any of the inserts, including changes that are made by successful inserts, are undone. This is the default.

NOT ATOMIC CONTINUE ON SQLEXCEPTION
Specifies that, regardless of the failure of any particular insert of a row, the INSERT statement will not undo any changes that are made to the database by the successful inserts of other rows, and inserting will be attempted for subsequent rows. However, the minimum level of atomicity is at least that of a single insert (that is, it is not possible for a partial insert operation to complete), including any triggers that might have been activated as a result of the INSERT statement.

This clause must not be specified if the INSERT statement is contained within a SELECT statement.

For preparing the MERGE statement, atomicity is specified only on the MERGE statement itself.

WITHOUT EXTENDED INDICATORS or WITH EXTENDED INDICATORS
Specifies whether the values that are provided for indicator variables during the execution of the statement follow standard SQL semantics for indicating NULL values, or if the values can use extended indicator variables to indicate a DEFAULT or UNASSIGNED value. WITHOUT EXTENDED INDICATORS is the default.

CONCENTRATE STATEMENTS OFF or CONCENTRATE STATEMENTS WITH LITERALS
Specifies whether a dynamic SQL statement that specifies literal constants will be cached as a separate unique statement entry in the dynamic statement cache instead of sharing an existing statement in the cache. Dynamic SQL statements are eligible to share an existing statement in the cache if the new statement meets all of the conditions for sharing a cached version of the same dynamic statement except that the new statement specifies one or more literal constants that are different than the cached statement.

CONCENTRATE STATEMENTS OFF
Specifies that the dynamic SQL statement that specifies literal constants will be cached as a unique statement entry if it specifies one or more constants that are different than the cached

version of the same dynamic statement. CONCENTRATE STATEMENTS OFF is the default dynamic statement caching behavior.

CONCENTRATE STATEMENTS WITH LITERALS
Specifies that the dynamic SQL statement that specifies literal constants will share a cached version of the same dynamic statement that is also prepared using the CONCENTRATE STATEMENTS WITH LITERALS option if the new dynamic statement meets all of the conditions for sharing the cached statement and the constants that are specified can be reused in place of the constants in the cached statement.

FROM
Specifies the statement string. The statement string is the value of the specified *string-expression* or the identified *variable*.

variable
Must identify a variable that is described in the application program in accordance with the rules for declaring string variables. If the source string is over 32KB in length, the *variable* must be a CLOB or DBCLOB variable. The maximum source string length is 2MB although the variable can be declared larger than 2MB. An indicator variable must not be specified with a host variable. In PL/I, COBOL and Assembler language, a host variable must be a varying-length string variable. In C, a host variable must not be a NUL-terminated string. In SQL PL, an SQL variable is used in place of a host variable, and the value must not be null.

string-expression
string-expression is any PL/I expression that yields a string. *string-expression* cannot be preceded by a colon. Variables that are within *string-expression* that include operators or functions should not be preceded by a colon. When *string-expression* is specified, the precompiler-generated structures for *string-expression* use an EBCDIC CCSID and an informational message is returned.

Notes

Rules for statement strings:
The value of the specified *statement-name* is called the *statement string*. The statement string must be one of the following SQL statements:

ALLOCATE CURSOR	RELEASE SAVEPOINT
ALTER	RENAME
ASSOCIATE LOCATORS	REVOKE
COMMENT	ROLLBACK
COMMIT	SAVEPOINT
CREATE	*select-statement*
DECLARE GLOBAL	SET CURRENT DEGREE
TEMPORARY TABLE	SET CURRENT DEBUG MODE
DELETE	SET CURRENT DECFLOAT
DROP	ROUNDING MODE
EXPLAIN	SET CURRENT LOCALE LC_CTYPE
FREE LOCATOR	SET CURRENT MAINTAINED TABLE
GRANT	TYPES FOR OPTIMIZATION
HOLD LOCATOR	SET CURRENT OPTIMIZATION HINT
INSERT	SET CURRENT PRECISION
LABEL	SET CURRENT QUERY ACCELERATION
LOCK TABLE	SET CURRENT REFRESH AGE
MERGE	SET CURRENT ROUTINE VERSION
REFRESH TABLE	SET CURRENT RULES
	SET CURRENT SQLID
	SET ENCRYPTION PASSWORD
	SET PATH
	SET SCHEMA
	SET SESSION TIME ZONE

	SIGNAL TRUNCATE UPDATE

The statement string must not:

- Begin with EXEC SQL
- End with END-EXEC or a semicolon
- Include references to variables

Parameter markers:

Although a statement string cannot include references to variables, other than global variables, it can include *parameter markers*. The parameter markers are replaced by the values of variables when the prepared statement is executed. A parameter marker is a question mark (?) that appears where a variable could appear if the statement string were a static SQL statement.

For an explanation of how parameter markers are replaced by values, see the EXECUTE statement, “OPEN” on page 1844, and Dynamically executing a data change statement (Db2 Application programming and SQL).

The two types of parameter markers are typed and untyped:

Typed parameter marker

A parameter marker that is specified with its target data type. A typed parameter marker has the general form:

```
CAST(? AS data-type)
```

This invocation of a CAST specification is a "promise" that the data type of the parameter at run time will be of the data type that is specified or some data type that is assignable to the specified data type. For example, in the following UPDATE statement, the value of the argument of the TRANSLATE function will be provided at run time:

```
UPDATE EMPLOYEE
  SET LASTNAME = TRANSLATE(CAST(? AS VARCHAR(12)))
 WHERE EMPNO = ?
```

The data type of the value that is provided for the TRANSLATE function will either be VARCHAR(12), or some data type that can be converted to VARCHAR(12). For more information, refer to “Assignment and comparison” on page 135.

Typed parameter markers can be used in dynamic SQL statements wherever a host variable is supported and the data type is based on the promise made in the CAST specification.

Untyped parameter marker

A parameter marker that is specified without its target data type. An untyped parameter marker has the form of a single question mark. The context in which the parameter marker appears determines its data type. For example, in the above UPDATE statement, the data type of the untyped parameter marker in the predicate is the same as the data type of the EMPNO column.

Untyped parameters markers can be used in dynamic SQL statements in selected locations where host variables are supported. Table 222 on page 1859, Table 223 on page 1860, Table 224 on page 1862, and Table 225 on page 1863 show these locations and the resulting data type of the parameter. The tables group the locations into expressions, predicates, functions, and other statements to help show where untyped parameter markers are allowed.

Table 222. Untyped parameter marker usage in expressions (including select list, CASE, and VALUES)

Location of untyped parameter marker	Data type (or error if not supported)
Alone in a select list. For example: `SELECT ?`	Error
Both operands of a single arithmetic operator, after considering operator precedence and the order of operation rules. Includes cases such as: `? + ? + 10`	DECFLOAT(34)
One operand of a single operator in an arithmetic expression (except datetime arithmetic expressions). Includes cases such as: `? + ? * 10`	The data type of the other operand
Any operand of a datetime expression. For example: `'timecol + ?' or '? - datecol'`	Error
A labeled duration in a datetime expression with a type unit other than SECONDS (the portion of a labeled duration that indicates the type of units cannot be a parameter marker).	DECIMAL(15,0)
A labeled duration in a datetime expression with a type unit of SECONDS (the portion of a labeled duration that indicates the type of units cannot be a parameter marker).	DECIMAL(27,12)
Both operands of a CONCAT operator	Error
One operand of a CONCAT operator when the other operand is any character data type except CLOB	If the other operand is CHAR(*n*) or VARCHAR(*n*), where n is less than 128, the data type is VARCHAR(254 - *n*). In all other cases, the data type is VARCHAR(254).
One operand of a CONCAT operator when the other operand is any graphic data type except DBCLOB	If the other operand is GRAPHIC(*n*) or VARGRAPHIC(*n*), where n is less than 64, the data type is VARGRAPHIC(127 - *n*). In all other cases, the data type is VARGRAPHIC(127).
One operand of a CONCAT operator when the other operand is any binary type except BLOB	If the other operand is BINARY(n) or VARBINARY(n) where n is less than 128, the data type is VARBINARY(255-n). In all other cases, the data type is VARBINARY(255)
One operand of a CONCAT operator when the other operand is a LOB string	The data type of the other operand (the LOB string)
The *expression* following the CASE keyword in a simple CASE expression	Error

Table 222. Untyped parameter marker usage in expressions (including select list, CASE, and VALUES) (continued)

Location of untyped parameter marker	Data type (or error if not supported)
Any or all *expressions* following the WHEN keyword in a simple CASE expression	The result of applying the "Rules for result data types" on page 157 to the expression following CASE and the expressions following WHEN that are not untyped parameter markers
A *result-expression* in any CASE expression when all the other *result-expression*s are either NULL or untyped parameter markers.	Error
A *result-expression* in any CASE expression when at least one other *result-expression* is neither NULL nor an untyped parameter marker.	The result of applying the "Rules for result data types" on page 157 to all the *result-expression*s that are not NULL or untyped parameter markers
Alone as a *column-expression* in a single-row VALUES clause that is not within an INSERT statement or the VALUES clause of in insert operation of a MERGE statement	Error
Alone as a *column-expression* in a single-row VALUES clause within an INSERT statement	The data type of the column or, if the column is defined as a distinct type, the source data type of the distinct type
Alone as a *column-expression* in a *values-single-row* or *values-multiple-row* clause of *source-table* for a MERGE statement	The data type of the column of the source-table, or if the data type is a distinct type, the source data type of the distinct type. The column of the source-table must be referenced elsewhere in the MERGE statement such that its data type can be determined from the context in which it is used, and all such references must resolve to the same data type.
Alone as a *column-expression* in the VALUES clause of an insert operation of a MERGE statement	The data type of the column or, if the column is defined as a distinct type, the source data type of the distinct type
Alone as a *column-expression* on the right side of *assignment-clause* for an update operation of a MERGE statement	The data type of the column or, if the column is defined as a distinct type, the source data type of the distinct type
Alone as a *column-expression* on the right side of a SET clause in an UPDATE statement	The data type of the column or, if the column is defined as a distinct type, the source data type of the distinct type

Table 223. Untyped parameter marker usage in predicates

Location of untyped parameter marker	Data type (or error if not supported)
Both operands of a comparison operator	Error
One operand of a comparison operator when the other operand is not an untyped parameter marker	The data type of the other operand. If the operand has a datetime data type, the result of DESCRIBE INPUT will show the data type as CHAR(255) although Db2 uses the datetime data type in any comparisons.
All the operands of a BETWEEN predicate	Error

Table 223. Untyped parameter marker usage in predicates (continued)

Location of untyped parameter marker	Data type (or error if not supported)
Two operands of a BETWEEN predicate (either the first and second, or the first and third)	The data type of the operand that is not a parameter marker
Only one operand of a BETWEEN predicate	The result of applying the "Rules for result data types" on page 157 on the other operands that are not parameter markers
All the operands of an IN predicate, for example, `? IN (?,?,?)`	Error
The first and second operands of an IN predicate, for example, `? IN (?,A,B)`	The result of applying the "Rules for result data types" on page 157 on the operands in the IN list that are not parameter markers
The first operand of an IN predicate and zero or more operands of the IN list except for the first operand of the IN list, for example, `? IN (A,?,B,?)`	The result of applying the "Rules for result data types" on page 157 on the operands in the IN list that are not parameter markers
The first operand of an IN predicate when the right side is a fullselect of fullselect, for example, `? IN (fullselect)`	The data type of the selected column
Any or all operands of the IN list of the IN predicate and the first operand of the IN predicate is not an untyped parameter marker, for example, `A IN (?,A,?)`	The data type of the first operand (the operand on the left side of the IN list)
All the operands of a LIKE predicate	The first and second operands (*match-expression* and *pattern-expression*) are VARCHAR(4000). The third operand (*escape-expression*) is VARCHAR(1).
The first operand of a LIKE predicate (the *match-expression*) when at least one other operand (the *pattern-expression* or *escape-expression*) is not an untyped parameter marker.	VARCHAR(4000), VARGRAPHIC(2000), or VARBINARY(4000), depending on the data type of the first operand that is not an untyped parameter marker
The second operand of a LIKE predicate (the *pattern-expression*) when at least one other operand (the *match-expression* or *escape-expression*) is not an untyped parameter marker. When the pattern specified in a LIKE predicate is a parameter marker and a fixed-length character host variable is used to replace the parameter marker, specify a value for the host variable that is the correct length. If you do not specify the correct length, the select does not return the intended results.	VARCHAR(4000), VARGRAPHIC(2000), or VARBINARY(4000), depending on the data type of the first operand that in not an untyped parameter marker.
The third operand of a LIKE predicate (the *escape-expression*) when at least one other operand (the *match-expression* or *pattern-expression*) is not an untyped parameter marker	CHAR(1), GRAPHIC(1), or BINARY(1), depending on the data type of the first operand that in not an untyped parameter marker
Operand of a NULL predicate	Error

Table 224. Untyped parameter marker usage in functions

Location of untyped parameter marker	Data type (or error if not supported)
All arguments of COALESCE or NULLIF	Error
Any argument of COALESCE or NULLIF when at least one other argument is not an untyped parameter marker	The result of applying the "Rules for result data types" on page 157 on the arguments that are not untyped parameter markers, the data type of the other argument
First argument of COLLATION_KEY	VARGRAPHIC(2000)
Second argument of COLLATION_KEY	VARCHAR(255)
First argument of LOWER	VARCHAR(4000)
Second argument of LOWER	VARCHAR(255)
Any argument other than the first argument of MAX	The data type of the corresponding parameter in the function instance
Any argument other than the first argument of MIN	The data type of the corresponding parameter in the function instance
Both arguments of POSSTR or POSITION	VARCHAR(4000) for both arguments
One argument of POSSTR or POSITION when the other argument is a character data type	VARCHAR(4000)
One argument of POSSTR or POSITION when the other argument is a graphic data type	VARGRAPHIC(2000)
One argument of POSSTR or POSITION when the other argument is a BINARY or VARBINARY data type	VARBINARY(4000)
One argument of POSSTR or POSITION when the other argument is a BLOB	BLOB(4000)
First argument of SUBSTR or SUBSTRING	VARCHAR(4000)
Second or third argument of SUBSTR or SUBSTRING	INTEGER
One argument of TIMESTAMP	TIME
First argument of TIMESTAMP_FORMAT	VARCHAR(255)
First argument of TRANSLATE	Error
Second or third argument of TRANSLATE	VARCHAR(4000), VARGRAPHIC(2000), depending on whether the data type of the first argument is character or graphic
Fourth argument of TRANSLATE	VARCHAR(1) or VARGRAPHIC(1), depending on whether the data type of the first argument is character or graphic
Second argument of TRIM_ARRAY	BIGINT
array-index for *array-element-specification*	BIGINT
First argument of UPPER	VARCHAR(4000)
Second argument of UPPER	VARCHAR(255)
First argument of VARCHAR_FORMAT	TIMESTAMP WITHOUT TIME ZONE

Table 224. Untyped parameter marker usage in functions (continued)

Location of untyped parameter marker	Data type (or error if not supported)
Unary minus	DECFLOAT(34)
Unary plus	Error
The argument of any built-in scalar function (except those that are described in this table)	Error
The argument of a built-in aggregate function	Error
The argument of a user-defined scalar function, user-defined aggregate function, or user-defined table function	The data type of the corresponding parameter in the function instance

Table 225. Untyped parameter marker usage in statements

Location of untyped parameter marker	Data type (or error if not supported)
FOR *n* ROWS clause of an INSERT or MERGE statement	Integer
The value on the right side of a SET clause in an UPDATE statement or the UPDATE clause of the MERGE statement	The data type of the column of the source-table, or if the column is defined as a distinct type, the source data type of the distinct type. The column of the source-table must be referenced elsewhere in the MERGE statement such that its data type can be determined from the context in which it is used, and all such references must resolve to the same data type.
value, *value1*, or *value2* in a period specification for a table, or period clause for a data change statement if the target of the statement is a table	The data type of the columns of the period referenced in the period specification or period clause
value, *value1*, or *value2* in a period specification for a view	Error
value1 or *value2* in a period clause in a data change statement if the target of the statement is a view	Error

Considerations for FETCH statements used with a sensitive static cursor:

Whether changes made outside the cursor are visible to the cursor depends on the type of FETCH that is used with a SENSITIVE STATIC cursor:

- A SENSITIVE FETCH is sensitive to all updates and deletes that are made by this cursor (including changes made by triggers) and committed updates and deletes by all other application processes because every fetched row is retrieved from the underlying base table and not a temporary table. This is the default type of FETCH statement for a SENSITIVE cursor.

  Changes that are made to the underlying data using this cursor result in an automatic refresh of the row. The changes that are made using this type of cursor can result in holes in the result table of the cursor. In addition, re-fetching rows (fetching rows that have already been retrieved) can result in holes in the result table. If a sensitive FETCH is issued to re-fetch a row and the row no longer qualifies for the search condition of the query, it results in a "delete hole" or an "update hole". In this case, no data is returned, and the cursor is left positioned on the hole.
- An INSENSITIVE FETCH is not sensitive to updates and deletes that are made outside this cursor; however, it is sensitive to all updates and deletes that are made by this cursor. Changes that made

with triggers are not visible with an INSENSITIVE FETCH until the content of the rows are updated in the result table with a SENSITIVE FETCH statement. If an application does not want to be sensitive to changes that are made outside this cursor (that is, the application does not want to see changes made either with another cursor or by another application process), INSENSITIVE can be explicitly specified as part of the FETCH statement for a SENSITIVE STATIC cursor. This type of FETCH is useful for refreshing data in user data buffers. For more information, see INSENSITIVE.

Error checking:

When a PREPARE statement is executed, the statement string is parsed and checked for errors. If the statement string is invalid, a prepared statement is not created and the error condition that prevents its creation is reported in the SQLCA.

In local and remote processing, the DEFER(PREPARE) and REOPT(ALWAYS)/REOPT(ONCE) bind options can cause some SQL statements to receive "delayed" errors. For example, DESCRIBE, EXECUTE, and OPEN might receive an SQLCODE that normally occurs during PREPARE processing.

Reference and execution rules:

Prepared statements can be referred to in the following kinds of statements, with the following restrictions:

Type of statement	Restriction for prepared statement
DESCRIBE	no restriction
DECLARE CURSOR	Statement must be SELECT when the cursor is opened
EXECUTE	Statement must not be SELECT

A prepared statement can be executed many times. Indeed, if a prepared statement is not executed more than once and does not contain parameter markers, it is more efficient to use the EXECUTE IMMEDIATE statement rather than the PREPARE and EXECUTE statements.

Prepared statement persistence:

All prepared statements created by a unit of work are destroyed when the unit of work is terminated, with the following exceptions:

- A SELECT statement whose cursor is declared with the option WITH HOLD persists over the execution of a commit operation if the cursor is open when the commit operation is executed.
- SELECT, INSERT, UPDATE, MERGE, and DELETE statements that are bound with KEEPDYNAMIC(YES) are kept past the commit point if your system is enabled for dynamic statement caching, and none of the following are true:
  - SQL RELEASE has been issued for the site
  - Bind option DISCONNECT(AUTOMATIC) was used
  - Bind option DISCONNECT(CONDITIONAL) was used and there are no hold cursors for the site
- INSERT, UPDATE, MERGE, and DELETE statements that are bound with or use the RELEASE(DEALLOCATE) option and that reference a declared global temporary table are kept past commit operations unless one of the following statements is true:
  - The declared global temporary table is defined with the ON COMMIT DROP TABLE option.
  - The statement also references a Db2 base object (for example, a table or view), and one of the following statements is true:
    - The base object reference is for a Db2 catalog table.
    - At the commit point, Db2 determines that another Db2 thread is waiting for an X-lock on the base object's database descriptor (DBD).
    - The statement references an XML function or operation, and at the commit point Db2 determines that the base object DBD S-lock for the XML operation must be released.

- At the commit point, Db2 determines that a base object DBD S-lock that is used by the statement must be released and cannot be maintained across the commit point.

– Db2 determines that another Db2 thread is waiting for an X-lock on the Db2 package that contains the statement.

Scope of a statement name:
The scope of a *statement-name* is the same as the scope of a *cursor-name*. See "DECLARE CURSOR" on page 1643 for more information about the scope of a *cursor-name*.

Preparation with PREPARE INTO and REOPT bind option:
If bind option REOPT(ALWAYS) or REOPT(ONCE) is in effect, PREPARE INTO is equivalent to a PREPARE and a DESCRIBE being performed. If a statement has input variables, the DESCRIBE causes the statement to be prepared with default values, and the statement must be prepared again when it is opened or executed. When REOPT(ONCE) is in effect, the statement is always prepared twice even if there are no input variables. Therefore, to avoid having a statement prepared twice, avoid using PREPARE INTO when REOPT(ALWAYS) or REOPT(ONCE) is in effect.

Relationship of cursor attributes on PREPARE statements and SELECT or DECLARE CURSOR statements:
Cursor attributes that are specified as part of the *select-statement* are used instead of any corresponding options that specified with the ATTRIBUTES clause on PREPARE. Attributes that are specified as part of the ATTRIBUTES clause of PREPARE take precedence over any corresponding option that is specified with the DECLARE CURSOR statement. The order for using cursor attributes is as follows:

- SELECT (highest priority)
- PREPARE statement ATTRIBUTES clause
- DECLARE CURSOR (lowest priority)

For example, assume that host variable MYQ has been set to the following SELECT statement:

```
SELECT WORKDEPT, EMPNO, SALARY, BONUS, COMM
     FROM EMP
    WHERE WORKDEPT IN ('D11', 'D21')
    FOR UPDATE OF SALARY, BONUS, COMM
```

If the following PREPARE statement were issued, then the FOR UPDATE clause specified as part of the SELECT statement would be used instead of the FOR READ ONLY clause specified with the ATTRIBUTES clause as part of the PREPARE statement. Thus, the cursor would be updatable.

```
attrstring = 'FOR READ ONLY';
EXEC SQL PREPARE stmt1 ATTRIBUTES :attrstring FROM :MYQ;
```

Effect of the CURRENT EXPLAIN MODE special register:
If the CURRENT EXPLAIN MODE special register is set to EXPLAIN, the statement is prepared for explain only and is not executable, unless the statement is a SET statement. Attempting to execute the prepared statement will return an error. See the "CURRENT EXPLAIN MODE" on page 182 special register for more information.

Precedence of attributes for SELECT and UPDATE WHERE CURRENT OF for positioned updates:
If an UPDATE WHERE CURRENT OF statement and the associated SELECT statement are both prepared and both statements have the same PREPARE attributes, the values of the PREPARE attributes for the UPDATE WHERE CURRENT OF statement override the values of the PREPARE attributes for the SELECT statement.

Effect of extended indicator PREPARE attributes on dynamically executed positioned updates:
If an UPDATE statement with the WHERE CURRENT OF clause and the associated SELECT statement are both prepared, if extended indicator variables are used depends on the WITH EXTENDED INDICATORS or WITHOUT EXTENDED INDICATORS attributes in each of the PREPARE statements.

Table 226. Interaction between EXTENDED INDICATOR attributes of PREPARE statements for SELECT and UPDATE statements

Extended indicator attribute of PREPARE for SELECT statement	Extended indicator attribute of PREPARE for UPDATE statement with WHERE CURRENT OF clause	Result
WITH EXTENDED INDICATORS	WITH EXTENDED INDICATORS	The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. Non-updatable columns can be in the select-list.
WITH EXTENDED INDICATORS	WITHOUT EXTENDED INDICATORS	The UPDATE statement is executed without extended indicator parameters.
WITH EXTENDED INDICATORS	Default (without attribute specified)	The PREPARE attributes of the SELECT statement override the default PREPARE attributes for the UPDATE statement. Non-updatable columns can be in the select-list.
WITHOUT EXTENDED INDICATORS	WITH EXTENDED INDICATORS	The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. Non-updatable columns are not in the implicit or explicit select-list.
WITHOUT EXTENDED INDICATORS	WITHOUT EXTENDED INDICATORS	The UPDATE statement is executed without extended indicator parameters.
WITHOUT EXTENDED INDICATORS	Default (without attribute specified)	The PREPARE attributes of the SELECT statement override the default PREPARE attributes for the UPDATE statement. The UPDATE statement is executed without extended indicator parameters.
Default (without attribute specified)	WITH EXTENDED INDICATORS	The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. Non-updatable columns are not in the implicit or explicit select-list.
Default (without attribute specified)	WITHOUT EXTENDED INDICATORS	The PREPARE attributes of the UPDATE statement override the PREPARE attributes of the SELECT statement. The UPDATE statement is executed without extended indicator parameters.

Table 226. Interaction between EXTENDED INDICATOR attributes of PREPARE statements for SELECT and UPDATE statements (continued)

Extended indicator attribute of PREPARE for SELECT statement	Extended indicator attribute of PREPARE for UPDATE statement with WHERE CURRENT OF clause	Result
Default (without attribute specified)	Default (without attribute specified)	The UPDATE statement is executed without extended indicator parameters.

Interactions between the SKIPUNCI subsystem parameter and the PREPARE statement:

When the PREPARE statement is specified with either the CURRENTLY COMMITTED or WAIT FOR OUTCOME clauses and the subsystem parameter SKIPUNCI is in effect, the following table describes whether uncommitted inserts are skipped, or if the transaction will wait until a commit or rollback before completing:

Table 227. Interaction between SKIPUNCI subsystem parameter and PREPARE statement

Value of SKIPUNCI subsystem parameter	PREPARE statement attributeworking	Skip uncommitted inserts, or wait for commit or rollback
YES	CURRENTLY COMMITTED	Skip
YES	WAIT FOR OUTCOME	Wait
YES	Not specified	Skip
NO	CURRENTLY COMMITTED	Skip
NO	WAIT FOR OUTCOME	Wait
NO	Not specified	Wait

Extended indicator variables and deferred error checks:

When extended indicator variables are enabled, the indicator value of unassigned causes the associated target column to be omitted from the statement. Because of that, validation that is normally done in statement preparation (to recognize an INSERT into, or UPDATE of, a non-updatable column) is deferred until statement execution. If statement validation fails, an error is returned when the statement is run, not when the statement is prepared.

Reuse of prepared statements in the dynamic statement cache with `CONCENTRATE STATEMENTS WITH LITERALS`

To be eligible for reuse of constants, the constants in both the new statement and the cached statement must have the same:

1. immediate usage context
2. data type
3. data type length and size

If Db2 determines that both instances of the constant meet the criteria for reuse, a cached statement that is prepared using the `CONCENTRATE STATEMENTS WITH LITERALS` option can be shared by the same SQL statement with different constants. Even though the new dynamic SQL statement will share the cached statement, the new statement will use its own literal constants when the statement is run, not the constants of the cached statement.

There are some exceptions. For example, the built-in function SUBSTR, for which, because of the immediate usage context, constant reuse in the cached statement that uses a different constant value can not be done without the risk of returning incorrect output or results. In such cases, only an SQL

statement instance with the exact same constant value as the cached version of the statement is eligible for reuse. Db2 determines when and where this immediate usage context restriction applies.

When the CONCENTRATE STATEMENTS WITH LITERALS option is specified, Db2 considers the values of the literal constants for access path selection only for statements that are bound with the REOPT(ONCE) or REOPT(AUTO) bind options.

The DECFLOAT defined constants NAN, SNAN, and INFINITY can qualify for literal constant reuse.

The following examples show how PREPARE is used with CONCENTRATE STATEMENTS WITH LITERALS. X, Y, and Z are columns of defined as DECIMAL data type:

```
DECLARE C1 CURSOR
    FOR DYNSQL_WITH_LITERAL;

DYNSQL_SELECT = 'SELECT X, Y, Z
                                FROM TABLE1
                                WHERE X < 9';

attrstring = 'CONCENTRATE STATEMENTS WITH LITERALS';

EXEC SQL PREPARE DYNSQL_WITH_LITERAL
    ATTRIBUTES :attrstring
    FROM :DYNSQL_SELECT;

EXEC SQL OPEN C1;
```

```
DYNSQL_INSERT = 'INSERT INTO
                                TABLE1 (X, Y, Z)
                                VALUES (8,109,29)';

attrstring = 'CONCENTRATE STATEMENTS WITH LITERALS';

EXEC SQL PREPARE DYNSQL_INSERT_WITH_LITERAL
     ATTRIBUTES :attrstring
     FROM :DYNSQL_INSERT;

EXEC SQL EXECUTE DYNSQL_INSERT_WITH_LITERAL;
```

Examples

Example 1: In this PL/I example, an INSERT statement with parameter markers is prepared and executed. Before execution, values for the parameter markers are read into the host variables S1, S2, S3, S4, and S5.

```
EXEC SQL PREPARE DEPT_INSERT FROM
  'INSERT INTO DSN8B10.DEPT VALUES(?,?,?,?,?)';
-- Check for successful execution and read values into host variables
EXEC SQL EXECUTE DEPT_INSERT USING :S1, :S2, :S3, :S4, :S5;
```

Example 2: Prepare a dynamic SELECT statement specifying the attributes of the cursor with a host variable on the PREPARE statement. Assume that the text of the SELECT statement is in a variable named stmttxt, and that the attributes of the cursor are in a variable named attrvar.

```
  EXEC SQL DECLARE mycursor CURSOR FOR mystmt;
  EXEC SQL PREPARE mystmt ATTRIBUTES :attrvar
             FROM :stmttxt;
  EXEC SQL DESCRIBE mystmt INTO :mysqlda;
  EXEC SQL OPEN mycursor;
  EXEC SQL FETCH FROM mycursor USING DESCRIPTOR :mysqlda;
```

REFRESH TABLE

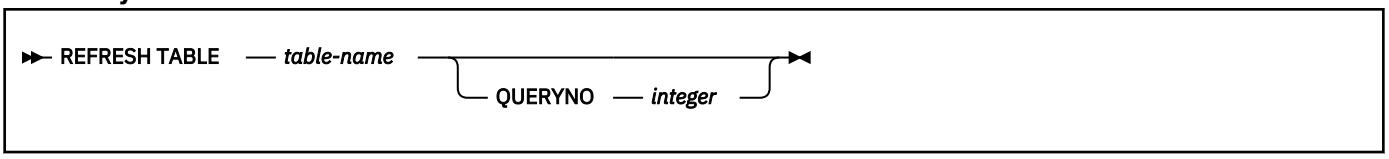
The REFRESH TABLE statement refreshes the data in a materialized query table. The statement deletes all rows in the materialized query table, executes the fullselect in the table definition to recalculate the data from the tables specified in the fullselect, inserts the calculated result into the materialized query

table, and updates the catalog for the refresh timestamp and cardinality of the table. The table can exist at the current server or at any Db2 subsystem with which the current server can establish a connection.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization



The privilege set for REFRESH TABLE must include at least one of the following authorities:

- Ownership of the materialized query table
- DBADM or DBCTRL authority on the database that contains the materialized query table
- SYSADM or SYSCTRL authority
- DATAACCESS authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statements dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke). For more information on these behaviors, including a list of the DYNAMICRULES bind option values, see "Authorization IDs and dynamic SQL" on page 91.

Syntax

Description

table-name
Identifies the table to be refreshed. The name must identify a materialized query table. REFRESH TABLE evaluates the fullselect in the *materialized-query-definition* clause to refresh the table. The isolation level for the fullselect is the isolation level of the materialized query table recorded when CREATE TABLE or ALTER TABLE was issued.

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Notes

Automatic query rewrite using materialized query tables is not attempted for the fullselect in the materialized query table definition during the processing of REFRESH TABLE statement.

After successful execution of a REFRESH TABLE statement, the SQLCA field SQLERRD(3) will contain the number of rows inserted into the materialized query table.

The EXPLAIN output for REFRESH TABLE *table-name* is the same as the EXPLAIN output for INSERT INTO *table-name fullselect* where *fullselect* is from the materialized query table definition.

If the materialized query table has a security label column, the REFRESH TABLE statement does not do any checking for multilevel security with row-level granularity when it deletes and repopulates the data in the table by executing the fullselect. Instead, Db2 performs the checking for multilevel security with row-level granularity when the materialized query table is exploited in automatic query rewrite or is used directly.

The REFRESH TABLE statement can be used to remove a table space from the logical page list and reset recover-pending status. This can only be done by using REFRESH TABLE to repopulate a materialized query table where the materialized query table is the only table in the table space.

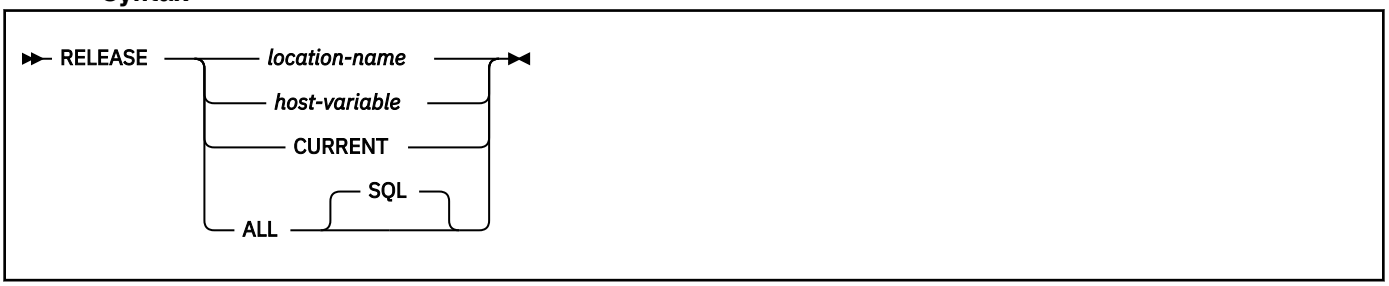
Example

Issue a statement to refresh the content of a materialized query table that is named SALESCOUNT. The statement recalculates the data from the fullselect that was used to define SALESCOUNT and refreshes the content of SALESCOUNT with the recalculated results.

```
REFRESH TABLE SALESCOUNT;
```

RELEASE (connection)

The RELEASE (connection) statement places one or more connections in the release pending state.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

None required.

Syntax

Description

location-name* or *host-variable

Identifies an SQL connection by the specified location name or the location name contained in the host variable. If a host variable is specified:

- It must be a character string variable with a length attribute that is not greater than 16. (A C NUL-terminated character string can be up to 17 bytes.)
- It must not be followed by an indicator variable.
- The location name must be left-justified within the host variable and must conform to the rules for forming an ordinary location identifier.
- If the length of the location name is less than the length of the host variable, it must be padded on the right with blanks.

The specified location name or the location name contained in the host variable must identify an existing SQL connection of the application process.

CURRENT
Identifies the current SQL connection of the application process. The application process must be in the connected state.

ALL or ALL SQL
Identifies all existing connections (including local, and SQL) of the application process. An error or warning does not occur if no connections exist when the statement is executed.

If the RELEASE (connection) statement is successful, each identified connection is placed in the release-pending state and, therefore, will be ended during the next commit operation. If the RELEASE (connection) statement is unsuccessful, the connection state of the application process and the states of its connections are unchanged.

Notes

RELEASE and CONNECT (Type 1): Using CONNECT (Type 1) semantics does not prevent using RELEASE (connection).

Scope of RELEASE: RELEASE (connection) does not close cursors, does not release any resources, and does not prevent further use of the connection.

Resource considerations for remote connections: Resources are required to create and maintain remote connections. Thus, a remote connection that is not going to be reused should be in the release pending status and one that is going to be reused should not be in the release pending status. Remote connections can also be ended during a commit operation as a result of the DISCONNECT(AUTOMATIC) or DISCONNECT(CONDITIONAL) bind option.

If the current SQL connection is in the release pending status when a commit operation is performed, the connection is ended and the application process is in the unconnected state. In this case, the next executed SQL statement should be CONNECT or SET CONNECTION.

Connection states: ROLLBACK does not reset the state of a connection from release pending to held.

If the current SQL connection is in the release pending state when a commit operation is performed, the connection is ended and the application process is in the unconnected state. In this case, the next executed SQL statement must be CONNECT or SET CONNECTION.

For further information, see “Application process connection states” on page 68.

Location names CURRENT and ALL: A database server named CURRENT or ALL can only be identified by a host variable or a delimited identifier. A connection in the release pending state is ended during a commit operation even though it has an open cursor defined with WITH HOLD.

Encoding scheme of a host variable: If the RELEASE statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Examples

Example 1: The SQL connection to TOROLAB1 is not needed in the next unit of work. The following statement causes it to be ended during the next commit operation:

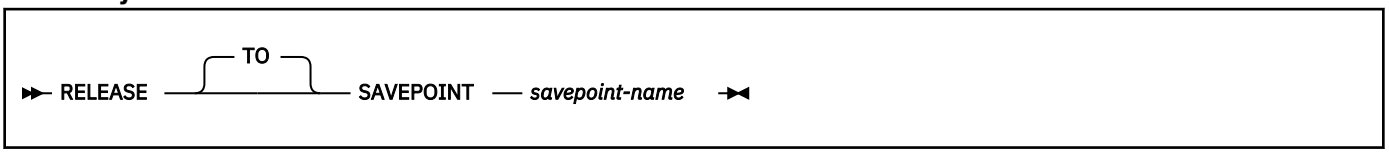
```
EXEC SQL RELEASE TOROLAB1;
```

Example 2: The current SQL connection is not needed in the next unit of work. The following statement causes it to be ended during the next commit operation:

```
EXEC SQL RELEASE CURRENT;
```

RELEASE SAVEPOINT

The RELEASE SAVEPOINT statement releases the identified savepoint and any subsequently established savepoints within a unit of recovery.



Invocation

This statement can be imbedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

savepoint-name
Identifies the savepoint to release. If the named savepoint does not exist, an error occurs. The name must identify a savepoint that exists at the current server. After a savepoint is released, it is no longer maintained and rollback to the savepoint is no longer possible.

Notes

Savepoint names: The name of the savepoint that was released can be reused in another SAVEPOINT statement, regardless of whether the UNIQUE keyword was specified on an earlier SAVEPOINT statement that specified this same savepoint name.

Example

Assume that a main routine sets savepoint A and then invokes a subroutine that sets savepoints B and C. When control returns to the main routine, release savepoint A and any subsequently set savepoints. Savepoints B and C, which were set by the subroutine, are released in addition to A.

```
    ⋮
RELEASE SAVEPOINT A;
```

RENAME

The RENAME statement renames an existing table or index. An accelerator-only table cannot be renamed.

Invocation

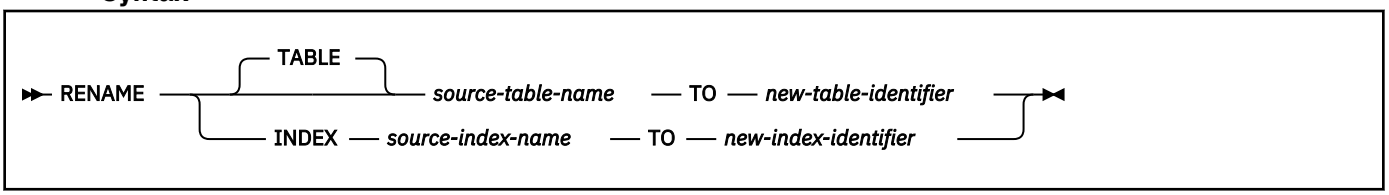
This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

Authorization

To rename a table, the privilege set that is defined below must include at least one of the following privileges:

- Ownership of the table
- DBADM, DBCTRL, or DBMAINT authority for the database that contains the table
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.



To rename an index, the privilege set that is defined below must include at least one of the following privileges:

- Ownership of the table for which the index is defined
- Ownership of the index that is being renamed
- DBADM, DBCTRL, or DBMAINT authority for the database that contains the index
- SYSADM or SYSCTRL authority
- System DBADM

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is the union of the privilege sets that are held by each authorization ID of the process.

Syntax

Description

source-table-name
Identifies the existing table that is to be renamed. The name, including the implicit or explicit qualifier, must identify a table that exists at the current server. The name must not identify any of the following types of tables:

- A declared temporary table
- A catalog table
- A directory table
- An active resource limit specification table
- A materialized query table
- A clone table
- A system-period temporal table
- A history table for a system-period temporal table
- A table with a trigger defined on it
- A table that is referenced in the definition of a row permission
- A table that is referenced in the definition of a column mask
- A view

- A synonym
- An archive-enabled table
- An archive table
- An SQL table function

If you specify a three-part name or alias for the source table, the source table must exist at the current server. If any view definitions or materialized query table definitions currently reference the source table, an error occurs.

new-table-identifier
Specifies the new name for the table without a qualifier. The qualifier of the *source-table-name* is used to qualify the new name for the table. The qualified name must not identify a table, view, alias, or synonym that exists at the current server, or a table that exists in the SYSIBM.SYSPENDINGOBJECTS catalog table.

source-index-name
Identifies the existing index that is to be renamed. The name, including an implicit or explicit qualifier, must identify an index that exists at the current server. The name must not identify a system defined catalog index, a directory index, an index on a declared temporary table, or an index on an active resource limit specification table.

new-index-identifier
Specifies that new name for the index without a qualifier. The qualifier of the *source-index-name* is used to qualify the new name for the index. The qualified name must not identify an index that exists at the current server or an index that exists in the SYSIBM.SYSPENDINGOBJECTS catalog table.

Notes

Effects of the statement
The specified table or index is renamed to the new name. For a renamed table, all privileges and indexes on the table are preserved. For a renamed index, all privileges are preserved.

Invalidation of packages:
This statement might invalidate all packages that depend on target objects, and sometimes other related objects through cascading effects, depending on the clauses and keywords specified and other factors. For more information, see Changes that invalidate packages (Db2 Application programming and SQL).

Restriction when there are pending changes to the definition
A RENAME INDEX statement is not allowed if there are pending changes to the definition of the index.

A RENAME TABLE statement is not allowed if there are pending changes to the definition of the table .

Alias considerations
If an alias name is specified for *table-name*, the table must exist at the current server, and the table that is identified by the alias is renamed. The name of the alias is not changed and continues to refer to the old table name after the rename.

Changing the name of an alias with the RENAME statement is not supported. To change the name to which an alias refers, you must drop the alias and then re-create it.

PLAN_TABLE considerations
The RENAME INDEX statement does not update the contents of a plan table. Rows that exist in a plan table that are generated from a EXPLAIN statement can contain the name of an index in the access path selections. When an index is renamed, any entries in existing plan tables that refer to the old index name are not updated.

Transfer of authorization, referential integrity constraints, and indexes
All authorizations associated with the source table name are *transferred* to the new (target) table name. The authorization catalog tables are updated appropriately.

Referential integrity constraints involving the source table are updated to refer to the new table. The catalog tables are updated appropriately.

Indexes that are defined for the source table are *transferred* to the new table. The index catalog tables are updated appropriately.

Object identifier
Renamed tables and indexes keep the same object identifier as the original table or index.

Renaming registration tables
If an application registration table (ART) or object registration table (ORT) or an index of an ART or ORT is specified as the source table for RENAME, when RENAME completes, it is as if that table had been dropped. There is no ART or ORT once the ART or ORT table has been renamed.

Renaming a table with dependent views or SQL table functions
The RENAME TABLE statement returns an error if the target table is referenced in a view definition or an SQL table function, unless the RENAMETABLE subsystem parameter is set to ALLOW_DEP_VIEW_SQLTUDF.

Catalog table updates
Entries in the following catalog tables are updated to reflect the new table:

- SYSAUXRELS
- SYSCHECKS
- SYSCHECKS2
- SYSCHECKDEP
- SYSCOLAUTH
- SYSCOLDIST
- SYSCOLDIST_HIST
- SYSCOLDISTSTATS
- SYSCOLSTATS
- SYSCOLUMNS
- SYSCOLUMNS_HIST
- SYSCONSTDEP
- SYSFIELDS
- SYSFOREIGNKEYS
- SYSINDEXES
- SYSINDEXES_HIST
- SYSKEYCOLUSE
- SYSPLANDEP
- SYSPACKDEP
- SYSRELS
- SYSSEQUENCESDEP
- SYSSYNONYMS
- SYSTABAUTH
- SYSTABCONST
- SYSTABLES
- SYSTABLES_HIST
- SYSTABSTATS
- SYSTABSTATS_HIST

Entries in SYSSTMT and SYSPACKSTMT are not updated.

Entries in the following catalog tables are updated to reflect the new index:

- SYSDEPENDENCIES

- SYSINDEXES
- SYSINDEXES_HIST
- SYSINDEXESPART
- SYSINDEXESPART_HIST
- SYSINDEXSPACESTATS
- SYSINDEXSTATS
- SYSINDEXSTATS_HIST
- SYSKEYS
- SYSKEYTARGETS
- SYSKEYTARGETS_HIST
- SYSKEYTARGETSTATS
- SYSKEYTGTDIST
- SYSKEYTGTDIST_HIST
- SYSKEYTGTDISTSTATS
- SYSOBJROLEDEP
- SYSPACKDEP
- SYSPLANDEP
- SYSRELS
- SYSTABCONST
- SYSTABLEPART

Examples

Example 1: Change the name of the EMP table to EMPLOYEE:

```
RENAME TABLE EMP TO EMPLOYEE;
```

Example 2: Change the name of the EMP_USA_HIS2002:

```
RENAME TABLE EMP_USA_HIS2002 TO EMPLOYEE_UNITEDSTATES_HISTORY2002;
```

Example 3: Change the name of the EMPINDX1 to EMPLOYEE_INDEX:

```
RENAME INDEX COMPANY.EMPINDX1 TO EMPLOYEE_INDEX;
```

REVOKE

The REVOKE statement revokes privileges from authorization IDs.

A separate form of the statement exists for each of the following privilege classes:

- Collection
- Database
- Function or stored procedure
- Package
- Plan
- Schema
- Sequence

- System
- Table or view
- Type or JAR file
- Variable
- Use

The applicable objects are always at the current server.

Invocation

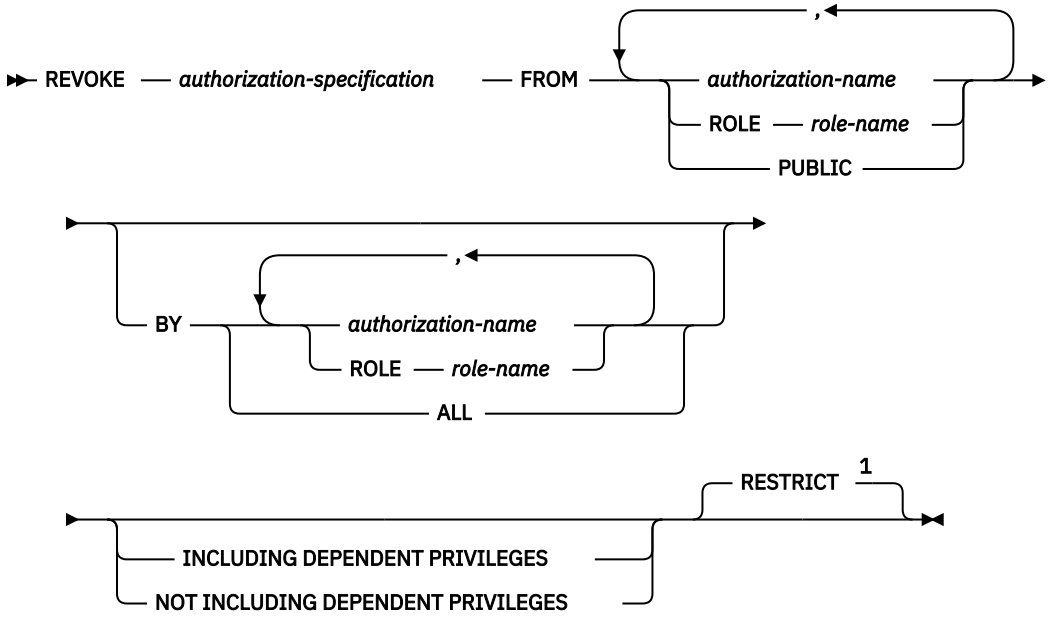
This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.

If the authorization mechanism was not activated when the Db2 subsystem was installed, an error condition occurs.

Authorization

If the BY clause is not specified, the authorization ID of the statement must have granted at least one of the specified privileges to every *authorization-name* specified in the FROM clause (including PUBLIC, if specified). If the BY clause is specified, the authorization ID of the statement must have SECADM or ACCESSCTRL authority.

Note: If installation parameter SEPARATE SECURITY is NO, SYSADM authority has implicit SECADM authority and SYSCTRL authority has implicit ACCESSCTRL authority.



If the BY clause is specified and the privilege set includes ACCESSCTRL, all privileges and authorities can be revoked except for the following:

- System DBADM
- ACCESSCTRL
- DATAACCESS
- CREATE_SECURE_OBJECT privilege

To revoke the CREATE_SECURE_OBJECT privilege, with or without the BY clause, the privilege set must include SECADM authority.

If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. The owner can be a role. If the statement is dynamically prepared, the privilege set is the privileges that are held by the SQL authorization ID of the process. However, if the process is running in a trusted context that is defined with the ROLE AS OBJECT OWNER AND QUALIFIER CLAUSE, the privilege set is the privileges that are held by the role that is in effect.

Syntax

Notes:

[1] The RESTRICT clause is the default only for the forms of the REVOKE statement that allow it.

Description

authorization-specification
Specifies one or more privileges for the class of privilege. The same privilege must not be specified more than once.

FROM
Specifies from what authorization IDs the privileges are revoked.

authorization-name,...
Lists one or more authorization IDs. Do not use the same authorization ID more than one time. If the *authorization-name* is specified in lowercase, it must be delimited using double quotes.

The value of CURRENT RULES determines if you can use the ID of the REVOKE statement itself (to revoke privileges from yourself). When CURRENT RULES is:

Db2
You cannot use the ID of the REVOKE statement.

STD
You can use the ID of the REVOKE statement.

ROLE *role-name*
Lists one or more roles. Do not specify the same role more than one time.

PUBLIC
Revokes a grant of privileges to PUBLIC.

BY
Lists grantors who have granted privileges and revokes each named privilege that was explicitly granted to some named user by one of the named grantors. Only an authorization ID or role with SYSADM or SYSCTRL authority can use BY, even if the authorization ID or role names only itself in the BY clause.

authorization-name,...
Lists one or more authorization IDs of users who were the grantors of the privileges named. Do not use the same authorization ID more than once. Each grantor that is listed must have explicitly granted some named privilege to all of the named users or roles.

ROLE ***role-name***
Lists one or more roles that were the grantors of the privileges named. Do not specify the same role more than one time. Each grantor that is listed must have explicitly granted some named privilege to all of the named users or roles.

ALL
Revokes each named privilege from all named users who were explicitly granted the privilege, regardless of who granted it.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

RESTRICT
Prevents the named privilege from being revoked when certain conditions apply. RESTRICT is the default only for the forms of the REVOKE statement that allow it. These forms are revoking the USAGE privilege on distinct types, the EXECUTE privilege on user-defined functions and stored procedures, and the USAGE privilege on sequences.

Notes

Revoked privileges

The privileges revoked from an authorization ID or a role are those that are identified in the statement and which were granted to the user by the grantor. Other privileges can be revoked as the result of revoking dependent privileges. For more on Db2 privileges, see *Db2 Administration Guide*.

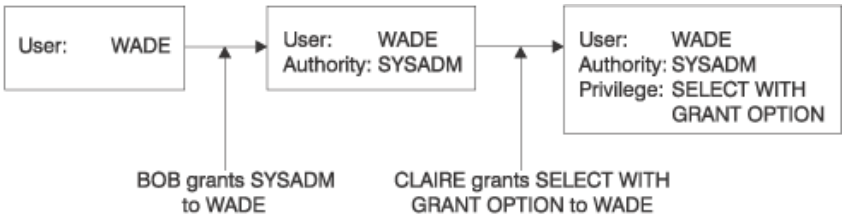
Revoke dependent privileges

Revoking a privilege from a user can also cause that privilege to be revoked from other users. This was previously known as *cascade revoke*. When revoking a privilege from an authorization ID or a role, Db2 looks for and revokes any grants of the privilege where the grantor is the same as the authorization ID or role of the original revoke. The following rules must be true for privilege P' to be revoked from U3 when U1 revokes privilege P from U2:

- P and P' are the same privilege.
- U2 granted privilege P' to U3.
- No one granted privilege P to U2 prior to the grant by U1.
- U2 does not have installation SYSADM authority.

The rules also apply to the implicit grants that are made as a result of a CREATE VIEW statement.

Revoking dependent privileges does not occur under any of the following conditions:

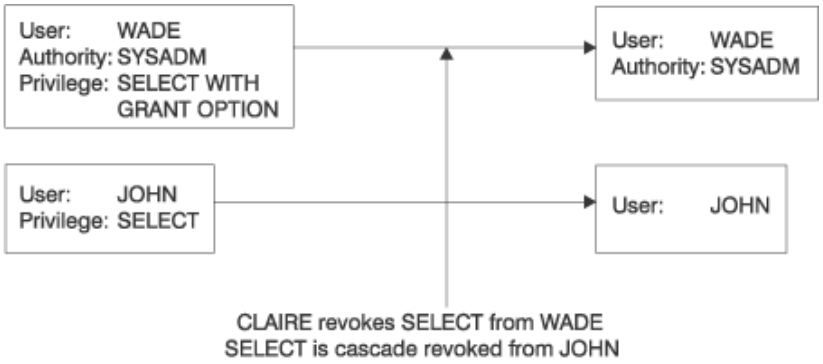


- The privilege was granted by a current installation SYSADM user.
- The privilege is the USAGE privilege on a distinct type and the revokee owns any of these items:
  - A user-defined function or stored procedure that uses the distinct type
  - A table that has a column that uses the distinct type
  - A sequence whose data type is the distinct type
- The privilege is the USAGE privilege on a sequence and the revokee owns any of these items:
  - A trigger that has a NEXT VALUE or PREVIOUS VALUE expression that specifies the sequence
  - An inline SQL function that has a NEXT VALUE or PREVIOUS VALUE expression in the function body that specifies the sequence
- The privilege is the EXECUTE privilege on a user-defined function and the revokee owns any of these items:
  - A user-defined function that is sourced on the function
  - A view that uses the function
  - A trigger package that uses the function
  - A table that uses the function in a check constraint or a user-defined default type
- The privilege is the EXECUTE privilege on a stored procedure and the revokee owns any of these items:
  - A trigger package that refers to the stored procedure in a CALL statement.
- If the ACCESSCTRL administrative authority is revoked from a user, grants that are made by this ACCESSCTRL user are not revoked.

  If this user revoked grants made by it, those revokes will continue to revoke the dependent privileges, unless the behavior to not include the dependent privileges was specified either by using the system parameter REVOKE_DEP_PRIVILEGES or by using the REVOKE statement if REVOKE_DEP_PRIVILEGES is set to SQLSTMT.
- If SECADM is removed from a user, grants that are made by this SECADM user are not revoked.

  If this user revoked grants made by it, those revokes will continue to revoke the dependent privileges, unless the behavior to not include the dependent privileges was specified either by using the system parameter REVOKE_DEP_PRIVILEGES or by using the REVOKE statement if REVOKE_DEP_PRIVILEGES is set to SQLSTMT.
- If `NOT INCLUDING DEPENDENT PRIVILEGES` option is specified, the grants made by this user are not revoked.

Refer to the diagrams for the following example:



1. Suppose BOB grants SYSADM authority to WADE. Later, CLAIRE grants the SELECT privilege on a table with the WITH GRANT OPTION to WADE.

2. WADE grants the SELECT privilege to JOHN on the same table.

3. When CLAIRE revokes the SELECT privilege on the table from WADE, the SELECT privilege on that table is also revoked from JOHN.

The grant from WADE to JOHN is removed because WADE had not been granted the SELECT privilege from any other source before CLAIRE made the grant. The SYSADM authority granted to WADE from BOB does not affect the cascade revoke. For more on SYSADM and installation SYSADM authority, see *Db2 Administration Guide*. For another example of cascading revokes, see *Db2 Administration Guide*.

Revoking a SELECT privilege that was exercised to create a view or materialized query table causes the view to be dropped, unless the owner of the view was directly granted the SELECT privilege from another source before the view was created. Revoking a SYSADM privilege that was required to create a view causes the view to be dropped. For details on when SYSADM authority is required to create a view, see *Authorization* in "CREATE VIEW" on page 1636.

Invalidation of packages

A revoke or cascaded revoke of any privilege or role that was exercised to create a package makes the package invalid when the revokee no longer holds the privilege from any other source. Corresponding authorization caches are cleared even if the revokee has the privilege from any other source. For more information, see Changes that invalidate packages (Db2 Application programming and SQL). [40]

Inoperative packages

A revoke or cascaded revoke of the EXECUTE privilege on a user-defined function that was exercised to create a package makes the package inoperative and causes the corresponding authorization caches to be cleared when the revokee no longer holds the privilege from any other source.[40]

Privileges belonging to an authority

You can revoke an administrative authority, but you cannot separately revoke the specific privileges inherent in that administrative authority.

Let P be a privilege inherent in authority X. A user with authority X can also have privilege P as a result of an explicit grant of P. In this case:

- If X is revoked, the user still has privilege P.
- If P is revoked, the user still has the privilege because it is inherent in X.

Revoking of privileges in a trusted context
Revokes that are made in a trusted context that is defined with the ROLE AS OBJECT OWNER clause result in the revoker being the role in effect. If the statement is prepared dynamically, the revoker is the role that is associated with the user that is running the statement. If the statement is embedded in a program, the revoker is the owner of the plan or package. If the ROLE AS OBJECT OWNER clause is not specified for the trusted context, the revoker is the authorization ID of the process.

Ownership privileges
The privileges inherent in the ownership of an object cannot be revoked.

Revoke not including dependent privileges
When a privilege is revoked from a user by specifying `NOT INCLUDING DEPENDENT PRIVILEGES`, the grants that were made by this user are not revoked and the grantor remains unchanged. If that user is later granted the same privilege and then this privilege is revoked by specifying `INCLUDING DEPENDENT PRIVILEGES`, that would also revoke all the grants that were previously made by this user. Refer to the following examples:

User U1 is granted SELECT on table T1 with GRANT OPTION:

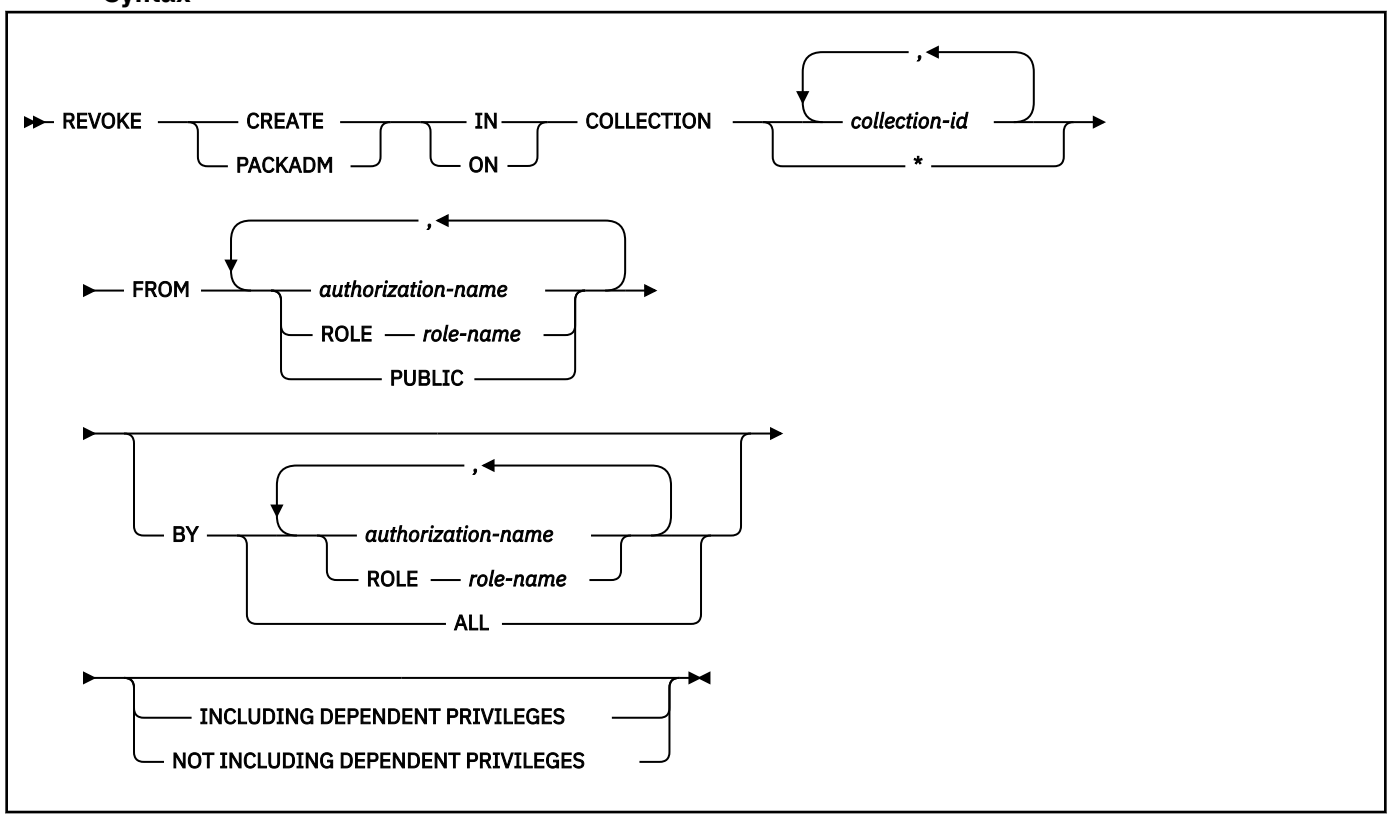
1. U1 grants this privilege to U2.
2. SELECT privilege is revoked from U1 without including dependent privileges. As a result, the grant from U1 to U2 is not revoked.
3. U1 is again granted SELECT on T1.
4. SELECT is now revoked from U1 with including dependent privileges and the grant from U1 to U2 is now revoked.

1.

User U1 is granted SYSADM authority:

1. U1 grants privilege P1 to U2 and privilege P2 to U3.
2. SYSADM is revoked from U1 without including dependent privileges. The grants of privileges P1 and P2 to U2 and U3 are not revoked.
3. U1 is again granted SYSADM. U1 grants privilege P3 to U3.
4. SYSADM is now revoked from U1 including dependent privileges. Now, P1 granted to U2 and P2 and P3 granted to U3 are also revoked.

1.



Related tasks
Revoking privileges with the REVOKE statement (Managing Security)

[40] Dependencies on stored procedures can be checked only if the procedure name is specified as a constant and not via a host variable in the CALL statement.

REVOKE (collection privileges)

This form of the REVOKE statement revokes privileges on collections.

Syntax

Description

CREATE IN

Revokes the privilege to use the BIND subcommand to create packages in the designated collections.

The word ON can be used instead of IN.

PACKADM ON

Revokes the package administrator authority for the designated collections.

The word IN can be used instead of ON.

COLLECTION *collection-id,...*

Identifies the collections on which the specified privilege is revoked. For each identified collection, you (or the indicated grantors) must have granted the specified privilege on that collection to all identified users (including PUBLIC if specified). The same collection must not be identified more than once.

COLLECTION *

Indicates that the specified privilege on COLLECTION * is revoked. You (or the indicated grantors) must have granted the specified privilege on COLLECTION * to all identified users (including PUBLIC if specified). Privileges granted on specific collections are not affected.

FROM

Refer to “REVOKE” on page 1876 for a description of the FROM clause.

BY

Refer to “REVOKE” on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

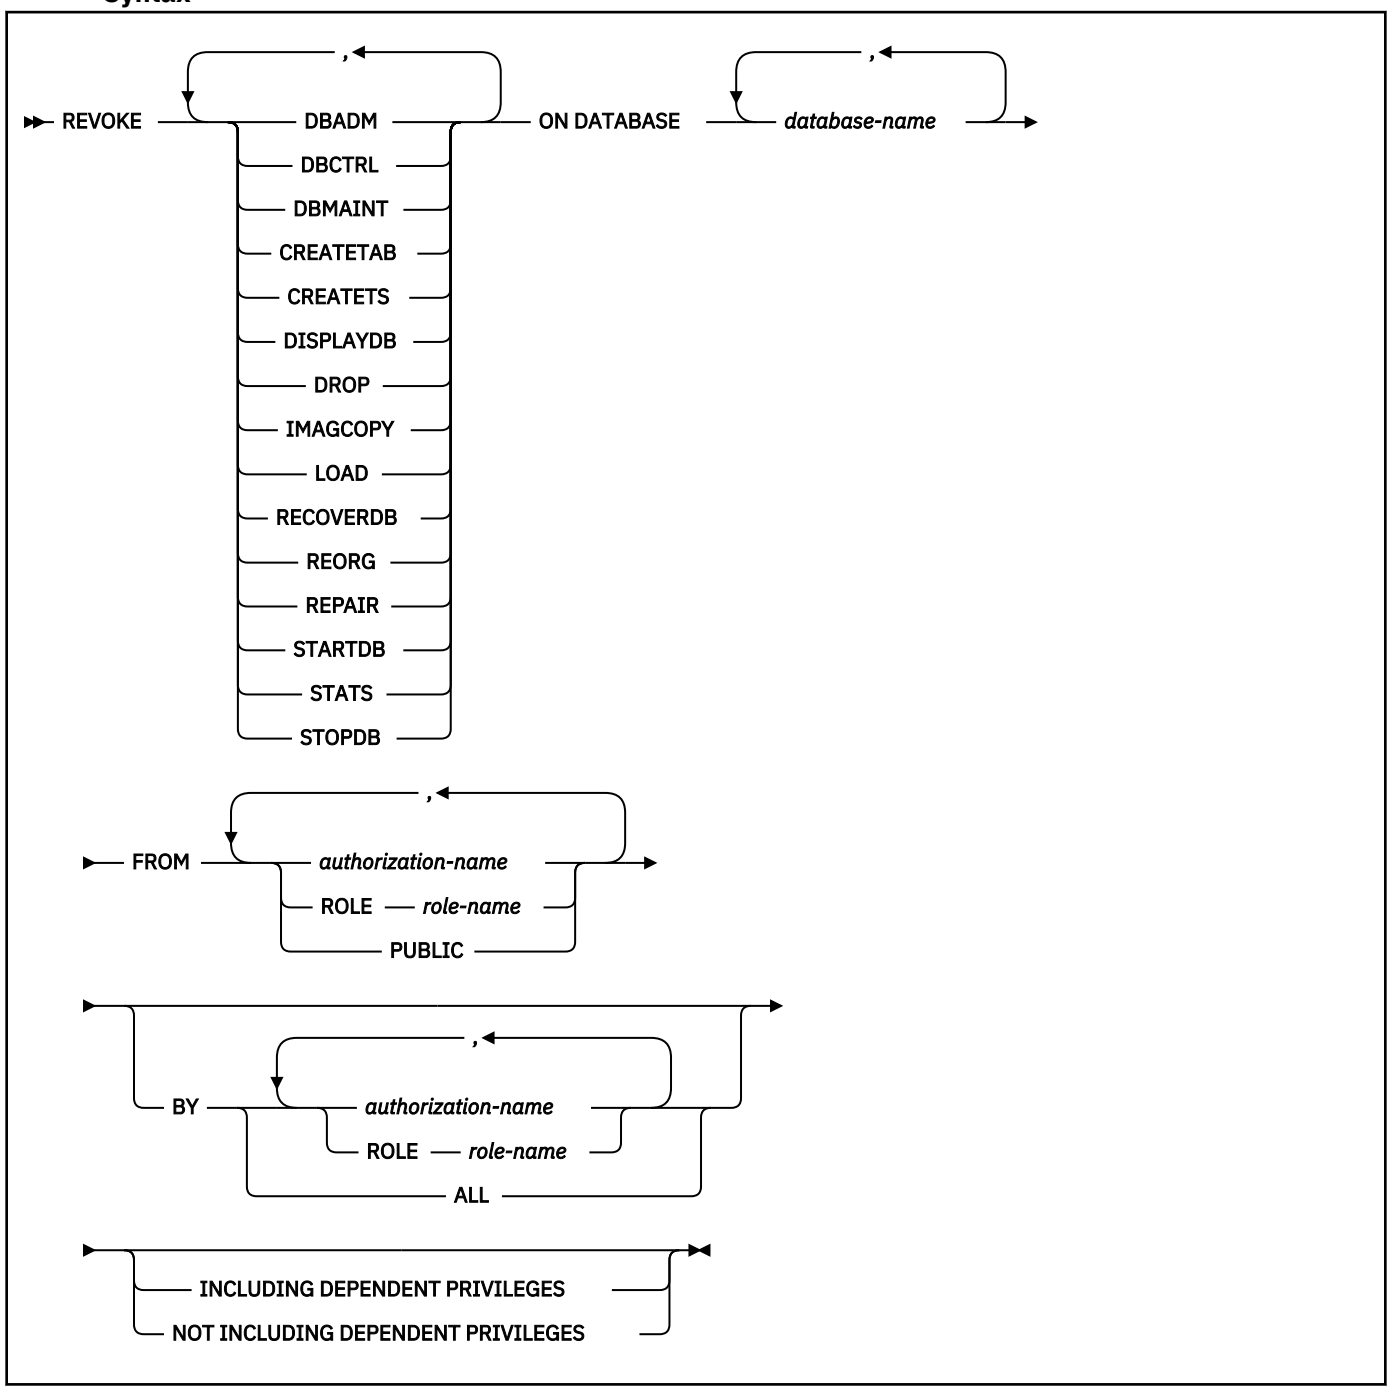
`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke the privilege to create new packages in collections QAACLONE and DSN8CC61 from CLARK.

```
REVOKE CREATE IN COLLECTION QAACLONE, DSN8CC61 FROM CLARK;
```



Example 2: Revoke the privilege to create new packages in collections DSN8CC91 from role ROLE1:

```
REVOKE CREATE IN COLLECTION DSN8CC91 FROM ROLE ROLE1;
```

REVOKE (database privileges)

This form of the REVOKE statement revokes database privileges.

Syntax

Description

Each keyword listed revokes the privilege described, but only as it applies to or within the databases named in the statement.

DBADM
Revokes the database administrator authority.

DBCTRL
Revokes the database control authority.

DBMAINT
Revokes the database maintenance authority.

CREATETAB
Revokes the privilege to create new tables. If CREATETAB privilege is revoked from DSNDB04, tables cannot be created in implicitly created databases. For a work file database, you cannot revoke the privilege from PUBLIC. When a work file database is created, PUBLIC implicitly receives the CREATETAB privilege (without GRANT authority); this privilege is not recorded in the Db2 catalog, and it cannot be revoked.

CREATETS
Revokes the privilege to create new table spaces.

DISPLAYDB
Revokes the privilege to issue the DISPLAY DATABASE command.

DROP
Revokes the privilege to issue the DROP or ALTER statements in the specified databases.

IMAGCOPY
Revokes the privilege to run the COPY, MERGECOPY, and QUIESCE utilities against table spaces of the specified databases, and to run the MODIFY RECOVERY utility.

LOAD
Revokes the privilege to use the LOAD utility to load tables.

RECOVERDB
Revokes the privilege to use the RECOVER and REPORT utilities to recover table spaces and indexes.

REORG
Revokes the privilege to use the REORG utility to reorganize table spaces and indexes.

REPAIR
Revokes the privilege to use the REPAIR and DIAGNOSE utilities.

STARTDB
Revokes the privilege to issue the START DATABASE command.

STATS
Revokes the privilege to use the RUNSTATS utility to update statistics, and the CHECK utility to test whether indexes are consistent with the data they index, and the MODIFY STATISTICS utility to delete unwanted statistics history records from the corresponding catalog tables.

STOPDB
Revokes the privilege to issue the STOP DATABASE command.

ON DATABASE *database-name,...*
Identifies databases on which you are revoking the privileges. For each database you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that database to all identified users (including PUBLIC, if specified). The same database must not be identified more than once.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.
- Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke drop privileges on database DSN8D11A from user PEREZ.

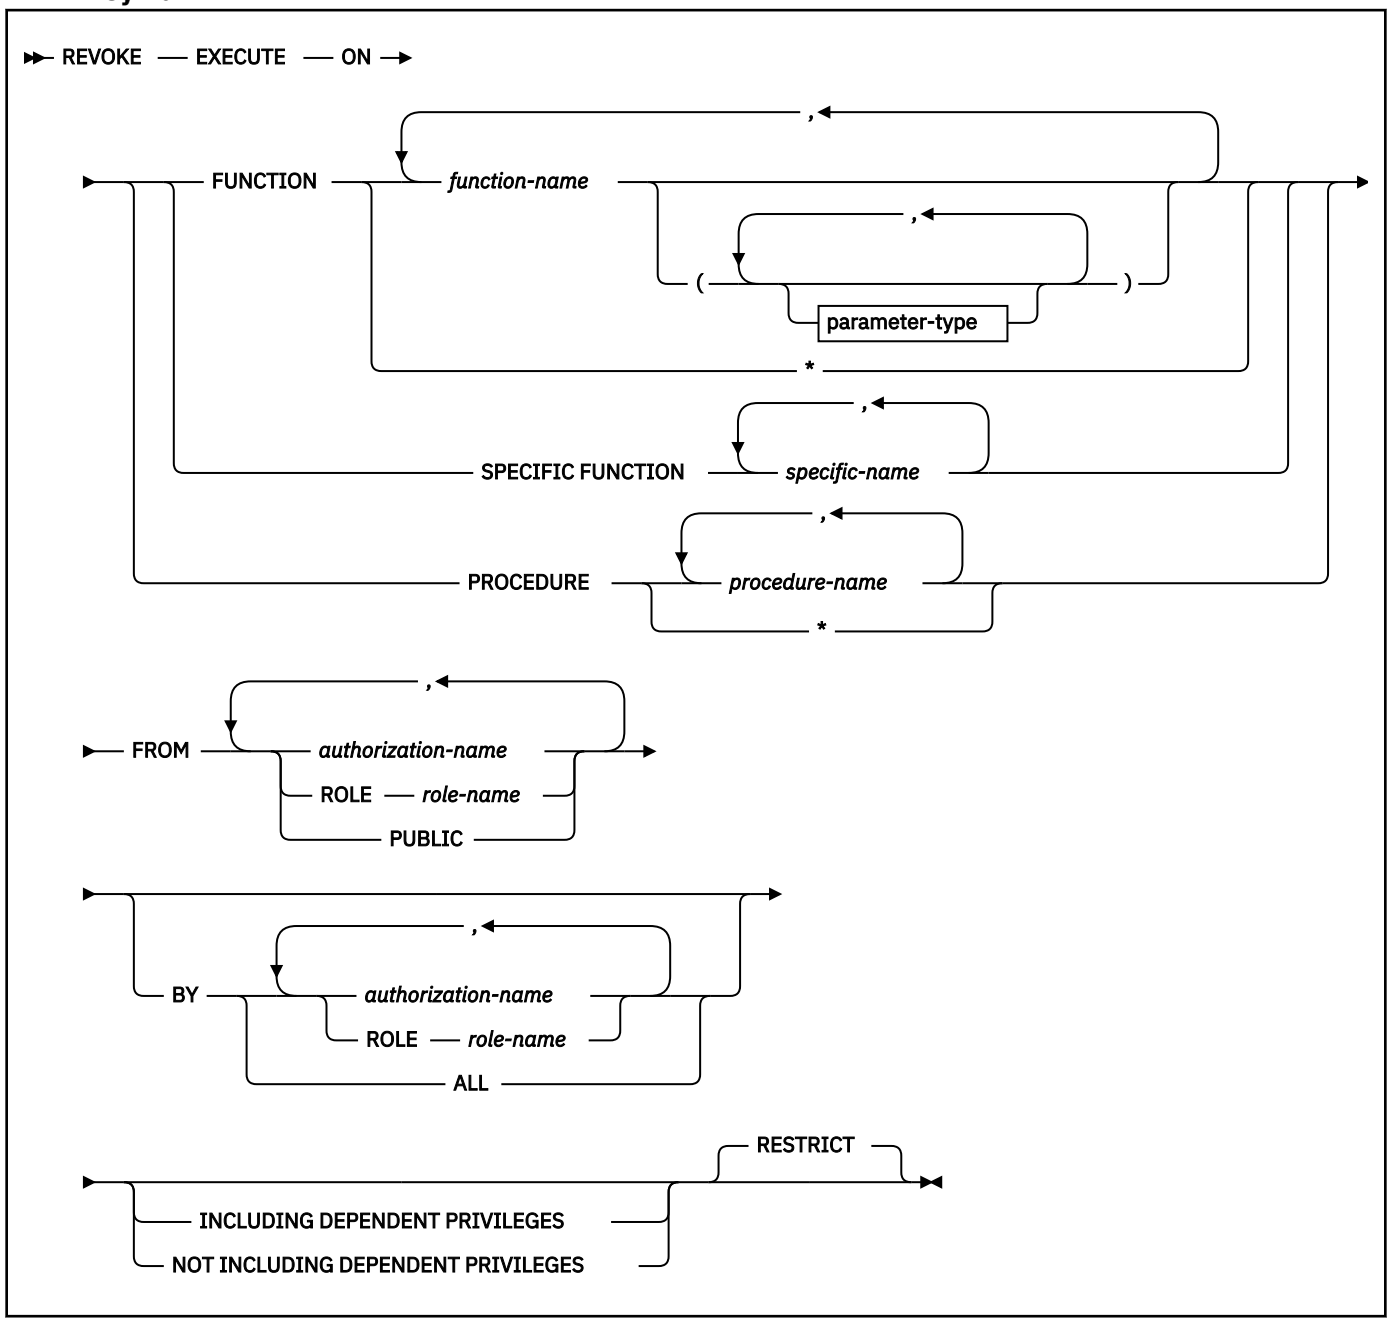
```
REVOKE DROP
  ON DATABASE DSN8D11A
  FROM PEREZ;
```

Example 2: Revoke repair privileges on database DSN8D11A from all local users. (Grants to specific users will not be affected.)

```
REVOKE REPAIR
  ON DATABASE DSN8D11A
  FROM PUBLIC;
```

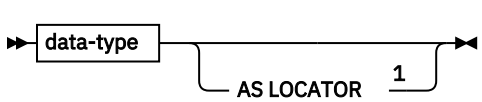
Example 3: Revoke authority to create new tables and load tables in database DSN8D11A from users WALKER, PIANKA, and FUJIMOTO.

```
REVOKE CREATETAB,LOAD
  ON DATABASE DSN8D11A
  FROM WALKER,PIANKA,FUJIMOTO;
```



Example 4: Revoke load privileges on database DSN8D11A from role ROLE1:

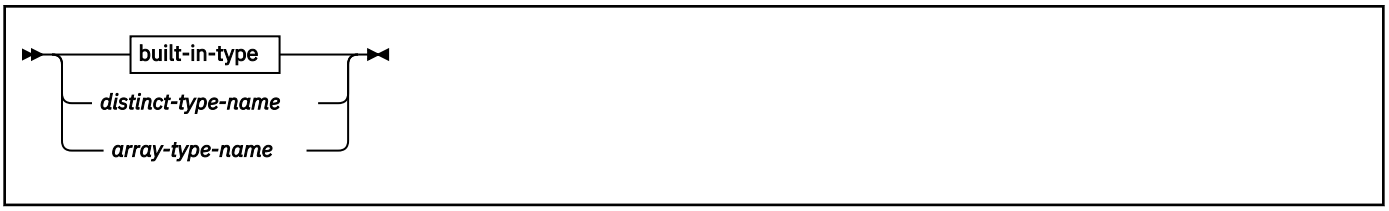
```
REVOKE LOAD
  ON DATABASE DSN8D11A
  FROM ROLE ROLE1;
```



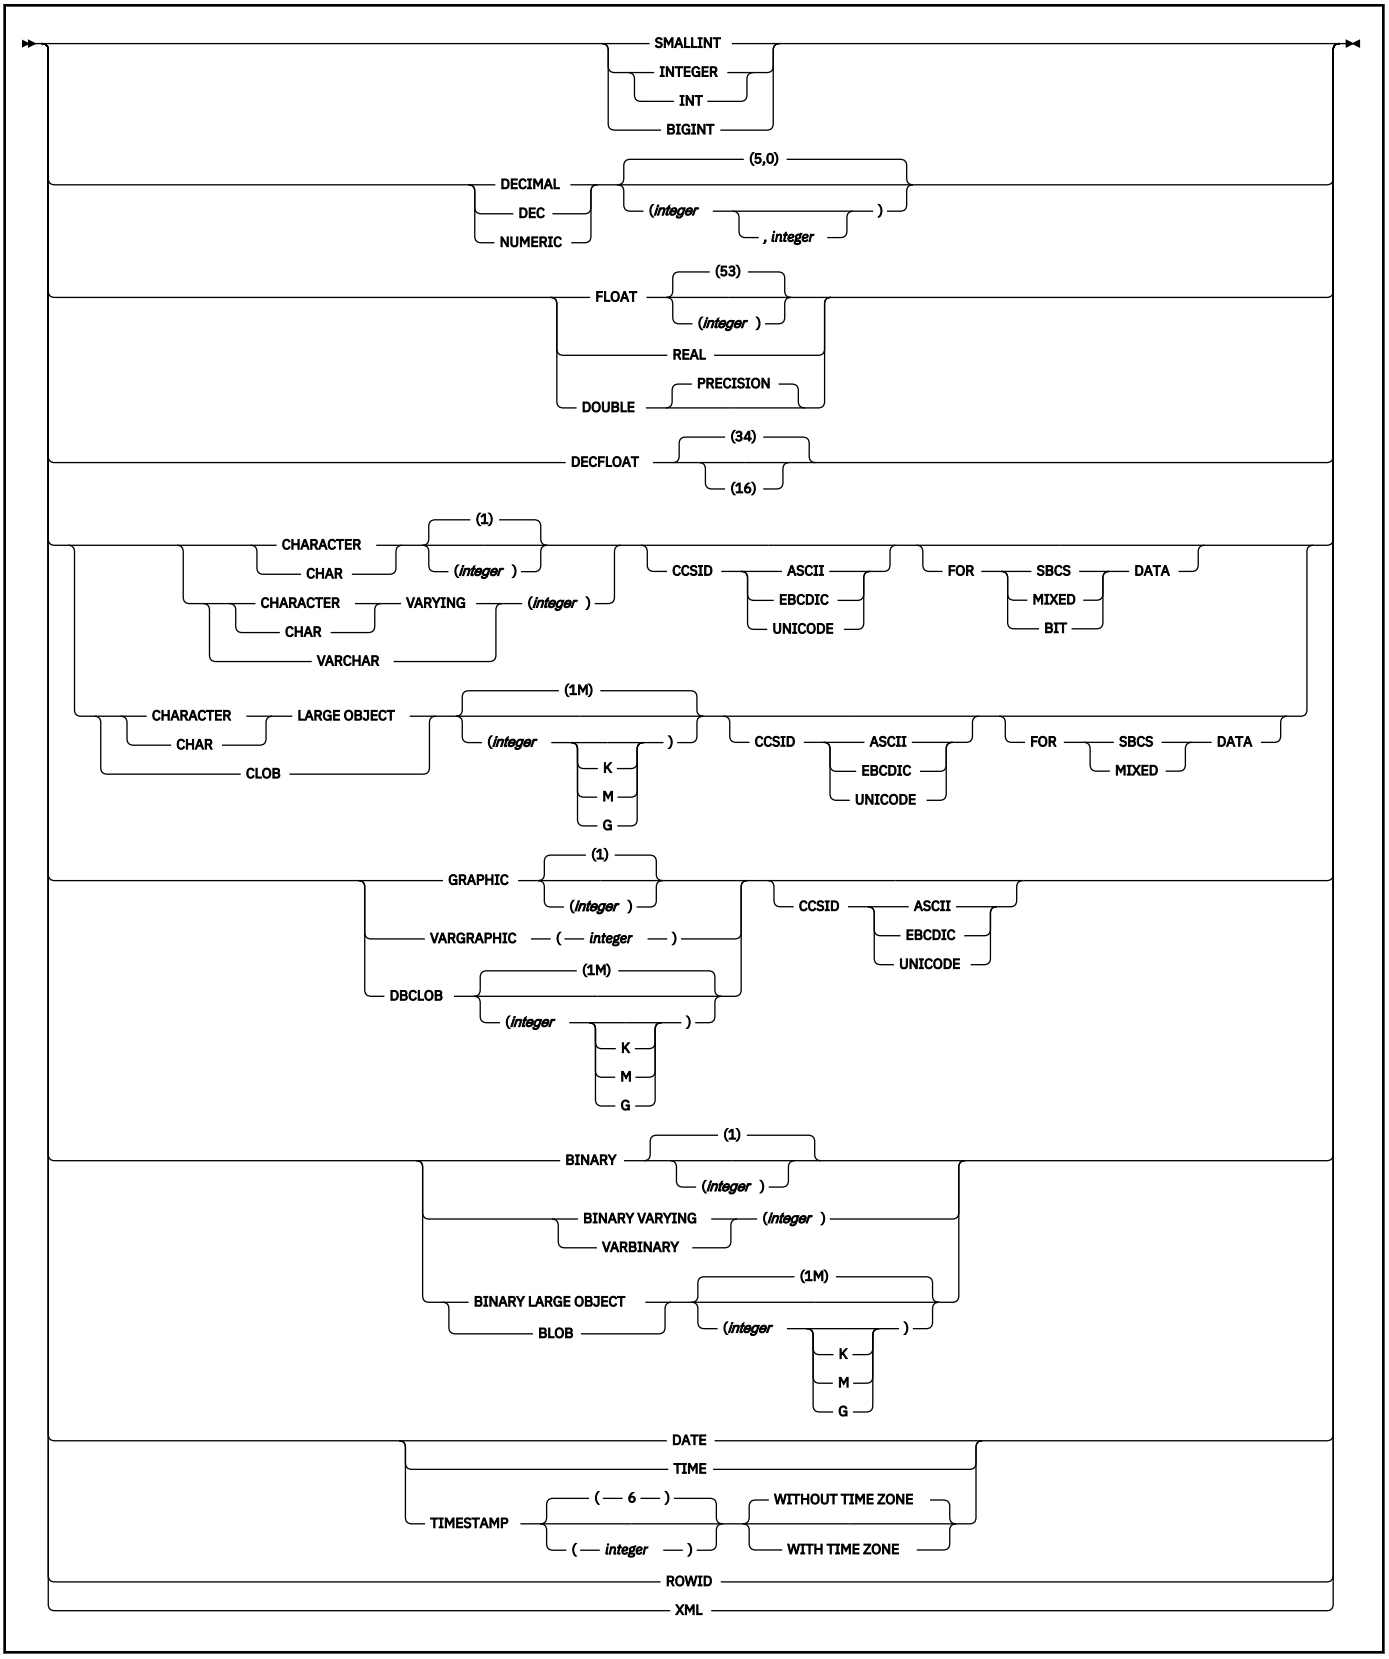
REVOKE (function or procedure privileges)

This form of the REVOKE statement revokes privileges on user-defined functions, cast functions that were generated for distinct types, and stored procedures.

Syntax



parameter-type:



Notes:

[1] AS LOCATOR can be specified only for a LOB data type or a distinct type that is based on a LOB data type.

data-type:

built-in-type:

Description

EXECUTE

Revokes the privilege to run the identified user-defined function, cast function that was generated for a distinct type, or stored procedure.

FUNCTION or SPECIFIC FUNCTION

Identifies the function from which the privilege is revoked. The function must exist at the current server, and it must be a function that was defined with the CREATE FUNCTION statement or a cast function that was generated by a CREATE TYPE statement. The function can be identified by name, function signature, or specific name.

If the function was defined with a table parameter (the LIKE TABLE was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to identify the function. Instead, identify the function with its function name, if unique, or with its specific name.

FUNCTION *function-name*

Identifies the function by its name. The *function-name* must identify exactly one function. The function can have any number of parameters defined for it. If there is more than one function of the specified name in the specified or implicit schema, an error is returned.

An * can be specified for a qualified or unqualified *function-name*. An * (or *schema-name*.*) indicates that the privilege is revoked for all the functions in the schema. You (or the indicated grantors) must have granted the privilege on FUNCTION * to all identified users (including PUBLIC if specified). Privileges granted on specific functions are not affected.

FUNCTION *function-name (parameter-type,...)*

Identifies the function by its function signature, which uniquely identifies the function. The *function-name (parameter-type, ...)* must identify a function with the specified function signature. The specified parameters must match the data types in the corresponding position that were specified when the function was created. The number of data types, and the logical concatenation of the data types is used to identify the specific function instance on which the privilege is to be granted. Synonyms for data types are considered a match.

If the function was defined with a table parameter (the LIKE TABLE *name* AS LOCATOR clause was specified in the CREATE FUNCTION statement to indicate that one of the input parameters is a transition table), the function signature cannot be used to uniquely identify the function. Instead, use one of the other syntax variations to identify the function with its function name, if unique, or its specific name.

If *function-name ()* is specified, the function identified must have zero parameters.

function-name

Identifies the name of the function. If you do not explicitly qualify the function name with a schema name, the function name is implicitly qualified with a schema name as described in the preceding description for FUNCTION *function-name*.

(parameter-type,...)

Identifies the parameters of the function.

If an unqualified distinct type name is specified, Db2 searches the SQL path to resolve the schema name for the distinct type.

For data types that have a length, precision, or scale attribute, use one of the following:

- Empty parentheses indicate that the database manager ignores the attribute when determining whether the data types match. For example, DEC() will be considered a match for a parameter of a function defined with a data type of DEC(7,2). Similarly DECFLOAT() will be considered a match for DECFLOAT(16) or DECFLOAT(34). However, FLOAT cannot be specified with empty parenthesis because its parameter value indicates a specific data type (REAL or DOUBLE).
- If a specific value for a length, precision, or scale attribute is specified, the value must exactly match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement. If the data type is FLOAT, the precision does not have to exactly match the value that was specified because matching is based on the data type (REAL or DOUBLE).
- If length, precision, or scale is not explicitly specified, and empty parentheses are not specified, the default attributes of the data type are implied. The implicit length must exactly

match the value that was specified (implicitly or explicitly) in the CREATE FUNCTION statement.

For data types with a subtype or encoding scheme attribute, specifying the FOR *subtype* DATA clause or the CCSID clause is optional. Omission of either clause indicates that Db2 ignores the attribute when determining whether the data types match. If you specify either clause, it must match the value that was implicitly or explicitly specified in the CREATE FUNCTION statement.

AS LOCATOR
Specifies that the function is defined to receive a locator for this parameter. If AS LOCATOR is specified, the data type must be a LOB or a distinct type based on a LOB.

SPECIFIC FUNCTION *specific-name*
Identifies the function by its specific name. The *specific-name* must identify a specific function that exists at the current server.

PROCEDURE *procedure-name*
Identifies a stored procedure that is defined at the current server.

An * can be specified for a qualified or unqualified *procedure-name*. An * (or *schema-name*.*) indicates that the privilege is revoked for all the procedures in the schema. You (or the indicated grantors) must have granted the privilege on PROCEDURE * to all identified users (including PUBLIC if specified). Privileges granted on specific procedures are not affected.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

RESTRICT

Prevents the EXECUTE privilege from being revoked on a user-defined function or stored procedure if the revokee owns any of the following objects and does not have the EXECUTE privilege from another source:

- A function that is sourced on the function
- A view that uses the function
- A trigger package that uses the function or stored procedure
- A table that uses the function in a check constraint or user-defined default clause
- A materialized query table whose fullselect uses the function
- An extended index that uses the function

Examples

Example 1: Revoke the EXECUTE privilege on function CALC_SALARY for user JONES. Assume that there is only one function in the schema with function CALC_SALARY.

```
REVOKE EXECUTE ON FUNCTION CALC_SALARY FROM JONES;
```

Example 2: Revoke the EXECUTE privilege on procedure VACATION_ACCR from all users at the current server.

```
REVOKE EXECUTE ON PROCEDURE VACATION_ACCR FROM PUBLIC;
```

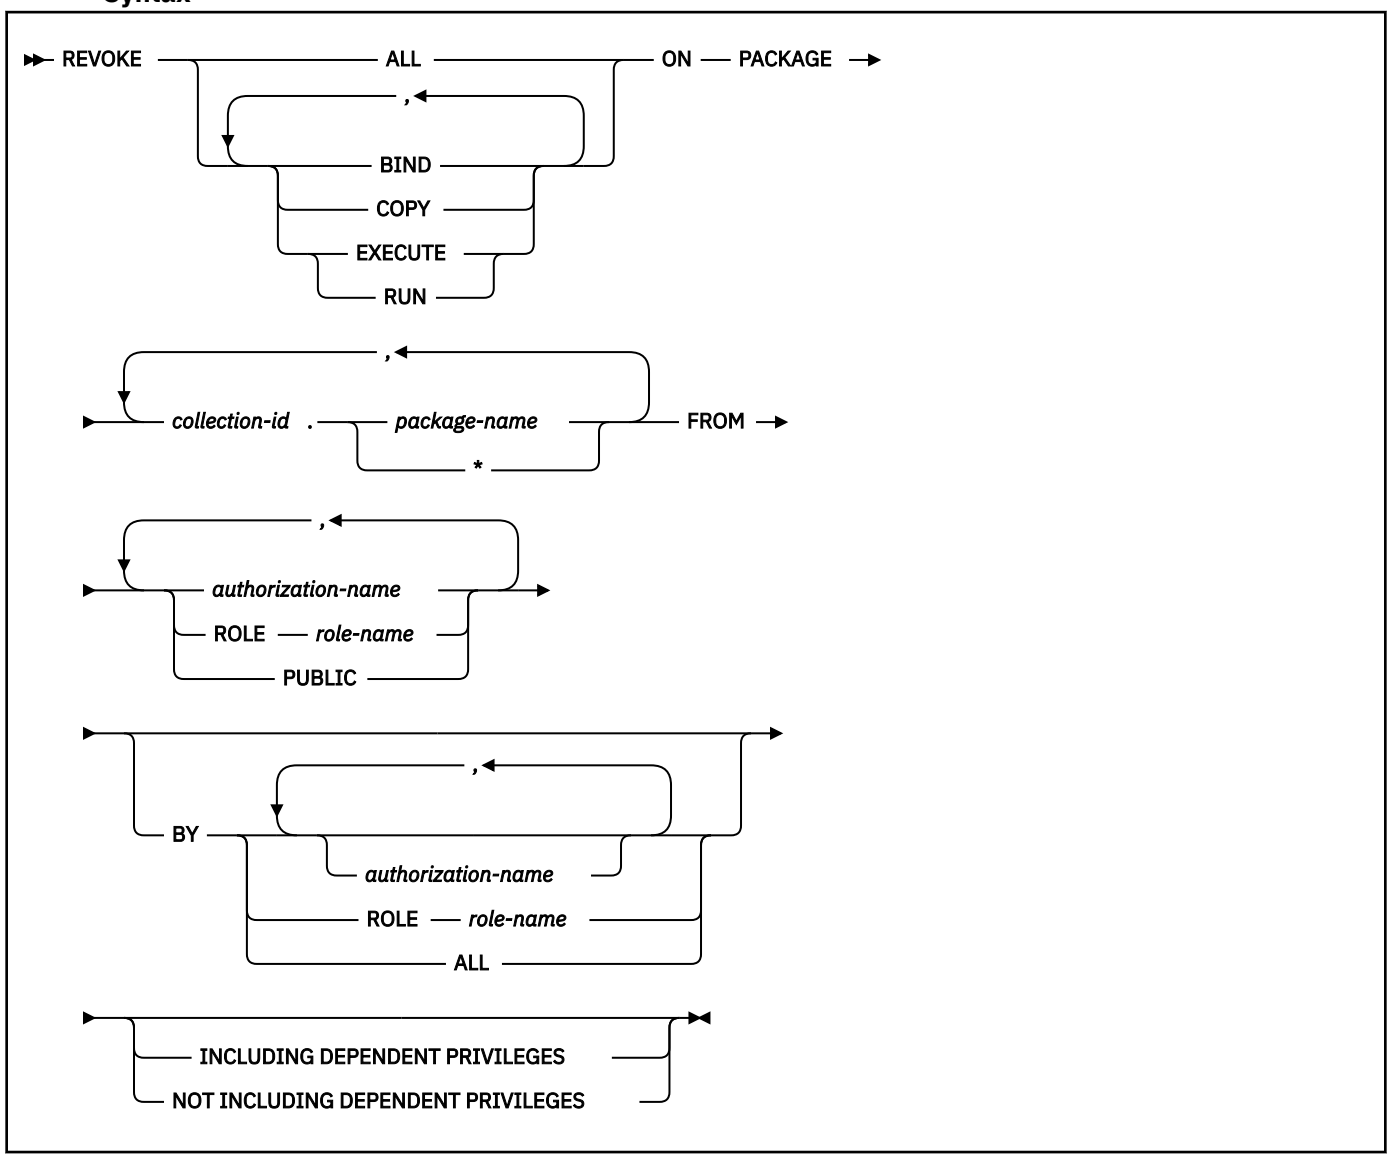
Example 3: Revoke the privilege of the administrative assistant to grant EXECUTE privileges on function DEPT_TOTAL to other users. The administrative assistant will still have the EXECUTE privilege on function DEPT_TOTALS.

```
REVOKE EXECUTE ON FUNCTION DEPT_TOTALS
      FROM ADMIN_A;
```

Example 4: Revoke the EXECUTE privilege on function NEW_DEPT_HIRES for HR (Human Resources). The function has two input parameters with data types of INTEGER and CHAR(10), respectively. Assume that the schema has more than one function that is named NEW_DEPT_HIRES.

```
REVOKE EXECUTE ON FUNCTION NEW_DEPT_HIRES (INTEGER, CHAR(10))
      FROM HR;
```

You can also code the CHAR(10) data type as CHAR().



Example 5: Revoke the EXECUTE privilege on function FIND_EMPDEPT from role ROLE1:

```
REVOKE EXECUTE ON FUNCTION FIND_EMPDEPT
      FROM ROLE ROLE1;
```

REVOKE (package privileges)

This form of the REVOKE statement revokes privileges on packages.

Syntax

Description

BIND

Revokes the privilege to use the BIND and REBIND subcommands for the designated packages. In addition, if the value of field BIND NEW PACKAGE on installation panel DSNTIPP is BIND, the additional BIND privilege of adding new versions of packages is revoked. (For details, see "GRANT (package privileges)" on page 1789.)

COPY

Revokes the privilege to use the COPY option of the BIND subcommand for the designated packages.

EXECUTE

Revokes the privilege to run application programs that use the designated packages and to specify the packages following PKLIST for the BIND PLAN and REBIND PLAN commands. RUN is an alternate name for the same privilege.

ALL
Revokes all package privileges for which you have authority for the packages named in the ON clause.

ON PACKAGE *collection-id.package-name,...*
Identifies packages for which you are revoking privileges. The revoking of a package privilege applies to all versions of that package. For each package that you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that package to all identified users (including PUBLIC, if specified). An authorization ID with PACKADM authority over the collection or all collections, SYSADM, or SYSCTRL authority can specify all packages in the collection by using * for *package-name*. The same package must not be specified more than once.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

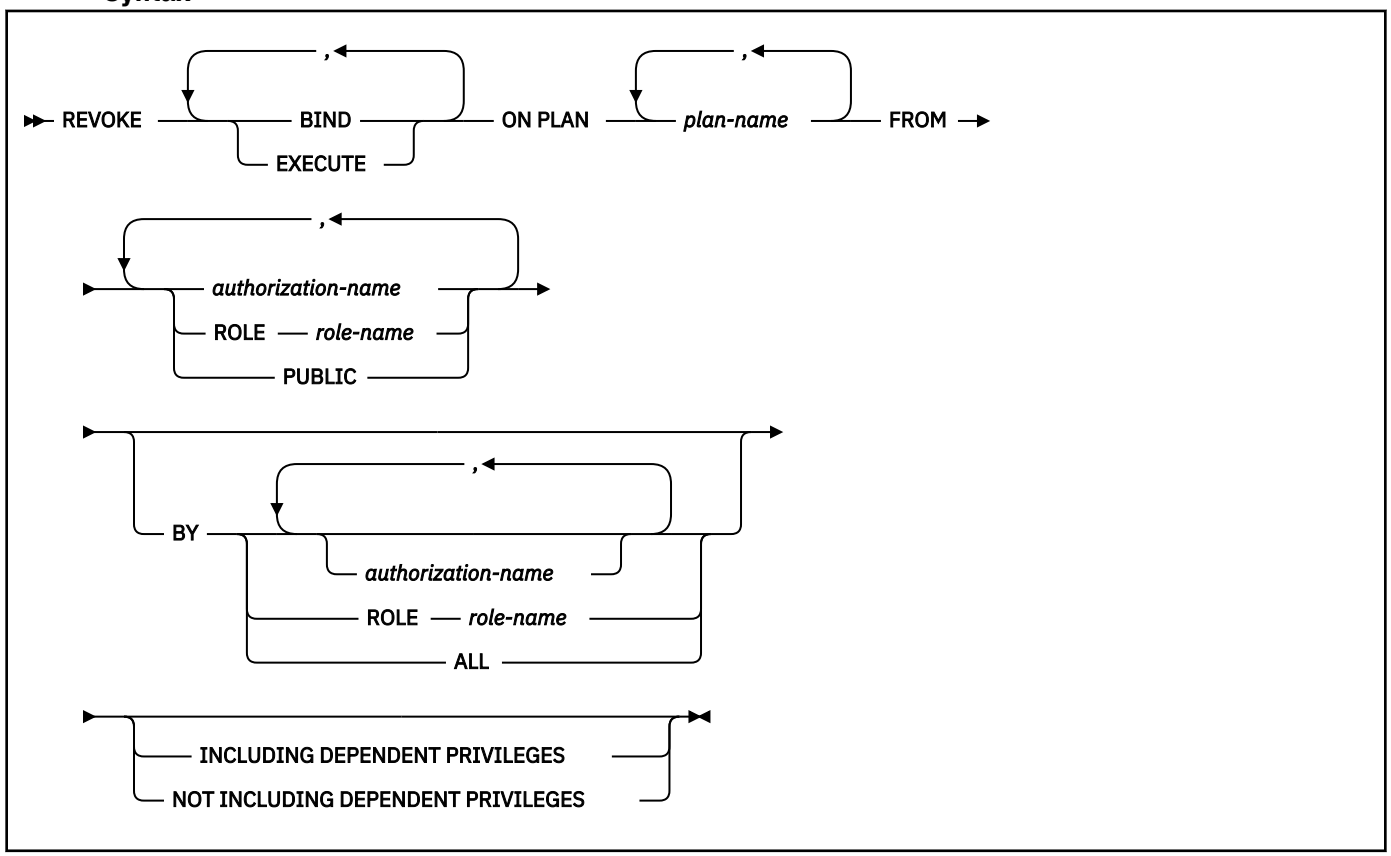
Notes

Alternative syntax and synonyms: To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports specifying PROGRAM as a synonym for PACKAGE.

Examples

Example 1: Revoke the privilege to copy all packages in collection DSN8CC61 from LEWIS.

```
REVOKE COPY ON PACKAGE DSN8CC61.* FROM LEWIS;
```



Example 2: Revoke the privilege to run all packages in collection DSN9CC13 from role ROLE1:

```
REVOKE EXECUTE ON PACKAGE DSN9CC13.* FROM ROLE ROLE1;
```

REVOKE (plan privileges)

This form of the REVOKE statement revokes privileges on application plans.

Syntax

Description

BIND
Revokes the privilege to use the BIND, REBIND, and FREE subcommands for the identified plans.

EXECUTE
Revokes the privilege to run application programs that use the identified plans.

ON PLAN *plan-name,...*
Identifies application plans for which you are revoking privileges. For each plan that you identify, you (or the indicated grantors) must have granted at least one of the specified privileges on that plan to all identified users (including PUBLIC, if specified). The same plan must not be specified more than once.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke authority to bind plan DSN8IP11 from user JONES.

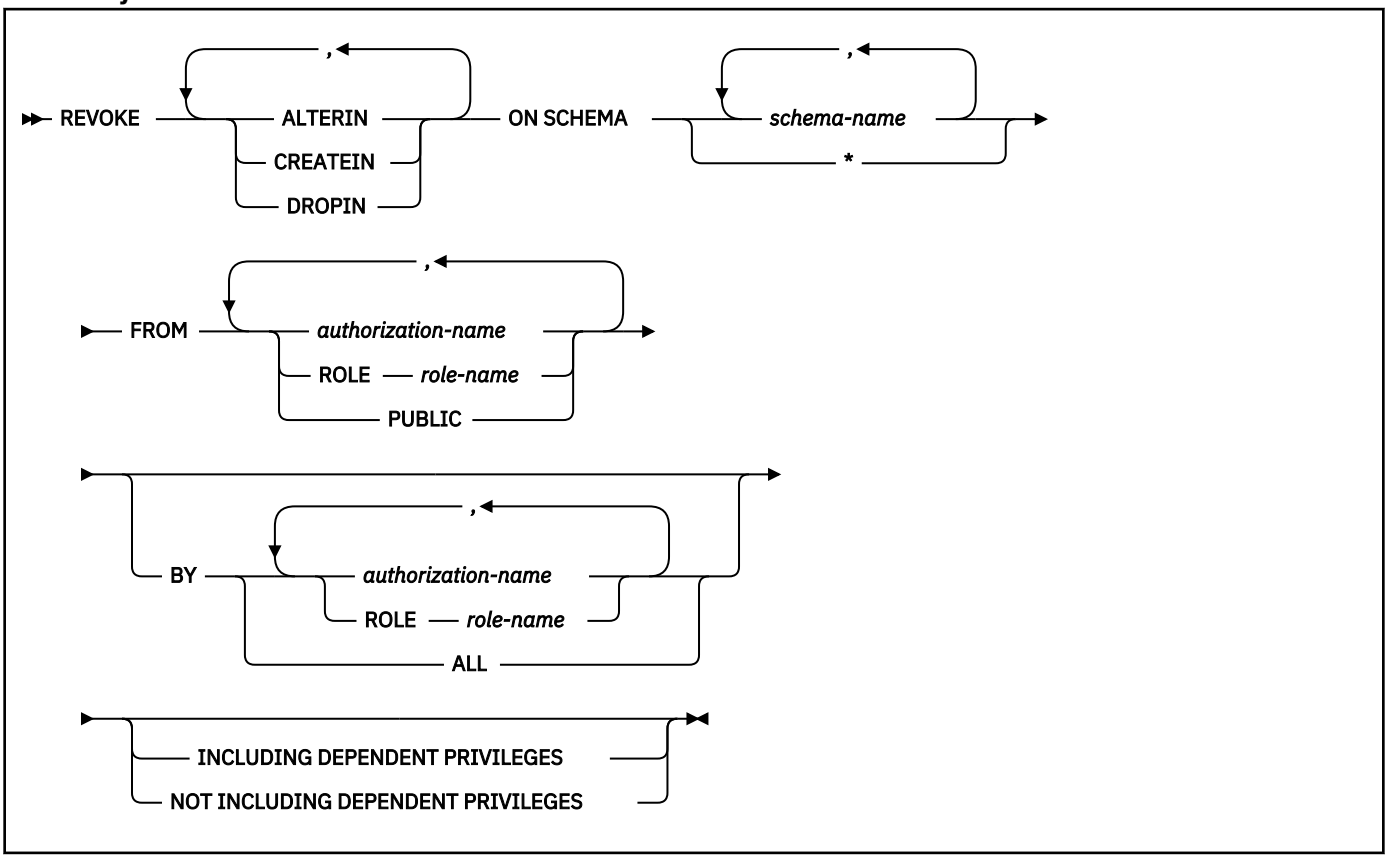
```
REVOKE BIND ON PLAN DSN8IP11 FROM JONES;
```

Example 2: Revoke authority previously granted to all users at the current server to bind and execute plan DSN8CP11. (Grants to specific users will not be affected.)

```
REVOKE BIND,EXECUTE ON PLAN DSN8CP11 FROM PUBLIC;
```

Example 3: Revoke authority to execute plan DSN8CP11 from users ADAMSON and BROWN.

```
REVOKE EXECUTE ON PLAN DSN8CP11 FROM ADAMSON,BROWN;
```



Example 4: Revoke authority to bind plan DSN91PLN from role ROLE1:

```
REVOKE BIND ON PLAN DSN91PLN FROM ROLE ROLE1;
```

REVOKE (schema privileges)

This form of the REVOKE statement revokes privileges on schemas.

Syntax

Description

ALTERIN
Revokes the privilege to alter sequences, stored procedures, and user-defined functions, or specify a comment for distinct types, cast functions that are generated for distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

CREATEIN
Revokes the privilege to create distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

DROPIN
Revokes the privilege to drop distinct types, sequences, stored procedures, triggers, and user-defined functions in the designated schemas.

SCHEMA *schema-name*
Identifies the schema on which the privilege is revoked.

SCHEMA *
Indicates that the specified privilege on all schemas is revoked. You (or the indicated grantors) must have previously granted the specified privilege on SCHEMA * to all identified users (including PUBLIC if specified). Privileges granted on specific schemas are not affected.

FROM
Refer to “REVOKE” on page 1876 for a description of the FROM clause.

BY
Refer to “REVOKE” on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke the CREATEIN privilege on schema T_SCORES from user JONES.

```
REVOKE CREATEIN ON SCHEMA T_SCORES FROM JONES;
```

Example 2: Revoke the CREATEIN privilege on schema VAC from all users at the current server.

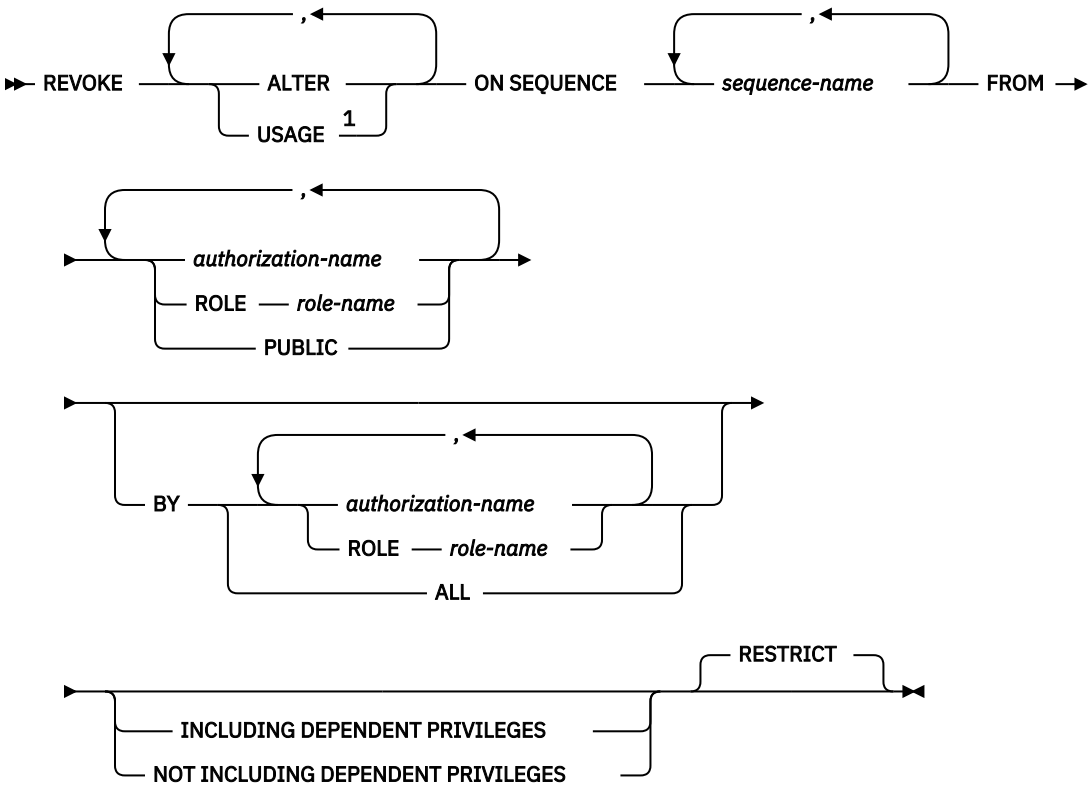
```
REVOKE CREATEIN ON SCHEMA VAC FROM PUBLIC;
```

Example 3: Revoke the ALTERIN privilege on schema DEPT from the administrative assistant.

```
REVOKE ALTERIN ON SCHEMA DEPT FROM ADMIN_A;
```

Example 4: Revoke the ALTERIN and DROPIN privileges on schemas NEW_HIRE, PROMO, and RESIGN from HR (Human Resources).

```
REVOKE ALTERIN, DROPIN ON SCHEMA NEW_HIRE, PROMO, RESIGN FROM HR;
```



Example 5: Revoke the ALTERIN privilege on schemas EMPLOYEE from role ROLE1:

```
REVOKE ALTERIN ON SCHEMA EMPLOYEE FROM ROLE ROLE1;
```

REVOKE (sequence privileges)

This form of the REVOKE statement revokes the privileges on a user-defined sequence.

Syntax

Notes:

[1] The keyword SELECT is an alternative keyword for USAGE.

Description

ALTER
Revokes the privilege to alter a sequence or record a comment on a sequence.

USAGE
Revokes the USAGE privilege to use a sequence. This privilege is needed when the NEXT VALUE or PREVIOUS VALUE expression is invoked for a sequence name.

SEQUENCE *sequence-name*
Identifies the sequence. The name, including the implicit or explicit schema qualifier, must uniquely identify an existing sequence at the current server. If no sequence by this name exists in the explicitly or implicitly specified schema, an error occurs. *sequence-name* must not be the name of an internal sequence object that is generated by the system for an identity column.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES

Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

RESTRICT

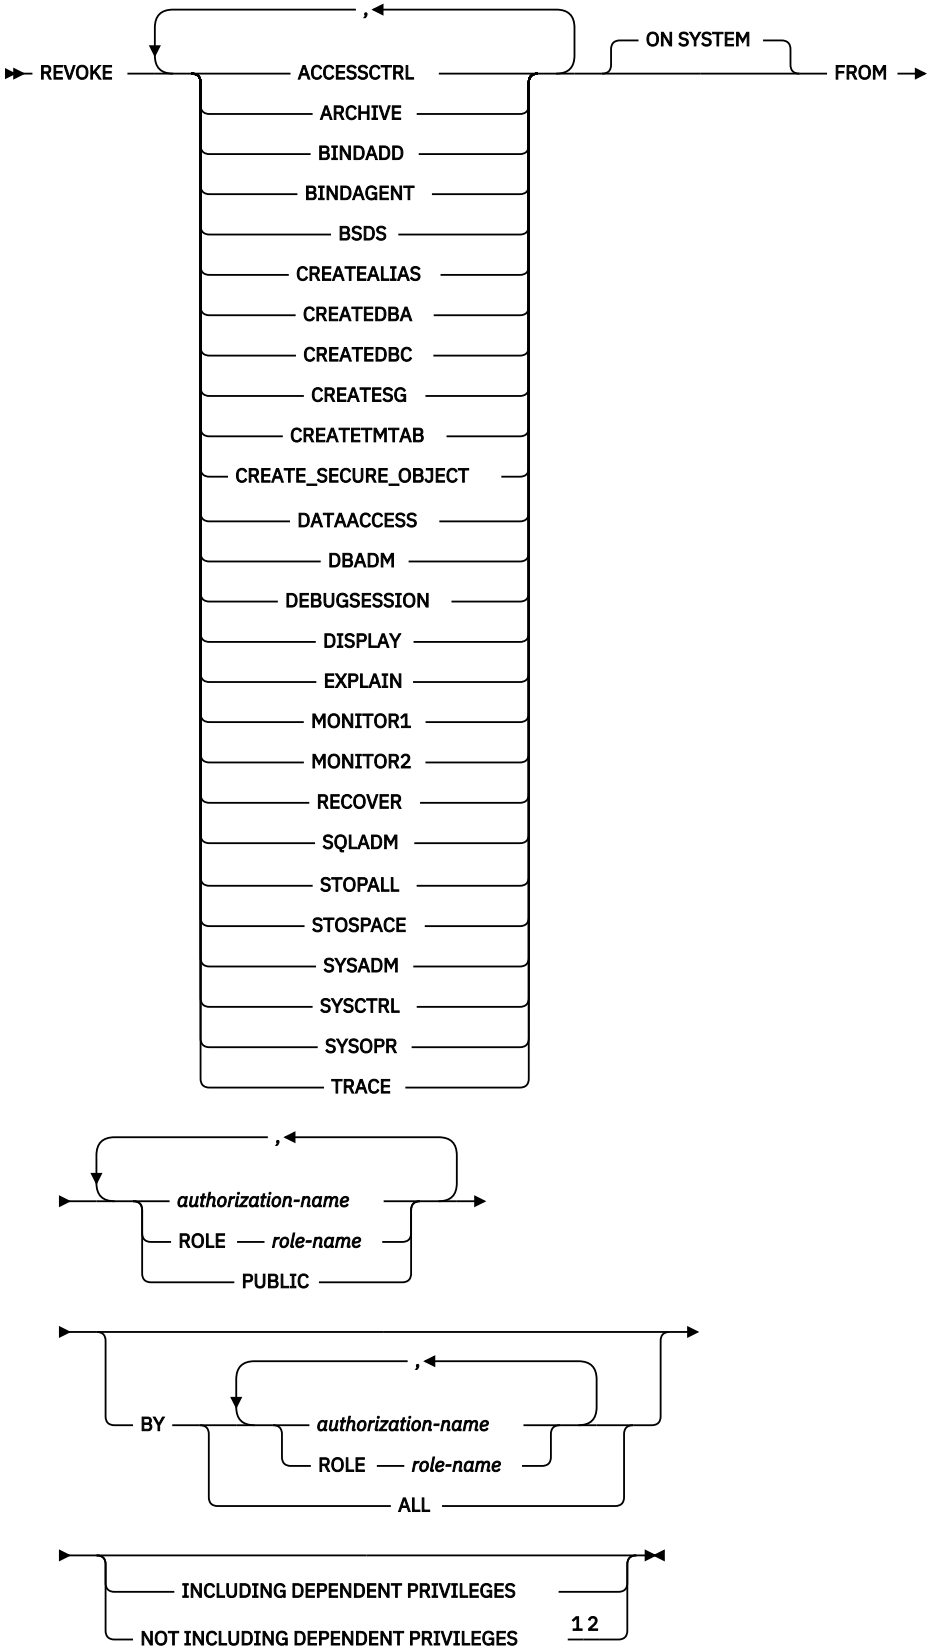
Prevents the USAGE privilege from being revoked on a sequence if the revokee owns one of the following objects and does not have the USAGE privilege from another source:

- A trigger that specifies the sequence in a NEXT VALUE or PREVIOUS VALUE expression
- An inline SQL function that specifies the sequence in a NEXT VALUE or PREVIOUS VALUE expression

Examples

Example 1: Revoke USAGE privilege on sequence MYNUM to user JONES.

```
REVOKE USAGE
  ON SEQUENCE MYNUM
  FROM JONES;
```



Example 2: Revoke the USAGE privilege on sequence ORDER_SEQ from role ROLE1:

```
REVOKE USAGE
  ON SEQUENCE ORDER_SEQ
  FROM ROLE ROLE1;
```

REVOKE (system privileges)

This form of the REVOKE statement revokes system privileges.

Syntax

Notes:

[1] INCLUDING DEPENDENT PRIVILEGES must not be specified when ACCESSCTRL, DATAACCESS, or DBADM is specified.
[2] NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or DBADM is specified

Description

ACCESSCTRL
Revokes the ACCESSCTRL authority, but does not revoke any privileges that are dependent on it.

ARCHIVE
Revokes the privilege to use the ARCHIVE LOG command.

BINDADD
Revokes the privilege to create plans and packages using the BIND subcommand with the ADD option.

BINDAGENT
Revokes the privilege to issue the BIND, FREE PACKAGE, or REBIND subcommands for plans and packages and the DROP PACKAGE statement on behalf of the grantor. The privilege also allows the holder to copy and replace plans and packages on behalf of the grantor.

A revoke of this privilege does not cascade.

BSDS
Revokes the privilege to issue the RECOVER BSDS command.

CREATEALIAS
Revokes the privilege to use the CREATE ALIAS statement.

CREATEDBA
Revokes the privilege to issue the CREATE DATABASE statement and acquire DBADM authority over those databases.

CREATEDBC
Revokes the privilege to issue the CREATE DATABASE statement and acquire DBCTRL authority over those databases.

CREATESG
Revokes the privilege to create new storage groups.

CREATETMTAB
Revokes the privilege to use the CREATE GLOBAL TEMPORARY TABLE statement.

CREATE_SECURE_OBJECT
Revokes the privilege to create a secure object.

DATAACCESS
Revokes the DATAACCESS authority, but does not revoke any privileges that are dependent on it. Revoking DATAACCESS can result in authorization cache entries (plan, package, routine, and dynamic statement) being updated if they were dependent on it. The RESTRICT semantics on objects prevents the DATAACCESS authority from being revoked if the revokee owns an object that was created with dependencies on the authority to be revoked.

Revoking DATAACCESS is similar to revoking the individual privileges that DATAACCESS includes. For example, if a view was created based on the view owner having the SELECT privilege as acquired through the DATAACCESS authority, revoking DATAACCESS would be the equivalent of revoking the SELECT privilege and the view would be dropped.

DBADM
Revokes the DBADM authority from the user. If this user was also granted DATACCESS or ACCESSCTRL authority along with DBADM authority, DATACCESS or ACCESSCTRL would not be revoked.

DISPLAY
Revokes the privilege to use the following commands:

- The DISPLAY ARCHIVE command for archive log information
- The DISPLAY BUFFERPOOL command for the status of buffer pools
- The DISPLAY DATABASE command for the status of all databases
- The DISPLAY FUNCTION SPECIFIC command for statistics about accessed external user-defined functions
- The DISPLAY LOCATION command for statistics about threads with a distributed relationship
- The DISPLAY PROCEDURE command for statistics about accessed stored procedures
- The DISPLAY THREAD command for information on active threads with in Db2
- The DISPLAY TRACE command for a list of active traces

DEBUGSESSION
Revokes the privilege to create a debug session, which prevents client application debugging of native SQL or Java procedures that are executed within the session.

EXPLAIN
Revokes the privilege to issue the following:

- The EXPLAIN statement with the following options:
  - PLAN
  - ALL
- The PREPARE statement
- The DESCRIBE TABLE statement
- The ability to explain dynamic SQL statements that are executing with the special register CURRENT EXPLAIN MODE = EXPLAIN
- The BIND options EXPLAIN(ONLY) and SQLERROR(CHECK)

  EXPLAIN(ONLY) allows to explain the statements. SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements being bound.

MONITOR1
Revokes the privilege to obtain IFC data classified as serviceability data, statistics, accounting, and other performance data that does not contain potentially secure data.

MONITOR2
Revokes the privilege to obtain IFC data classified as containing potentially sensitive data such as SQL statement text and audit data. (Having the MONITOR2 privilege also implies having MONITOR1 privileges, however, revoking the MONITOR2 privilege does not cause the revoke of an explicitly granted MONITOR1 privilege.)

RECOVER
Revokes the privilege to issue the RECOVER INDOUBT command.

SQLADM
Revokes the privilege to issue the following:

- The DESCRIBE TABLE statement
- The EXPLAIN statement with the following options:
  - PLAN
  - ALL
  - STMTCACHE ALL
  - STMTID
  - STMTTOKEN
  - MONITORED STMTS

- The PREPARE statement
- The ability to explain dynamic SQL statements that are executing with the special register CURRENT EXPLAIN MODE = EXPLAIN
- The BIND options EXPLAIN(ONLY) and SQLERROR(CHECK)

  EXPLAIN(ONLY) allows to explain the statements. SQLERROR(CHECK) performs all syntax and semantic checks on the SQL statements being bound.
- The START command
- The STOP command
- The DISPLAY PROFILE command
- The ability to execute the RUNSTATS utility and the MODIFY STATISTICS utility in any database
- MONITOR2 privilege, which allows users to obtain IFC data that is classified as containing potentially sensitive data, such as SQL statement text and audit data, as well as IFC data that is classified as serviceability data, statistics, accounting, and other performance data.

STOPALL
Revokes the privilege to use the STOP DB2 command.

STOSPACE
Revokes the privilege to use the STOSPACE utility.

SYSADM
Revokes the system administrator authority.

SYSCTRL
Revokes the system control authority.

SYSOPR
Revokes the system operator authority.

TRACE
Revokes the privilege to use the MODIFY TRACE, START TRACE, and STOP TRACE commands.

ON SYSTEM
Identifies that the system privilege is revoked for the entire Db2 subsystem.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES

Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Examples

Example 1: Revoke DISPLAY privileges from user LUTZ.

```
REVOKE DISPLAY
  FROM LUTZ;
```

Example 2: Revoke BSDS and RECOVER privileges from users PARKER and SETRIGHT.

```
REVOKE BSDS,RECOVER
  FROM PARKER,SETRIGHT;
```

Example 3: Revoke TRACE privileges previously granted to all local users. (Grants to specific users will not be affected.)

```
REVOKE TRACE
  FROM PUBLIC;
```

Example 4: Revoke ARCHIVE privileges from role ROLE1:

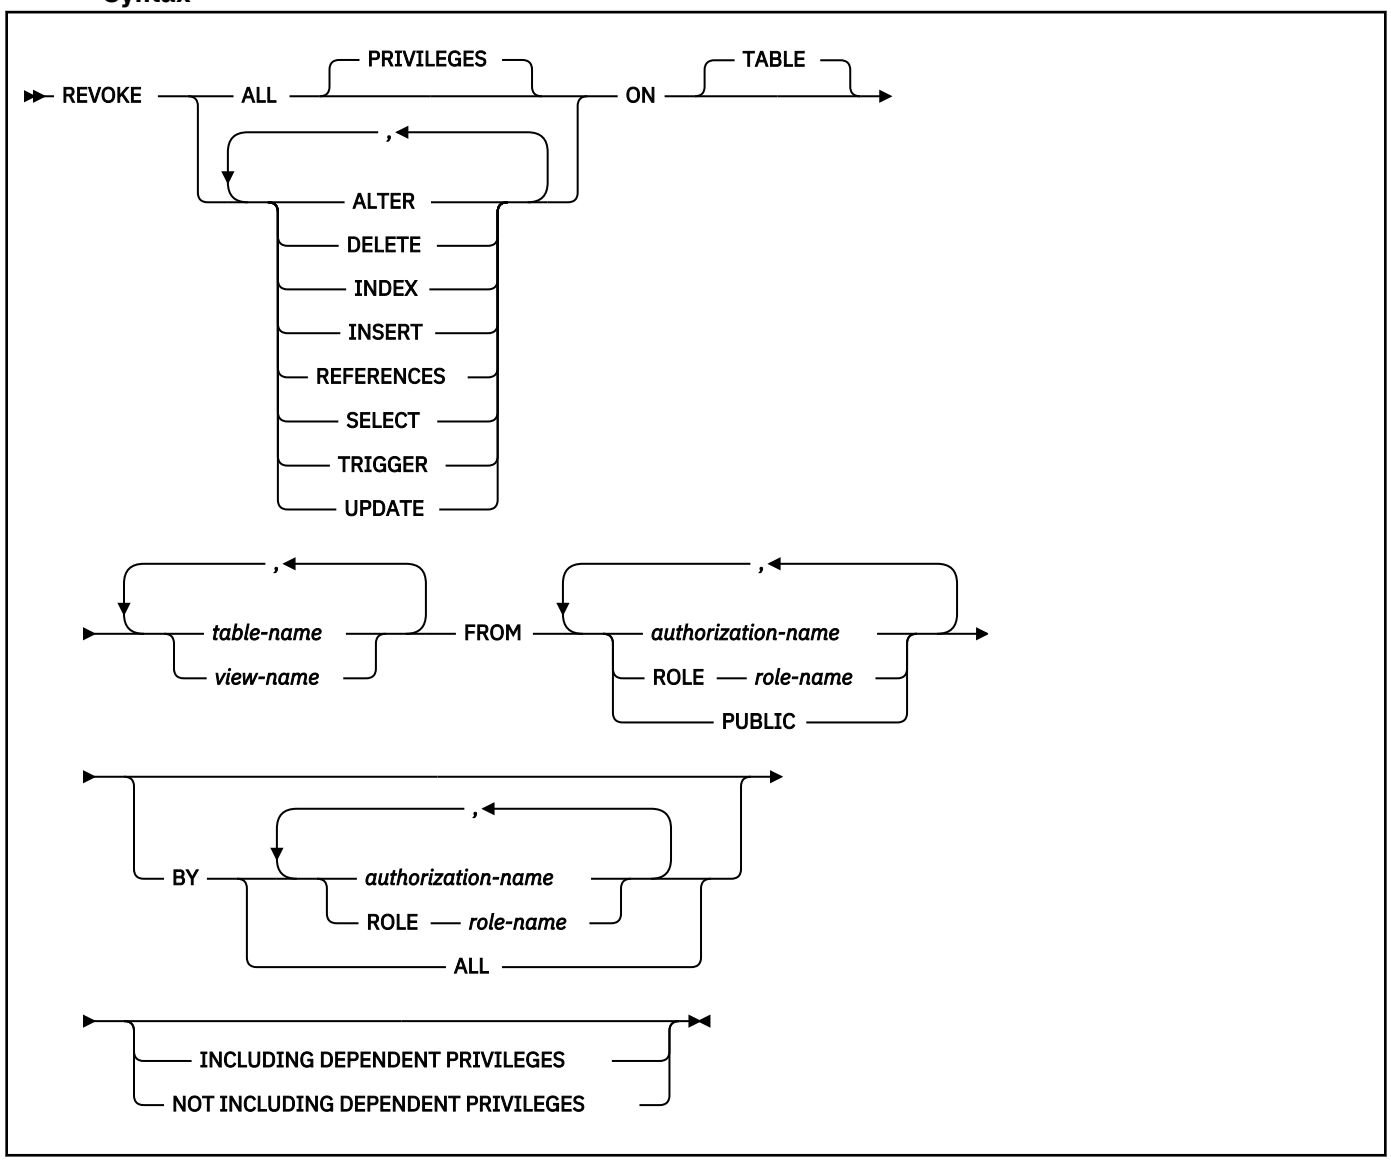
```
REVOKE ARCHIVE
  FROM ROLE ROLE1;
```

Example 5: SECADM Mary revokes the privilege to create a secure object from Steve that was granted by another SECADM.

```
REVOKE CREATE_SECURE_OBJECT
      FROM STEVE BY MARY;
```

Example 6: Revoke system DBADM from the role, ADMINROLE. This only revokes system DBADM authority from the role. If DATAACCESS and ACCESSCTRL authorities were granted during GRANT DBADM, those authorities are not revoked.

```
REVOKE DBADM ON SYSTEM
     FROM ROLE ADMINROLE
     NOT INCLUDING DEPENDENT PRIVILEGES;
```



Example 7: Revoke system DBADM, DATAACCESS, and ACCESSCTRL authorities from the role, ADMINROLE.

```
REVOKE DBADM, DATAACCESS, ACCESSCTRL ON SYSTEM
     FROM ROLE ADMINROLE
     NOT INCLUDING DEPENDENT PRIVILEGES;
```

REVOKE (table or view privileges)

This form of the REVOKE statement revokes privileges on one or more tables or views.

Syntax

Description

ALL or ALL PRIVILEGES

If you specify ALL, the authorization ID of the statement must have granted a least one privilege on each identified table or view to each *authorization-name*. The privilege revoked from an authorization ID are those privileges on the table or view that the authorization ID of the statement granted to the authorization ID.

If you do not use ALL, you must use one or more of the keywords listed below. Each keyword revokes the privilege described, but only as it applies to the tables or views named in the ON clause.

ALTER

Revokes the privilege to alter the specified table or create a trigger on the specified table.

DELETE

Revokes the privilege to delete rows in the specified table or view.

INDEX
Revokes he privilege to create an index on the specified table.

INSERT
Revokes the privilege to insert rows into the specified table or view.

REFERENCES
Revokes the privilege to define and drop referential constraints. Although you can use a list of column names with the GRANT statement, you cannot use a list of column names with REVOKE; the privilege is revoked for all columns.

SELECT
Revokes the privilege to create a view or read data from the specified table or view. A view or a materialized query table is dropped when the SELECT privilege that was used to create it is revoked, unless the owner of the view or materialized query table was directly granted the SELECT privilege from another source before the view or materialized query table was created.

TRIGGER
Revokes the privilege to create a trigger on the specified table.

UPDATE
Revokes the privilege to update rows in the specified table or view. A list of column names can be used only with GRANT, not with REVOKE.

ON *table-name* or *view-name*
Names one or more tables or views on which you are revoking the privileges. The list can consist of table names, view names, or a combination of the two. A table or view must not be identified more than one time, and a declared temporary table and a table that is implicitly created for an XML column must not be identified.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
If you omit BY, you must have granted each named privilege to each of the named users. More precisely, each privilege must have been granted to each user by a GRANT statement whose authorization ID is also the authorization ID of your REVOKE statement. Each of these grants is then revoked. (No single privilege need be granted on all tables and views.)

If BY is specified, each named grantor must satisfy the above requirement. In that case, the authorization ID of the statement need not satisfy the requirement unless it is one of the named grantors.

Refer to "REVOKE" on page 1876 for a description of the BY clause.

`INCLUDING DEPENDENT PRIVILEGES` or `NOT INCLUDING DEPENDENT PRIVILEGES`
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

`INCLUDING DEPENDENT PRIVILEGES`
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Notes

For a created temporary table, only ALL or ALL PRIVILEGES can be revoked. Specific table privileges cannot be revoked.

For a view of a created temporary table, either ALL or the specific UPDATE, DELETE, INSERT and SELECT privileges can be revoked.

For a declared temporary table, no privileges can be revoked because none can be granted. When a declared temporary table is defined, PUBLIC implicitly receives all table privileges (without GRANT authority) for the table. These privileges are not recorded in the Db2 catalog.

Examples

Example 1: Revoke SELECT privileges on table DSN8B10.EMP from user PULASKI.

```
REVOKE SELECT ON TABLE DSN8B10.EMP FROM PULASKI;
```

Example 2: Revoke update privileges on table DSN8B10.EMP previously granted to all local Db2 users. (Grants to specific users are not affected.)

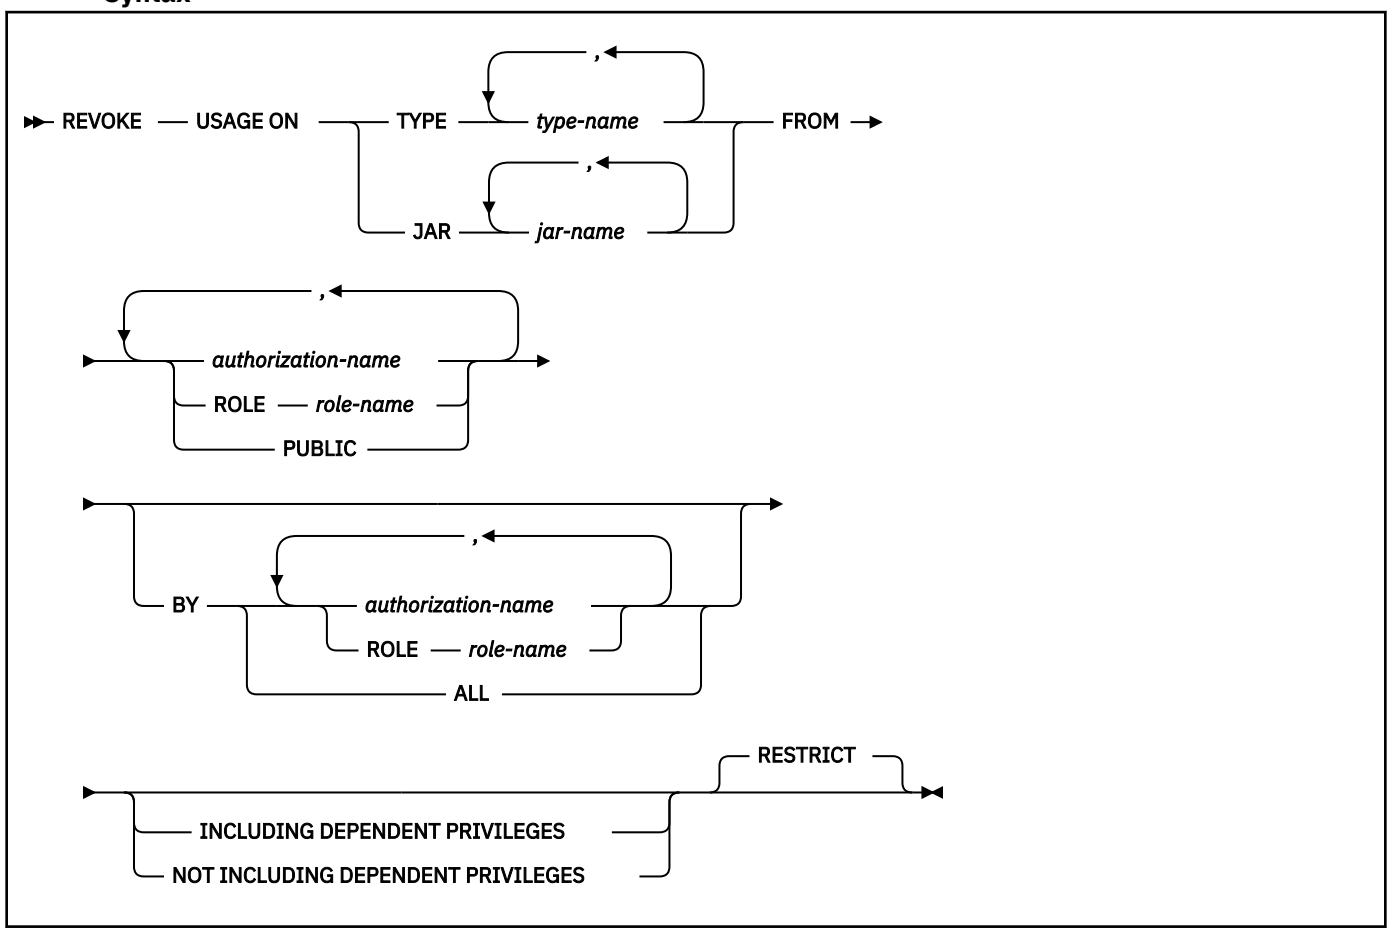
```
REVOKE UPDATE ON TABLE DSN8B10.EMP FROM PUBLIC;
```

Example 3: Revoke all privileges on table DSN8B10.EMP from users KWAN and THOMPSON.

```
REVOKE ALL ON TABLE DSN8B10.EMP FROM KWAN,THOMPSON;
```

Example 4: Revoke the grant of SELECT and UPDATE privileges on the table DSN8B10.DEPT to every user in the network. Doing so does not affect users who obtained these privileges from some other grant.

```
REVOKE SELECT, UPDATE ON TABLE DSN8B10.DEPT
  FROM PUBLIC;
```



Example 5: Revoke the ALTER privileges on the table DSN8B10.EMP that were previously granted to role ROLE1:

```
REVOKE ALTER ON TABLE DSN8B10.EMP
  FROM ROLE ROLE1;
```

REVOKE (type or JAR file privileges)

This form of the REVOKE statement revokes the privilege to use distinct types, array types, or JAR files.

Syntax

Description

USAGE
Revokes the privilege to use the distinct type in tables, functions procedures, or the privilege to use the JAR file.

TYPE *type-name*
Identifies the user-defined type. The name, including the implicit or explicit schema name, must identify a unique user-defined type that exists at the current server.

JAR *jar-name*
Identifies the JAR file. The name, including the implicit or explicit schema name, must identify a unique JAR file that exists at the current server.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, NOT INCLUDING DEPENDENT PRIVILEGES is assumed and an error is returned if the statement includes INCLUDING DEPENDENT PRIVILEGES.
- Otherwise, INCLUDING DEPENDENT PRIVILEGES is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

NOT INCLUDING DEPENDENT PRIVILEGES must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

NOT INCLUDING DEPENDENT PRIVILEGES cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

RESTRICT
Prevents the USAGE privilege from being revoked on a user-defined type or JAR file if any of the following conditions exist and the revokee does not have the USAGE privilege from another source:

- The revokee owns a function or stored procedure that uses the user-defined type or references the JAR file.
- The revokee owns a JAR file whose path references the JAR file for which USAGE is being revoked.
- The revokee owns a table that has a column that uses the user-defined type.
- A sequence exists for which the data type of the sequence is the user-defined type.

Notes

Alternative syntax and synonyms: To provide compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports DATA TYPE or DISTINCT TYPE as a synonym for TYPE.

Examples

Example 1: Revoke the USAGE privilege on distinct type SHOESIZE from user JONES.

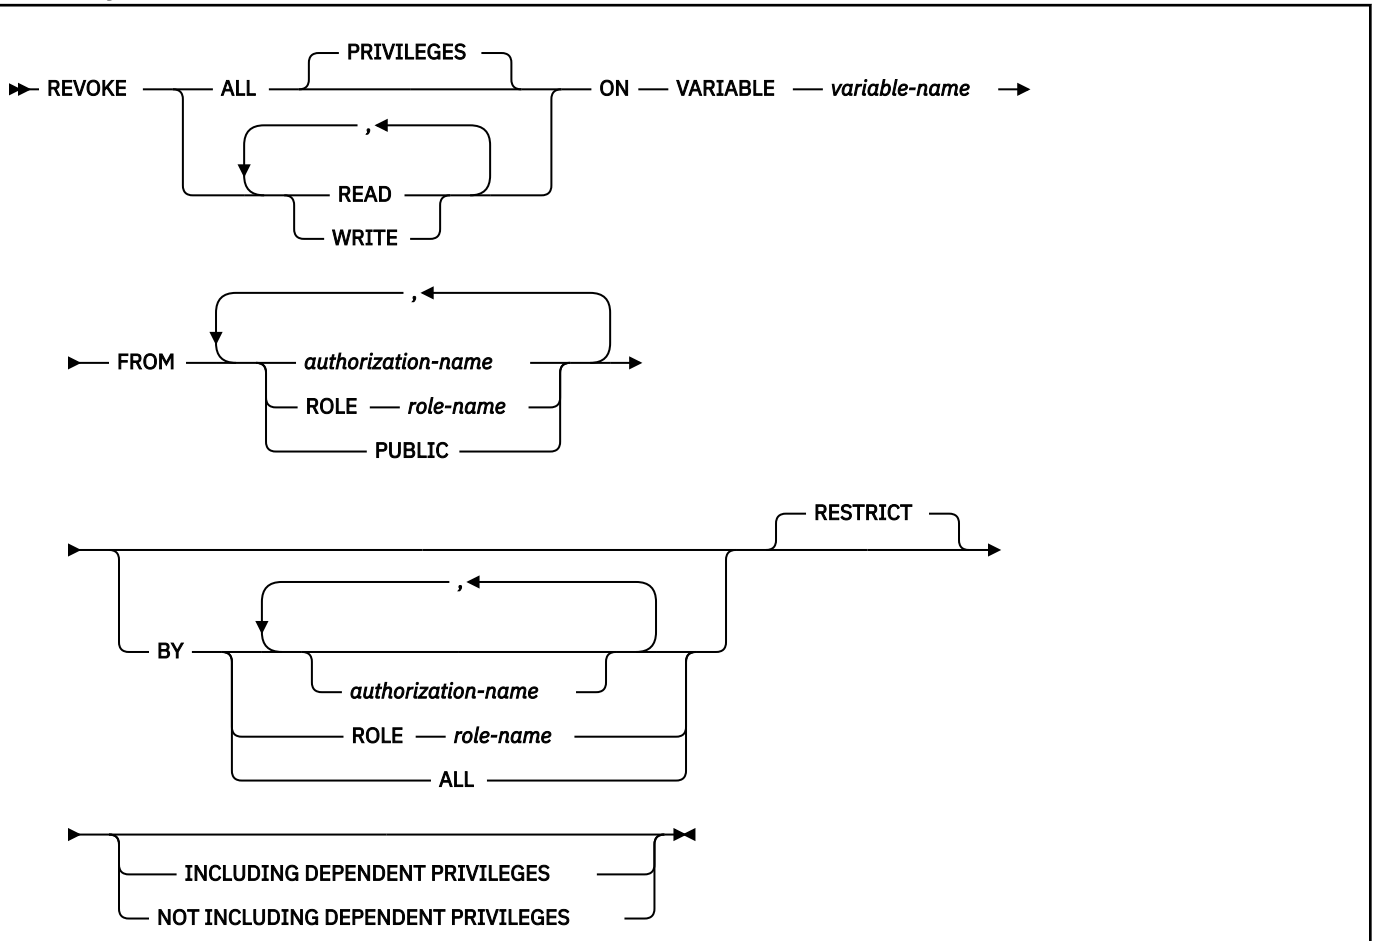
```
REVOKE USAGE ON TYPE SHOESIZE FROM JONES;
```

Example 2: Revoke the USAGE privilege on distinct type US_DOLLAR from all users at the current server except for those who have been specifically granted USAGE and not through PUBLIC.

```
REVOKE USAGE ON TYPE US_DOLLAR FROM PUBLIC;
```

Example 3: Revoke the USAGE privilege on distinct type CANADIAN_DOLLARS from the administrative assistant (ADMIN_A).

```
REVOKE USAGE ON TYPE CANADIAN_DOLLARS
      FROM ADMIN_A;
```



Example 4: Revoke the USAGE privilege on distinct type MILES from the role ROLE1:

```
REVOKE USAGE ON TYPE MILES
      FROM ROLE ROLE1;
```

REVOKE (variable privileges)

This form of the REVOKE statement revokes privileges on global variables.

Syntax

Description

ALL PRIVILEGES
Revokes both READ and WRITE privileges on the specified global variable.

READ
Revokes the privilege to read the value of the specified global variable.

WRITE
Revokes the privilege to assign a value to the specified global variable.

ON VARIABLE *variable-name*
Identifies the global variable from which privileges are revoked. *variable-name* must identify a global variable that exists at the current server.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

RESTRICT
Prevents the specified privileges from being revoked on a global variable if the following conditions exist:

- A function that is owned by the revokee references (READ or WRITE privilege) the specified global variable
- A view that is owned by the revokee references (READ or WRITE privilege) the specified global variable
- A trigger that is owned by the revokee references (READ or WRITE privilege) the specified global variable

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

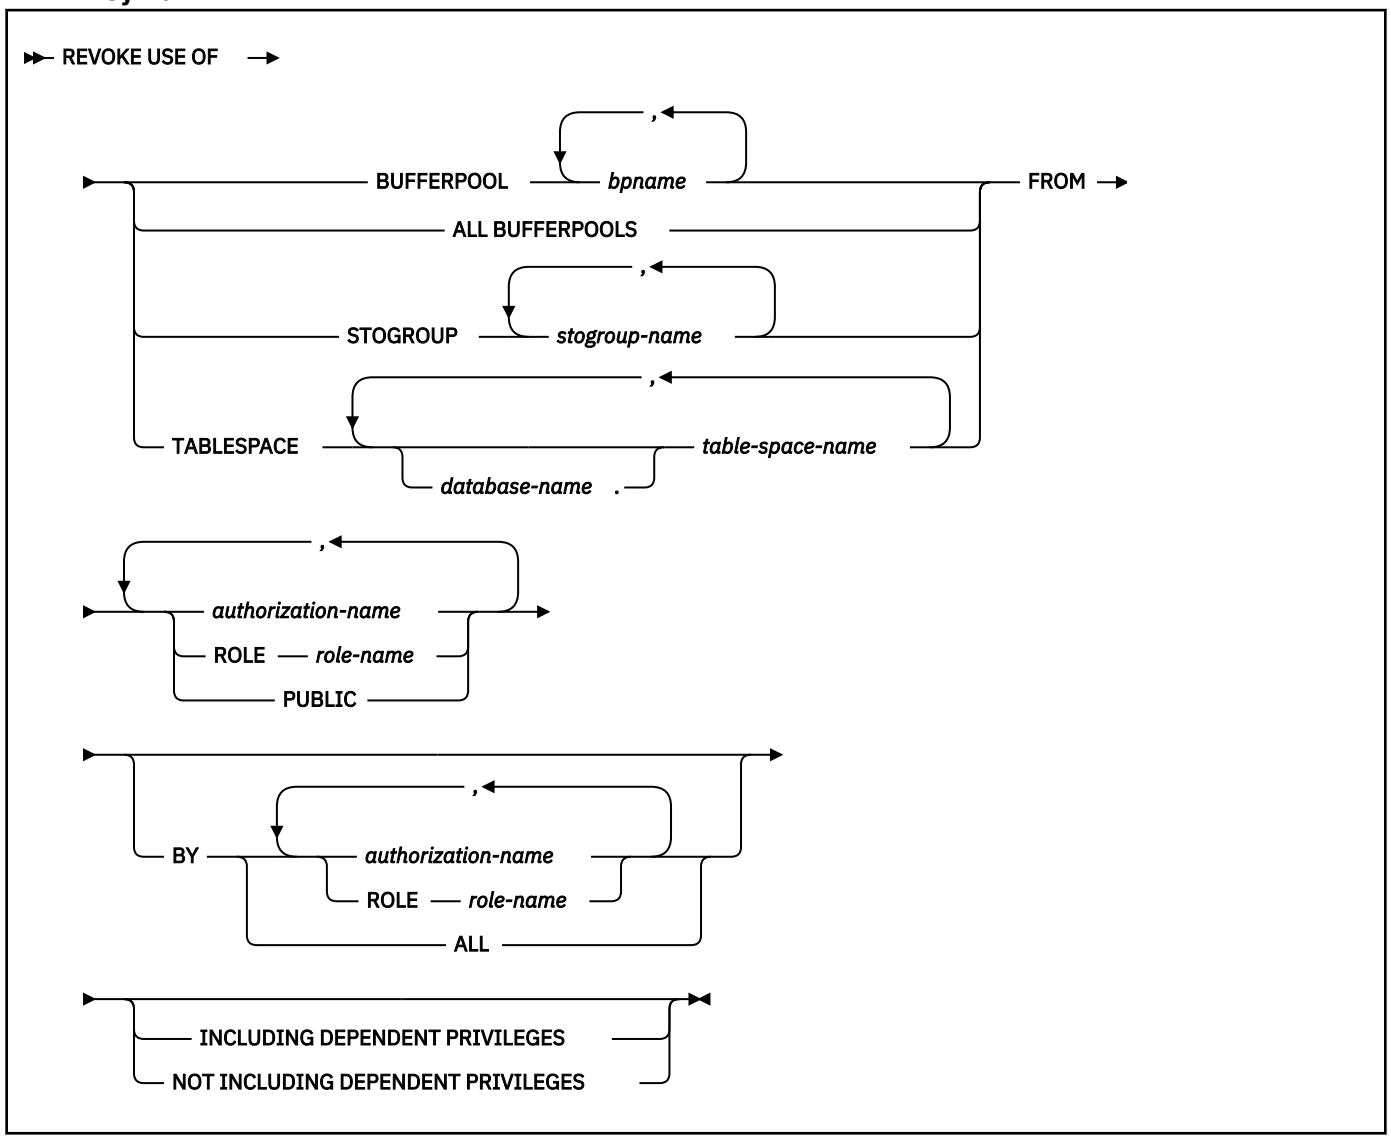
INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.



Notes

Global variables and statements in the dynamic statement cache: If a cached dynamic statement depends on the revoked authorization for the specified global variable and the cache statement is not in use, the cached dynamic statement will be invalidated.

REVOKE (use privileges)

This form of the REVOKE statement revokes authority to use particular buffer pools, storage groups, or table spaces.

Syntax

Description

BUFFERPOOL *bpname,...*
Revokes the privilege to refer to any of the identified buffer pools in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement. See “Naming conventions” on page 77 for more details about *bpname*.

ALL BUFFERPOOLS
Revokes the privilege to refer to any buffer pool in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

STOGROUP *stogroup-name,...*
Revokes the privilege to refer to any of the identified storage groups in a CREATE INDEX, CREATE TABLESPACE, ALTER INDEX, or ALTER TABLESPACE statement.

TABLESPACE *database-name.table-space-name,...*
Revokes the privilege to refer to any of the specified table spaces in a CREATE TABLE statement. The default *database-name* is DSNDB04.

For table spaces in a work file database you cannot revoke the privilege from PUBLIC. When a table space is created in a work file database, PUBLIC implicitly receives the TABLESPACE privilege (without GRANT authority); this privilege is not recorded in the Db2 catalog, and it cannot be revoked.

FROM
Refer to "REVOKE" on page 1876 for a description of the FROM clause.

BY
Refer to "REVOKE" on page 1876 for a description of the BY clause.

INCLUDING DEPENDENT PRIVILEGES or NOT INCLUDING DEPENDENT PRIVILEGES
Specifies whether revoking a privilege or an authority from an authorization ID or a role also results in revoking the grants that were made by that user. The default value is based on the authority that is being revoked and the REVOKE_DEP_PRIVILEGES system parameter:

- When ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.
- When the REVOKE_DEP_PRIVILEGES system parameter is set to NO, `NOT INCLUDING DEPENDENT PRIVILEGES` is assumed and an error is returned if the statement includes `INCLUDING DEPENDENT PRIVILEGES`.
- Otherwise, `INCLUDING DEPENDENT PRIVILEGES` is assumed and the clause must be specified on the REVOKE statement.

INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role also results in revoking dependent privileges. This means that any grants that were made by the user will continue to be revoked, until all grants in the chain have been revoked.

`INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set to NO, which enforces the behavior to not include the dependent privileges.

NOT INCLUDING DEPENDENT PRIVILEGES
Specifies that revoking a privilege or an authority from an authorization ID or a role does not cause the grants that were made by the user to be revoked. However, for the revoked privileges, all implications of the privilege being revoked are applied. For example, if the revoked privileges were required to bind a package successfully, that package would continue to be invalidated as a result of the package owner losing these privileges. An object might be dropped if a privilege is revoked that was used to create the object.

`NOT INCLUDING DEPENDENT PRIVILEGES` must be specified when ACCESSCTRL, DATAACCESS, or system DBADM authority is revoked.

`NOT INCLUDING DEPENDENT PRIVILEGES` cannot be specified if the system parameter REVOKE_DEP_PRIVILEGES is set toYES, which enforces the behavior to include dependent privileges in the revoke.

Notes

You can revoke privileges for only one type of object with each statement. Thus you can revoke the use of several table spaces with one statement, but not the use of a table space and a storage group.

For each object you name, you (or the indicated grantors) must have granted the USE privilege on that object to all identified users (including PUBLIC, if specified). The same object must not be identified more than once.

Revoking the privilege USE OF ALL BUFFERPOOLS does not cascade to all other privileges that can be granted under that privilege. A user with the privilege USE OF ALL BUFFERPOOLS WITH GRANT OPTION can make two types of grants:

- GRANT USE OF ALL BUFFERPOOLS TO *userid*. This privilege is revoked when the original user's privilege is revoked.
- GRANT USE OF BUFFERPOOL BP*n* TO *userid*. This privilege is *not revoked* when the original user's privilege is revoked.

Examples

Example 1: Revoke authority to use buffer pool BP2 from user MARINO.

```
REVOKE USE OF BUFFERPOOL BP2
  FROM MARINO;
```

Example 2: Revoke a grant of the USE privilege on the table space DSN8S11D in the database DSN8D11A. The grant is to PUBLIC, that is, to everyone at the local Db2 subsystem. (Grants to specific users are not affected.)

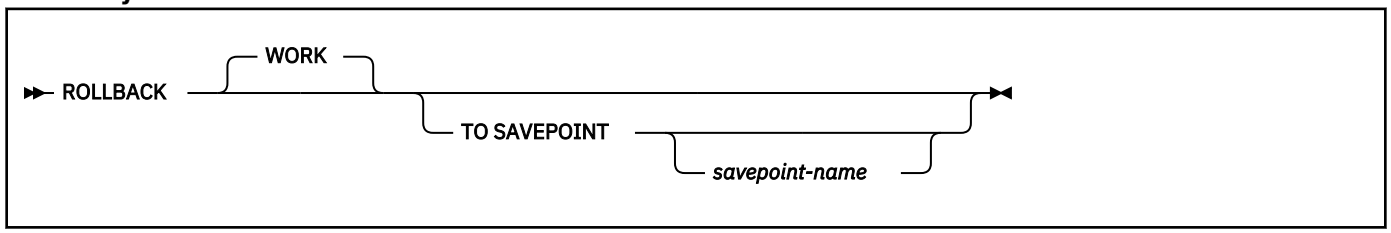
```
REVOKE USE OF TABLESPACE DSN8D11A.DSN8S11D
  FROM PUBLIC;
```

Example 3: Revoke the authority to use storage group SG1 from role ROLE1:

```
REVOKE USE OF STOGROUP SG1
  FROM ROLE ROLE1;
```

ROLLBACK

The ROLLBACK statement can be used to end a unit of recovery and back out all the relational database changes that were made by that unit of recovery. If relational databases are the only recoverable resources used by the application process, ROLLBACK also ends the unit of work. ROLLBACK can also be used to back out only the changes made after a savepoint was set within the unit of recovery without ending the unit of recovery. Rolling back to a savepoint enables selected changes to be undone.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared. It can be used in the IMS or CICS environment only if the TO SAVEPOINT clause is specified.

Authorization

None required.

Syntax

Description

When ROLLBACK is used without the SAVEPOINT clause, the unit of recovery in which the ROLLBACK statement is executed is ended and a new unit of recovery is started.

All changes that are made by the following statements during the unit of recovery are backed out:

- ALTER
- COMMENT
- CREATE
- DELETE
- DROP
- EXPLAIN
- GRANT
- INSERT
- LABEL
- MERGE
- REFRESH TABLE
- RENAME
- REVOKE
- SELECT INTO with an SQL data change statement
- select-statement with an SQL data change statement
- TRUNCATE when the IMMEDIATE clause is not specified
- UPDATE

ROLLBACK without the TO SAVEPOINT clause also causes the following actions to occur:

- All locks that are implicitly acquired during the unit of recovery are released. See "LOCK TABLE" on page 1829 for an explanation of the duration of explicitly acquired locks.
- All cursors are closed, all prepared statements are destroyed, and any cursors that are associated with the prepared statements are invalidated.
- All rows and all logical work files of every created temporary table of the application process are deleted. (All the rows of a declared temporary table are not implicitly deleted. As with base tables, any changes that are made to a declared temporary table during the unit of recovery are undone to restore the table to its state at the last commit point.)
- All LOB locators, including those that are held, are freed.

TO SAVEPOINT
Specifies that the unit of recovery is not to be ended and that only a partial rollback (to a savepoint) is to be performed. If a savepoint name is not specified, rollback is to the last active savepoint. For example, if in a unit of recovery, savepoints A, B, and C are set in that order and then C is released, ROLLBACK TO SAVEPOINT causes a rollback to savepoint B.

savepoint-name
Identifies the savepoint to which to roll back. The name must identify a savepoint that exists at the current server.

All database changes (including changes made to a declared temporary tables but excluding changes made to created temporary tables) that were made after the savepoint was set are backed out. Changes that are made to created temporary tables are not logged and are not backed out; a warning is issued instead. (A warning is also issued when a created temporary table is changed and there is an active savepoint.)

In addition, none of the following items are backed out:

- The opening or closing of cursors
- Changes in cursor positioning
- The acquisition and release of locks
- The caching of the rolled back statements

Any savepoints that are set after the one to which rollback is performed are released. The savepoint to which rollback is performed is not released.

ROLLBACK with or without the TO SAVEPOINT clause has no effect on connections.

Notes

The following information applies only to rolling back all changes in the unit of recovery (the ROLLBACK statement without the TO SAVEPOINT clause):

- *Stored procedures.* The ROLLBACK statement cannot be used if the procedure is in the calling chain of a user-defined function or a trigger or if Db2 is not the commit coordinator.
- *IMS or CICS.* Using a ROLLBACK to SAVEPOINT statement in an IMS or CICS environment only rolls back Db2 resources. Any other recoverable resources updated in the environment are not rolled back. To do a rollback operation in these environments, SQL programs must use the call prescribed by their transaction manager. The effect of these rollback operations on Db2 data is the same as that of the SQL ROLLBACK statement.

  A rollback operation in an IMS or CICS environment might handle the closing of cursors that were declared with the WITH hold option differently than the SQL ROLLBACK statement does. If an application requests a rollback operation from CICS or IMS, but no work has been performed in Db2 since the last commit point, the rollback request will not be broadcast to Db2. If the application had opened cursors using the WITH HOLD option in a previous unit of work, the cursors will not be closed, and any prepared statements associated with those cursors will not be destroyed.
- *Implicit rollback operations:* In all Db2 environments, the abend of a process is an implicit rollback operation.

ROLLBACK and non-LOB table spaces that are not logged: If ROLLBACK is executed for a unit of work that includes changes to a non-LOB table space that is not logged (specifies the NOT LOGGED attribute), that table space is marked RECOVER-pending and the table space is placed in the logical page list. The table space is therefore not available after the rollback operation completes. For more information about the RECOVER utility, see RECOVER (Db2 Utilities).

ROLLBACK and declared global temporary tables that are not logged: When NOT LOGGED is specified on a declared global temporary table and Db2 must roll back because of an error such as a duplicate key error, rows are deleted or preserved depending on the option that was specified for ON ROLLBACK.

If the ON ROLLBACK DELETE ROWS option was specified for the table, insert, update, and delete activity is not logged. During a ROLLBACK or ROLLBACK TO SAVEPOINT operation, if the table was updated since the last COMMIT statement, all rows are deleted from the table. Any open cursors for the table do not have positions. If the declaration of the declared global temporary table was not committed, the declaration of the table is rolled back.

If the ON ROLLBACK PRESERVE ROWS option was specified for the table, insert, update, and delete activity is not logged. During a ROLLBACK or ROLLBACK TO SAVEPOINT operation, all rows in the table are preserved regardless of any updates to the table since the last COMMIT statement. Any open cursors for the table do not have positions. If the declaration of the declared global temporary table was not committed, the declaration of the table is rolled back.

Effect of ROLLBACK on global variables: Global variables are not controlled at the transaction level. Issuing a ROLLBACK statement does not affect the contents of a global variable.

Effect of ROLLBACK on insert operations: If execution of an INSERT statement results in creation of a data set in a table space, and the INSERT operation is rolled back, the inserted data is deleted, but the data set is not deleted.

Examples

Example 1: Roll back all Db2 database changes made since the unit of recovery was started.

```
ROLLBACK WORK;
```

Example 2: After a unit of recovery started, assume that three savepoints A, B, and C were set and that C was released:

```
...
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
...
SAVEPOINT B ON ROLLBACK RETAIN CURSORS;
...
SAVEPOINT C ON ROLLBACK RETAIN CURSORS;
...
RELEASE SAVEPOINT C;
...
```

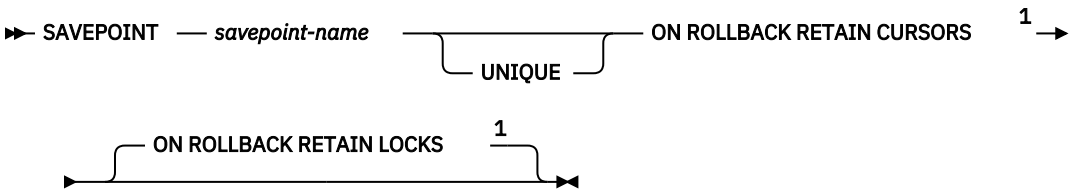
Roll back all Db2 database changes only to savepoint A:

```
ROLLBACK WORK TO SAVEPOINT A;
```

If a savepoint name was not specified (that is, `ROLLBACK WORK TO SAVEPOINT`), the rollback would be to the last active savepoint that was set, which is B.

SAVEPOINT

The SAVEPOINT statement sets a savepoint within a unit of recovery to identify a point in time within the unit of recovery to which relational database changes can be rolled back.



Invocation

This statement can be imbedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Notes:

1 These clauses can be specified in either order.

Description

savepoint-name
Names the savepoint. *savepoint-name* must not begin with 'SYS'.

UNIQUE
Specifies that the application program cannot reuse the savepoint name within the unit of recovery. An error occurs if a savepoint with the same name as *savepoint-name* already exists within the unit of recovery.

Omitting UNIQUE indicates that the application can reuse the savepoint name within the unit of recovery. If *svpt-name* identifies a savepoint that already exists within the unit of recovery and the savepoint was not created with the UNIQUE option, the existing savepoint is destroyed and a new savepoint is created. Destroying a savepoint to reuse its name for another savepoint is not the same as releasing the savepoint. Reusing a savepoint name destroys only one savepoint. Releasing a savepoint with the RELEASE SAVEPOINT statement releases the savepoint and all savepoints that have been subsequently set.

ON ROLLBACK RETAIN CURSORS
Specifies that any cursors that are opened after the savepoint is set are not tracked, and thus, are not closed upon rollback to the savepoint. Although these cursors remain open after rollback to the savepoint, they might not be usable. For example, if rolling back to the savepoint causes the insertion of a row on which the cursor is positioned to be rolled back, using the cursor to update or delete the row results in an error.

ON ROLLBACK RETAIN LOCKS
Specifies that any locks that are acquired after the savepoint is set are not tracked, and thus, are not released on rollback to the savepoint. ON ROLLBACK RETAIN LOCKS is the default behavior.

Example

Assume that you want to set three savepoints at various points in a unit of recovery. Name the first savepoint A and allow the savepoint name to be reused. Name the second savepoint B and do not allow the name to be reused. Because you no longer need savepoint A when you are ready to set the third savepoint, reuse A as the name of the savepoint.

```
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
    ⋮
SAVEPOINT B UNIQUE ON ROLLBACK RETAIN CURSORS;
    ⋮
SAVEPOINT A ON ROLLBACK RETAIN CURSORS;
```

SELECT

The *select-statement* is the form of a query that can be directly specified in a DECLARE CURSOR statement, or prepared and then referenced in a DECLARE CURSOR statement. It can also be issued interactively using SPUFI or the command line processor which causes a result table to be displayed at your terminal. In any case, the table specified by *select-statement* is the result of the fullselect.

For a description of the SELECT statement, see “select-statement” on page 987.

SELECT INTO

The SELECT INTO statement produces a result table that contains at most one row. The statement assigns the values in that row to variables. If the table is empty, the statement does not assign values to the host variables or global variables.

Invocation

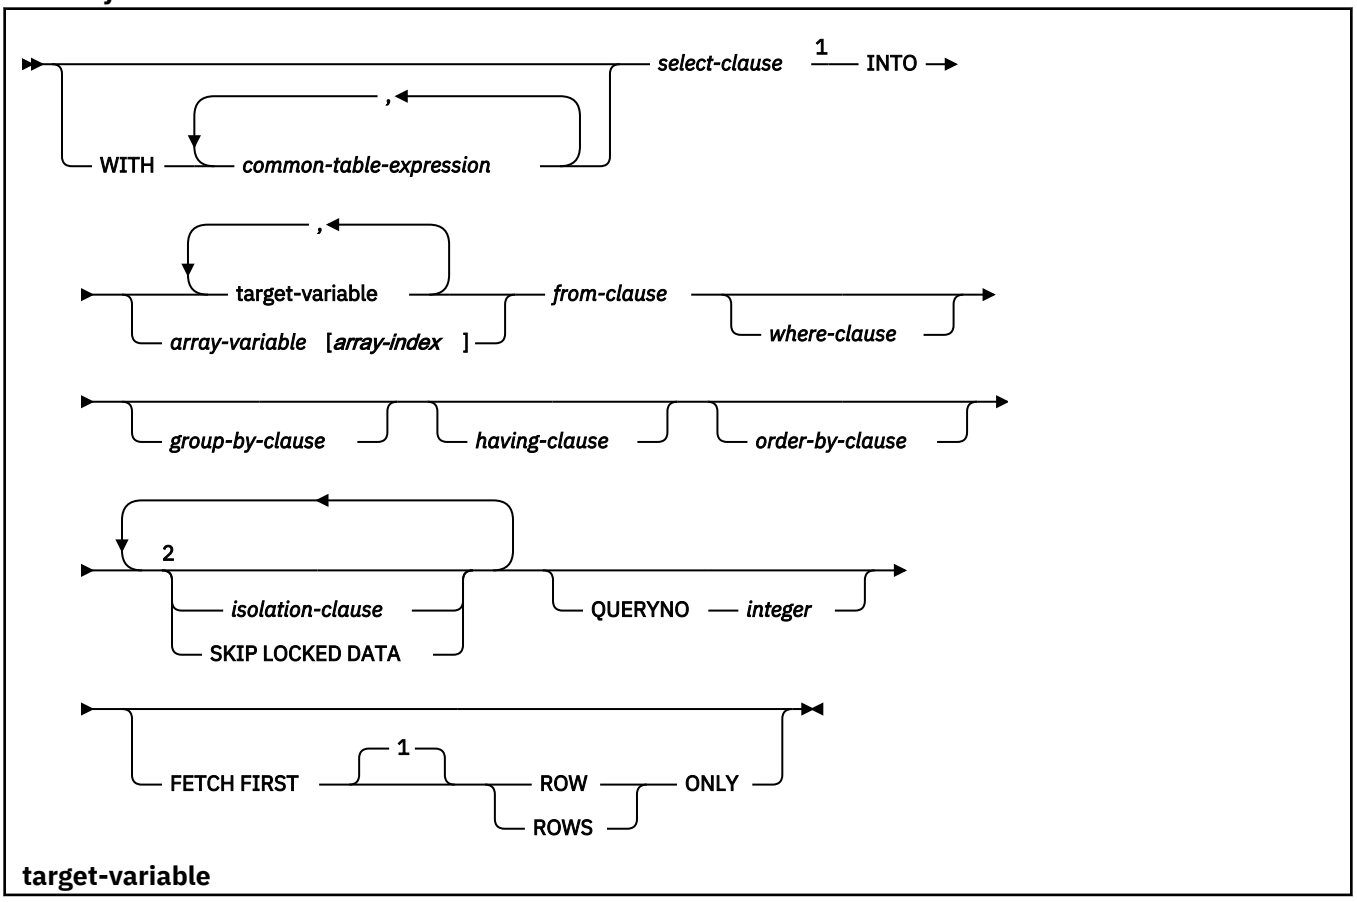
This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

The privilege set that is defined below must include at least one of the following:

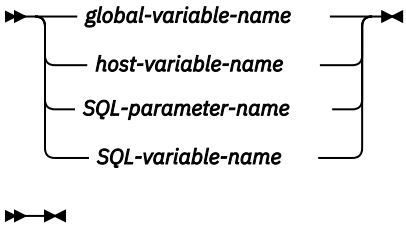
- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement

- READ privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)



If the SELECT INTO statement includes an SQL data change statement, the privilege set must also include at least the privileges (INSERT, UPDATE, or DELETE) that are associated with that SQL data change statement on the table or view.

For an assignment to a global variable, the privilege set must include at least one of the following:



- The WRITE privilege on the variable
- Ownership of the variable
- DATAACCESS authority
- SYSADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in DYNAMICRULES behaviors and authorization checking. For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.

Syntax

target-variable

Notes:

[1] The *select-clause* cannot reference both a system-period temporal table and an archive-enabled table.
[2] The same clause must not be specified more than once.

Description

The result table is derived by logically evaluating the *isolation-clause*, *from-clause*, *where-clause*, *group-by-clause*, *having-clause*, *order-by-clause*, and the *select-clause*, in this order. See Chapter 6, "Queries," on page 931 for a description of these clauses.

The tables or views identified in the statement can exist at the current server or at any Db2 subsystem with which the current server can establish a connection.

WITH *common-table-expression*
Refer to "common-table-expression" on page 988 for information about specifying a *common-table-expression*.

INTO *target-variable* or *array-variable*[*array-index*]
Identifies one or more targets for the assignment of output values. The number of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 135.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

***array-variable* [*array-index*]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

array-variable
Specifies an array variable.

[*array-index*]
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression
- A column that is not in a scalar fullselect.

The data type of a variable must be compatible with the value assigned to it. If the value is numeric, the variable must have the capacity to represent the integral part of the value. For a date or time value, the variable must be a character string variable of a minimum length as defined in "Assignment and comparison" on page 135.

Each assignment to a variable is made according to the rules described in "Assignment and comparison" on page 135. Assignments are made in sequence through the list.

If an error occurs as the result of an arithmetic expression in the SELECT list of a SELECT INTO statement (division by zero or overflow) or a numeric conversion error occurs, the result is the null value. As in any other case of a null value, an indicator variable must be provided and the main variable is unchanged. In this case, however, the indicator variable is set to -2. Processing of the statement continues as if the error had not occurred. (However, this error causes a positive SQLCODE.) If you do not provide an indicator variable, a negative value is returned in the SQLCODE field of the SQLCA. Processing of the statement terminates when the error is encountered.

If an error occurs, no value is assigned to the variable or to later variables, though any values that have already been assigned to variables remain assigned.

If an error occurs because the result table has more than one row, values might be assigned to the variables. If values are assigned to the variables, the row that is the source of the values is undefined and not predictable.

isolation-clause
Specifies the isolation level at which the statement is executed and, optionally, the type of locks that are acquired.

SKIP LOCKED DATA
Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. SKIP LOCKED DATA can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

SKIP LOCKED DATA is ignored if it is specified when the isolation level that is in effect is repeatable read (WITH RR) or uncommitted read (WITH UR).

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO columns of the plan tables for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the QUERYNO clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *Managing Performance*.

FETCH FIRST ROW ONLY *integer*

The FETCH FIRST ROW ONLY clause can be used in the SELECT INTO statement when the query can result in more than a single row. The clause indicates that only one row should be retrieved regardless of how many rows might be in the result table. When a number is explicitly specified, it must be 1.

Using the FETCH FIRST ROW ONLY clause to explicitly limit the result table to a single row provides a way for the SELECT INTO statement to be used with a query that returns more than a single row. Using the clause helps you to avoid using a cursor when you know that you want to retrieve only one row. To influence which row is returned, you can use the *order-by-clause*. When you specify *order-by-clause*, the rows of the result are ordered and then the first row is returned. If the FETCH FIRST ROW ONLY clause is not specified and the result table contains more than a single row, an error occurs.

Notes

Assignment to targets:

The *n*th target identified by the INTO clause or described in the SQLDA corresponds to the *n*th column of the result table of the cursor. The data type of target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 115. When the target is a host variable, if the value is null, an indicator variable must be specified.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 73. If the number of targets is less than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If the target is a host variable and the value is null, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (Db2 Application programming and SQL).

A timestamp without time zone value must not be assigned to a timestamp with time zone target.

Default encoding scheme:

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

If the result table is empty:
If the table is empty, the statement assigns +100 to SQLCODE, '02000' to SQLSTATE, and does not assign values to the host variables or global variables.

Number of rows inserted:
If the SELECT INTO statement of the cursor contains an SQL data change statement, the SELECT INTO operation sets SQLERRD(3) to the number of rows inserted.

Examples

Example 1: Put the maximum salary in DSN8B10.EMP into the host variable MAXSALRY.

```
EXEC SQL SELECT MAX(SALARY)
  INTO :MAXSALRY
  FROM DSN8B10.EMP;
```

Example 2: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC.

```
EXEC SQL SELECT * INTO :EMPREC
  FROM DSN8B10.EMP
  WHERE EMPNO = '528671'
END-EXEC.
```

Example 3: Put the row for employee 528671, from DSN8B10.EMP, into the host structure EMPREC. Assume that the row will be updated later and should be locked when the query executes.

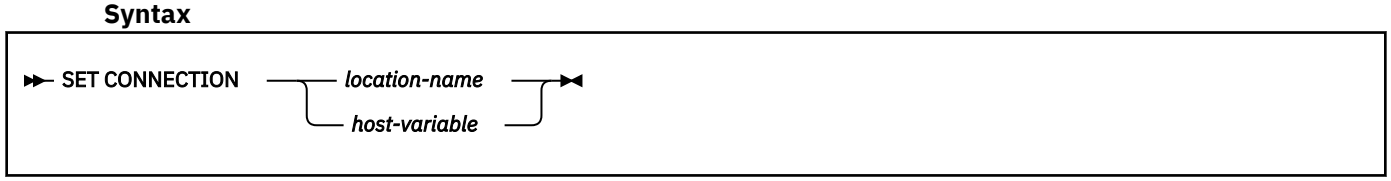
```
EXEC SQL SELECT * INTO :EMPREC
  FROM DSN8B10.EMP
  WHERE EMPNO = '528671'
  WITH RS USE AND KEEP EXCLUSIVE LOCKS
END-EXEC.
```

Example 4: Using a SELECT INTO statement, retrieve the value of INTCOL1 from table T1 into an element in array MYINTARRAY1, which is indexed by the value of the expression INTCOL2+MYINTVAR+1.

```
SELECT INTCOL1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1]
 FROM T1
 WHERE INTCOL1 = MYINTARRAY1[INTCOL2] ;
```

SET CONNECTION

The SET CONNECTION statement establishes the database server of the process by identifying one of its existing connections.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared. It must not be specified in Java.

Authorization

None required.

Syntax

Description

location-name* or *host-variable

Identifies the SQL connection by the specified location name or the location name contained in the host variable. If a host variable is specified:

- It must be a character string variable with a length attribute that is not greater than 16. (A C NUL-terminated character string can be up to 17 bytes.)
- It must not be followed by an indicator variable.
- The location name must be left-justified within the host variable and must conform to the rules for forming an ordinary location identifier.
- If the length of the location name is less than the length of the host variable, it must be padded on the right with blanks.

Let S denote the specified location name or the location name contained in the host variable. S must identify an existing SQL connection of the application process. If S identifies the current SQL connection, the state of S and all other connections of the application process are unchanged. The following rules apply when S identifies a dormant SQL connection.

If the SET CONNECTION statement is successful:

- SQL connection S is placed in the current state.
- S is placed in the CURRENT SERVER special register.
- Information about server S is placed in the SQLERRP field of the SQLCA. If the server is an IBM product, the information has the form *pppvvrrm*.

  The format of product identifier values is *pppvvrrm*, where *ppp* is a 3-letter product code (such as DSN for Db2), *vv* is the version, *rr* is the release, and *m* is the modification level. For example, DSN11015 identifies Db2 11 in new-function mode, the value is 'DSN11015'. The product code (*ppp*) is one of the following values:

  AQT for IBM Db2 Analytics Accelerator for z/OS
  ARI for DB2 Server for VSE & VM
  DSN for Db2 for z/OS
  HTP for non-secure HTTP URL connections for Db2 native REST services
  HTS for secure HTTPS connections for Db2 native REST services
  JCC for IBM Data Server Driver for JDBC and SQLJ
  QSQ for DB2 for i
  SQL for Db2 for Linux, UNIX, and Windows

  Modification (*m*) values have the following meanings:

  0
  Conversion and enabling-new-function modes for migration from DB2 10 (CM10, CM10*, ENFM10, and ENFM10*)

  5
  New-function mode.

- Any previously current SQL connection is placed in the dormant state.

If the SET CONNECTION statement is unsuccessful, the connection state of the application process and the states of its SQL connections are unchanged.

Notes

SET CONNECTION after CONNECT (Type 1): The use of CONNECT (Type 1) statements does not prevent the use of SET CONNECTION, but the statement either fails or does nothing because dormant SQL connections do not exist. The SQLRULES(Db2) bind option does not prevent the use of SET CONNECTION, but the statement is unnecessary because CONNECT (Type 2) statements can be used instead. Use the SET CONNECTION statement to conform to the SQL standard.

Status of locks, cursors, and prepared statements: When an SQL connection is used, made dormant, and then restored to the current state in the same unit of work, the status of locks, cursors, and prepared statements for that SQL connection reflects its last use by the application process.

Host variables: If the SET CONNECTION statement contains host variables, the contents of the host variables are assumed to be in the encoding scheme that was specified in the ENCODING parameter when the package or plan that contains the statement was bound.

Restrictions on array types and array variables: In any SQL statement other than a CALL statement, array types and array variables must not be referenced after a connection at a remote server has been established. This restriction includes an SQL statement that executes at a remote server as a result of a three-part name or alias that resolves to an object at a remote server. An exception is that an array element can be the target of a FETCH, SELECT INTO, SET *assignment-statement*, or VALUES INTO statement in an SQL routine even when the statement is executed at a remote server.

Example

Execute SQL statements at TOROLAB1, execute SQL statements at TOROLAB2, and then execute more SQL statements at TOROLAB1.

```
EXEC SQL CONNECT TO TOROLAB1;
  -- execute statements referencing objects at TOROLAB1
EXEC SQL CONNECT TO TOROLAB2;
  -- execute statements referencing objects at TOROLAB2
EXEC SQL SET CONNECTION TOROLAB1;
  -- execute statements referencing objects at TOROLAB1
```

The first CONNECT statement creates the TOROLAB1 connection, the second CONNECT statement places it in the dormant state, and the SET CONNECTION statement returns it to the current state.

SET assignment-statement

The SET *assignment-statement* statement assigns values to variables and array elements.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can by dynamically prepared if the targets of all assignments are global variables.

Authorization

The privileges that are held by the privilege set must include those required to execute any of the expressions.

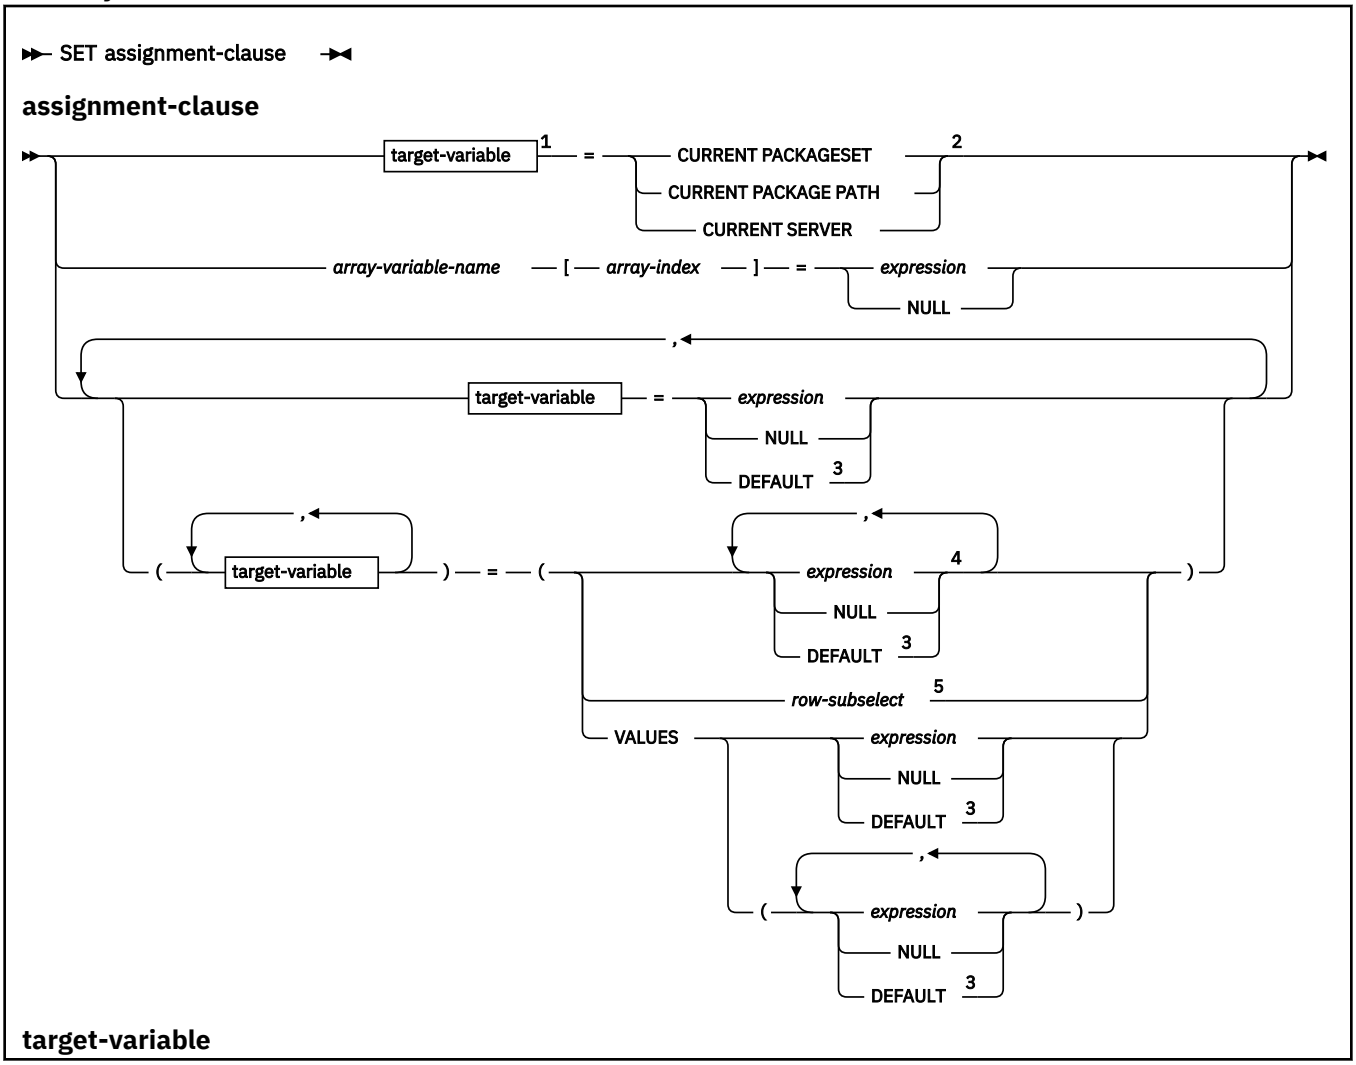
If a *row-subselect* is specified, see Chapter 6, “Queries,” on page 931 for an explanation of the authorization that is required for each subselect.

If a global variable is referenced, the privilege set must include at least one of the following:

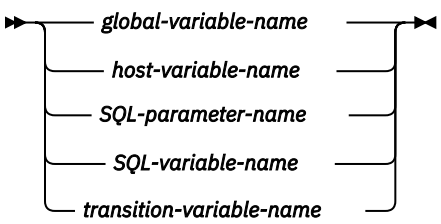
- The READ privilege on the variable
- Ownership of the variable
- DATAACCESS authority
- SYSADM authority

For an assignment to a global variable, the privilege set must include at least one of the following:

- The WRITE privilege on the variable



- Ownership of the variable
- DATAACCESS authority
- SYSADM authority



For an assignment to a transition variable, the privilege set must include at least one of the following:

- The UPDATE privilege on the table or view on which the trigger that contains the assignment statement is defined
- The UPDATE privilege on the column corresponding to the transition variable to be assigned a value
- Ownership of the table or view on which the trigger that contains the assignment statement is defined
- DBADM authority on the database that contains the table on which the trigger that contains the assignment statement is defined
- DATAACCESS authority
- SYSADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in DYNAMICRULES behaviors and authorization checking. For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.

Syntax

Notes:

[1] *target-variable* must not be an array type in this context.
[2] When the target is not a transition variable, SQL parameter, or an SQL variable that is used in a native SQL procedure or compiled SQL function, these special registers can be referenced only as a source value in this form of the syntax for this statement.
[3] DEFAULT must only be specified when the corresponding target is a transition variable.
[4] The number of source value specifications (expression, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.
[5] *row-subselect* can be specified only in the outermost subselect within SQL PL. *target-variable* cannot be a *global-variable-name* or *transition-variable-name*.

Description

***array-variable* [*array-index*]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

array-variable
Specifies an array variable.

[*array-index*]
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

The value that is to be assigned to an array element must be specified immediately following the array element. For example:

```
array-variable[array-index]=expression
```

expression
Specifies the value that is to be assigned to the corresponding assignment target. The expression is any expression of the type described in "Expressions" on page 229. The expression cannot contain a reference to the CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special register, unless the expression appears in a native SQL procedure or compiled SQL function. All

expressions are evaluated before any result is assigned to a target. If an expression refers to a variable or array element that is used in the list of assignment targets, the value of the variable or array element in the expression is the value of the variable or array element prior to any assignments.

Each assignment to a target is made according to the assignment rules described in "Assignment and comparison" on page 135. When the target variables and expressions are in the following form, the first value is assigned to the first target variable in the list, the second value is assigned to the second target variable in the list, and so on.

```
(target-variable,target-variable,…)=(expression,expression,…)
```

DEFAULT
Specifies that the default value is used based on how the corresponding column is defined in the table. The value that is assigned depends on how the column is defined.

- If the column is defined using the IDENTITY clause, the column is generated by the Db2 system.
- If the column is defined as a row change timestamp column, the column value is generated by the Db2 system.
- If the column is defined using the WITH DEFAULT clause, the value is set to the default that is defined for the column.
- If the column is defined without specifying the WITH DEFAULT clause, the GENERATED clause, or the NOT NULL clause, the value is NULL
- If the column is specified in the INCLUDE column list, the column value is set to null.

A ROWID column must not be set to the DEFAULT keyword.

An identity column or a row change timestamp column that is defined as GENERATED ALWAYS can be set only to the DEFAULT keyword.

If the column is defined using the NOT NULL clause and the GENERATED clause is not used, or the WITH DEFAULT clause is not used, the DEFAULT keyword cannot be specified for that column.

NULL
Specifies the null value and can only be specified for host variables that have an associated indicator variable.

VALUES
Specifies the values that are to be assigned to the corresponding assignment targets. When more than one value is specified, the values must be enclosed in parentheses. Each value can be an expression or NULL, as previously described. The following syntaxes are equivalent:

- (*target-variable*, *target-variable*) = (VALUES(*expression*, NULL))
- (*target-variable*, *target-variable*) = (*expression*, NULL)

The CURRENT APPLICATION ENCODING SCHEME, CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers can be referenced only in a SET *assignment-statement* statement or SQL PL *assignment-statement* statement that results in the assignment of a single target.

A parameter marker must not be specified.

target-variable
Identifies one or more targets for the assignment of values. The number of targets must equal the number of values that are to be assigned.

The value that is to be assigned to each target variable can be specified immediately following the variable. For example:

```
variable=expression, variable=expression
```

Alternatively, sets of parentheses can be used to specify all of the target variables, and then all of the values. For example:

```
(variable,variable)=(expression,expression)
```

The data type of each variable in the variable list must be compatible with its corresponding result column. Each assignment to a *target-variable* is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 135.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

transition-variable-name
Identifies the column that is to be updated in the transition row. A transition variable name must identify a column in the subject table of a trigger, and is optionally qualified by a correlation name that identifies the new value.

transition-variable-name must not correspond to a begin column or end column of a BUSINESS_TIME period, and must not be specified if the statement contains a *period-clause*.

Notes

Multiple assignments:
If more than one assignment is included in the same SET statement, all expressions and *row-subselects* are completely evaluated before the assignments are performed. Thus, references to a target variable in an expression or *row-subselect* are always the value of the target variable prior to any assignment in the SET statement.

LOBs assignments:
Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (Db2 Application programming and SQL).

Default encoding scheme:
The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Examples

Example 1: Set the host variable HVL to the value of the CURRENT PATH special register.

```
SET :HVL = CURRENT PATH;
```

Example 2: Set the host variable PATH to the contents of the SQL PATH special register, the host variable XTIME to the local time at the current server, and the host variable MEM to the current member of the data sharing environment.

```
SET :SERVER = CURRENT PATH,
    :XTIME = CURRENT TIME,
    :MEM = CURRENT MEMBER;
```

Example 3: Set the host variable DETAILS to a portion of a LOB value, using a LOB expression with a LOB locator to refer the extracted portion of the value.

```
SET :DETAILS = SUBSTR(:LOCATOR,1,35);
```

If the LOB data that is specified by the LOB locator LOCATOR is in a different encoding scheme from the value of the ENCODING bind option, and you want to avoid LOB materialization and character conversion, use the following statement instead of the SET statement:

```
SELECT SUBSTR(:LOCATOR,1,35)
   INTO :DETAILS
   FROM SYSIBM.SYSDUMMYU;
```

Example 4: Set host variable HV1 to the results of external function CALC_SALARY and host variable HV2 to the value of special register CURRENT PATH. Use an indicator value with HV1 in case CALC_SALARY returns a null value.

```
SET (:HV1:IND1, :HV2) =
    (CALC_SALARY(:HV3, :HF4), CURRENT PATH);
```

Example 5: Assume that you want to create a before trigger that sets the salary and commission columns to default values for newly inserted rows in the EMPLOYEE table and that you will define the trigger only with NEW in the REFERENCING clause. Assign the default values to the SALARY and COMMISSION columns.

```
SET (SALARY, COMMISSION) = (50000, 8000);
```

Example 6: Assume that you want to create a before trigger that detects any commission increases greater than 10% for updated rows in the EMPLOYEE table and limits the commission increase to 10%. You will define the trigger with both OLD and NEW in the REFERENCING clause. Limit an increase to the COMMISSION column to 10%.

```
SET NEWROW.COMMISSION = 1.1 * OLDROW.COMMISSION;
```

Example 7: Suppose that the associative array variable CANADACAPITALS has array type CAPITALSARRAY. Use SET *assignment-statement* statements to assign values to CANADACAPITALS.

```
SET CANADACAPITALS['British Columbia'] = 'Victoria';
SET CANADACAPITALS['Alberta'] = 'Edmonton';
SET CANADACAPITALS['Manitoba'] = 'Winnipeg';
SET CANADACAPITALS['Ontario'] = 'Toronto';
SET CANADACAPITALS['Nova Scotia'] = 'Halifax';
```

In the CANADACAPITALS array, the array index values are province names, and the associated array element values are the names of the corresponding capital cities. The order in which values are assigned to associative array elements does not matter. The elements of an associative array are stored in the array in ascending order of the associated array index values.

Example 8: Suppose that the associative array variables CANADACAPITALSA and CANADACAPITALSB have array type CAPITALSARRAY. The following SET *assignment-statement* statements have been used to assign values to CANADACAPITALSA.

```
SET CANADACAPITALSA['British Columbia'] = 'Victoria';
SET CANADACAPITALSA['Alberta'] = 'Edmonton';
SET CANADACAPITALSA['Manitoba'] = 'Winnipeg';
SET CANADACAPITALSA['Ontario'] = 'Toronto';
SET CANADACAPITALSA['Nova Scotia'] = 'Halifax';
```

Use a single SET *assignment-statement* statement to assign all of the values that are in CANADACAPITALSA to CANADACAPITALSB.

```
SET CANADACAPITALSB = CANADACAPITALSA;
```

Example 9: Suppose that P_PHONENUMBERS SQL array variable is defined as an ordinary array. Set P_PHONENUMBERS to an array of fixed numbers.

```
SET P_PHONENUMBERS = ARRAY[9055553907, 4165554213, 4085553678];
```

Example 10: Set the SQL array variable P_PHONENUMBERS to an array of numbers that are retrieved from the PHONENUMBER table.

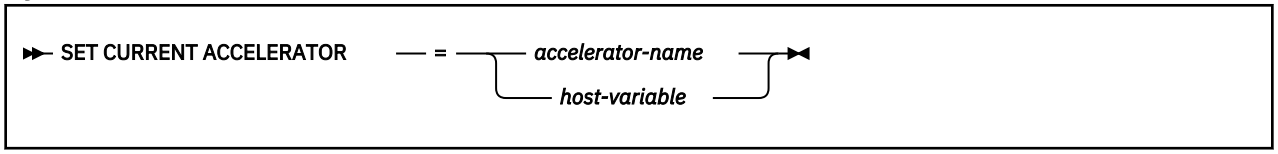
```
SET P_PHONENUMBERS =
 ARRAY [SELECT NUMBER
 FROM PHONENUMBERS
 WHERE EMPID = 624];
```

Example 11: Suppose that no values have been assigned to SQL array variable P_PHONENUMBERS. Assign the value of SQL variable P_MYNUMBER to the first and tenth elements of P_PHONENUMBERS. After the first assignment, the cardinality of P_PHONENUMBERS is 1. After the second assignment, the cardinality is 10, and elements 2 to 9 have been implicitly assigned the null value.

```
SET P_PHONENUMBERS[1]  = P_MYNUMBER;
SET P_PHONENUMBERS[10] = P_MYNUMBER;
```

SET CURRENT ACCELERATOR

The SET CURRENT ACCELERATOR statement changes the value of the CURRENT ACCELERATOR special register.



Invocation

This statement can be embedded in an application program, or it can be issued interactively. SET CURRENT ACCELERATOR is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

accelerator-name
A character string constant that represents an accelerator name or an accelerator logical name that is recorded in SYSIBM.LOCATIONS.

host variable
A variable that represents an accelerator name or an accelerator logical name that is recorded in SYSIBM.LOCATIONS.

The accelerator name or host variable that you specify must meet these criteria:

- It must be unique within the Db2 subsystem or data sharing group.
- It must be 8 characters or fewer.
- It must consist of the characters A-Z and 0-9.

Examples

The following statement sets the CURRENT ACCELERATOR special register so that ACCEL1 is the preferred accelerator.

```
SET CURRENT ACCELERATOR = ACCEL1;
```

The following statement sets the CURRENT ACCELERATOR special register to an alias that includes two accelerators, ACCLPRO1 and ACCLPRO2.

```
INSERT INTO SYSIBM.LOCATIONS (LOCATION, LINKNAME, DBALIAS)
VALUES (IDAATEST, 'DSNACCELERATORALIAS', 'ACCLPRO1 ACCLPRO2');

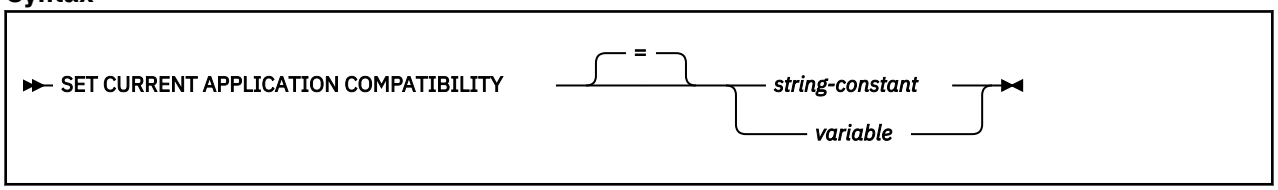
SET CURRENT ACCELERATOR = IDAATEST;
```

Related reference

“CURRENT ACCELERATOR” on page 173The CURRENT ACCELERATOR special register specifies a particular accelerator to which Db2 sends dynamic SQL. The CURRENT ACCELERATOR special register does not apply to static SQL.

SET CURRENT APPLICATION COMPATIBILITY

The SET CURRENT APPLICATION COMPATIBILITY statement assigns a value to the CURRENT APPLICATION COMPATIBILITY special register. This special register allows users to control the package compatibility level behavior for dynamic SQL.



Invocation

This statement can be embedded in an application program or dynamically prepared.

Authorization

None required.

Syntax

Description

string-constant
Specifies a character string constant. The value must represent a valid release compatibility level, in uppercase.

variable
A variable with a data type of CHAR or VARCHAR. The value of *variable* must not be null and must represent a valid release compatibility level, in uppercase.

The value must:

- Be left-aligned within the *variable*
- Be padded on the right with blanks if its length is less than the *variable*

The following levels can be specified to set to specify the compatibility behavior of dynamic SQL statements in packages:

V11R1
Specifies Db2 11 application compatibility behavior. This value is supported only in Db2 11 new-function mode.

V10R1
Specifies Db2 10 compatibility behavior.

Examples

The following examples set the CURRENT APPLICATION COMPATIBILITY special register to 'V10R1' (in the second example, host variable HV1 = 'V10R1').

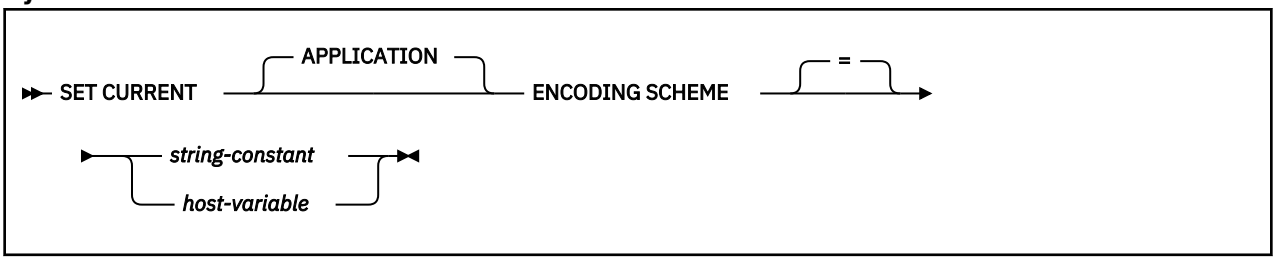
```
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = 'V10R1';
EXEC SQL SET CURRENT APPLICATION COMPATIBILITY = :HV1;
```

Related reference

CURRENT APPLICATION COMPATIBILITY
CURRENT APPLICATION COMPATIBILITY specifies the application compatibility level support for dynamic SQL statements in packages.

SET CURRENT APPLICATION ENCODING SCHEME

The SET CURRENT APPLICATION ENCODING SCHEME statement assigns a value to the CURRENT APPLICATION ENCODING SCHEME special register. This special register allows users to control which encoding scheme will be used for dynamic SQL statements after the SET statement has been executed.



Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

Description

string-constant
A character string constant that represents a valid encoding scheme (ASCII, EBCDIC, UNICODE, or a character representation of a number between 1 and 65533).

host variable
A variable with a data type of CHAR or VARCHAR. The value of *host-variable* must not be null and must represent a valid encoding scheme or a character representation of a number between 1 and 65533). An associated indicator variable must not be provided.

The value must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

Examples

The following examples set the CURRENT APPLICATION ENCODING SCHEME special register to 'EBCDIC' (in the second example, Host variable HV1 = 'EBCDIC').

```
EXEC SQL SET CURRENT APPLICATION ENCODING SCHEME = 'EBCDIC';
EXEC SQL SET CURRENT ENCODING SCHEME  = :HV1;
```

Related reference

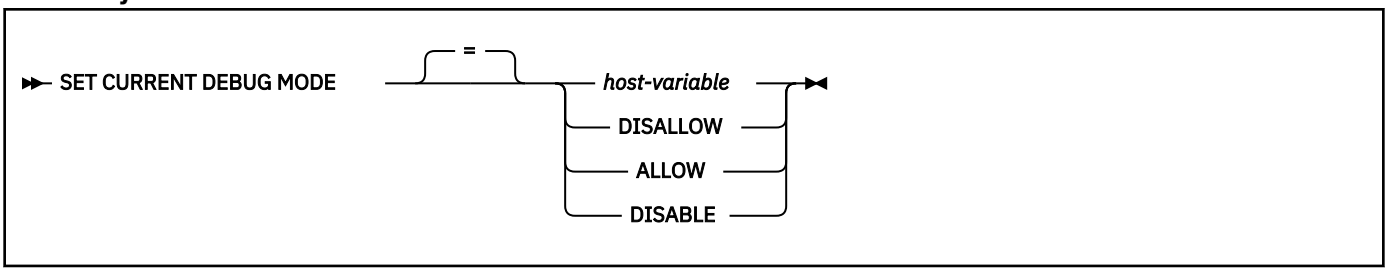
CURRENT APPLICATION ENCODING SCHEME
CURRENT APPLICATION ENCODING SCHEME specifies which encoding scheme is to be used for dynamic statements. It allows an application to indicate the encoding scheme that is used to process data. This register is not supported in REXX applications or in stored procedures written in REXX.

SET CURRENT DEBUG MODE

The SET CURRENT DEBUG MODE statement assigns a value to the CURRENT DEBUG MODE special register.

The special register sets the default value for the DEBUG MODE option for the following statements:

- CREATE FUNCTION statements that define an SQL scalar function
- ALTER FUNCTION statements that create or replace a version of an SQL scalar function
- CREATE PROCEDURE statements that define a native SQL or Java procedure
- ALTER PROCEDURE statements that create or replace a version of a native SQL procedure



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

host-variable
Specifies a host variable that contains the debugging option. The host variable must conform to the following rules:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of the special register.
- Include a keyword value of DISALLOW, ALLOW, or DISABLE that is left justified
- Be padded on the right with blanks if the host variable is a fixed length character
- Not contain lowercase letters or characters that cannot be specified in an ordinary identifier
- Not be empty or contain only blanks
- Not be the null value

DISALLOW
Specifies that DISALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, or a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

ALLOW
Specifies that ALLOW DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

DISABLE
Specifies that DISABLE DEBUG MODE is the default option for CREATE statements when defining an SQL scalar function, a native SQL procedure, a Java procedure, or ALTER statements that create or replace a version of an SQL scalar function or a native SQL procedure.

Examples

Example: The following statement sets the CURRENT DEBUG MODE special register so that the default option for CREATE PROCEDURE statements will be ALLOW DEBUG MODE:

```
SET CURRENT DEBUG MODE = ALLOW;
```

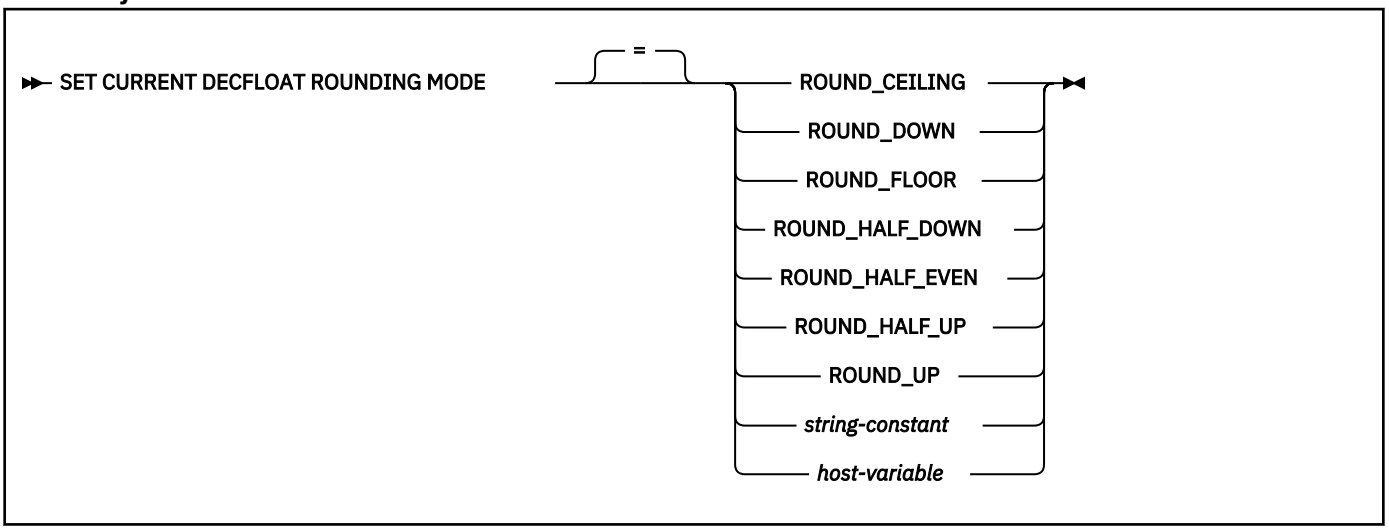
Related reference

CURRENT DEBUG MODE

CURRENT DEBUG MODE specifies the default value for the DEBUG MODE option when certain routines are created. The DEBUG MODE option specifies whether the routine should be built with the ability to run in debugging mode.

SET CURRENT DECFLOAT ROUNDING MODE

The SET CURRENT DECFLOAT ROUNDING MODE statement assigns a value to the CURRENT DECFLOAT ROUNDING MODE special register. The special register sets the default rounding mode that is used with decimal floating point values (DECFLOAT).



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

ROUND_CEILING
Round towards positive infinity. If all of the discarded digits are zero or if the sign is negative, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up).

ROUND_DOWN
Round towards 0 (truncation). The discarded digits are ignored.

ROUND_FLOOR
Round towards negative infinity. If all of the discarded digits are zero or if the sign is positive, the result is unchanged other than the removal of discarded digits. Otherwise, the sign is negative and the result coefficient is incremented by 1 (round down).

ROUND_HALF_DOWN
Round to nearest value; if values are equidistant, rounds down. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise, the discarded digits are ignored. This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

ROUND_HALF_EVEN
Round to nearest value; if values are equidistant, round so that the final digit is even. If the discarded digits represent greater than half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). If the discarded digits represent less than half of the value, the result coefficient is not adjusted (that is, the discarded digits are ignored). Otherwise, the result coefficient is unaltered if its rightmost digit is even, or is incremented by 1 (round up) if its rightmost digit is odd (to make an even digit).

ROUND_HALF_UP
Round to nearest value; if values are equidistant, round up. If the discarded digits represent greater than or equal to half (0.5) of the value of a number in the next left position, the result coefficient is incremented by 1 (round up). Otherwise the discarded digits are ignored.

ROUND_UP
Round away from 0. If all of the discarded digits are zero, the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient is incremented by 1 (round up). This rounding mode is not recommended when creating a portable application because it is not supported by the IEEE draft standard for floating-point arithmetic.

string-constant
Specifies a string constant that contains a specification of the rounding mode. The string-constant must have the following characteristics:

- Must be a string constant. The actual length of the contents of the string constant, after trailing blanks have been removed, must not exceed 19 characters.
- Must not be the null value.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must specify one of the seven rounding mode keywords as a string constant.

host-variable
Specifies a variable that contains a specification of the rounding mode. The variable must have the following characteristics:

- Must have a length, after trailing blanks have been removed, that does not exceed 19 bytes.
- Must not be followed by an indicator variable.
- Must not be a CLOB or DBCLOB.
- Must include a rounding mode that is left justified and conforms to the rules for forming an ordinary identifier.
- Must not contain lower case letters or characters that cannot be specified in an ordinary identifier.
- Must be padded on the right with blanks if the variable is a fixed length string.
- Must contain one of the seven rounding mode keywords.

Examples

Example: The following statement sets the CURRENT DECFLOAT ROUNDING MODE to ROUND_CEILING, using a string constant and a keyword.

```
SET CURRENT DECFLOAT ROUNDING MODE = ROUND_CEILING;
```

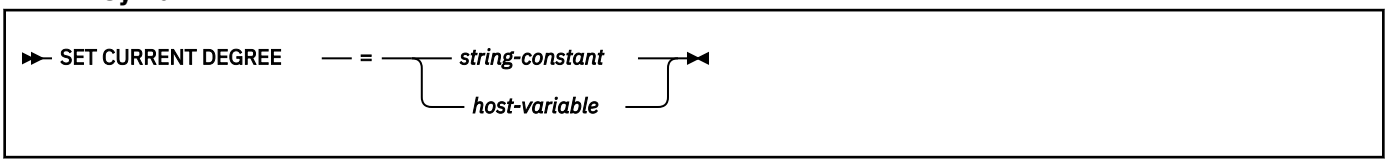
Related reference

CURRENT DECFLOAT ROUNDING MODE

CURRENT DECFLOAT ROUNDING MODE specifies the default rounding mode that is used for DECFLOAT values.

SET CURRENT DEGREE

The SET CURRENT DEGREE statement assigns a value to the CURRENT DEGREE special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

The value of CURRENT DEGREE is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 3 bytes and the value must be 'ANY', '1', or '1 '.

Notes

If the value of CURRENT DEGREE is '1' when a query is dynamically prepared, the execution of that query will not use parallel operations. If the value of CURRENT DEGREE is 'ANY' when a query is dynamically prepared, the execution of that query can involve parallel operations.

For distributed applications, the default value at the server is used unless the requesting application issues the SQL statement SET CURRENT DEGREE. For requests using DRDA, the SET CURRENT DEGREE statement must be within the scope of the CONNECT statement.

The value specified in the SET CURRENT DEGREE statement remains in effect until it is changed by the execution of another SET CURRENT DEGREE statement or until deallocation of the application process. For applications that connect to Db2 using the call attachment facility, the value of register CURRENT DEGREE can be requested to remain in effect for a longer duration. For more information, see the description of the call attachment facility CONNECT statement in *Db2 Application Programming and SQL Guide*.

Examples

Example 1: The following statement inhibits parallel operations:

```
SET CURRENT DEGREE = '1';
```

Example 2: The following statement allows parallel operations:

```
SET CURRENT DEGREE = 'ANY';
```

Related concepts

Parallel processing (Db2 Performance)

Related reference

CURRENT DEGREE

CURRENT DEGREE specifies the degree of parallelism for the execution of queries that are dynamically prepared by the application process.

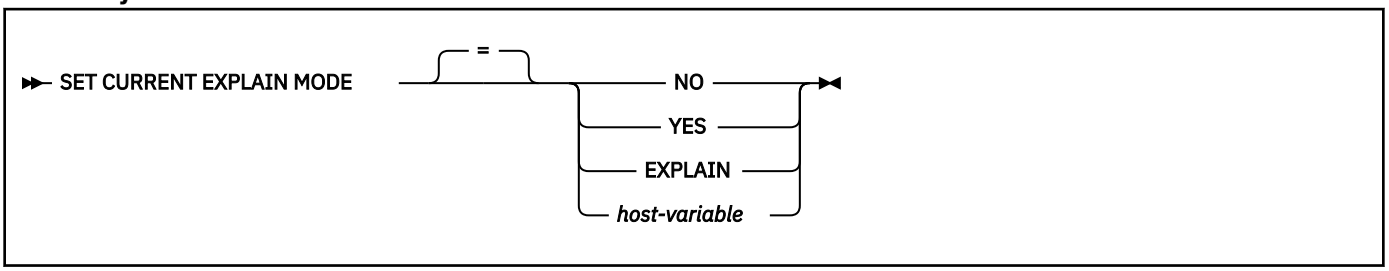
CURRENT DEGREE field (CDSSRDEF subsystem parameter) (Db2 Installation and Migration)

CONNECT

The CONNECT statement connects an application process to a database server. This server becomes the *current server* for the process. The CONNECT statement of Db2 for z/OS is equivalent to CONNECT (Type 2) in IBM Db2 SQL Reference for Cross-Platform Development.

SET CURRENT EXPLAIN MODE

The SET CURRENT EXPLAIN MODE statement assigns a value to the CURRENT EXPLAIN MODE special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

This statement replaces the value of the CURRENT EXPLAIN MODE special register with the value of the specified keyword or host variable.

NO
Specifies that no EXPLAIN information is captured. NO is the initial value of the EXPLAIN MODE special register.

YES
Enables the EXPLAIN facility and causes EXPLAIN information to be inserted into the EXPLAIN tables for eligible dynamic SQL statements after the statement is prepared and executed. All dynamic SQL statements are compiled and executed normally.

EXPLAIN
Enables the EXPLAIN facility and causes EXPLAIN information to be captured for any eligible dynamic SQL statement after the statement is prepared. This setting behaves similarly to YES, however, dynamic statements, except for SET statements, are not executed.

host-variable
host-variable must be a CHAR or VARCHAR value and must be NO, YES, or EXPLAIN. Leading blanks are not allowed. All input values must be uppercase, must be left justified within the host variable, and must be padded on the right with blanks if the length of the value is less than the length of the host variable.

For values YES and EXPLAIN, prepared statements are not saved into the dynamic statement cache.

Examples

Example 1: The following statement sets the CURRENT EXPLAIN MODE special register, so that EXPLAIN information will be captured for any subsequent eligible dynamic SQL statements during execution.

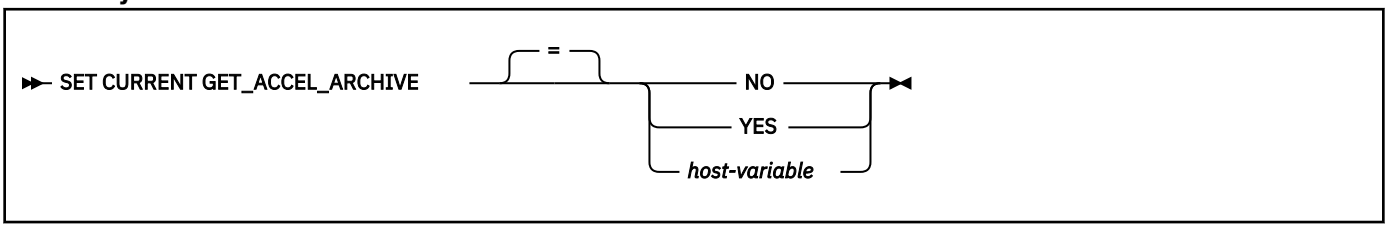
```
SET CURRENT EXPLAIN MODE = YES;
```

Related reference

CURRENT EXPLAIN MODE
The CURRENT EXPLAIN MODE special register contains the values that control the EXPLAIN behavior in regards to eligible dynamic SQL statements.

SET CURRENT GET_ACCEL_ARCHIVE

The SET CURRENT GET_ACCEL_ARCHIVE statement changes the value of the CURRENT GET_ACCEL_ARCHIVE special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

NO
Specifies that if a table is archived in an accelerator server, and a query references that table, the query does not use the data that is archived.

YES
Specifies that if a table is archived in an accelerator server, and a query references that table, the query uses the data that is archived.

host-variable
A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are YES or NO. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be left justified and must be padded on the right with blanks.

Examples

The following statement sets the CURRENT GET_ACCEL_ARCHIVE special register to NO to indicate that when a table is archived in an accelerator server, the table reference does not include the archived data.

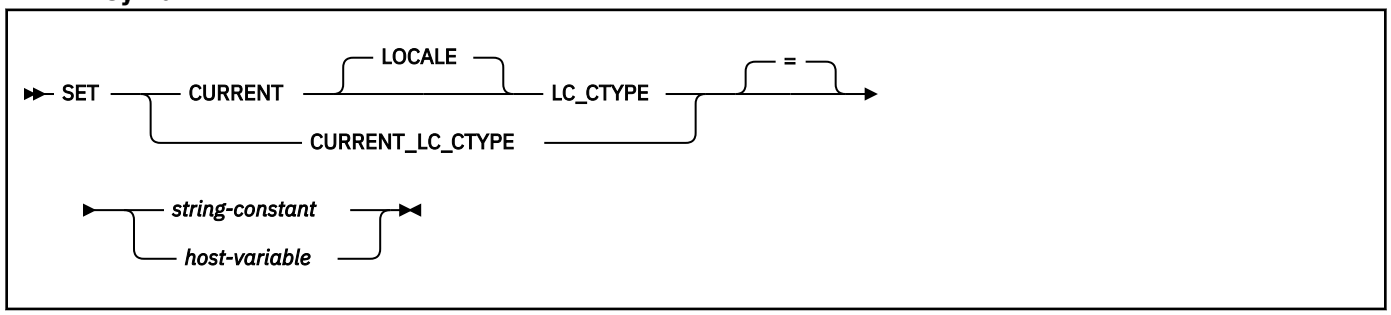
```
SET CURRENT GET_ACCEL_ARCHIVE=NO;
```

Related reference

CURRENT GET_ACCEL_ARCHIVE
The CURRENT GET_ACCEL_ARCHIVE special register specifies whether a dynamic SQL query that references a table that is archived on an accelerator server uses the archived data. The special register does not apply to static SQL queries.

SET CURRENT LOCALE LC_CTYPE

The SET CURRENT LOCALE LC_CTYPE statement assigns a value to the CURRENT LOCALE LC_CTYPE special register. The special register allows control over the LC_CTYPE locale for statements that use a built-in function that refers to a locale, such as LCASE, UCASE, and TRANSLATE (with a single argument).



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

The value of CURRENT LOCALE LC_CTYPE is replaced by the value specified.

string-constant
A character string constant that must not be longer than 50 bytes and must represent a valid locale.

host-variable
A variable with a data type of CHAR or VARCHAR and a length that is not longer than 50 bytes. The value of *host-variable* must not be null and must represent a valid locale. If the host variable has an associated indicator variable, the value of the indicator variable must not indicate a null value.

The locale must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

A locale can be specified in uppercase characters, lowercase characters, or a combination of the two. For more information, see CURRENT LOCALE LC_CTYPE.

Note: The existence of a locale is not validated when the CURRENT LOCALE LC_CTYPE special register is set. For example, a locale name that is misspelled is not detected, which could affect the way subsequent SQL operates. When the special register value is used at execution time, an error is returned if the locale does not exist. For example, if the LOWER function is invoked without specifying a locale name, the special register determines the locale that is used.

Examples

Example 1: Set the CURRENT LOCALE LC_CTYPE special register to the locale 'En_US'.

```
EXEC SQL SET CURRENT LOCALE LC_CTYPE = 'En_US';
```

Example 2: Set the CURRENT LOCALE LC_CTYPE special register to the value of host variable HV1, which contains 'Fr_FR@EURO'.

```
EXEC SQL SET CURRENT LOCALE LC_CTYPE = :HV1;
```

Related concepts

z/OS Unicode Services User's Guide and Reference

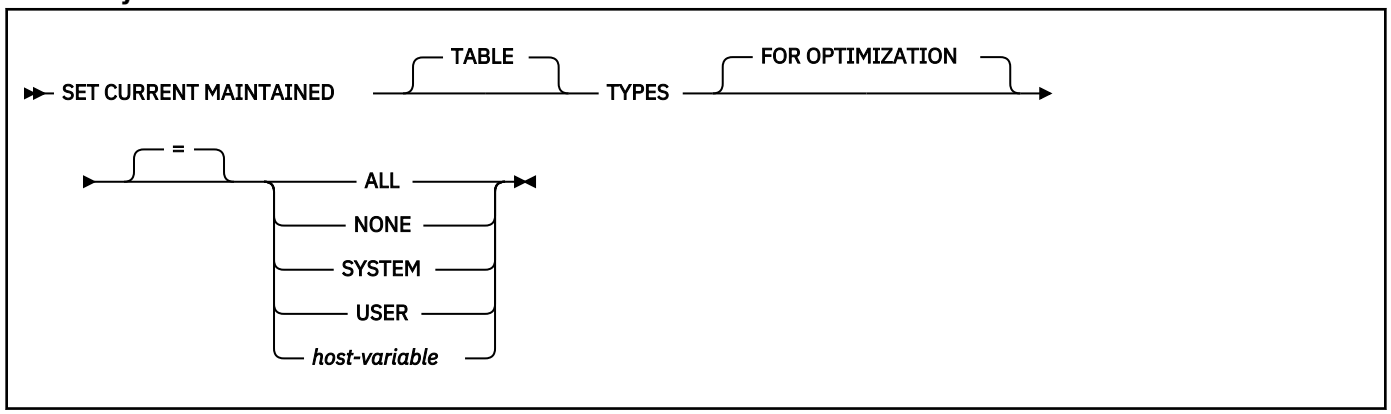
Related reference

CURRENT LOCALE LC_CTYPE

CURRENT LOCALE LC_CTYPE specifies the LC_CTYPE locale that will be used to execute SQL statements that use a built-in function that references a locale. Functions LCASE, UCASE, and TRANSLATE (with a single argument) refer to the locale when they are executed.

SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION

The SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION statement changes the value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

The value indicates which materialized query tables that are enabled for optimization are considered when optimizing the processing of dynamic SQL queries.

ALL
Indicates that all materialized query tables will be considered.

NONE
Indicates that no materialized query tables will be considered.

SYSTEM
Indicates that only system-maintained materialized query tables that are refresh deferred will be considered.

USER
Indicates that only user-maintained materialized query tables that are refresh deferred will be considered.

host-variable
A variable of type CHAR or VARCHAR. The length of the contents of *host-variable* must not exceed 255 bytes. It cannot be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value.

The characters of *host-variable* must be left justified. The content of the host variable must be a string that would match what can be specified as keywords for the special register in the exact case intended as there is no conversion to uppercase characters.

Notes

The CURRENT REFRESH AGE special register needs to be set to a value other than zero in order for the specified types of objects to be considered for optimizing the processing of dynamic SQL queries.

The CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register affects dynamic statement cache matching.

Examples

Example 1: The following statement sets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register:

```
SET CURRENT MAINTAINED TABLE TYPES ALL;
```

Example 2: The following example retrieves the current value of the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register into the host variable called CURMAINTYPES.

```
EXEC SQL VALUES (CURRENT MAINTAINED TABLE TYPES) INTO :CURMAINTYPES;
```

The value would be ALL if set by the previous example.

Example 3: The following example resets the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register so that no materialized query tables can be considered to optimize the processing of dynamic SQL queries.

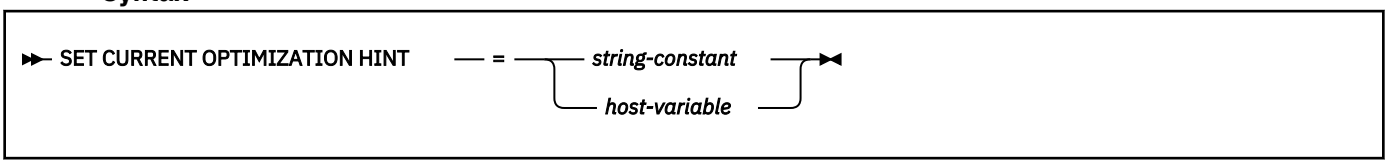
```
SET CURRENT MAINTAINED TABLE TYPES NONE;
```

Related reference
CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION

CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION specifies a value that identifies the types of objects that can be considered to optimize the processing of dynamic SQL queries. This register contains a keyword representing table types.

SET CURRENT OPTIMIZATION HINT

The SET CURRENT OPTIMIZATION HINT statement assigns a value to the CURRENT OPTIMIZATION HINT special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

The value of special register CURRENT OPTIMIZATION HINT is replaced by the value of the string constant or host variable. The value must be a character string that is not longer than 128 bytes.

Notes

Using the OPTIMIZATION HINT special register: The CURRENT OPTIMIZATION HINT special register specifies whether optimization hints are used in determining the access path of dynamic statements. An empty string or all blanks indicates that Db2 uses normal optimization techniques and ignores optimization hints.

Example

Example 1: Assume that string constant 'NOHYB' identifies a user-defined optimization hint in owner.PLAN_TABLE. Set the CURRENT OPTIMIZATION HINT special register so that Db2 uses this optimization hint to generate the access path for dynamic statements.

```
SET CURRENT OPTIMIZATION HINT = 'NOHYB';
```

If you set the register this way, Db2 validates and considers information in the rows in owner.PLAN_TABLE where the value in the OPTHINT column matches 'NOHYB' for dynamic SQL statements.

Example 2: Clear the CURRENT OPTIMIZATION HINT special register by specifying an empty string.

```
SET CURRENT OPTIMIZATION HINT = '';
```

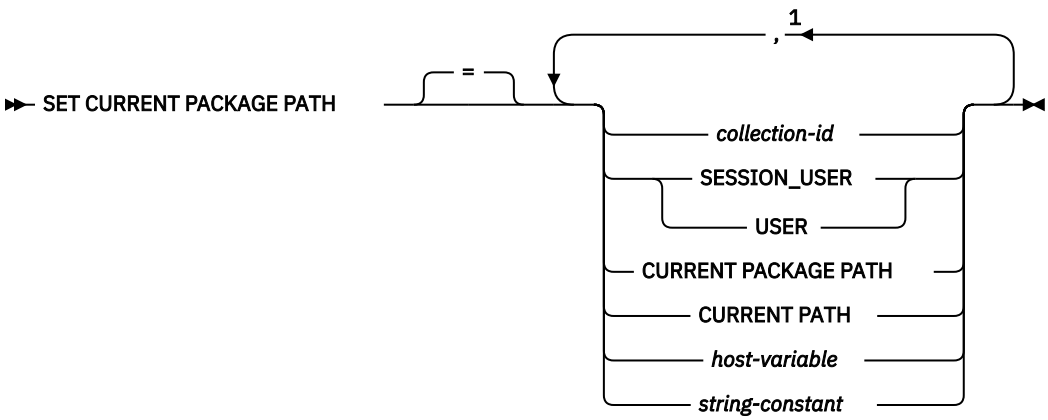
Related reference

CURRENT OPTIMIZATION HINT

CURRENT OPTIMIZATION HINT specifies the user-defined optimization hint that Db2 should use to generate the access path for dynamic statements.

SET CURRENT PACKAGE PATH

The SET CURRENT PACKAGE PATH statement assigns a value to the CURRENT PACKAGE PATH special register.



Invocation

This statement can be embedded only in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

Notes:

[1] SESSION_USER (or USER), CURRENT PACKAGE PATH, and CURRENT PATH can each be specified only once on the right side of the statement.

Description

The value of CURRENT PACKAGE PATH is replaced by the values specified.

collection-id
Identifies a collection. *collection-id* must not be a delimited identifier that is empty or contains only blanks.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

CURRENT PACKAGE PATH
Specifies the value of the CURRENT PACKAGE PATH special register before the execution of the SET CURRENT PACKAGE PATH statement.

CURRENT PATH
Specifies the value of the CURRENT PATH special register.

host-variable
Specifies a host variable that contains one or more collection IDs, separated by commas. The host variable must:

- Have a data type of CHAR or VARCHAR. The actual length of the contents of the host variable must not exceed the maximum length of the CURRENT PACKAGE PATH special register.
- Not be the null value if an indicator variable is provided.
- Contain an empty or blank string, or one or more collection IDs that are separated by commas.
- Be padded on the right with blanks if the host variable is fixed-length, or if the actual length of the host variable is longer than the content.
- Not contain a delimited identifier that is empty or contains only blanks.

string-constant
Specifies a string constant that contains one or more collection IDs, separated by commas. The string constant must:

- Have a length that does not exceed the maximum length of the CURRENT PACKAGE PATH special register.
- Contain an empty or blank string, or one or more collection IDs separated by commas.
- Not contain a delimited identifier that is empty or contains only blanks.

Notes

Contents of host variable or string constant: The contents of a host variable or string constant are interpreted as a list of collection IDs if the value contains at least one comma. If multiple collection IDs are specified, they must be separated by commas. Each collection ID in the list must conform to the rules for forming an ordinary identifier or be specified as a delimited identifier.

Checking for the existence of collections: No validation that the collections exist is made at the time that the CURRENT PACKAGE PATH special register is set. For example, a collection ID that is misspelled is not detected, which could affect the way subsequent SQL operates. At package execution time, authorization to the specific package is checked, and if this authorization check fails, an error is issued.

Resulting contents of the special register: The special register string is built by taking each collection ID specified and removing trailing blanks, delimiting with double quotation marks, doubling any double quotation marks within the collection ID as necessary, and then separating each collection ID by a comma. If the same collection ID appears more than once in the list, the first occurrence of the collection is used, and a warning is issued. The length of the resulting list cannot exceed the length of the special register. For example, assume that the following statements are issued:

```
SET CURRENT PACKAGE PATH = MYPKGS, "ABC E", SYSIBM
SET :HVPKLIST = CURRENT PACKAGE PATH
```

These statements result in the value of the host variable being set to: "MYPKGS", "ABC E", "SYSIBM".

A collection ID that does not conform to the rules for an ordinary identifier must be specified as a delimited collection ID and must not be specified within a host variable or string constant.

Considerations for keywords: A difference exists between specifying a single keyword, such as SESSION_USER, as a single keyword or as a delimited identifier. To indicate that the current value of a special register that is specified as a single keyword should be used in the package path, specify the name of the special register as a keyword. If you specify the name of the special register as a delimited identifier, it is interpreted as a collection ID of that value. For example, assume that the current value of the SESSION_USER special register is SMITH and that the following statement is issued:

```
SET CURRENT PACKAGE PATH = SYSIBM, SESSION_USER, "USER"
```

The result is that the value of the CURRENT PACKAGE PATH special register is set to: "SYSIBM, "SMITH", "USER".

Specifying a collection ID in an SQL procedure: Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, Db2 uses the following rules to determine whether a value that is specified in a SET PACKAGE PATH = *name* statement is a variable or a collection ID:

- If *name* is the same as a parameter or SQL variable in the SQL procedure, Db2 uses *name* as a parameter or SQL variable and assigns the value in *name* to the package path.
- If *name* is not the same as a parameter or SQL variable in the SQL procedure, Db2 uses *name* as a collection ID and assigns and the value in *name* is the package path.

DRDA classification: The SET CURRENT PACKAGE PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA. The SET CURRENT PACKAGE PATH statement requires a new level of DRDA support. If SET CURRENT PACKAGE PATH is issued when connected to the local server, the SET CURRENT PACKAGE PATH special register at the local server is set. Otherwise, when SET CURRENT PACKAGE PATH is issued when connected to a remote server, the SET CURRENT PACKAGE PATH special register at the remote server is set.

Examples

Example 1: Set the CURRENT PACKAGE PATH special register to the list of collections COLL4 and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following two collection IDs: "COLL4","COLL5".

Example 2: Set the CURRENT PACKAGE PATH special register to the list of collections: COLL1, COLL#2, COLL3, COLL4, and COLL5, where :hvar1 contains the value COLL4,COLL5:

```
SET CURRENT PACKAGE PATH = "COLL1","COLL#2","COLL3", :hvar1;
```

The value of CURRENT PACKAGE PATH is set to the following five collection IDs: "COLL1,"COLL#2","COLL3","COLL4","COLL5".

Example 3: Clear the CURRENT PACKAGE PATH special register.

```
SET CURRENT PACKAGE PATH = ' ';
```

Example 4: In preparation of calling a stored procedure that is named SUMARIZE, temporarily add two collections, COLL_PROD1" and "COLL_PROD2, to the end of the CURRENT PACKAGE PATH special register (the values of the collections are in host variables :prodcoll1 and prodcoll2, respectively). Because the stored procedure SUMARIZE is not defined with a COLLID value and is defined with INHERIT SPECIAL REGISTERS, the stored procedure will inherit the value of CURRENT PACKAGE PATH. When the stored procedure returns, set the value of the CURRENT PACKAGE PATH special register back to its original value.

```
SET :oldCPP = CURRENT PACKAGE PATH;
SET CURRENT PACKAGE PATH = CURRENT PACKAGE PATH, :prodcoll1, :prodcoll2;
CALL SUMARIZE(:V1,:V2);
SET CURRENT PACKAGE PATH = :oldCPP;
```

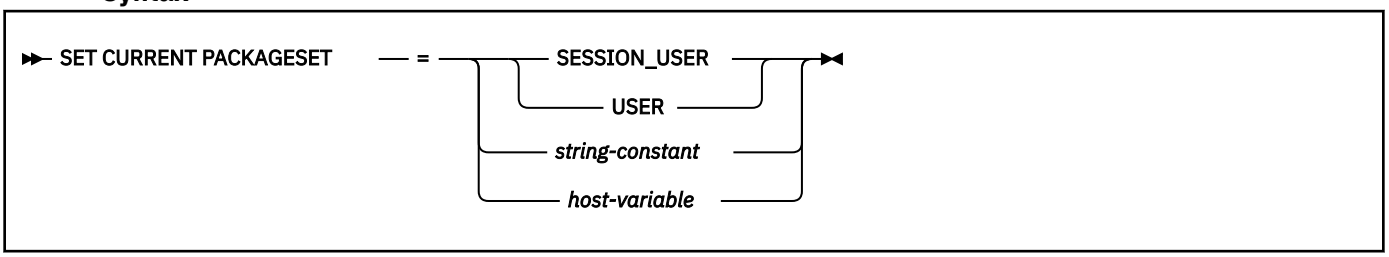
Related reference

CURRENT PACKAGE PATH

CURRENT PACKAGE PATH specifies a value that identifies the path used to resolve references to packages that are used to execute SQL statements. This special register applies to both static and dynamic statements.

SET CURRENT PACKAGESET

The SET CURRENT PACKAGESET statement assigns a value to the CURRENT PACKAGESET special register.



Invocation

This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

None required.

Syntax

Description

The value of CURRENT PACKAGESET is replaced by the value of the SESSION_USER special register, *string-constant*, or *host-variable*. The value specified by *string-constant* or *host-variable* must be a character string that is not longer than 128 bytes.

Notes

Selection of plan elements: A *plan element* is a DBRM that has been bound into the plan or a package that is implicitly or explicitly identified in the package list of the plan. Plan elements contain the control structures used to execute certain SQL statements.

Since a plan can have many elements, one of the first steps involved in the execution of an SQL statement that requires a control structure is the selection of the plan element that contains its control structure. The information used by Db2 to select plan elements includes the value of CURRENT PACKAGESET.

SET CURRENT PACKAGESET is used to specify the collection ID of a package that exists at the current server. SET CURRENT PACKAGESET is optional and should not be used without an understanding of the following rules for selecting a plan element.

If the CURRENT PACKAGESET special register is an empty string, Db2 searches for a DBRM or a package in one of these sequences:

At the local location (if CURRENT SERVER is blank or explicitly names that location), the order is:

1. All DBRMs bound directly to the plan
2. All packages that have already been allocated for the application process
3. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan. The order of search is the order those packages are named in the package list.

At a remote location, the order is:

1. All packages that have already been allocated for the application process at that location
2. All unallocated packages explicitly named in, and all collections completely included in, the package list of the plan, whose locations match the value of CURRENT SERVER. The order of search is the order those packages are named in the package list.

If the special register CURRENT PACKAGESET is set, Db2 skips the check for programs that are part of the plan and uses the value of CURRENT PACKAGESET as the collection. For example, if CURRENT PACKAGESET contains COL5, then Db2 uses COL5.PROG1.*timestamp* for the search. For additional information, see *Db2 Application Programming and SQL Guide*.

DRDA classification: SET CURRENT PACKAGESET is executed by the requester and is therefore classified as a local SET statement in DRDA.

CURRENT PACKAGESET special register with stored procedures and user-defined functions: The initial value of the CURRENT PACKAGESET special register in a stored procedure or user-defined function is the value of the COLLID parameter with which the stored procedure or user-defined function was defined. If the routine was defined without a value for the COLLID parameter, the value of the special register is inherited from the calling program. A stored procedure or user-defined function can use the SET CURRENT PACKAGESET statement to change the value of the special register. This allows the routine to select the version of the Db2 package that is used to process the SQL statements in a called routine that is not defined with a COLLID value.

When control returns from the stored procedure to the calling program, the special register CURRENT PACKAGESET is restored to the value it contained before the stored procedure was called.

Examples

Example 1: Limit the plan element selection to packages in the PERSONNEL collection at the current server.

```
EXEC SQL SET CURRENT PACKAGESET = 'PERSONNEL';
```

Example 2: Eliminate collections as a factor in plan element selection.

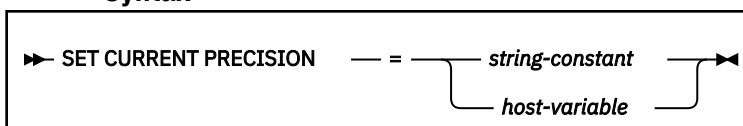
```
EXEC SQL SET CURRENT PACKAGESET = '';
```

Related reference

CURRENT PACKAGESET
CURRENT PACKAGESET specifies an empty string, a string of blanks, or the collection ID of the package that will be used to execute SQL statements.

SET CURRENT PRECISION

The SET CURRENT PRECISION statement assigns a value to the CURRENT PRECISION special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

This statement replaces the value of the CURRENT PRECISION special register with the value of the string constant or host variable. The value must be a character string 5 bytes in length. The value must be 'DEC15,' 'DEC31,' or 'Dpp.s', where 'pp' is either 15 or 31 and 's' is a number between 1 and 9. If the form 'Dpp.s' is used, 'pp' represents the precision that will be used with the rules that are used for DEC15 or DEC31, and 's' represents the minimum divide scale to use for division operations. The separator used in the form 'Dpp.s' can be either the '.'or the ',' character, regardless of the setting of the default decimal point.

Example

Set the CURRENT PRECISION special register so that subsequent statements that are prepared use DEC15 rules for decimal arithmetic.

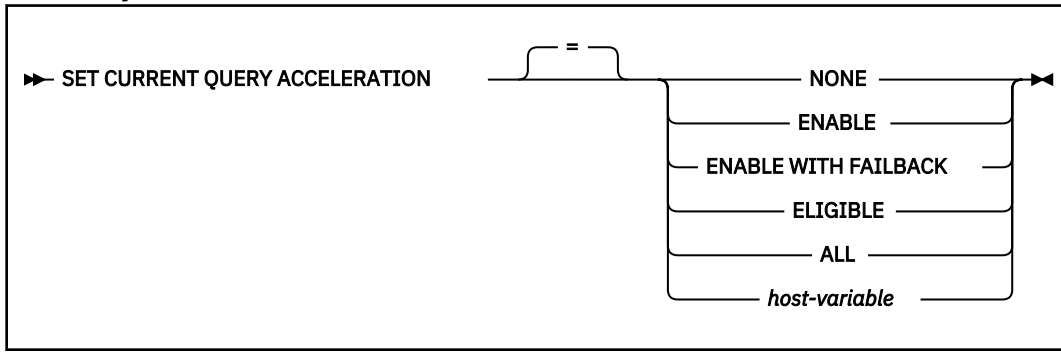
```
EXEC SQL SET CURRENT PRECISION = 'DEC15';
```

Related reference

CURRENT PRECISION
CURRENT PRECISION specifies the rules to be used when both operands in a decimal operation have precisions of 15 or less.

SET CURRENT QUERY ACCELERATION

The SET CURRENT QUERY ACCELERATION statement changes the value of the CURRENT QUERY ACCELERATION special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

NONE
Specifies that no query acceleration is done.

ENABLE
Specifies that queries are accelerated only if Db2 determines that it is advantageous to do so. If an accelerator failure occurs while a query is running or if the accelerator returns an error, Db2 returns a negative SQLCODE to the application.

ENABLE WITH FAILBACK
Specifies that queries are accelerated only if Db2 determines that it is advantageous to do so. If the accelerator returns an error during the PREPARE or first OPEN for the query, Db2 executes the query without the accelerator. If the accelerator returns an error during a FETCH or a subsequent OPEN, Db2 returns the error to the user and does not execute the query.

ELIGIBLE
Specifies that queries are accelerated if they are eligible for acceleration. Db2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are executed by Db2. If an accelerator failure occurs while a query is running or if the accelerator returns an error, Db2 returns a negative SQLCODE to the application.

ALL
Specifies that queries are accelerated if they are eligible for acceleration. Db2 does not use cost information to determine whether to accelerate the queries. Queries that are not eligible for acceleration are not executed by Db2, and an SQL error is returned. If an accelerator failure occurs while a query is running or if the accelerator returns an error, Db2 returns a negative SQLCODE to the application.

host-variable
A variable with a data type of CHAR or VARCHAR. The length must not exceed 255 bytes. Valid values are NONE, ENABLE, ENABLE WITH FAILBACK, ELIGIBLE, or ALL. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be left justified and must be padded on the right with blanks.

Notes

The precedence order (lowest to highest) for setting the value of the special register is as follows:

- The QUERY_ACCELERATION subsystem parameter
- The QUERYACCELERATION bind option, if specified
- An explicit SET CURRENT QUERY ACCELERATION statement

Examples

The following statement sets the CURRENT QUERY ACCELERATION special register to NONE to indicate that no acceleration is done.

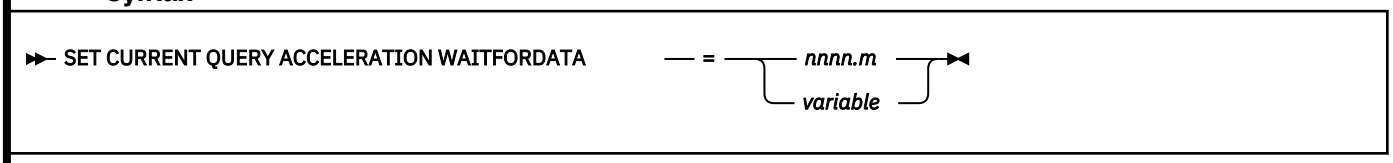
```
SET CURRENT QUERY ACCELERATION NONE;
```

Related reference
CURRENT QUERY ACCELERATION

The CURRENT QUERY ACCELERATION special register specifies a value that identifies when Db2 sends dynamic SQL queries to an accelerator server and what Db2 does if the accelerator server fails. The special register does not apply to static SQL queries.

SET CURRENT QUERY ACCELERATION WAITFORDATA

The SET CURRENT QUERY ACCELERATION WAITFORDATA statement assigns a value to the CURRENT QUERY ACCELERATION WAITFORDATA special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

nnnn.m

Is a DECIMAL(5,1) numeric-constant value that specifies the maximum number of seconds that the accelerator will delay a query while the accelerator waits for the replication of committed Db2 data changes that occurred prior to Db2 running the query.

You can specify a value in the range of 0.0 - 3600.0 seconds. For example, a value of 20.0 represents 20.0 seconds (or 20000 milliseconds), and a value of 30.5 represents 30.5 seconds (or 30500 milliseconds). The maximum value of 3600.0 means that the query is delayed for 60 minutes.

The default value is 0.0, which means that the query is not delayed and is run immediately on the accelerator. Other WAITFORDATA behavior is not applied to the query.

The wait time value can also be specified as an INTEGER numeric constant value ranging from 0 - 3600 seconds, which Db2 will convert to a DECIMAL (5,1) value.

variable

Is a language host-variable or SQL variable that has a data type of DECIMAL(5,1) or other data type that is assignable to DECIMAL(5,1). Any value that is specified for *variable* must conform to the specifications for *nnnn.m*. Additionally, *variable* cannot be a global variable.

Notes

The WAITFORDATA special register is used only for dynamic queries and applies only when query acceleration behavior is also requested by using the CURRENT QUERY ACCELERATION special register. The WAITFORDATA special register is not applied to accelerated queries that reference only accelerator-only tables (AOTs).

The delay wait time begins when the query reaches the accelerator, not when the query starts running in Db2. For more information about how to determine appropriate WAITFORDATA delay time values for query acceleration with replication in your environment, see the IBM Db2 Analytics Accelerator for z/OS documentation for Hybrid Transactional and Analytical Processing (HTAP) and the WAITFORDATA feature.

Setting CURRENT QUERY ACCELERATION WAITFORDATA to a value greater than 0 specifies that Db2 and the accelerator will apply WAITFORDATA delay behavior and restrictions to *all* dynamic queries to be accelerated afterward. The following behaviors, requirements, and restrictions apply to using WAITFORDATA to delay queries:

- When Db2 sends a query to the accelerator, Db2 also sends the specified WAITFORDATA delay wait time and an internal value that represents the latest committed Db2 data change on the entire Db2 subsystem (for a data sharing environment, across all the Db2 subsystems of the data sharing group) at the time Db2 sends the query to the accelerator. The committed data change might or might not be related to an accelerated table that is referenced in the query, but the internal value that represents this committed change is still used for the query that is accelerated.
- If the specified WAITFORDATA delay wait time expires before the expected committed Db2 data change is replicated to the accelerator, the accelerator will fail the query and issue SQLCODE -904 accompanied by additional message information.

  If the delay wait time expires on the first OPEN for the query in the current Db2 unit of work, the failing query qualifies for failback to Db2 if CURRENT QUERY ACCELERATION has been set to ENABLE WITH FAILBACK.

  This default WAITFORDATA delay wait time expiration behavior can be changed by modifying the accelerator configuration settings for replication. For information about changing the default WAITFORDATA delay wait time expiration behavior, see the WAITFORDATA information in the IBM Db2 Analytics Accelerator for z/OS documentation.
- All accelerated Db2 tables referenced in the query must be subscribed to and enabled for replication to the target accelerator. If all accelerated tables in the query do not meet this requirement, the accelerator will fail the query and issue SQLCODE -904 accompanied by additional message information.

  If this failure occurs on the first OPEN for the query in the current Db2 unit of work, the failing query qualifies for failback to Db2 if CURRENT QUERY ACCELERATION has been set to ENABLE WITH FAILBACK.

  This default WAITFORDATA behavior can be changed by modifying the accelerator configuration settings for replication. For information about changing this default WAITFORDATA behavior requirement, see the WAITFORDATA information in the IBM Db2 Analytics Accelerator for z/OS documentation.
- WAITFORDATA behavior is dependent on the replication process. Therefore, accelerated queries can be directly affected by current replication status, function, and performance, possibly resulting in the accelerated query failing on the accelerator with SQLCODE -904 if replication is not functioning or performing properly.
- In the following situations, Db2 changes that are committed before the query is sent to the accelerator will not be available to the query when it is run on the accelerator, even if WAITFORDATA delay behavior is requested for the query:
  - The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. In this situation, accelerator WAITFORDATA behavior cannot be achieved for the query, and the query will not be accelerated. The Db2 change might or might not be related to the Db2 accelerated table that is referenced in the query.
  - The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted accelerator-only table (AOT) change. This uncommitted change resulted in the creation of an accelerator database *snapshot isolation* (SI) for this unit of work before the query was run; therefore, accelerator WAITFORDATA behavior cannot be achieved for the query, and the query will not be accelerated. This accelerator database SI can prevent committed and replicated Db2 changes, made by either this transaction or by a different transaction, from being available to the accelerated query, even if the Db2 changes are replicated to the accelerator before the query is run there.

  For these situations, Db2 will not accelerate the query but instead will run it only in Db2, if possible. If the QUERY ACCELERATION behavior requested does not allow the query to be run only in Db2 or if the

query also references an AOT, then Db2 will fail the query and issue SQLCODE -4742. The default WAITFORDATA behavior for these situations can be changed only by modifying the transaction application with the changes that are described in the associated reason codes in SQLCODE -4742.

Examples

The following statement sets the CURRENT QUERY ACCELERATION WAITFORDATA special register to 180 seconds, which delays the query for three minutes:

```
SET CURRENT QUERY ACCELERATION WAITFORDATA = 180.0;
```

The following statement sets the CURRENT QUERY ACCELERATION WAITFORDATA special register to 2.5 seconds:

```
SET CURRENT QUERY ACCELERATION WAITFORDATA = 2.5;
```

Related reference

CURRENT QUERY ACCELERATION WAITFORDATA
The CURRENT QUERY ACCELERATION WAITFORDATA special register specifies the maximum amount of time, if any, that the accelerator delays a dynamic SQL query while the accelerator waits for the replication of committed Db2 data changes that occurred prior to Db2 running the query. This special register does not apply to static SQL queries.

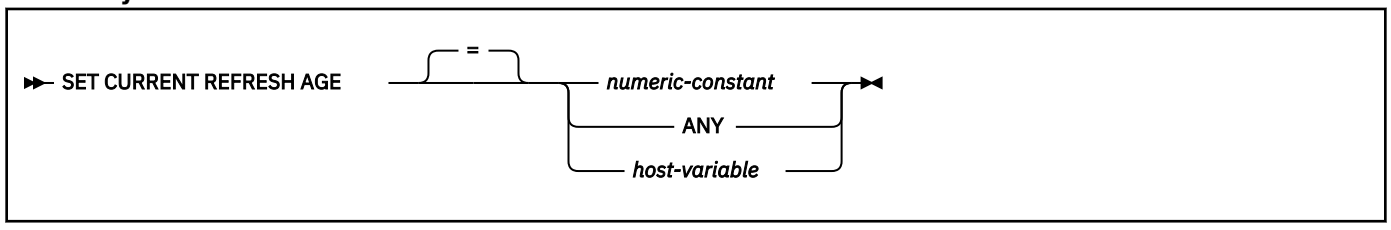
WAIT FOR DATA field (QUERY_ACCEL_WAITFORDATA subsystem parameter) (Db2 Installation and Migration)

CURRENT QUERY ACCELERATION
The CURRENT QUERY ACCELERATION special register specifies a value that identifies when Db2 sends dynamic SQL queries to an accelerator server and what Db2 does if the accelerator server fails. The special register does not apply to static SQL queries.

SET CURRENT REFRESH AGE

The SET CURRENT REFRESH AGE statement changes the value of the CURRENT REFRESH AGE special register.

The CURRENT REFRESH AGE value corresponding to ANY (99 999 999 999 999) cannot be used in timestamp arithmetic operations because the result would be outside the valid range of dates.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

numeric-constant
A DECIMAL(20,6) value representing a timestamp duration. The value must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.

0
Indicates that query optimization using materialized query tables will not be attempted.

99999999999999
Indicates that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register may be used to optimize the processing of a query. This value represents 9999 years, 99 months, 99 days, 99 hours, 99 minutes, and 99 seconds.

ANY
Shorthand for 99999999999999.

host-variable
A variable of type DECIMAL(20,6) or other type that is assignable to DECIMAL(20,6). It cannot be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value. The value of *host-variable* must be 0 or 99 999 999 999 999, the partial seconds of which is ignored and thus can be any value.

Notes

Materialized query tables created or altered with DISABLE QUERY OPTIMIZATION specified are not eligible for automatic query rewrite. Thus, they are not affected by the setting of this special register.

Setting the CURRENT REFRESH AGE special register to a value other than zero should be done with caution. Allowing a materialized query table that may not represent the values of the underlying base table to be used to optimize the processing of a query may produce results that do not accurately represent the data in the underlying table. This situation may be acceptable when you know the underlying data has not changed or you are willing to accept the degree of error in the results based on your knowledge of the data.

Examples

Example: Set the CURRENT REFRESH AGE special register to 99 999 999 999 999 to indicate that any materialized query tables identified by the CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION special register can be used to optimize the processing of a query.

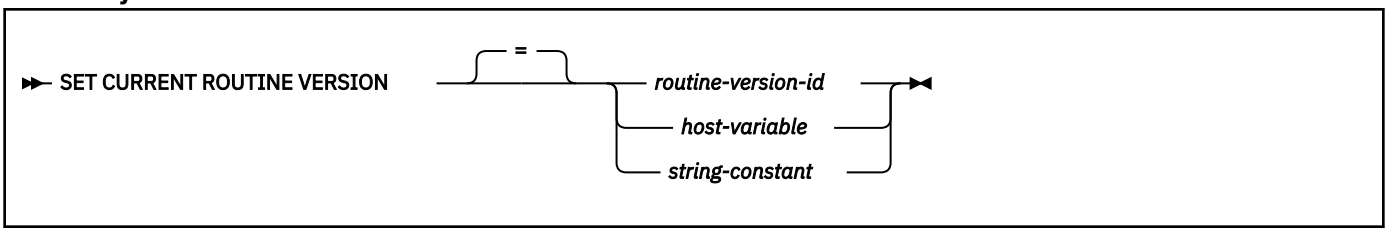
```
SET CURRENT REFRESH AGE ANY;
```

Related reference

CURRENT REFRESH AGE
CURRENT REFRESH AGE specifies a timestamp duration value. This duration is the maximum duration since a REFRESH TABLE statement has been processed on a system-maintained REFRESH DEFERRED materialized query table such that the materialized query table can be used to optimize the processing of a query. This special register affects dynamic statement cache matching.

SET CURRENT ROUTINE VERSION

The SET CURRENT ROUTINE VERSION statement assigns a value to the CURRENT ROUTINE VERSION special register. The special register sets the override value for the version identifier of native SQL procedures when they are invoked.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

routine-version-id
Specifies a routine version identifier.

host-variable
Specifies a host variable that contains a version identifier. The host variable must conform to the following rules:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the host variable must not exceed the length of a version identifier.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or empty.
- Be padded on the right with blanks if the host variable is a fixed length character.
- Not be empty or contain only blanks if the identifier is delimited.
- Not be the null value.

string-constant
Specifies a string constant that contains a version identifier. The string constant must conform to the following rules:

- Have a length that does not exceed the length of a *routine-version-id*.
- Include a routine version identifier that is left justified and conforms to the rules for forming an ordinary identifier or a delimited identifier, or must be blank or an empty string
- Not be empty or contain only blanks if the identifier is delimited

Notes

Resetting the special register: To reset the special register, specify an empty string constant, a string of blanks, or a host variable that is empty or contains only blanks. A routine version override is not in effect when the special register is reset.

Implications of using the special register: Setting the CURRENT ROUTINE VERSION special register to a version identifier will affect all SQL procedures that are subsequently invoked using CALL statements that specify the name of the procedure using a host variable, until the value of CURRENT ROUTINE VERSION is changed. If a version of the procedure that is identified by the version identifier in the special register exists for an SQL procedure that is being invoked, that version of the procedure is used. Otherwise, the currently active version of the procedure (as noted in the catalog) is used.

When you use the CURRENT ROUTINE VERSION special register to test a version of one or more native SQL procedures, you should use a routine version identifier that is a value other than the default value (V1) on the CREATE PROCEDURE statement. This will avoid having the special register affect more procedures that you intend when testing a new version of a procedure. For example, assume that you want to run version VER2 of procedure P1, and procedure P1 invokes another procedure, P2. If a version exists for both procedures P1 and P2 with the routine version identifier VER2, that version will be used for both procedures.

Examples

Example: The following statement sets the CURRENT ROUTINE VERSION special register so that the override value for the version identifier of native SQL procedures will be the value that is specified in the host variable *rvid*:

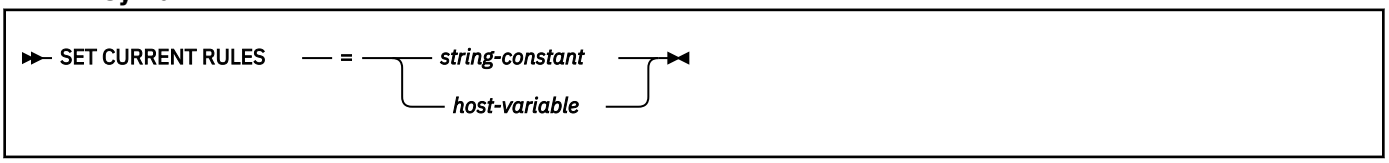
```
SET CURRENT ROUTINE VERSION = :rvid;
```

Related reference

CURRENT ROUTINE VERSION
CURRENT ROUTINE VERSION specifies the version identifier that is to be used when invoking a native SQL procedure. CURRENT ROUTINE VERSION is used for CALL statements that use a host variable to specify the procedure name.

SET CURRENT RULES

The SET CURRENT RULES statement assigns a value to the CURRENT RULES special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

This statement replaces the value of the CURRENT RULES special register with the value of the string constant or host variable. The value must be a character string that is 3 bytes in length, and the value must be 'DB2' or 'STD'.

Notes

For the effect of the values 'DB2' and 'STD' on the execution of certain SQL statements, see “CURRENT RULES” on page 191.

Example

Set the SQL rules to be followed to Db2 rules.

```
EXEC SQL SET CURRENT RULES = 'DB2';
```

Related reference

CURRENT RULES

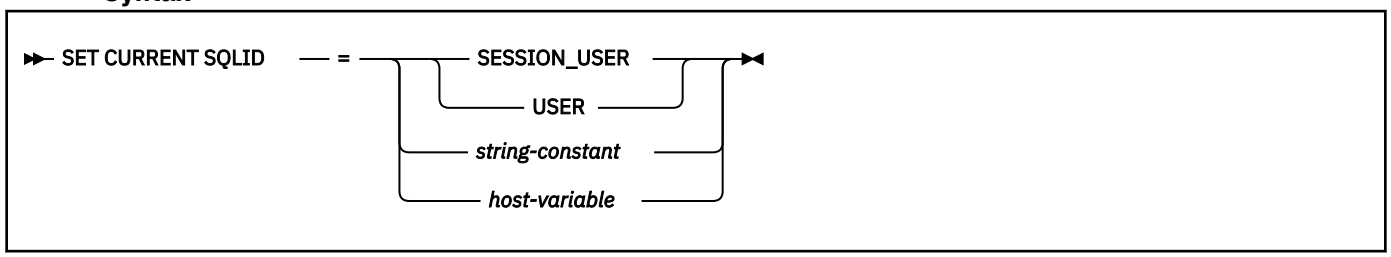
CURRENT RULES specifies whether certain SQL statements are executed in accordance with Db2 rules or the rules of the SQL standard.

SET CURRENT SQLID

The SET CURRENT SQLID statement assigns a value to the CURRENT SQLID special register.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only if DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.



Authorization

The specified value must be equal to one of the authorization IDs of the application process. This rule always applies, even when SET CURRENT SQLID is a static statement.

Exception: If any of the authorization IDs of the process has SYSADM authority, CURRENT SQLID can be set to any value when the SEPARATE SECURITY system parameter is set to NO. Note that the SEPARATE_SECURITY subsystem parameter does not apply to or affect users with installation SYSADM authority.

CURRENT SQLID cannot be set to the name of a role.

Syntax

Description

The value of CURRENT SQLID is replaced by the value of SESSION_USER, *string-constant*, or *host-variable*. The value specified by a *string-constant* or *host-variable* must be a character string that contains 8 characters or less. Unless some authorization ID of the process has SYSADM authority, the value must be equal to one of the authorization IDs of the process.

Notes

Effect on authorization IDs: SET CURRENT SQLID does not change the primary authorization ID of the process.

If the SET CURRENT SQLID statement is executed in a stored procedure or user-defined function package that has a dynamic SQL behavior other than run behavior, the SET CURRENT SQLID statement does not affect the authorization ID that is used for dynamic SQL statements in the package. The dynamic SQL behavior determines the authorization ID. For more information, see DYNAMICRULES bind option (Db2 Commands).

Effect on special register CURRENT PATH: When the value of the PATH special register depends on the value of the CURRENT SQLID special register, any changes to the CURRENT SQLID special register are not reflected in the value of the PATH special register until a commit operation is performed or a SET PATH statement is issued to change the SQL path to use the new value of the CURRENT SQLID.

DRDA classification: SET CURRENT SQLID is executed by the database server and is therefore classified as a non-local SET statement in DRDA.

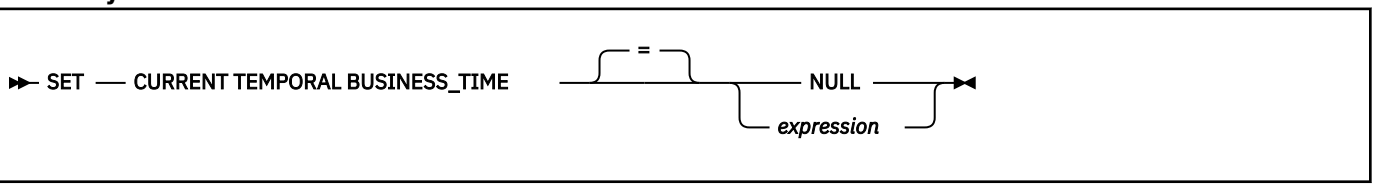
Examples

Example 1: Set the CURRENT SQLID to the primary authorization ID.

```
SET CURRENT SQLID = SESSION_USER;
```

SET CURRENT TEMPORAL BUSINESS_TIME

The SET CURRENT TEMPORAL BUSINESS_TIME statement changes the value of the CURRENT TEMPORAL BUSINESS_TIME special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

NULL
Specifies the null value.

expression
Specifies an expression that returns the null value or the value of one of the following built-in data types:

- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:

- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

expression can contain any of the following supported operands:

- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands

- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

Related information:

"String representations of datetime values" on page 115
"Casting between data types" on page 124

Notes

Transactions

The SET CURRENT TEMPORAL BUSINESS_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL BUSINESS_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL BUSINESS_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL BUSINESS_TIME special register to '2008-01-06-00.00.00.000000000000'.

```
SET CURRENT TEMPORAL BUSINESS_TIME = TIMESTAMP('2008-01-01') + 5 DAYS ;
SET CURRENT TEMPORAL BUSINESS_TIME = '2008-01-06-00.00.00.000000000000';
```

Example of how setting the special register affects subsequent SQL statements

In the following example, the first statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to last month. Assume that table att1 is an application-period temporal table. The setting of the CURRENT TEMPORAL BUSINESS_TIME special register affects the update of att1.

```
SET CURRENT TEMPORAL BUSINESS_TIME = CURRENT TIMESTAMP - 1 MONTH
UPDATE att1 SET c1 = 5 WHERE pk = 100
```

Assume that the att1 table has columns bt_begin and bt_end to indicate the beginning and end of the BUSINESS_TIME period. In this example, Db2 interprets the UPDATE statement as follows:

```
UPDATE att1 SET c1 = 5 WHERE pk = 100
AND bt_begin <= CURRENT TEMPORAL BUSINESS_TIME
AND bt_end > CURRENT TEMPORAL BUSINESS_TIME
```

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL BUSINESS_TIME special register to the null value. Subsequent SQL statements that reference application-period temporal tables are not affected by the CURRENT TEMPORAL BUSINESS_TIME special register.

```
SET CURRENT TEMPORAL BUSINESS_TIME = NULL
```

Related concepts

Data types

Db2 supports both IBM-supplied data types (built-in data types) and user-defined data types (distinct types).

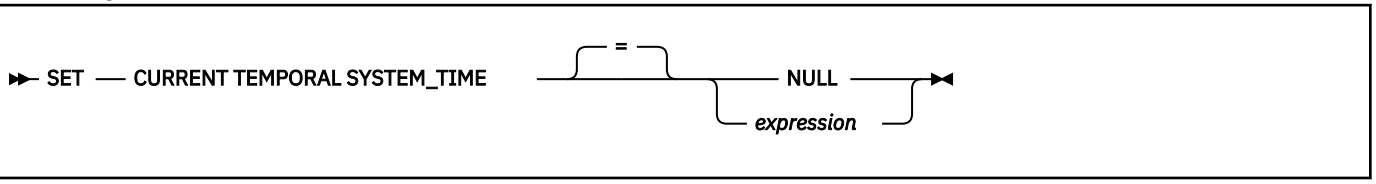
Related reference

CURRENT TEMPORAL BUSINESS_TIME

The CURRENT TEMPORAL BUSINESS_TIME special register specifies a TIMESTAMP(12) value that is used in the default BUSINESS_TIME period specification for references to application-period temporal tables.

SET CURRENT TEMPORAL SYSTEM_TIME

The SET CURRENT TEMPORAL SYSTEM_TIME statement changes the value of the CURRENT TEMPORAL SYSTEM_TIME special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

NULL
Specifies the null value.

expression
Specifies an expression that returns the null value or the value of one of the following built-in data types:

- Timestamp
- Character string
- Graphic string

If the expression is a character or graphic string, it must meet the following requirements:

- It must not be a CLOB or DBCLOB.
- The value of the expression must be a valid character-string or graphic-string representation of a timestamp.
- The result of the expression must be castable to TIMESTAMP(12).

expression can contain any of the following supported operands:

- Constant
- Special register
- Variable (host variable, SQL parameter, SQL variable, or global variable)
- Scalar function whose arguments are supported operands
- CAST specification where the cast operand is a supported operand
- Expression that uses arithmetic operators and operands

Related information:

"String representations of datetime values" on page 115
"Casting between data types" on page 124

Notes

Transactions

The SET CURRENT TEMPORAL SYSTEM_TIME statement is not a committable operation. The ROLLBACK statement has no effect on CURRENT TEMPORAL SYSTEM_TIME.

Effects on other special registers

The setting of the CURRENT TEMPORAL SYSTEM_TIME special register does not affect other special registers, such as the CURRENT DATE and CURRENT TIMESTAMP special registers.

Examples

Example of setting the special register to a valid value

Both of the following statements set the CURRENT TEMPORAL SYSTEM_TIME special register to '2008-01-06-00.00.00.000000000000'.

```
SET CURRENT TEMPORAL SYSTEM_TIME = TIMESTAMP('2008-01-01') + 5 DAYS;
SET CURRENT TEMPORAL SYSTEM_TIME = '2008-01-06-00.00.00.000000000000';
```

Example of setting the special register so that it does not affect subsequent SQL statements

The following statement sets the CURRENT TEMPORAL SYSTEM_TIME special register to the null value. Subsequent SQL statements that reference system-period temporal tables are not affected by the CURRENT TEMPORAL SYSTEM_TIME special register.

```
SET CURRENT TEMPORAL SYSTEM_TIME = NULL
```

Related concepts

Data types

Db2 supports both IBM-supplied data types (built-in data types) and user-defined data types (distinct types).

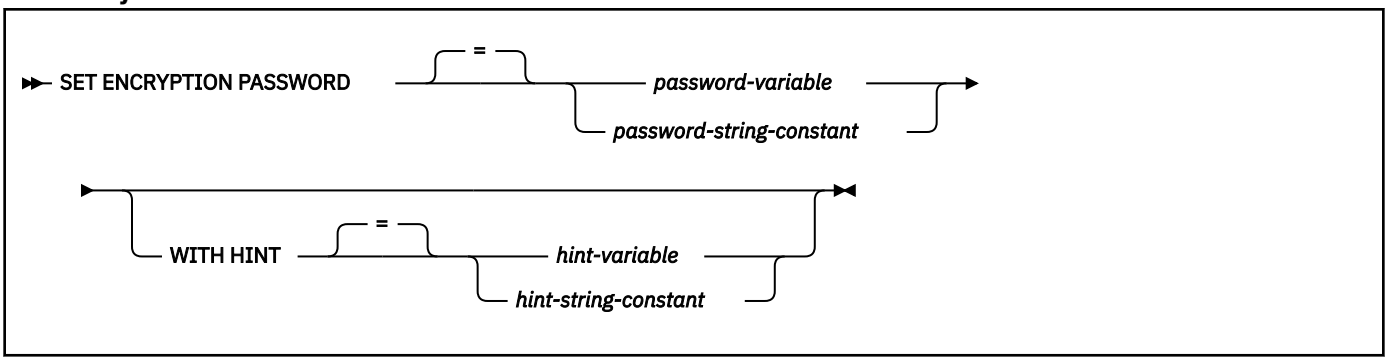
Related reference

CURRENT TEMPORAL SYSTEM_TIME

The CURRENT TEMPORAL SYSTEM_TIME special register specifies a TIMESTAMP(12) value that is used in the default SYSTEM_TIME period specification for references to system-period temporal tables.

SET ENCRYPTION PASSWORD

The SET ENCRYPTION PASSWORD statement sets the value of the encryption password and, optionally, the password hint. The ENCRYPT_TDES, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB built-in functions use this password and password hint for data encryption unless the functions are invoked with an explicitly specified password and hint. The password is not tied to Db2 authentication and is used only for data encryption.



Invocation

The statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

password-variable
Specifies a variable that contains an encryption password. The variable:

- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

password-string-constant
A character constant that contains an encryption password. The length of the constant must be between 6 and 127 inclusive or must be an empty string. If an empty string is specified, the default encryption password is set to no value. All characters are case-sensitive and are not converted to uppercase characters.

WITH HINT
Indicates that a value is specified that will help you remember passwords (for example, 'Ocean' as a hint to remember 'Pacific'). If a hint value is specified, the hint is used as the default for encryption functions. The hint can subsequently be retrieved for an encrypted value using the GETHINT function. If this clause is not specified and a hint is not explicitly specified on the encryption function, no hint will be embedded in encrypted data result.

hint-variable
Specifies a variable that contains an encryption password hint. The variable:

- Must be a CHAR or VARCHAR variable. The actual length of the contents of the variable must not be greater than 32. If an empty string is specified, the default encryption password hint is set to an empty string.
- Must not be the null value.
- All characters are case-sensitive and are not converted to uppercase characters.

hint-string-constant
A character string constant that contains an encryption password hint. The length of the constant must not be greater than 32. If the value is an empty string, the default encryption password hint is set to an empty string.

Notes

Normal Db2 mechanisms are used to transmit the host variable or constant to the database server.

Examples

Example 1: Set the ENCRYPTION PASSWORD to the value in :hv1. Do not specify a hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1
```

Example 2: Set the ENCRYPTION PASSWORD to the value in :hv1. Specify the value in :hv2 as the hint for the password.

```
SET ENCRYPTION PASSWORD = :hv1 WITH HINT :hv2
```

Related reference

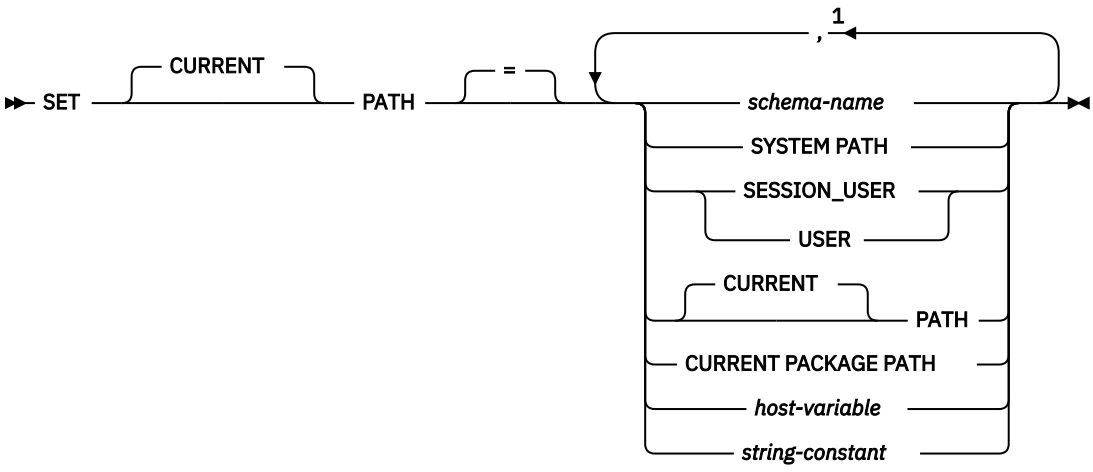
ENCRYPTION PASSWORD
The ENCRYPTION PASSWORD special register specifies the encryption password and the password hint (if one exists) that are used by the ENCRYPT_TDES, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB built-in functions.

ENCRYPT_TDES
The ENCRYPT_TDES function returns a value that is the result of encrypting the first argument by using the Triple DES encryption algorithm. The function can also set the password that is used for encryption.

DECRYPT_BINARY, DECRYPT_BIT, DECRYPT_CHAR, and DECRYPT_DB
The decryption functions return a value that is the result of decrypting encrypted data. The decryption functions can decrypt only values that are encrypted by using the ENCRYPT_TDES function.

SET PATH

The SET PATH statement assigns a value to the CURRENT PATH special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Notes:

[1] SYSTEM PATH, SESSION_USER or USER, and CURRENT PATH can be specified only once each.

Description

The value of PATH is replaced by the values specified.

schema-name
Identifies a schema. Db2 does not verify that the schema exists. For example, a schema name that is misspelled is not detected, which could affect the way subsequent SQL operates.

SYSTEM PATH
Specifies the schema names "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM".

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

PATH
Specifies the value of the CURRENT PATH special register before the execution of this statement.

CURRENT PACKAGE PATH
Specifies the value of the CURRENT PACKAGE PATH special register.

host-variable
A variable with a data type of CHAR or VARCHAR. The value of *host-variable* must not be null and must represent a valid schema name.

The schema name must:

- Be left justified within the host variable
- Be padded on the right with blanks if its length is less than that of the host variable

string-constant
A character string constant that represents a valid schema name.

If the schema name specified in *string-constant* will also be specified in other SQL statements and the schema name does not conform to the rules for ordinary identifiers, the schema name must be specified as a delimited identifier in the other SQL statements.

Notes

Restrictions on SET PATH:
These restrictions apply to the SET PATH statement:

- If the same schema name appears more than one time in the path, the first occurrence of the name is used and a warning is issued.
- The length of the CURRENT PATH special register limits the number of schema names that can be specified. The special register string is built by taking each schema name that is specified and removing trailing blanks, delimiting with double quotes, changing each double quote character to two double quote characters within the schema name as necessary, and then separating each schema name with a comma. The length of the resulting string cannot exceed 2048 bytes.
- The schema name SYSPUBLIC cannot be specified in the SQL path, even if you specify the value as a delimited identifier.

Specifying "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM":
Schemas "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" do not need to be specified in the special register. If these schemas are not explicitly specified in the CURRENT PATH special register, each schema is implicitly assumed at the front of the SQL path; if any of these schemas are not specified, they are assumed in the order of "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" (see "SQL path" on page 82 for an example). Only the schemas that are explicitly specified in the CURRENT PATH register are included in the 2048 byte limit.

To avoid having "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM" implicitly added to the front of the SQL path, explicitly specify them in the path when setting the value of the register. If you specify them at the end of the path, Db2 will check all the other schemas in the path first.

Specifying keywords versus delimited identifiers:
There is a difference between specifying a keyword and specifying a delimited identifier. For example, specifying SESSION_USER with and without escape characters. To indicate that the value of the SESSION_USER special register should be used in the SQL path, specify the keyword SESSION_USER. If you specify SESSION_USER is as a delimited identifier instead (for example, "SESSION_USER"), it is

interpreted as a schema name of 'SESSION_USER'. For example, assume that the current value of the SESSION_USER special register is SMITH and that the following statement is issued:

```
SET PATH = SYSIBM, SYSPROC, SESSION_USER, "SESSION_USER"
```

The result is that the value of the SQL path is set to:
"SYSIBM","SYSPROC","SMITH","SESSION_USER".

Specifying a schema name in an SQL procedure:
Because a host variable (SQL variable) in an SQL procedure does not begin with a colon, Db2 uses the following rules to determine whether a value that is specified in a SET PATH=*name* statement is a variable or a *schema-name*:

- If *name* is the same as a parameter or SQL variable in the SQL procedure, Db2 uses *name* as a parameter or SQL variable and assigns the value in *name* to PATH.
- If *name* is not the same as a parameter or SQL variable in the SQL procedure, Db2 uses *name* as a *schema-name* and assigns the value *name* to PATH.

The use of the path to resolve object names:
For information on when the SQL path is used to resolve unqualified data type, function, and procedure names and when the CURRENT PATH special register provides the SQL path, see “SQL path” on page 82.

DRDA classification:
The SET PATH statement is executed by the database server and, therefore, is classified as a non-local SET statement in DRDA.

Alternative syntax and synonyms:
For compatibility with previous releases of Db2 or other products in the Db2 family, Db2 supports CURRENT FUNCTION PATH or CURRENT_PATH as a synonym for CURRENT PATH. CURRENT_PATH is consistent with the SQL standard name of the special register.

Examples

Example 1: Set the CURRENT PATH special register to the list of schemas: "SCHEMA1", "SCHEMA#2", "SYSIBM".

```
SET PATH = SCHEMA1,"SCHEMA#2", SYSIBM;
```

When the SQL path specified in the special register is used for name resolution the system schemas which were not explicitly specified in the special register are implicitly assumed at the front of the SQL path, making the effective value of the path:

```
SYSFUN, SYSPROC, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM
```

Example 2: Add schema SMITH and SYSPROC to the value of the CURRENT PATH special register that was set in Example 1.

```
SET PATH = CURRENT PATH, SMITH, SYSPROC;
```

The effective value of the SQL path specified by the special register becomes:

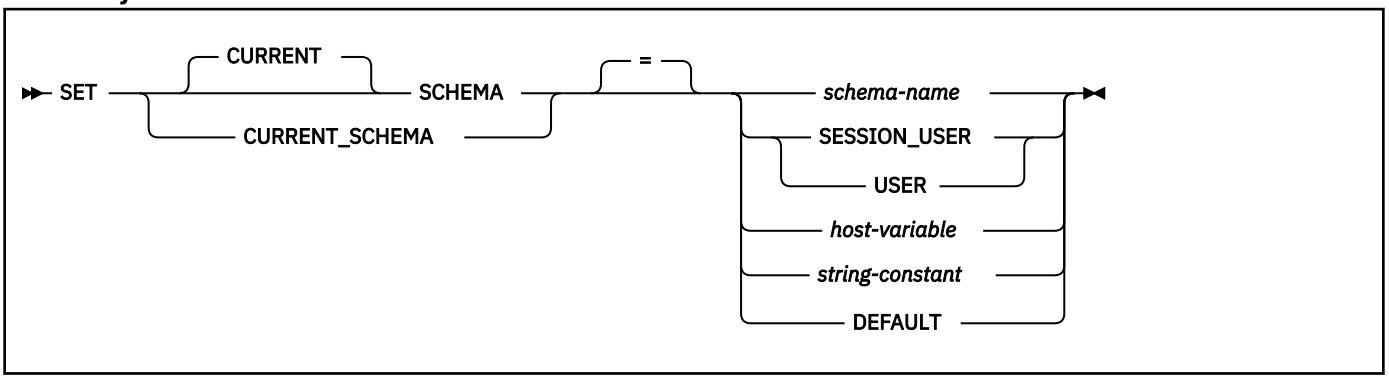
```
SYSFUN, SYSIBMADM, SCHEMA1, SCHEMA#2, SYSIBM, SMITH, SYSPROC
```

Related reference
CURRENT PATH

CURRENT PATH specifies the SQL path used to resolve unqualified data type names and function names in dynamically prepared SQL statements. It is also used to resolve unqualified procedure names that are specified as host variables in SQL CALL statements (CALL *host-variable*).

SET SCHEMA

The SET SCHEMA statement assigns a value to the CURRENT SCHEMA special register. If the package is bound with the DYNAMICRULES BIND option, this statement does not affect the qualifier that is used for unqualified database object references.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

schema-name
Identifies a schema. No validation that the schema exists is made at the time the CURRENT SCHEMA is set. For example, if a schema name is misspelled, it could affect the way subsequent SQL operates.

SESSION_USER or USER
Specifies the value of the SESSION_USER (USER) special register.

host-variable
Specifies a host variable that contains a schema name. The content is not folded to uppercase.

The host variable must:

- Be a CHAR, VARCHAR, GRAPHIC, or VARGRAPHIC variable. The actual length of the contents of the *host-variable* must not exceed the length of a schema name.
- Not be set to null. If *host-variable* has an associated indicator variable, the value of that indicator variable must not indicate a null value.
- Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
- Be padded on the right with blanks if the host variable is fixed length.
- Not contain SESSION_USER, USER, or DEFAULT.

string-constant
Specifies a string constant that contains a schema name. The content is not folded to uppercase.

The string constant must:

- Have a length that does not exceed the maximum length of a schema name.
- Include a schema name that is left justified and conforms to the rules for forming an ordinary identifier or delimited identifier. If the identifier is delimited, it must not be empty or contain only blanks.
- Not contain SESSION_USER, USER, or DEFAULT.

DEFAULT
Specifies that CURRENT SCHEMA is to be set to its initial value, as if it had never been explicitly set during the application process. For information about the initial value of CURRENT SCHEMA, see "CURRENT SCHEMA" on page 192.

Notes

Considerations for keywords:
There is a difference between specifying a single keyword (such as SESSION_USER or DEFAULT) as a single keyword or as a delimited identifier. To indicate that the current value of the SESSION_USER special register should be used for setting the current schema, specify SESSION_USER as a keyword. To indicate that the special register should be set to its default value, specify DEFAULT as a keyword. If SESSION_USER or DEFAULT is specified as a delimited identifier instead (for example, "SESSION_USER"), it is interpreted as a schema name of that value ("SESSION_USER").

Transaction considerations:
The SET SCHEMA statement is not a committable operation. ROLLBACK has no effect on CURRENT SCHEMA.

Usage of the assigned value:
The value of the CURRENT SCHEMA special register, as set by this statement, is used as the schema name in all dynamic SQL statements. The QUALIFIER bind option specifies the schema name for use as the qualifier for unqualified database object names in static SQL statements.

Impact on other special registers:
Setting the CURRENT SCHEMA special register does not affect any other special register. Therefore, the CURRENT SCHEMA is not be included in the SQL path that is used to resolve the schema name for unqualified references to function, procedures and user-defined types in dynamic SQL statements. To include the current schema value in the SQL path, whenever the SET SCHEMA statement is issued, also issue the SET PATH statement including the schema name from the SET SCHEMA statement.

Examples

Example 1: The following statement sets the CURRENT SCHEMA special register.

```
EXEC SQL SET SCHEMA RICK;
```

Example 2: The following example retrieves the current value of the CURRENT SCHEMA special register into the host variable called CURSCHEMA.

```
EXEC SQL SELECT CURRENT SCHEMA INTO :CURSCHEMA
   FROM SYSIBM.SYSDUMMY1;
```

The value of the host variable is RICK.

Example 3: Assume that the following statements are issued:

```
SET CURRENT SQLID = 'USRT001';
SET CURRENT SCHEMA = 'USRT002';
```

At this point, the two special registers contain different values. Any subsequent CREATE statements will use USRT002 as the implicit qualifier, but the owner of the newly created objects is USRT001.

Example 4: Assume that the value of CURRENT SCHEMA is 'Jane' and that the default value of the PATH special register was established using that value (that is, the value of PATH is "SYSIBM", "SYSFUN",

"SYSPROC", "SYSIBMADM", "JANE"). Change the value of the CURRENT SCHEMA special register to 'John'.

```
SET CURRENT SCHEMA = 'JOHN';
```

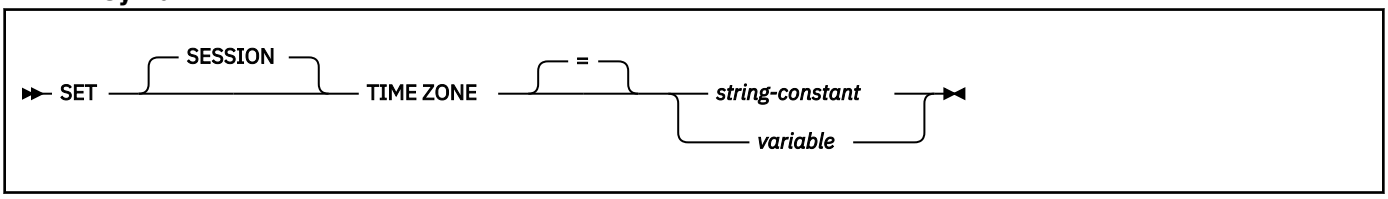
To change the SQL path to use the updated CURRENT SCHEMA value of "JOHN", issue a SET PATH statement to change the value of the PATH special register to specify "JOHN" as the first schema to check:

```
SET PATH = 'JOHN', CURRENT PATH;
```

Alternatively, a commit would cause PATH to be re-initialized. Otherwise, the path remains "SYSIBM", "SYSFUN", "SYSPROC", "SYSIBMADM", "JANE"), which might cause unqualified object names to resolve to "JANE" when you want them to resolve to "JOHN".

SET SESSION TIME ZONE

The SET SESSION TIME ZONE statement assigns a value to the SESSION TIME ZONE special register.



Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

None required.

Syntax

Description

string-constant
Identifies a time zone with a value of the form '±*th*:*tm*' , where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

variable
Specifies a variable that contains a time zone. The variable must be a CHAR or VARCHAR variable that is not followed by an indicator variable. The variable must not be the null value. The value must be left justified and be of the form '±*th*:*tm*' , where *th* represents the time zone hour between -12 and +14, and *tm* represents the time zone minutes between 0 and 59, with values ranging from -12:59 to +14:00.

Notes

Impact on other special registers:
Setting the SESSION TIME ZONE special register does not affect the CURRENT TIMEZONE special register.

Syntax alternatives:
SESSIONTIMEZONE, SESSION TIMEZONE, and TIMEZONE can be specified as an alternative to SESSION TIME ZONE or TIME ZONE.

Example

Set the SESSION TIME ZONE as -8:00:

```
    SET SESSION TIME ZONE = '-8:00';
```

Related reference

SESSION TIME ZONE
The SESSION TIME ZONE special register specifies a value that identifies the time zone of the application process.

SIGNAL

The SIGNAL statement is used to signal an error. It causes an error to be returned with the specified SQLSTATE and error description.

For a description of the statement, see "SIGNAL statement" on page 2035.

TRUNCATE

The Db2 TRUNCATE statement deletes all rows for either base tables or declared global temporary tables. The base table can be in a simple table space, a segmented (non-UTS) table space, a partitioned (non-UTS) table space, or a universal table space. If the table contains LOB or XML columns, the corresponding table spaces and indexes are also truncated.

Invocation

This statement can be embedded in an application program or issued interactively. It is an executable statement that can be dynamically prepared.

Authorization

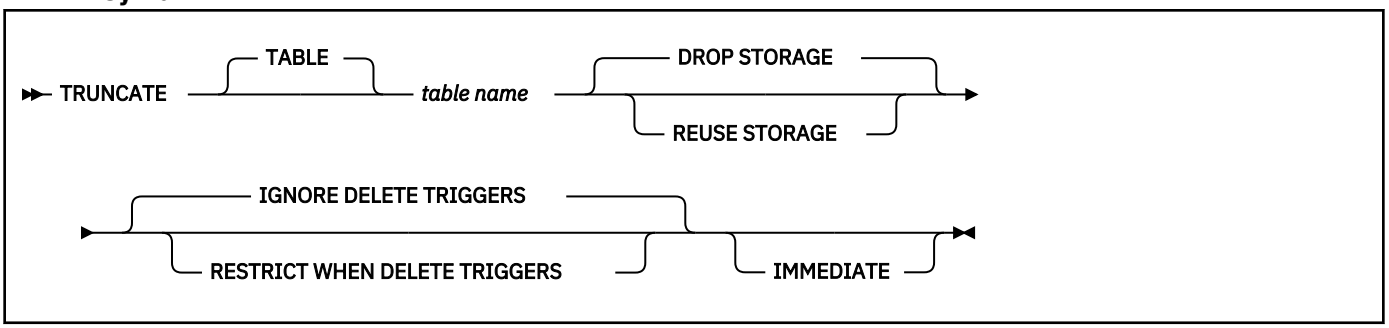
The privilege set that is defined below must include at least one of the following privileges:

- The DELETE privilege for the table
- Ownership of the table
- DBADM authority for the database
- DATAACCESS authority
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

If the IGNORE DELETE TRIGGERS option is in effect, the privilege set must include at least one of the following privileges:

- The ALTER privilege for the table
- Ownership of the table
- DBADM authority for the database
- System DBADM authority
- SYSADM authority



If row access control is activated for the table, the privilege set must include at least one of the following privileges or authorities:

- Ownership of the table

- DBADM authority
- SYSADM authority
- SYSCTRL authority
- System DBADM authority

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in "Dynamic preparation and execution" on page 1007. (For more details on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91.)

Syntax

Description

table-name
Identifies the table that is to be truncated. The name must identify a table that exists at the current server. The name must not identify the following objects:

- a view
- an auxiliary table
- an XML table
- a catalog table
- a system-period temporal table
- an accelerator-only table

If *table-name* is a base table of a table space, all tables that are defined under the table will also be truncated (for example: auxiliary LOB table spaces and XML table spaces), and all of its associated indexes will also be truncated.

DROP STORAGE or REUSE STORAGE
Specifies whether to drop or reuse the existing storage that is allocated for the table.

DROP STORAGE
Specifies that all storage that is allocated for the table is released and made available for use for the same table or any other table that resides in the table space. The scope of DROP STORAGE is always at the table space level and the deallocated space is always available for reuse by all tables in the table space.

DROP STORAGE is the default.

REUSE STORAGE
Specifies that all storage that is allocated for the table will be emptied, but will continue to be allocated for the table. REUSE STORAGE is ignored for a table in a simple table space and the statement is processed as if DROP STORAGE is specified.

RESTRICT WHEN DELETE TRIGGERS or IGNORE DELETE TRIGGERS
Specifies what to do when delete triggers are defined on the table.

RESTRICT WHEN DELETE TRIGGERS
Specifies that an error is returned if delete triggers are defined on the table.

IGNORE DELETE TRIGGERS
Specifies that any delete triggers that are defined for the table are not activated by the truncate operation. Additional authorization is required for this option; see "Authorization" on page 1973.

IGNORE DELETE TRIGGERS is the default.

IMMEDIATE
Specifies that the truncate operation is processed immediately and cannot be undone. If the IMMEDIATE option is specified, the table must not contain any uncommitted updates. In the case of a table in a multi-table table space, if there are any uncommitted updates to any table in the table space, the truncate operation will fail. Also, if there are any uncommitted CREATE, ALTER or DROP statements for any table in the table space, the truncate operation will fail.

The truncated table is immediately available for use in the same unit of work. Although a ROLLBACK statement is allowed to execute after a TRUNCATE statement, the truncate operation is not undone, and the table remains in a truncated state. For example, if another data change operation is done on the table after the TRUNCATE IMMEDIATE statement and then the ROLLBACK statement is executed, the truncate operation will not be undone, but all other data change operations are undone.

If IMMEDIATE is not specified, a ROLLBACK statement can undo the truncate operation.

The IMMEDIATE option can be specified for a table in a segmented (non-UTS) table space or a universal table space which allows deallocated spaces to be reclaimed immediately for subsequent insert operations in the same unit of work without committing the truncate operation.

Notes

Rules and restrictions:
The truncate operation cannot be executed if the table is a parent table in an enforced referential constraint. The Db2 subsystem issues an error when it detects the existence of rule violations. Therefore, if the referential integrity constraint exists, the TRUNCATE statement will be restricted regardless of whether the child table contains rows.

The TRUNCATE statement cannot be used if the table is a system-maintained temporal table.

If the TRUNCATE statement is used on a tables where any of the following conditions is true, the truncate operation will perform in a similar way to a mass delete operation:

- Tables with Change Data Capture (CDC) attribute

  The Db2 subsystem allows a table with the CDC-enabled attribute to be truncated without imposing any new restrictions.
- Tables with multi-level security

  If the table contains a column that is defined as a security label, the truncate operation needs to examine each row to determine if the security label of the authorization ID or role has the authority to delete that row. However, if the primary authorization ID or role has write-down privilege, verification of each row in the table is not necessary.
- Tables with a VALIDPROC attribute

  If a VALIDPROC is defined for the table, the truncate operation needs to verify the validity of each row in the table.

TRUNCATE and table spaces that are not logged:
The TRUNCATE TABLE statement can be used to remove a table space from the logical page list and to reset recover-pending status. When the table space is a segmented (non-UTS) table space or universal table space, the table is the only table in the table space, and the table does not have a VALIDPROC, referential constraints, delete triggers, or a SECURITY LABEL column, use the TRUNCATE TABLE statement to empty the table and the table space will be removed from the LPL and recover-pending status will be reset.

Truncating rows from a table with activated row permissions or column access control:
Row permissions and column access control is not enforced for the TRUNCATE statement.

Examples

Example 1: Empty an unused inventory table regardless of any existing triggers and return its allocated space.

```
TRUNCATE TABLE INVENTORY
         DROP STORAGE
    IGNORE DELETE TRIGGERS;
```

Example 2: Empty an unused inventory table regardless of any existing delete triggers but preserve its allocated space for later reuse.

```
TRUNCATE TABLE INVENTORY
   REUSE STORAGE
   IGNORE DELETE TRIGGERS;
```

Example 3: Empty an unused inventory table permanently (a ROLLBACK statement cannot undo the truncate operation when the IMMEDIATE option is specified) regardless of any existing delete triggers and preserve its allocated space for immediate use.

```
TRUNCATE TABLE INVENTORY
    REUSE STORAGE
    IGNORE DELETE TRIGGERS
    IMMEDIATE;
```

UPDATE

The UPDATE statement updates the values of specified columns in rows of a table or view. Updating a row of a view updates a row of its base table if no INSTEAD OF UPDATE trigger is defined for this view. If such a trigger is defined, the trigger is activated instead.

The table or view can exist at the current server or at any Db2 subsystem with which the current server can establish a connection.

There are two forms of this statement:

- The *searched* UPDATE form is used to update one or more rows optionally determined by a search condition.
- The *positioned* UPDATE form specifies that one or more rows corresponding to the current cursor position are to be updated.

Invocation

This statement can be embedded in an application program or issued interactively. A positioned UPDATE can be embedded in an application program. Both forms are executable statements that can be dynamically prepared.

Authorization

Authority requirements depend on whether the object identified in the statement is a user-defined table, a catalog table for which updates are allowed, or a view, and whether SQL standard rules are in effect:

When a user-defined table is identified: The privilege set must include at least one of the following:

- DATAACCESS authority
- The UPDATE privilege on the table
- The UPDATE privilege on each column to be updated

- Ownership of the table
- DBADM authority on the database that contains the table
- SYSADM authority

If the database is implicitly created, the database privileges must be on the implicit database or on DSNDB04.

When a catalog table is identified: The privilege set must include at least one of the following:

- ACCESSCTRL authority
- DATAACCESS authority
- The UPDATE privilege on each column to be updated
- DBADM authority on the catalog database
- SYSCTRL authority
- SYSADM authority
- SYSADM authority
- System DBADM authority

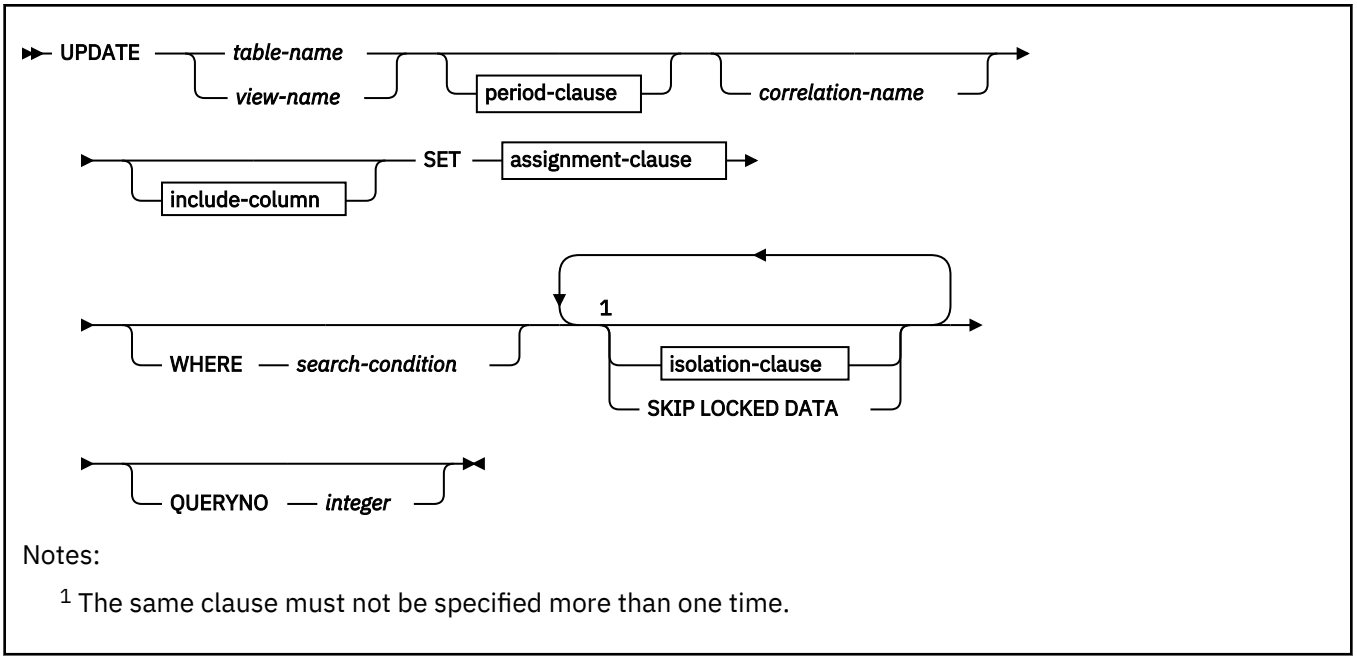
When a view is identified: The privilege set must include at least one of the following:

- DATAACCESS authority
- SYSADM authority
- UPDATE privilege on the view
- UPDATE privilege on each column to be updated

If the *expression* in the *assignment-clause* contains a reference to a column of the table or view, or if the *search-condition* in a searched UPDATE contains a reference to a column of the table or view, the privilege set must include at least one of the following:

- The SELECT privilege on the table or view
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table that is not a catalog table
- DATAACCESS
- SYSADM authority

When FOR PORTION OF BUSINESS_TIME is specified: The privilege set must include at least one of the following:

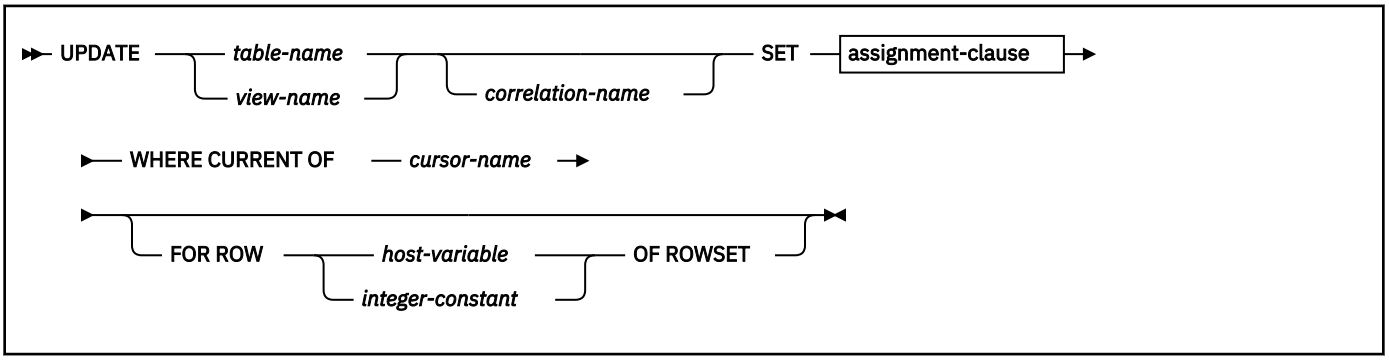


- The UPDATE privilege on the columns of the BUSINESS_TIME period
- The UPDATE privilege on the table
- Ownership of the table or view
- DBADM authority on the database that contains the table, if the target is a table and that table that is not a catalog table
- DATAACCESS
- SYSADM authority

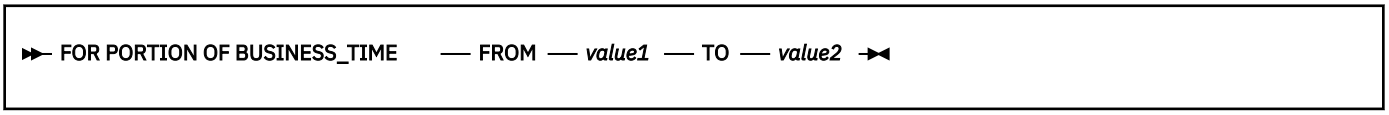
If the *search-condition* in a searched UPDATE includes a subquery, or if the *assignment-clause* includes a *scalar-fullselect* or a *row-fullselect*, see "Authorization" on page 931 for an explanation of the authorization required.

The owner of a view, unlike the owner of a table, might not have UPDATE authority on the view (or might have UPDATE authority without being able to grant it to others). The nature of the view itself can preclude its use for UPDATE. For more information, see the discussion of authority in "CREATE VIEW" on page 1636.

Privilege set: If the statement is embedded in an application program, the privilege set is the privileges that are held by the owner of the plan or package. If the statement is dynamically prepared, the privilege set is determined by the DYNAMICRULES behavior in effect (run, bind, define, or invoke) and is summarized in "Dynamic preparation and execution" on page 1007. (For more information on these behaviors, including a list of the DYNAMICRULES bind option values that determine them, see "Authorization IDs and dynamic SQL" on page 91).

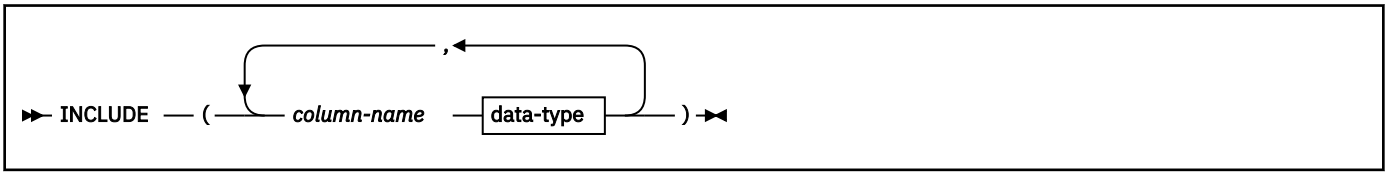


searched update:



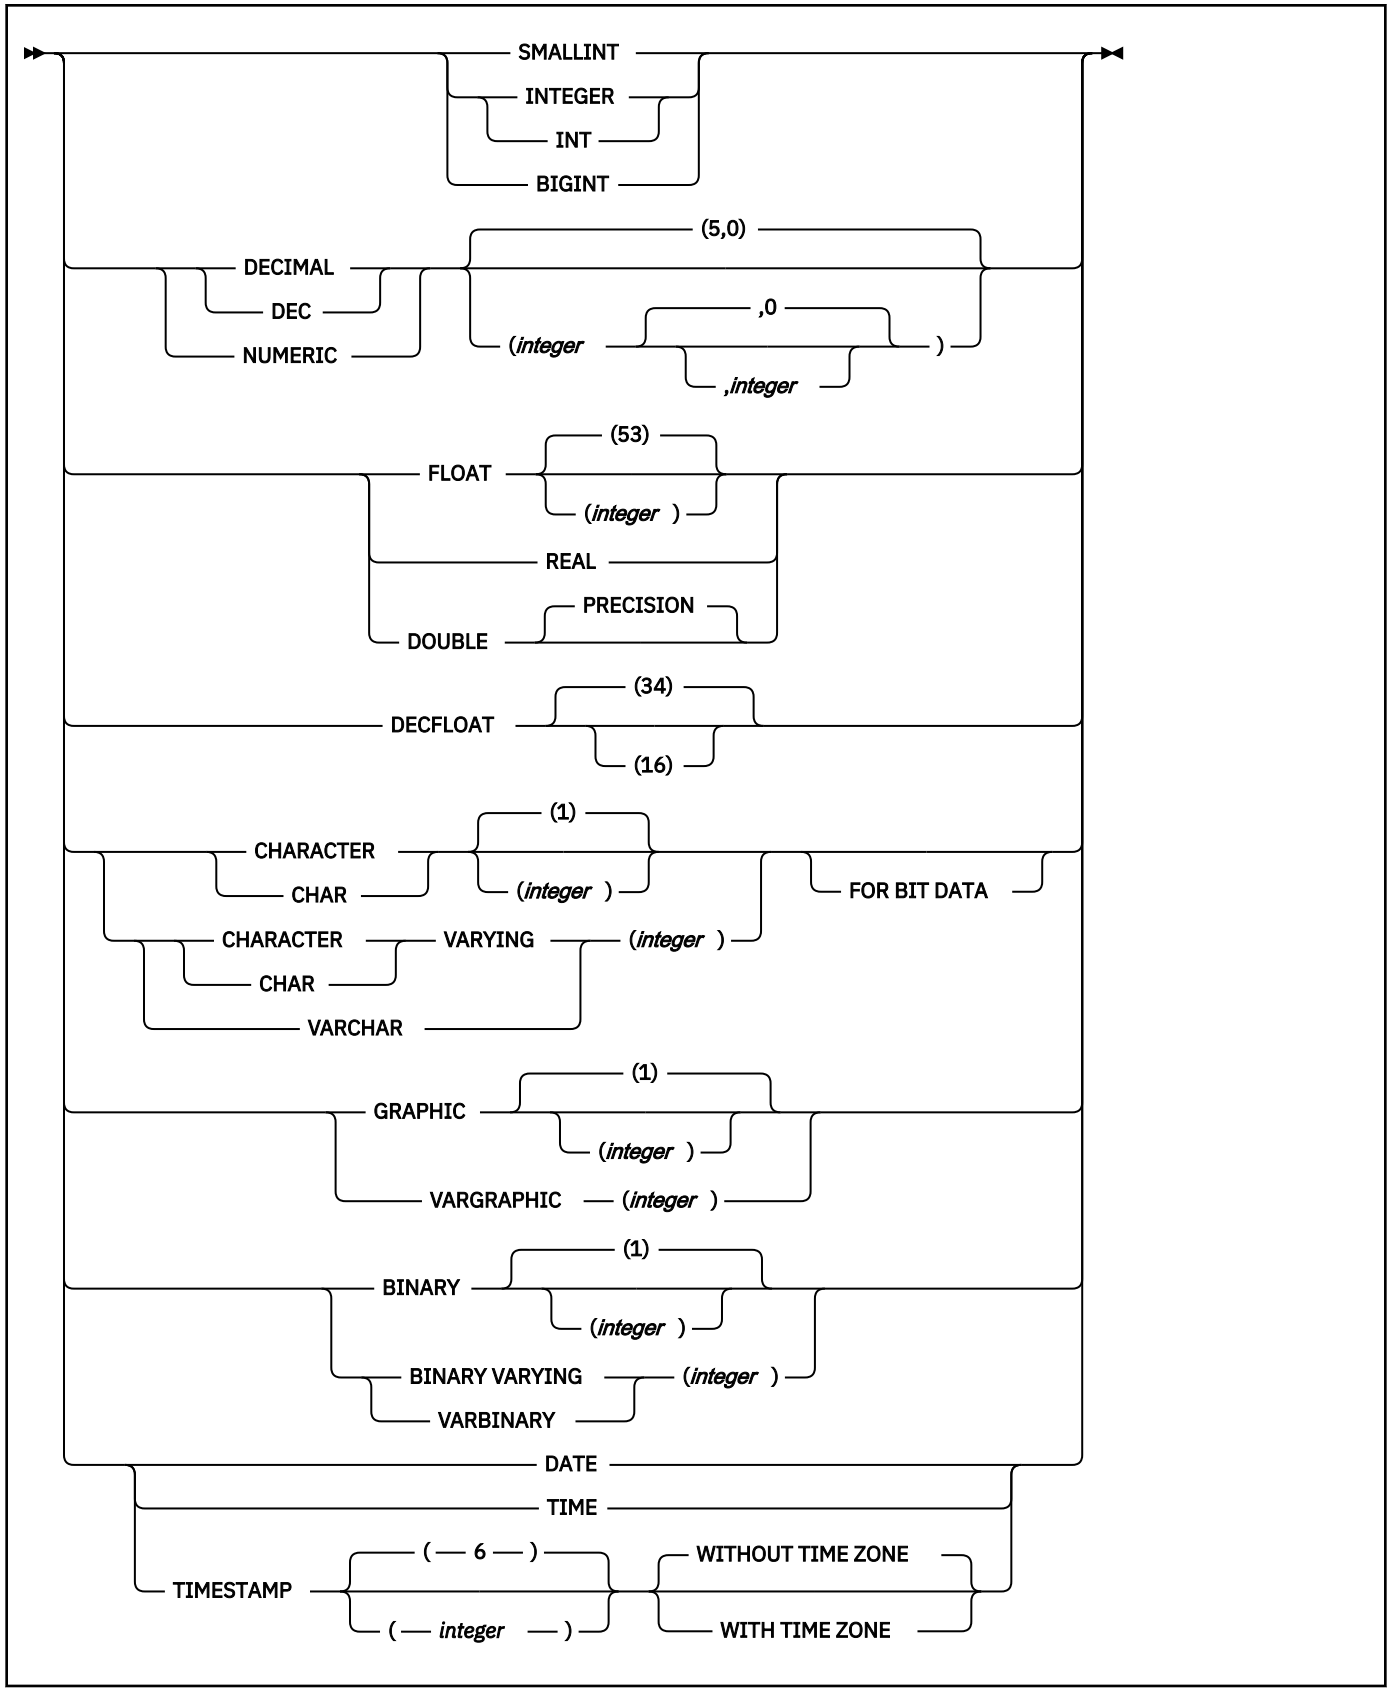
Notes:

[1] The same clause must not be specified more than one time.

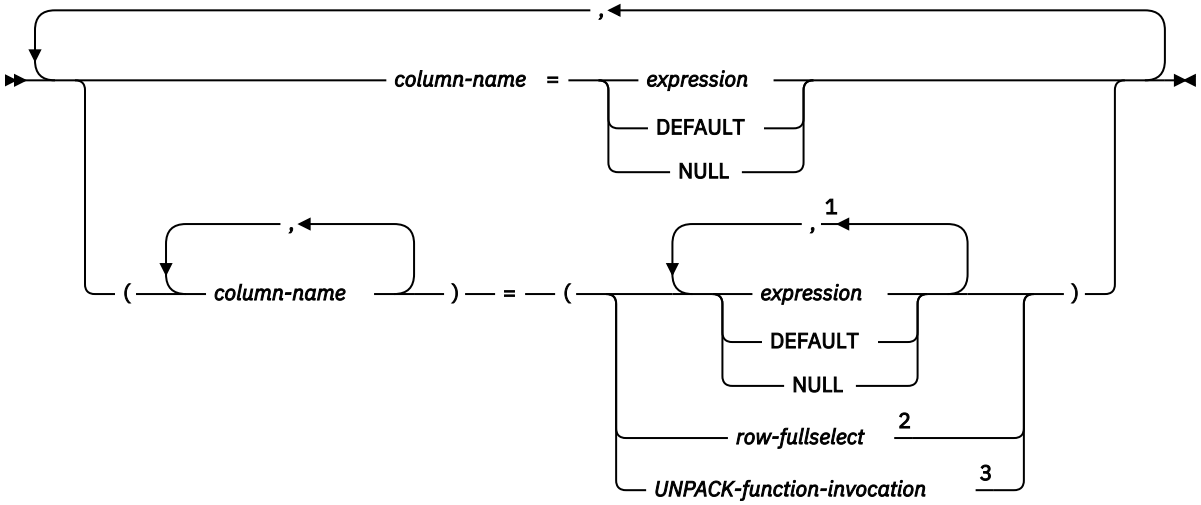


positioned update:

period-clause:



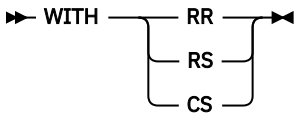
include-column:



data-type:

built-in-type:

assignment clause:



Notes:

[1] The number of *expressions*, DEFAULT, and NULL keywords must match the number of *column-names*. *Expressions* must not refer to UNPACK-function-invocation..

[2] The number of columns in the select list must match the number of *column-names*.

[3] The number of items returned from *UNPACK-function-invocation* must match the number of column names.

isolation-clause:

Description

table-name* or *view-name

Identifies the object of the UPDATE statement. The name must identify a table or view that exists at the Db2 subsystem that is identified by the implicitly or explicitly specified location name. The name must not identify one of the following tables:

- An auxiliary table
- A created temporary table or a view of a created temporary table
- A catalog table with no updatable columns or a view of a catalog table with no updatable columns
- A directory table
- A read-only view that has no INSTEAD OF trigger defined for its update operations. (For a description of a read-only view, see "CREATE VIEW" on page 1636.)
- A system-maintained materialized query table
- A table that is implicitly created for an XML column
- An archive-enabled table if any of the following conditions are true:
  - The SYSIBMADM.MOVE_TO_ARCHIVE global variable is set to Y.
  - The SYSIBMADM.GET_ARCHIVE global variable is set to Y, the ARCHIVESENSITIVE bind option is set to YES, and the operation is a positioned update.

In an IMS or CICS application, the Db2 subsystem that contains the identified table or view must be a remote server that supports two-phase commit.

A catalog table or a view of a catalog table can be identified if every column identified in the SET clause is an updatable column. If a column of a catalog table is updatable, its description in "Db2 catalog tables" on page 2115 indicates that the column can be updated. If the object table is SYSIBM.SYSSTRINGS, any column other than IBMREQD can be updated, but the rows that are selected for update must be rows that are provided by the user (the value of the IBMREQD column is N) and only certain values can be specified as explained in How an entry in SYSIBM.SYSSTRINGS works with character conversion (Db2 Installation and Migration).

period-clause

Specifies that a period clause applies to the target of the update operation. The same period name must not be specified more than one time. If the target of the update operation is a view:

- The FROM clause of the outer fullselect of the view definition must include a reference, directly or indirectly, to an application-period temporal table.
- The result table of the outer fullselect of the view definition must include, explicitly or implicitly, the start and end columns of the BUSINESS_TIME period.
- An INSTEAD OF trigger must not be defined for the view.

FOR PORTION OF BUSINESS_TIME

Specifies that the update only applies to row values for the portion of the BUSINESS_TIME period in the row that is specified by the period clause. BUSINESS_TIME must be a period that is defined on the table.

FOR PORTION OF BUSINESS_TIME must not be specified if the value of the CURRENT TEMPORAL BUSINESS_TIME special register is not NULL when the BUSTIMESENSITIVE bind option is set to YES.

FROM *value1* TO *value2*

Specifies that the update applies to rows for the period that is specified from *value1* to *value2*. No rows are updated if *value1* is greater than or equal to *value2* or if *value1* or *value2* is the null value.

For the period condition that is specified with FROM *value1* TO *value2*, the period that is specified with *period-name* in a row of the target update:

- Overlaps the beginning of the specified period if the value of the begin column is less than *value1* and the value of the end column is greater than *value1*.
- Overlaps the end of the specified period if the value of the end column is greater than or equal to *value2* and the value of the begin column is less than *value2*.
- Is fully contained within the specified period if the value for the begin column is greater than or equal to *value1* and the value for the end column is less than or equal to *value2*.
- Is not contained in the period if both columns of *period-name* are less than *value1* or greater than or equal to *value2*.
- Is partially contained in the specified period if the period in the row overlaps the beginning of the specified period or the end of the specified period, but not both.
- Fully overlaps the specified period if the period in the row overlaps both the beginning and the end of the specified period.

If the period, *period-name* in a row is not contained in the specified period, the row is not updated. Otherwise, the update is applied based on the specification of PORTION OF and how the values in the columns of *period-name* overlap the specified period as follows:

- If the period, *period-name* in a row is fully contained within the specified period, the row is updated and the values of the begin column and end column of *period-name* are unchanged.
- If the period, *period-name* in a row is partially contained in the specified period and overlaps the beginning of the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to *value1* and the value of the end column is the original value of the end column.
  - An additional row is inserted using the original values from the row, except that the end column is set to *value1*, and new values are used for other generated columns.

- If the period, *period-name* in a row is partially contained in the specified period and overlaps the end of the specified period:
  - The row is updated. In the updated row, the value of the begin column is the original value of the begin column and the end column is set to *value2*.
  - An additional row is inserted using the original values from the row, except that the begin column is set to *value2*, and new values are used for other generated columns.
- If the period, *period-name* in a row fully overlaps the specified period:
  - The row is updated. In the updated row, the value of the begin column is set to *value1* and the value of the end column is set to *value2*.
  - An additional row is inserted using the original values from the row, except that the end column is set to *value1*, a column defined as DATA CHANGE OPERATION is set to 'I', and new values are used for other generated columns.
  - An additional row is inserted using the original values from the row, except that the begin column is set to *value2*, a column defined as DATA CHANGE OPERATION is set to 'I', and new values are used for other generated columns.

Any existing update triggers are activated for the updated rows and any existing insert triggers are activated for rows that are implicitly inserted.

value1, value2
Specifies expressions that return a value of a built-in data type. The result of each expression must be comparable to the data type of the columns of the specified period. See the comparison rules described in "Assignment and comparison" on page 135. Each expression can contain any of the following supported operands:

- A constant
- A special register
- A variable
- An array element specification
- A built-in scalar function whose arguments are supported operands
- A CAST specification where the cast operand is a supported operand
- An expression that uses arithmetic operators and operands

Each expression must not have a timestamp precision that is greater than the precision of the columns for the period.

If the begin and end columns of the period are defined as TIMESTAMP WITHOUT TIME ZONE, each expression must not return a value of a timestamp with a time zone.

A period clause for a view must not contain a global variable or an untyped parameter marker.

correlation-name
Can be used within *search-condition* or *assignment-clause* to designate the table or view. (For an explanation of *correlation-name*, see "Correlation names" on page 205.)

include-column
Specifies a set of columns that are included, along with the columns of *table-name* or *view-name*, in the result table of the UPDATE statement when it is nested in the FROM clause of the outer fullselect that is used in a subselect, SELECT statement, or in a SELECT INTO statement. The included columns are appended to the end of the list of columns that is identified by *table-name* or *view-name*. If no value is assigned to a column that is specified by an *include-column*, a NULL value is returned for that column.

INCLUDE
Introduces a list of columns that are to be included in the result table of the UPDATE statement. The included columns are only available if the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement.

column-name
Specifies the name for a column of the result table of the UPDATE statement that is not the same name as another included column nor a column in the table or view that is specified in *table-name* or *view-name*.

data-type
Specifies the data type of the included column. The included columns are nullable.

built-in-type
Specifies a built-in data type. See "CREATE TABLE" on page 1509 for a description of each built-in type.

The CCSID 1208 and CCSID 1200 clauses must not be specified for an INCLUDE column.

distinct-type
Specifies a distinct type. Any length, precision, or scale attributes for the column are those of the source type of the distinct type as specified by using the CREATE TYPE statement.

SET
Introduces the assignment of values to column names.

assignment-clause
If *row-fullselect* is specified, the number of columns in the result of *row-fullselect* must match the number of *column-names* that are specified. If *row-fullselect* is not specified, the number of expressions, and NULL and DEFAULT keywords must match the number of *column-names* that are specified.

column-name
Identifies a column that is to be updated. *column-name* must identify a column of the specified table or view, and that column must be updatable if extended indicator variables are not enabled. The column must not identify a generated column or a view column where the column is derived from a scalar function, constant, or expression. *column-name* can also identify an INCLUDE column that must not be qualified. The same column must not be specified more than one time.

A column that is defined as part of a BUSINESS_TIME period must not be specified if the UPDATE statement contains a *period-clause*.

Assignments to included columns are only processed when the UPDATE statement is nested in the FROM clause of a SELECT statement or a SELECT INTO statement. There must be at least one assignment clause that specifies a *column-name* that is not an INCLUDE column. The null value is returned for an included column that is not set by using an explicit SET clause.

For a positioned update, allowable column names can be further restricted to those in a certain list. This list appears in the FOR UPDATE clause of the SELECT statement for the associated cursor. The clause can be omitted by using the conditions that are described in "Positioned updates of columns" on page 302.

A view column that is derived from the same column as another column of the view can be updated, but both columns cannot be updated in the same UPDATE statement.

expression
Indicates the new value of the column. The *expression* is any expression of the type described in "Expressions" on page 229. It must not include an aggregate function.

If *expression* is a host variable, the host variable can include an indicator variable. When extended indicator variables are enabled, an expression must not be more complex than a reference to a single host variable if the indicator is set to an extended indicator value of default (-5) or unassigned (-7). In addition, a CAST specification can be used if either of the following is true:

- The target column is defined as nullable.
- the target column is defined as NOT NULL with a non-null default, the source of the CAST specification is a single host variable, and the data attributes (data type, length, precision, and scale) of the host variable are the same as the result of the cast specification.

A *column-name* in an expression must identify a column of the table or view. For each row that is updated, the value of the column in the expression is the value of the column in the row before the row is updated.

DEFAULT
Specifies that the default value is used based on how the corresponding column is defined in the table. DEFAULT must not be specified for a ROWID, row-begin, row-end, transaction-start-ID, or generated expression column. The value that is assigned depends on how the column is defined.

- If the column is a generated expression, the column value will be generated by the Db2 subsystem based on the result of the expression.
- If the column is an identity column, row change timestamp column, row-begin column, row-end column, or transaction-start-ID column, the Db2 subsystem will generate a new value.
- If the column is defined using the `WITH DEFAULT` clause, the value is set to the default that is defined for the column.
- If the column is defined without specifying the `WITH DEFAULT` clause, the `GENERATED` clause, or the `NOT NULL` clause, the value is NULL.
- If the column is specified in the `INCLUDE` column list, the column value is set to null.

An identity column or a row change timestamp column that is defined as GENERATED ALWAYS can be set only to the `DEFAULT` keyword.

DEFAULT must be specified for a column that was defined as GENERATED ALWAYS. A valid value can be specified for a column that was defined as GENERATED BY DEFAULT.

If the column is defined using the `NOT NULL` clause and the `GENERATED` clause is not used, or the `WITH DEFAULT` clause is not used, the `DEFAULT` keyword cannot be specified for that column.

NULL
Specifies the null value as the new value of the column. Specify `NULL` only for nullable columns.

row-fullselect
Specifies a fullselect that returns a single row. The column values are assigned to each of the corresponding *column-names*. If the fullselect returns no rows, the null value is assigned to each column; an error occurs if any column to be updated is not nullable. An error also occurs if there is more than one row in the result.

For a positioned update, if the table or view that is the object of the UPDATE statement is used in the fullselect, a column from the instance of the table or view in the fullselect cannot be the same as *column-name*, a column being updated.

If the fullselect refers to columns to be updated, the value of such a column in the fullselect is the value of the column in the row before the row is updated.

UNPACK-function-invocation
Specifies an invocation of the UNPACK built-in function. The number of fields that are returned by the UNPACK function invocation must be the same as the number of *column-names*.

WHERE
Specifies the rows to be updated. You can omit the clause, give a search condition, or specify a cursor. If you omit the clause, all rows of the table or view are updated.

search-condition
Specifies any search condition described in Chapter 2, “Language elements,” on page 73. Each *column-name* in the search condition, other than in a subquery, must identify a column of the table or view.

The *search-condition* is applied to each row of the table or view and the updated rows are those for which the result of the *search-condition* is true. If the unique key or primary key is a parent key, the constraints are effectively checked at the end of the operation.

If the search condition contains a subquery, the subquery can be thought of as being executed each time the search condition is applied to a row, and the results used in applying the search

condition. In actuality, a subquery with no correlated references is executed just once, whereas it is possible that a subquery with a correlated reference must be executed once for each row.

WHERE CURRENT OF *cursor-name*

Identifies the cursor to be used in the update operation. *cursor-name* must identify a declared cursor as explained in the description of the DECLARE CURSOR statement in "DECLARE CURSOR" on page 1643. If the UPDATE statement is embedded in a program, the DECLARE CURSOR statement must include *select-statement* rather than *statement-name*.

The object of the UPDATE statement must also be identified in the FROM clause of the SELECT statement of the cursor. The columns to be updated can be identified in the FOR UPDATE clause of that SELECT statement though they do not have to be identified. If the columns are not specified, the columns that can be updated include all the updatable columns of the table or view that is identified in the first FROM clause of the fullselect.

The result table of the cursor must not be read-only. For an explanation of read-only result tables, see Read-only cursors. Note that the object of the UPDATE statement must not be identified as the object of the subquery in the WHERE clause of the SELECT statement of the cursor.

When the UPDATE statement is executed, the cursor must be open and positioned on a row or rowset of the result table.

- If the cursor is positioned on a single row, that row is the one updated.
- If the cursor is positioned on a rowset, all rows corresponding to the rows of the current rowset are updated.

A positioned UPDATE must not be specified for a cursor that references a view on which an instead of update trigger is defined, even if the view is an updatable view.

FOR ROW *n* OF ROWSET

Specifies which row of the current rowset is to be updated. The corresponding row of the rowset is updated, and the cursor remains positioned on the current rowset.

host-variable or *integer-constant* is assigned to an integral value *k*. If *host-variable* is specified, it must be an exact numeric type with scale zero, must not include an indicator variable, and *k* must be in the range 1 - 32767.

The cursor must be positioned on a rowset, and the specified value must be a valid value for the set of rows most recently retrieved for the cursor. If the specified row cannot be updated, an error is returned. It is possible that the specified row is within the bounds of the rowset most recently requested, but the current rowset contains less than the number of rows that were implicitly or explicitly requested when that rowset was established.

If this clause is not specified, the cursor position determines the rows that will be affected. If the cursor is positioned on a single row, that row is the one updated. In the case where the most recent FETCH statement returned multiple rows of data (but not as a rowset), this position would be on the last row of data that was returned. If the cursor is positioned on a rowset, all rows corresponding to the current rowset are updated. The cursor position remains unchanged.

It is possible for another application process to update a row in the base table of the SELECT statement so that the specified row of the cursor no longer has a corresponding row in the base table. An attempt to update such a row results in an error.

isolation-clause

Specifies the isolation level used when locating the rows to be updated by the statement.

WITH

Introduces the isolation level, which may be one of the following:

RR

Repeatable read

RS

Read stability

CS
Cursor stability

The default isolation level of the statement is the isolation level of the package or plan in which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

SKIP LOCKED DATA
Specifies that rows are skipped when incompatible locks are held on the row by other transactions. These rows can belong to any accessed table that is specified in the statement. `SKIP LOCKED DATA` can be used only when isolation CS or RS is in effect and applies only to row level or page level locks.

`SKIP LOCKED DATA` can be specified only in the searched UPDATE statement (or the searched update operation of a MERGE statement). `SKIP LOCKED DATA` is ignored if it is specified when the isolation level that is in effect is repeatable read (`WITH RR`) or uncommitted read (`WITH UR`). The default isolation level of the statement depends on the isolation level of the package or plan with which the statement is bound, with the package isolation taking precedence over the plan isolation. When a package isolation is not specified, the plan isolation is the default.

QUERYNO *integer*
Specifies the number to be used for this SQL statement in EXPLAIN output and trace records. The number is used for the QUERYNO column of the plan table for the rows that contain information about this SQL statement. This number is also used in the QUERYNO column of the SYSIBM.SYSSTMT and SYSIBM.SYSPACKSTMT catalog tables.

If the clause is omitted, the number associated with the SQL statement is the statement number assigned during precompilation. Thus, if the application program is changed and then precompiled, that statement number might change.

Using the `QUERYNO` clause to assign unique numbers to the SQL statements in a program is helpful:

- For simplifying the use of optimization hints for access path selection
- For correlating SQL statement text with EXPLAIN output in the plan table

For information on using optimization hints, such as enabling the system for optimization hints and setting valid hint values, and for information on accessing the plan table, see *Managing Performance*.

Notes

Update rules:
Update values must satisfy the following rules. If they do not, or if other errors occur during the execution of the UPDATE statement, no rows are updated and the position of the cursors are not changed.

- *Assignment*. Update values are assigned to columns using the assignment rules described in Chapter 2, “Language elements,” on page 73.
- *Validity*. Updates must obey the following rules. If they do not, or if any other errors occur during the execution of the UPDATE statement, no rows are updated.
  - *Fullselects:* The row-fullselect and expressions that contain a *scalar-fullselect* must return no more than one row.
  - *Unique constraints and unique indexes:* If the identified table (or base table of the identified view) has any unique indexes or unique constraints, each row that is updated in the table must conform to the limitations that are imposed by those indexes and constraints.

    All uniqueness checks are effectively made at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.
  - *Check constraints:* If the identified table (or base table of the identified view) has any check constraints, each check constraint must be true or unknown for each row that is updated in the table.

All checks constraints are effectively validated at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

  - *Views and the WITH CHECK OPTION*. For views defined with WITH CHECK OPTION, an updated row must conform to the definition of the view. If the view you name is dependent on other views whose definitions include WITH CHECK OPTION, the updated rows must also conform to the definitions of those views. For an explanation of the rules governing this situation, see "CREATE VIEW" on page 1636.

    For views that are not defined with WITH CHECK OPTION, you can change the rows so that they no longer conform to the definition of the view. Such rows are updated in the base table of the view and no longer appear in the view.

  - *Field and validation procedures*. The updated rows must conform to any constraints imposed by any field or validation procedures on the identified table (or on the base table of the identified view).

- *Referential constraints*. The value of the parent key in a parent row must not be changed. If the update value produces a foreign key that is nonnull, the foreign key must be equal to some value of the parent key of the parent table of the relationship.

  All referential constraints are effectively checked at the end of the statement. In the case of a multi-row update, this validation occurs after all the rows are updated.

- *Indexes with VARBINARY columns*. If the identified table has an index on a VARBINARY column or a column that is a distinct type that is based on VARBINARY data type, that index column cannot specify the DESC attribute. To use the SQL data change operation on the identified table, either drop the index or alter the data type of the column to BINARY and then rebuild the index.
- *Triggers*. An UPDATE statement might cause triggers to activate. A trigger might cause other statements to be executed or raise error conditions based on the update values. If an UPDATE statement for a view causes an instead of trigger to activate, validity, referential integrity, and check constraints are checked against the data changes that are performed in the trigger and not against the view that causes the trigger to activate or its underlying base tables.

Number of rows updated:

Normally, after an UPDATE statement completes execution, the value of SQLERRD(3) in the SQLCA is the number of rows updated. (For a complete description of the SQLCA, including exceptions to the preceding sentence, see "SQL communication area (SQLCA)" on page 2086.)

Nesting user-defined functions or stored procedures:

An UPDATE statement can implicitly or explicitly refer to user-defined functions or stored procedures. This is known as *nesting* of SQL statements. A user-defined function or stored procedure that is nested within the UPDATE must not access the table being updated.

Locking:

Unless appropriate locks already exist, one or more exclusive locks are acquired by the execution of a successful update operation. Until a commit or rollback operation releases the locks, only the application process that performed the insert can access the updated row. If LOBs are not updated, application processes that are running with uncommitted read can also access the updated row. The locks can also prevent other application processes from performing operations on the table. However, application processes that are running with uncommitted read can access locked pages and rows.

Locks are not acquired on declared temporary tables.

Datetime representation when using datetime registers:

As explained under Datetime special registers, when two or more datetime registers are implicitly or explicitly specified in a single SQL statement, they represent the same point in time. This is also true when multiple rows are updated.

Rules for positioned UPDATE with a SENSITIVE STATIC scrollable cursor:

When a SENSITIVE STATIC scrollable cursor has been declared, the following rules apply:

- *Update attempt of delete holes.* If, with a positioned update against a SENSITIVE STATIC scrollable cursor, an attempt is made to update a row that has been identified as a delete hole, an error occurs.

- *Update operations.* Positioned update operations with SENSITIVE STATIC scrollable cursors perform as follows:

  1. The SELECT list items in the target row of the base table of the cursor are compared with the values in the corresponding row of the result table (that is, the result table must still agree with the base table). If the values are not identical, then the update operation is rejected, and an error occurs. The operation may be attempted again after a successful FETCH SENSITIVE has occurred for the target row.
  2. The WHERE clause of the SELECT statement is re-evaluated to determine whether the current values in the base table still satisfy the search criteria. The values in the SELECT list are compared to determine that these values have not changed. If the WHERE clause evaluates as true, and the values in the SELECT have not changed, the update operation is allowed to proceed. Otherwise, the update operation is rejected, an error occurs, and an *update hole* appears in the cursor.

- *Update of update holes.* Update holes are not permanent. It is possible for another process, or a searched update in the same process, to update an update hole row so that it is no longer an update hole. Update holes become visible with a FETCH SENSITIVE for positioned updates and positioned deletes.
- *Result table.* After the base table is updated, the row is re-evaluated and updated in the temporary result table. At this time, it is possible that the positioned update changed the data such that the row does not qualify the search condition, in which case the row is marked as an update hole for subsequent FETCH operations.

Updating rows in a table with multilevel security:

When you update rows in a table with multilevel security, Db2 compares the security label of the user (the primary authorization ID) to the security label of the row. The update proceeds according to the following rules:

- If the security label of the user and the security label of the row are equivalent, the row is updated and the value of the security label is determined by whether the user has write-down privilege:
  - If the user has write-down privilege or write-down control is not enabled, the user can set the security label of the row to any valid security label. The value that is specified for the security label column must be assignable to a column that is defined as CHAR(8) FOR SBCS DATA NOT NULL.
  - If the user does not have write-down privilege and write-down control is enabled, the security label of the row is set to the value of the security label of the user.
- If the security label of the user dominates the security label of the row, the result of the UPDATE statement is determined by whether the user has write-down privilege:
  - If the user has write-down privilege or write-down control is not enabled, the row is updated and the user can set the security label of the row to any valid security label.
  - If the user does not have write-down privilege and write-down control is enabled, the row is not updated.
- If the security label of the row dominates the security label of the user, the row is not updated.

Updating rows in a table for which row or column access control is enforced:

When an UPDATE statement is issued for a table for which row or column access control is enforced, the rules specified in the enabled row permissions or column masks determine whether the row can be updated. Typically those rules are based on the authorization ID or role of the process. The following describes how enabled row permissions and column masks are used during UPDATE:

- Row permissions are used to identify the set of rows to be updated.

  When multiple enabled row permissions are defined for a table, a row access control search condition is derived by application of the logical OR operator to the search condition in each enabled permission. This row access control search condition is applied to the table to determine which rows are accessible to the authorization ID or role of the UPDATE statement. If the WHERE clause is specified in the UPDATE statement, the user-specified predicates are applied on the accessible

rows to determine the rows to be updated. If there is no WHERE clause, the accessible rows are the rows to be updated.

Column masks are not applicable in this step.

If the table is not enforced by row access control, the WHERE clause determines the rows to be updated, otherwise all rows in the table are to be updated.

- If there are rows to be updated, the following rules determine whether those rows can be updated:
  - For every column to be updated, the new value of the column must not be affected by enabled column masks whose columns are referenced when deriving the new value.

    When a column is referenced while deriving the values of a new row, if the column has an enabled column mask, the masked value is used to derive the new values. If the object table is also column access control activated, the column mask applied to derive the new values must ensure the evaluation of the access control rules defined in the column mask resolves the column to itself, not to a constant or an expression. If the column mask does not mask the column to itself, the new value cannot be used for update and an error is returned at run time.
  - If the rows are updatable, and there is a BEFORE UPDATE trigger for the table, the trigger is activated.

    Within the trigger actions, the new values for update might be modified in transition variables. When the final values are returned from the trigger, the new values are used for the update.
  - The rows that are to be updated must conform to the enabled row permissions:

    For each row that is to be updated, the old values are replaced with the new values that were specified in the UPDATE statement. A row that conforms to the enabled row permissions is a row that, if updated, can be retrieved using the derived row access control search condition.
  - If the rows are updatable, and there is an AFTER UPDATE trigger for the table, the trigger is activated.

The above rules are not applicable to the included columns. The included columns are subject to the rules for the select list because they are not the columns of the object table of the UPDATE statement.

Extended indicator variable usage:
When extended indicator variables are enabled, negative indicator values that are outside the range of -1 through -7 must not be specified, and the default and unassigned extended indicator values must not appear in contexts in which they are not supported.

Extended indicator variables:
Assigning an extended indicator value of unassigned has the same effect as if it had not been specified in the statement. Assigning an extended indicator value of default assigns the default value to the column. An extended indicator value of default must not be specified for a row-begin, row-end, transaction-start-ID, or generated expression column.

The UPDATE statement must not assign all target columns to the extended indicator value of unassigned.

Extended indicator variables and update triggers:
If a target column has been assigned an extended indicator value of unassigned, the column is not considered to have been updated. The column is treated as if it had not been specified in the 0F *column-name* list of any update trigger that is defined on the target table.

Considerations for a generated column:
A generated column that is defined as GENERATED ALWAYS should not be specified as the target of an assignment clause unless the value that is to be assigned is specified with the DEFAULT keyword or an extended indicator that specifies that a default value is to be assigned.

Considerations for a system-period temporal table:
When a row of a system-period temporal table is updated, Db2 updates the values of the row-begin and transaction-start-ID columns as follows:

- A row-begin column is assigned a value that is generated by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned

to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. Db2 ensures the uniqueness of the generated values for a row-begin column across transactions. If multiple rows are updated within a single SQL transaction, the values for the row-begin column are the same for all the rows and are unique from the values that are generated for the column for another transaction.

- A transaction-start-ID column is assigned a unique timestamp value per unit of work or the null value. The null value is assigned to the transaction-start-ID column if the column is nullable. Otherwise, the value is generated by using the time-of-day clock during execution of the first data change statement in the unit of work that requires a value to be assigned to a row-begin column or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. If multiple rows are updated within a single SQL unit of work, the values for the transaction-start-ID column are the same for all the rows and are unique from the values that are generated for the column for another unit of work.

If the UPDATE statement has a search condition that contains a correlated subquery that references historical rows (explicitly referencing the name of the history table or implicitly referenced through the use of a period specification in the FROM clause), the old version of the updated rows that are inserted as historical rows (into the history table) are potentially visible to update operations for the rows that are subsequently processed for the statement.

If the CURRENT TEMPORAL SYSTEM_TIME special register is set to a non-null value, the underlying target of the UPDATE statement cannot be a system-period temporal table. This restriction applies regardless of whether the system-period temporal table is directly or indirectly referenced.

Considerations for a history table:

When a row of a system-period temporal table is updated, a historical copy of the row is inserted into the corresponding history table and the end timestamp of the historical row is captured in the form of a system determined value that corresponds to the time of the data change operation. Db2 generates the value by using the time-of-day clock during the execution of the first data change statement in the transaction that requires a value to be assigned to a row-begin or transaction-start-ID column in a table. This also occurs when a row in a system-period temporal table is deleted. Db2 ensures uniqueness of the generated values for an end column in a history table across transactions. If a conflicting transaction is updating the same row in the system-period temporal table and the row that is to be inserted into the associated history table would have an end timestamp value that is greater than the begin timestamp value, an error is returned.

Considerations for an application-period temporal table:

An UPDATE statement that contains a FOR PORTION OF BUSINESS_TIME clause for an application-period temporal table indicates the two points in time between which the specified updates are effective.

Suppose that FOR PORTION OF BUSINESS_TIME is specified, and the period value for a row is only partially contained in the period that is specified from *value1* up to *value2*. (The period value for a row is specified by the values of the begin column and end column for the BUSINESS_TIME period.) In this case, the row is updated and one or two rows are automatically inserted to represent the portion of the row that is not changed. For each row that is automatically inserted as a result of an update operation on the table, new values are generated for each generated column in the application-period temporal table. If a generated column is defined as part of a unique or primary key, parent key in a referential constraint, or unique index, an automatic insert might violate a constraint or index. In this case, an error is returned.

When an application-period table is the target of an UPDATE statement and the value in effect for the CURRENT TEMPORAL BUSINESS_TIME special register is not the null value, Db2 adds the following additional predicates to the statement:

```
    bt_begin <= CURRENT TEMPORAL BUSINESS_TIME
AND bt_end > CURRENT TEMPORAL BUSINESS_TIME
```

In the preceding code, bt_begin and bt_end are the begin and end columns of the BUSINESS_TIME period of the target table of the UPDATE statement.

Archive-enabled tables:
A reference to an archive-enabled table as the target of the UPDATE statement does not affect rows in the associated archive table.

A data change statement must not reference an archive-enabled table when a system-period temporal table or application-period temporal table is also referenced.

Other SQL statements in the same unit of work:
The following statements cannot follow an UPDATE statement in the same unit of work:

- An ALTER TABLE statement that changes the data type of a column (ALTER COLUMN SET DATA TYPE)
- An ALTER INDEX statement that changes the padding attribute of an index with varying-length columns (PADDED to NOT PADDED or vice versa)
- A CREATE TABLE statement that creates an accelerator-only table.
- An INSERT, UPDATE, or DELETE statement that updates accelerator-only tables from a different accelerator.

Using UPDATE to reset AREO* status on a table:
An UPDATE statement will reset the AREO* state of a table if all conditions are true:

- The statement is a searched UPDATE statement. An UPDATE statement within a SELECT statement will not reset the AREO* state.
- The expression in the SET clause is not a *scalar-fullselect* or *row-fullselect*
- The update operation is against a table in a universal table space
- The table does not have row access control activated
- The SKIP LOCKED DATA clause is not specified
- The WHERE clause is not specified
- A resource unavailable condition is not encountered.

  No error or warning SQLCODE is returned if a resource unavailable condition is encountered. Only a resource unavailable console message will be displayed.

A DISPLAY DATABASE command can be used to determine if AREO* is reset.

Examples

Example 1
Change employee 000190's telephone number to 3565 in DSN8B10.EMP.

```
UPDATE DSN8B10.EMP
  SET PHONENO='3565'
  WHERE EMPNO='000190';
```

Example 2
Give each member of department D11 a 100-dollar raise.

```
UPDATE DSN8B10.EMP
  SET SALARY = SALARY + 100
  WHERE WORKDEPT = 'D11';
```

Example 3
Employee 000250 is going on a leave of absence. Set the employee's pay values (SALARY, BONUS, and COMMISSION) to null.

```
UPDATE DSN8B10.EMP
  SET SALARY = NULL, BONUS = NULL, COMM = NULL
  WHERE EMPNO='000250';
```

Alternatively, the statement could also be written as follows:

```
UPDATE DSN8B10.EMP
  SET (SALARY, BONUS, COMM) = (NULL, NULL, NULL)
  WHERE EMPNO='000250';
```

Example 4

Assume that a column named PROJSIZE has been added to DSN8B10.EMP. The column records the number of projects for which the employee's department has responsibility. For each employee in department E21, update PROJSIZE with the number of projects for which the department is responsible.

```
UPDATE DSN8B10.EMP
  SET PROJSIZE = (SELECT COUNT(*)
                  FROM DSN8B10.PROJ
                  WHERE DEPTNO = 'E21')
  WHERE WORKDEPT = 'E21';
```

Example 5

Double the salary of the employee represented by the row on which the cursor C1 is positioned.

```
EXEC SQL UPDATE DSN8B10.EMP
  SET SALARY = 2 * SALARY
  WHERE CURRENT OF C1;
```

Example 6

Assume that employee table EMP1 was created with the following statement:

```
CREATE TABLE EMP1
  (EMP_ROWID    ROWID GENERATED ALWAYS,
   EMPNO        CHAR(6),
   NAME         CHAR(30),
   SALARY       DECIMAL(9,2),
   PICTURE      BLOB(250K),
   RESUME       CLOB(32K));
```

Assume that host variable *HV_EMP_ROWID* contains the value of the ROWID column for employee with employee number '350000'. Using that ROWID value to identify the employee and user-defined function UPDATE_RESUME, increase the employee's salary by $1000 and update that employee's resume.

```
EXEC SQL UPDATE EMP1
  SET SALARY = SALARY + 1000,
      RESUME = UPDATE_RESUME(:HV_RESUME)
  WHERE EMP_ROWID = :HV_EMP_ROWID;
```

Example 7

In employee table X, give each employee whose salary is below average a salary increase of 10%.

```
EXEC SQL UPDATE EMP X
  SET SALARY = 1.10 * SALARY
  WHERE SALARY < (SELECT AVG(SALARY) FROM EMP Y
  WHERE X.JOBCODE = Y.JOBCODE);
```

Example 8

Raise the salary of the employees in department 'E11' whose salary is below average to the average salary.

```
EXEC SQL UPDATE EMP T1
  SET SALARY = (SELECT AVG(T2.SALARY) FROM EMP T2)
  WHERE WORKDEPT = 'E11' AND
        SALARY < (SELECT AVG(T3.SALARY) FROM EMP T3);
```

Example 9

Give the employees in department 'E11' a bonus equal to 10% of their salary.

```
EXEC SQL
  DECLARE C1 CURSOR FOR
    SELECT BONUS
```

```
      FROM DSN8710.EMP
      WHERE WORKDEPT = 'E12'
      FOR UPDATE OF BONUS;
  EXEC SQL
    UPDATE DSN8710.EMP
      SET BONUS = ( SELECT .10 * SALARY FROM DSN8710.EMP Y
                    WHERE EMPNO = Y.EMPNO )
      WHERE CURRENT OF C1;
```

Example 10

Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update all 10 rows in the rowset.

```
EXEC SQL UPDATE T1 SET C1 = 5 WHERE CURRENT OF CS1;
```

Example 11

Assuming that cursor CS1 is positioned on a rowset consisting of 10 rows in table T1, update the fourth row of the rowset.

```
short ind1, ind2;

int n, updt_value;

stmt = 'UPDATE T1 SET C1 = ? WHERE CURRENT OF CS1 FOR ROW ? OF ROWSET'

ind1 = 0;

ind2 = 0;

n = 4;

updt_value = 5;

...

strcpy(my_sqlda.sqldaid,"SQLDA");

my_sqlda.sqln = 2;

my_sqlda.sqld = 2;

my_sqlda.sqlvar[0].sqltype = 497;
my_sqlda.sqlvar[0].sqllen = 4;
my_sqlda.sqlvar[0].sqldata = (int *) &updt_value;
my_sqlda.sqlvar[0].sqlind = (short *) &ind1;

my_sqlda.sqlvar[1].sqltype = 497;
my_sqlda.sqlvar[1].sqllen = 4;
my_sqlda.sqlvar[1].sqldata = (int *) &n;
my_sqlda.sqlvar[1].sqlind = (short *) &ind2;

EXEC SQL PREPARE S1 FROM :stmt;

EXEC SQL EXECUTE S1 USING DESCRIPTOR :my_sqlda;
```

Example 12

Assume that table POLICY exists and that it is defined with a single period, BUSINESS_TIME. The table contains a row where column BK has a value of 'P138', column CLIENT has a value of 'C882', column TYPE has a value of 'PPO', and the period has value ('2013-01-01', '2020-12-31'). Update the portion of the row beginning from '2014-01-01' to set the TYPE column to 'HMO':

```
UPDATE POLICY
    FOR PORTION OF BUSINESS_TIME
        FROM '2014-01-01' TO '9999-12-31'
        SET TYPE='HMO'
        WHERE BK='P138', CLIENT='C882';
```

After the UPDATE statement is processed, the table contains 2 rows in place of the original row. One row with period value ('2013-01-01', '2014-01-01') represents a value of 'PPO' for the TYPE column (the value before the update) and the other row with period value ('2014-01-01', '2020-12-31') represents a value of 'HMO' for the TYPE column (that began with the UPDATE statement).

Example 13

Suppose that the INTARRAY and CHARARRAY array types, the INTA, CHARA, and SI variables, and the T1 table are defined as follows:

```
CREATE TYPE INTARRAY AS INTEGER ARRAY [6];
CREATE TYPE CHARARRAY AS CHAR(20) ARRAY [7];
DECLARE INTA AS INTARRAY;
DECLARE CHARA AS CHARARRAY;
CREATE VARIABLE SI INT;
CREATE TABLE T1 (COL1 CHAR(7), COL2 INT);
```

Assign values to CHARA, INTA, and SI.

```
SET CHARA = ARRAY [ 'a', 'b', 'c' ];
SET INTA = ARRAY [ 1, 2, 3, 4, 5 ];
SET SI = 1;
```

Insert a row into table T1, and then update the row values using values from the CHARA and INTA arrays, which are indexed by the value of variable SI.

```
INSERT INTO T1 VALUES ('abc', 10);
UPDATE T1
 SET COL1 = CHARA[SI],
 COL2 = INTA[SI];
```

In the table row, COL1 now contains 'a', and COL2 contains 1.

Set the value of column COL2 for all rows to the cardinality of array INTA.

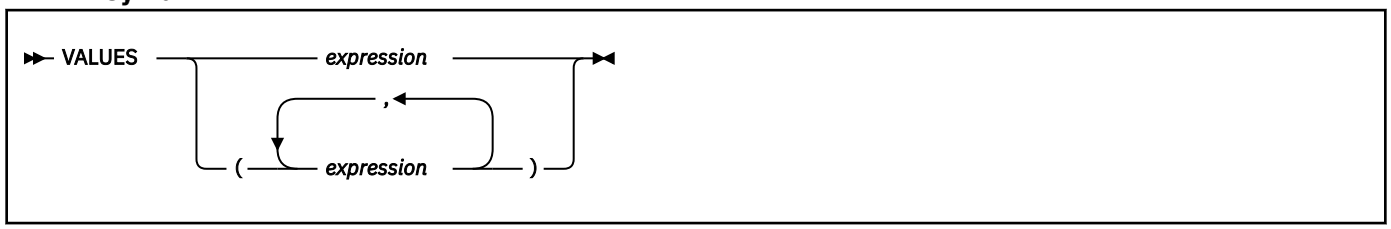
```
UPDATE T1
 SET COL2 = CARDINALITY(INTA);
```

In the table row, COL2 now contains 5.

VALUES

The VALUES statement provides a method for invoking a user-defined function from a trigger. Transition variables and transition tables can be passed to the user-defined function.

Invocation



This statement can only be used in the triggered action of a trigger.

VALUES followed by a *sequence-reference* is a *values-clause*, which is a form of *fullselect*. For information about invocation of the *values-clause*, see "fullselect" on page 982.

Authorization

Authorization is required for any expressions that are used in the statement. For more information, see "Expressions" on page 229.

Syntax

Description

VALUES

Specifies one or more expressions. If more than one expression is specified, the expressions must be enclosed within parentheses.

expression

Any expression of the type described in "Expressions" on page 229. The expression must not contain a host variable.

The expressions are evaluated, but the resulting values are discarded and are not assigned to any output variables.

If a user-defined function is specified as part of an expression, the user-defined function is invoked. If a negative SQLCODE is returned when the function is invoked, Db2 stops executing the trigger and rolls back any triggered actions that were performed.

Example

Example: Create an after trigger EMPISRT1 that invokes user-defined function NEWEMP when the trigger is activated. An insert operation on table EMP activates the trigger. Pass transition variables for the new employee number, last name, and first name to the user-defined function.

```
CREATE TRIGGER EMPISRT1
   AFTER INSERT ON EMP
   REFERENCING NEW AS N
   FOR EACH ROW
   MODE DB2SQL
   BEGIN ATOMIC
      VALUES(NEWEMP(N.EMPNO, N.LASTNAME, N.FIRSTNAME));
   END
```

VALUES INTO

The VALUES INTO statement assigns one or more values to variables.

Invocation

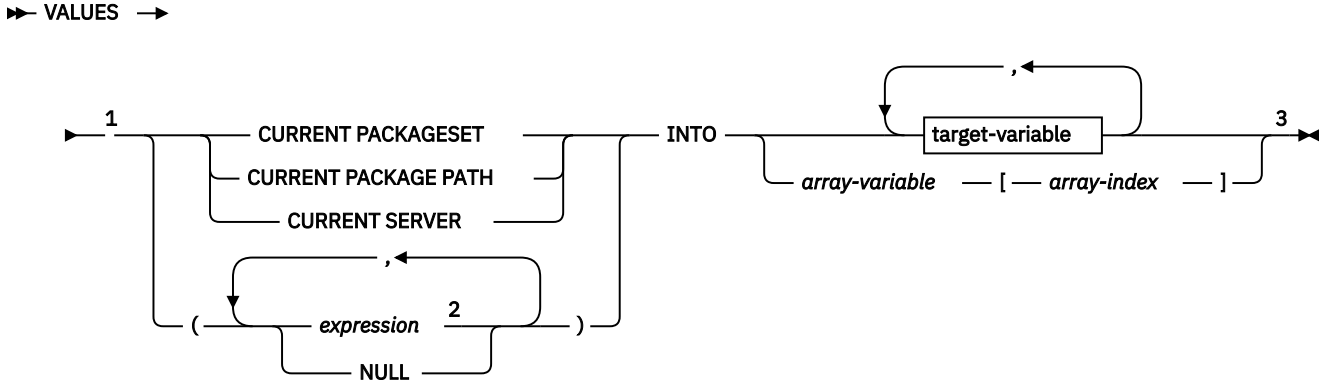
This statement can only be embedded in an application program. It is an executable statement that cannot be dynamically prepared.

Authorization

The privileges that are held by the authorization ID of the statement must include at least one of the following privileges or authorities:

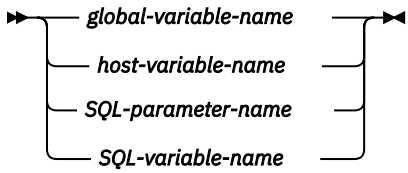
- The SELECT privilege on every table and view identified in the statement
- Ownership of every table and view identified in the statement
- READ and WRITE privileges on any global variables that are identified in the statement
- Ownership of any global variables that are identified in the statement
- DBADM authority for the database (tables only)
- DATAACCESS authority
- SYSADM authority
- SYSCTRL authority (catalog tables only)

For an assignment to a global variable, the privilege set must include at least one of the following:



- The WRITE privilege on the variable
- Ownership of the variable

- DATAACCESS authority
- SYSADM authority



Privilege set: The privilege set is the privileges that are held by the owner of the package.

Authorization is required for any expressions that are used in the statement. For more information, see "Expressions" on page 229.

Syntax

target-variable

Notes:

[1] When the target is not an SQL parameter or an SQL variable that is used in a native SQL procedure or compiled SQL function, these special registers can be referenced only as a source value in this form of the syntax for this statement.

[2] If *expression* is an *array-constructor*, it must not be the only source value specification in the list.

[3] The number of source value specifications (*expression*, NULL, or DEFAULT) on the right side of the equal sign must match the number of target specifications on the left side of the statement.

Description

VALUES

Introduces a single row that consists of one or more columns. If more than one value is specified, the list of values must be enclosed within parentheses.

expression

The expression is any expression of the type described in "Expressions" on page 229. In a native SQL routine, the expression can contain a reference to the CURRENT PACKAGESET, CURRENT PACKAGE PATH, or CURRENT SERVER special registers if *target-variable* is an SQL parameter or SQL variable. The expression must not include a column name.

NULL

The null value. NULL can only be specified for host variables that have an associated indicator variable.

INTO *target-variable* or *array-variable*[*array-index*]

Identifies one or more targets for the assignment of output values. The number of targets in the INTO clause must equal the number of values that are to be assigned. The first value in the result row is assigned to the first target in the list, the second value to the second target, and so on. A target

variable must not be specified more than once in the INTO clause. Each assignment to a target is made in sequence through the list, according to the rules described in "Assignment and comparison" on page 135.

The value 'W' is assigned to the SQLWARN3 field of the SQLCA if the number of targets is less than the number of result column values.

If an error occurs on any assignment, the value is not assigned to the target, and no more values are assigned to the specified targets. Any values that have already been assigned remain assigned.

global-variable-name
Identifies the global variable that is the assignment target.

host-variable-name
Identifies the host variable that is the assignment target. For LOB output values, the target can be a regular host variable (if it is large enough), a LOB locator variable, or a LOB file reference variable.

SQL-parameter-name
Identifies the parameter that is the assignment target.

SQL-variable-name
Identifies the SQL variable that is the assignment target. SQL variables must be declared before they are used.

***array-variable* [*array-index*]**
Specifies an array element that is the target of the assignment.

An array element must not be specified as the target for an assignment if *common-table-expression* is also specified in the statement.

array-variable
Specifies an array variable.

[*array-index*]
An expression that specifies which element in the array is the target of the assignment.

For an ordinary array, the array index expression must be castable to INTEGER, and must not be the null value. The index value must be between 1 and the maximum cardinality that is defined for the array.

For an associative array, the array index expression must be castable to the index data type of the associative array, and must not be the null value.

array-index must not be:

- An expression that references the CURRENT DATE, CURRENT TIME, or CURRENT TIMESTAMP special register
- A nondeterministic function
- A function that is defined with EXTERNAL ACTION
- A function that is defined with MODIFIES SQL DATA
- A sequence expression

Notes

Assignment to targets:
The *n*th target identified by the INTO clause corresponds to the *n*th column of the result table of the cursor. The data type of the target must be compatible with its corresponding value. If the value is numeric, the target must have the capacity to represent the whole part of the value. For a datetime value, the target must be a character string variable of a minimum length as defined in "String representations of datetime values" on page 115. When the value that is to be assigned is null, an indicator variable must be specified for the target variable.

Assignments are made in sequence through the list. Each assignment to a target is made according to the rules described in Chapter 2, "Language elements," on page 73. If the number of targets is less

than the number of values in the row, the SQLWARN3 field of the SQLCA is set to 'W'. There is no warning if there are more targets than the number of result columns. If a null value is assigned to a target variable, an indicator variable must be provided. If an assignment error occurs, the value is not assigned to the target and no more values are assigned to targets. Any values that have already been assigned to targets remain assigned. However, if LOB values are involved, there is a possibility that the corresponding target was modified, but the variable's contents are unpredictable.

If more than one assignment is included in the same assignment statement, all expressions are evaluated before the assignments are performed. For example, a reference to a variable in an expression always uses the value of the variable prior to any assignment in the assignment statement.

Normally, you use LOB locators to assign and retrieve data from LOB columns. However, because of compatibility rules, you can also use LOB locators to assign data to targets with other data types. For more information on using locators, see Saving storage when manipulating LOBs by using LOB locators (Db2 Application programming and SQL).

Default encoding scheme:

The default encoding scheme for the data is the value in the bind option ENCODING, which is the option for application encoding. If this statement is used with functions such as LENGTH or SUBSTRING that are operating on LOB locators, and the LOB data that is specifies by the locator is in a different encoding scheme from the ENCODING bind option, LOB materialization and character conversion occur. To avoid LOB materialization and character conversion, select the LOB data from the SYSIBM.SYSDUMMYA, SYSIBM.SYSDUMMYE, or SYSIBM.SYSDUMMYU sample table.

Examples

Example 1: Assign the value of the CURRENT PATH special register to host variable *HV1*.

```
EXEC SQL VALUES(CURRENT PATH)
         INTO :HV1;
```

Example 2: Assign the value of the CURRENT MEMBER special register to host variable *MEM*.

```
EXEC SQL VALUES(CURRENT MEMBER)
         INTO :MEM;
```

Example 3: Assume that LOB locator *LOB1* is associated with a CLOB value. Assign a portion of the CLOB value to host variable *DETAILS* using the LOB locator.

```
EXEC SQL VALUES (SUBSTR(:LOB1,1,35))
         INTO :DETAILS;
```

If the LOB data that is specified by the LOB locator *LOB1* is in a different encoding scheme from the value of the ENCODING bind option, and you want to avoid LOB materialization and character conversion, use the following statement instead of the VALUES INTO statement:

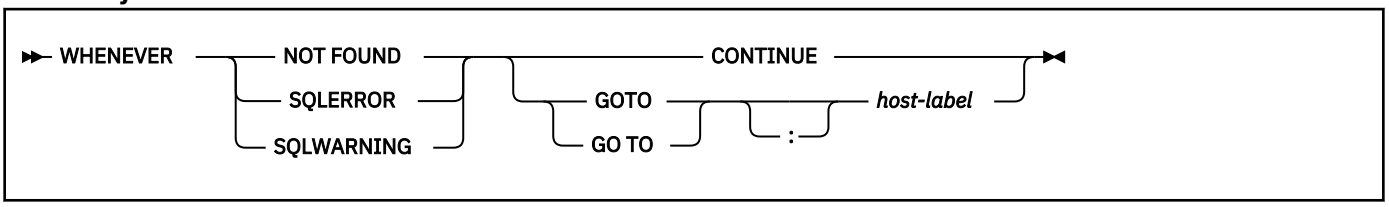
```
EXEC SQL SELECT SUBSTR(:LOB1,1,35)
         INTO :DETAILS
         FROM SYSIBM.SYSDUMMYU;
```

Example 4: Using a VALUES INTO statement, retrieve the value of INTVAR1 into an element in array MYINTARRAY1, which is indexed by the value of the expression INTCOL2+MYINTVAR+1.

```
VALUES INTVAR1 INTO MYINTARRAY1[INTCOL2+MYINTVAR+1];
```

WHENEVER

The WHENEVER statement specifies the host language statement to be executed when a specified exception condition occurs.



Invocation

This statement can only be embedded in an application program. It is not an executable statement. It must not be specified in Java or REXX.

Authorization

None required.

Syntax

Description

The NOT FOUND, SQLERROR, or SQLWARNING clause is used to identify the type of exception condition.

NOT FOUND
Identifies any condition that results in an SQLCODE of +100 (equivalently, an SQLSTATE code of '02000').

SQLERROR
Identifies any condition that results in a negative SQLCODE.

SQLWARNING
Identifies any condition that results in a warning condition (SQLWARN0 is W), or that results in a positive SQLCODE other than +100.

The CONTINUE or GO TO clause specifies the next statement to be executed when the identified type of exception condition exists.

CONTINUE
Specifies the next sequential statement of the source program.

GOTO or GOTO *host-label*
Specifies the statement identified by *host-label*. For *host-label*, substitute a single token, optionally preceded by a colon. The form of the token depends on the host language. In COBOL, for example, it can be *section-name* or an unqualified *paragraph-name*.

Notes

There are three types of WHENEVER statements:

- WHENEVER NOT FOUND
- WHENEVER SQLERROR
- WHENEVER SQLWARNING

Every executable SQL statement in an application program is within the scope of one implicit or explicit WHENEVER statement of each type. The scope of a WHENEVER statement is related to the listing sequence of the statements in the application program, not their execution sequence.

An SQL statement is within the scope of the last WHENEVER statement of each type that is specified before that SQL statement in the source program. If a WHENEVER statement of some type is not specified

before an SQL statement, that SQL statement is within the scope of an implicit WHENEVER statement of that type in which CONTINUE is specified. If a WHENEVER statement is specified in a Fortran subprogram, its scope is that subprogram, not the source program.

The GET DIAGNOSTICS statement can be used to provide additional information.

Examples

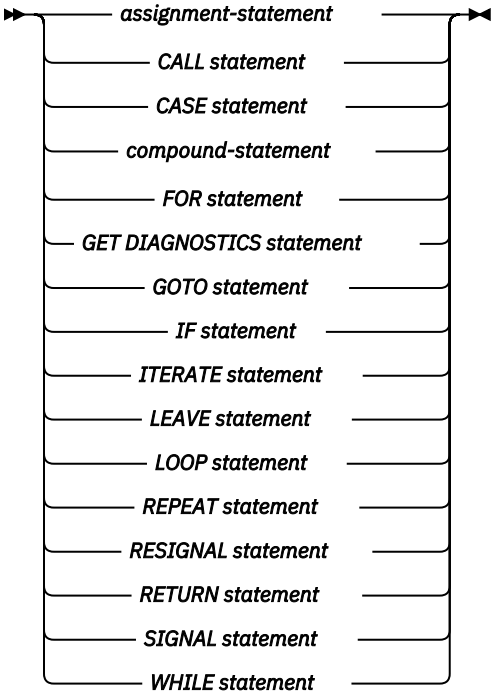
The following statements can be embedded in a COBOL program.

Example 1: Go to the label HANDLER for any statement that produces an error.

```
    EXEC SQL WHENEVER SQLERROR GOTO HANDLER END-EXEC.
```

Example 2: Continue processing for any statement that produces a warning.

```
    EXEC SQL WHENEVER SQLWARNING CONTINUE END-EXEC.
```



Example 3: Go to the label ENDDATA for any statement that does not return.

```
    EXEC SQL WHENEVER NOT FOUND GO TO ENDDATA END-EXEC.
```

Chapter 8. SQL control statements for SQL routines (SQL PL)

The *SQL procedural language (SQL PL)* is a set of SQL control statements for SQL routines can be used in SQL functions and native SQL procedures. *SQL control statements* provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

SQL-control-statement:

Control statements are supported in SQL functions and SQL procedures.

- SQL functions are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE FUNCTION (compiled SQL) statement. An SQL function can be changed. A new SQL routine body can be specified in an ALTER FUNCTION (compiled SQL) statement.
- SQL procedures are created by specifying LANGUAGE SQL and an SQL routine body in a CREATE PROCEDURE (SQL - native) statement. An SQL procedure can be changed. A new SQL routine body can be specified in an ALTER PROCEDURE (SQL - native) statement.

The SQL routine body is the executable part of the function or procedure and is transformed by Db2 into a program.

The remainder of the topics about SQL control statements for SQL routines contain information about references to SQL parameters and variables, SQL condition names, SQL cursor names, labels, and reference information for the use of the statements that constitute the SQL routine body.

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- “SQL-procedure-statement” on page 2007

Related reference

CREATE PROCEDURE

© Copyright IBM Corp. 1982, 2020

The CREATE PROCEDURE statement registers a stored procedure with a database server. You can register the following types of procedures with this statement, each of which is described separately.

References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a variable can be specified. Host variables cannot be specified in SQL routines. SQL parameters can be referenced anywhere in the routine and can be qualified with the routine name. SQL variables can be referenced anywhere in the compound statement in which they are declared, including any statement that is directly or indirectly nested within that compound statement.

If the compound statement where the variable is declared has a label, references to the variable name can be qualified with that label.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or an SQL variable in an SQL routine can be the same as the name of a column in a table or view that is referenced in the routine. The name of an SQL variable can also be the same as the name of another SQL variable that is declared in the same routine. This can occur when the two SQL variables are declared in different *compound-statements*. The *compound-statement* that contains the declaration of an SQL variable determines the scope of that variable. See "compound-statement" on page 2014 for additional information.

The name of an SQL variable or an SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to an identifier, an SQL variable, or an SQL parameter:

- In the SET CURRENT PACKAGE PATH, SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter with that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT, RELEASE (connection), and SET CONNECTION statements, the name is used as an identifier.

Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, an SQL variable, or an SQL parameter. If the name is not qualified or is qualified but is still ambiguous, the following rules describe whether the name refers to a column or to an SQL variable or an SQL parameter in an SQL routine:

- The name is checked to see if it is the name of a column of any existing table or a view that is specified in the SQL routine body at the current server. If the name is found as a column name, but the privilege set that is used to issue the CREATE PROCEDURE or ALTER PROCEDURE statement does not have the proper authority to access the table or view, the VALIDATE option that is in effect for the procedure determines what happens:
  - If VALIDATE BIND is in effect, an error is returned.
  - If VALIDATE RUN is in effect, the name is assumed to be a column name. If the privilege set that is used to issue the CREATE statement does not have the proper authority to access the table or view at run time, an error is returned.
- If the referenced tables or views do not exist at the current server, the name will be checked first as an SQL variable name in the compound statement and then as an SQL parameter name. The variable can be declared within the *compound-statement* that contains the reference, or within a compound statement in which that compound statement is nested. If two SQL variables are within the same scope and have the same name, the SQL variable that is declared in the innermost compound statement is used.

  If the name is not found as an SQL parameter or SQL variable, the VALIDATE option that is in effect for the procedure determines what happens:
  - If VALIDATE BIND is in effect, an error is returned.
  - If VALIDATE RUN is in effect, the name is assumed to a be column name. If a column does not exist with that name at run time, an error is returned.

References to SQL condition names

A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used.

The name of an SQL condition can be the same as the name of another SQL condition that is declared in the same routine. This can occur when the two SQL conditions are declared in different *compound-statements*. The *compound-statement* that contains the declaration of an SQL condition name determines the scope of that condition name. A condition name must be unique within the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement. A condition name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When there is a reference to a condition name, the condition that is declared in the innermost compound statement is the condition that is used. See “compound-statement” on page 2014 for additional information.

References to SQL cursor names

A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

The name of an SQL cursor can not be the same as the name of another SQL cursor that is declared on the same routine. The *compound-statement* that contains the declaration of an SQL cursor name determines the scope of that cursor name. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. See “compound-statement” on page 2014 for additional information.

References to labels

Labels can be specified on most SQL procedure statements. If a label is specified on an SQL procedure statement, it must be unique from other labels within the same scope. A label must not be the same as any other label within the same compound statement, must not be the same as a label specified on the compound statement itself, and if the compound statement is nested within another compound statement, the label must not be the same as the label specified on any higher level compound statement. The label must not be the same as the name of the SQL function or SQL procedure.

Specifying a label for an SQL procedure statement defines that label and determines the scope of that label. A label name can only be referenced within the compound statement in which it is defined, including a reference from any statement that is directly or indirectly nested within that compound statement. The FOR statement is considered the same as a compound statement with respect to defining and referencing labels. A label can be specified as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for the statement that references the label as a target.

References to SQL statement names

The name of an SQL statement can be the same as the name of another SQL statement declared in the same routine.

This can occur when the two SQL statements are declared in different compound statements. The compound statement that contains the declaration of an SQL statement name determines the scope of that statement name. A statement name must be unique within the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement. A statement name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. When

there is a reference to a statement name, the statement that is declared in the innermost compound statement is the statement that is used.

Nested compound statements and scope of names

Nested compound statements can be used within an SQL routine to define the scope of SQL variable declarations, cursors, condition names, and condition handlers.

In addition, labels have a defined scope in the context of nested compound statements. However, the rules for name spaces and how non-unique names can be referenced, differs depending on the type of name. The following table summarizes these differences:

Table 228. Scope and qualification of names within nested compound statements

Type of name	Name can be qualified	Name must be unique within	Name can be referenced within
SQL variable	Yes. The name can be qualified with the label of the compound statement in which the variable is declared	the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. When multiple SQL variables are defined with the same name, a label can be used to explicitly refer to a specific variable that is not the most local in scope
condition name	No	the compound statement in which it is declared, excluding any declarations in compound statements that are nested within that compound statement	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. Condition names can be used in the declaration of a condition handler, or in a SIGNAL or RESIGNAL statement. If multiple conditions are defined with the same name, there is no way to explicitly refer to the condition that is not the most local in scope.
cursor name	No	the routine	The compound statement in which it is declared, including any compound statements that are nested within that compound statement. If the cursor is defined as a result set cursor, the invoking application can access the result set.

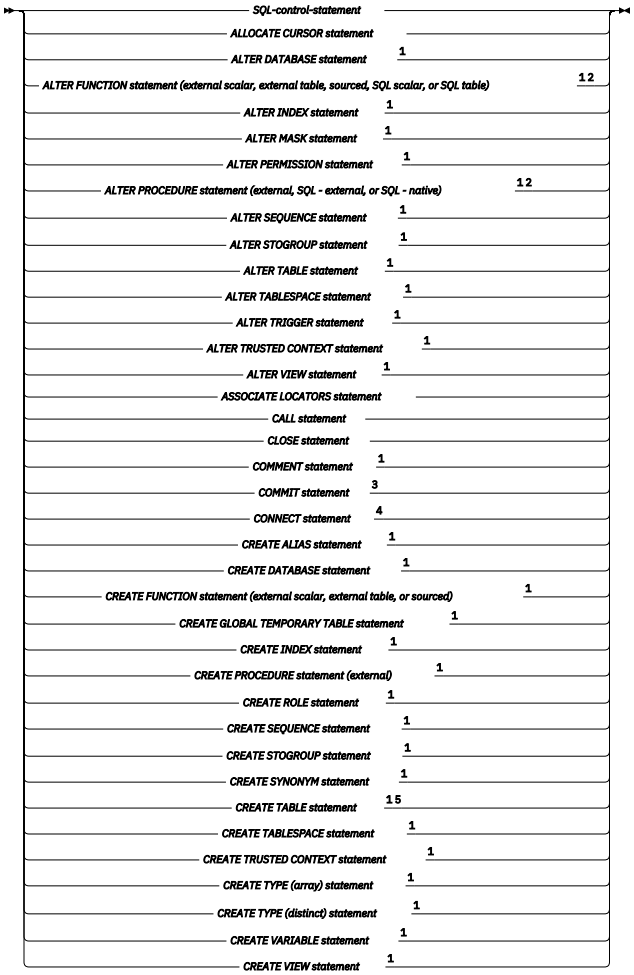


Table 228. Scope and qualification of names within nested compound statements (continued)

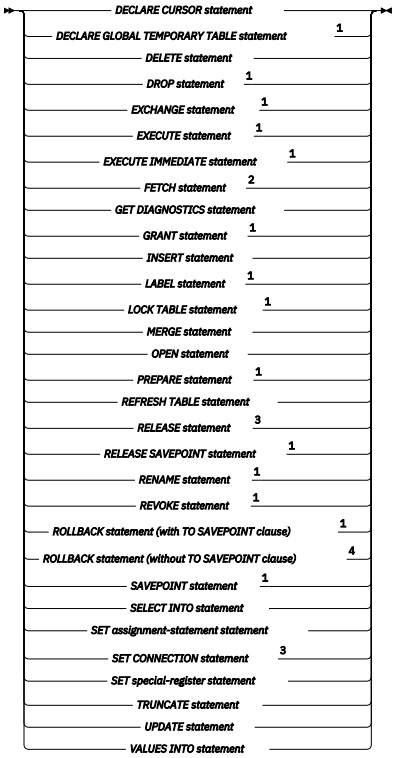
Type of name	Name can be qualified	Name must be unique within	Name can be referenced within
label	No	the compound statement that defined the label, including any definitions in compound statements that are nested within that compound statement	The compound statement in which it is defined, including any compound statements that are nested within that compound statement. Use a label to qualify the name of an SQL variable or as the target of a GOTO, LEAVE, or ITERATE statement, subject to the rules for these statements.

SQL-procedure-statement

An SQL control statement can allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax

Notes:



[1] The statement is not allowed in an *SQL-routine-body* for an SQL function.

[2] An ALTER FUNCTION statement (SQL scalar) or an ALTER PROCEDURE statement (SQL - native) with an ADD VERSION or REPLACE clause is not allowed in an *SQL-routine-body*.

[3] The COMMIT and ROLLBACK (without the TO SAVEPOINT clause) statements must only be specified within the body of an SQL procedure. A procedure containing one of these statements must not be invoked directly, or indirectly, from the body of a function.

[4] The CONNECT, RELEASE connection, and SET CONNECTION statements must only be specified within the body of an SQL procedure.

[5] A CREATE TABLE statement must not include a column defined as a LOB or XML.

Notes:

[1] The statement is not allowed in an *SQL-routine-body* for an SQL function.

[2] A FETCH statement must not specify a *fetch-orientation* clause, *multiple-row-fetch* clause, the WITH CONTINUE or the CURRENT CONTINUE clauses.

[3] The CONNECT, RELEASE connection, and SET CONNECTION statements must only be specified within the body of an SQL procedure.

[4] The COMMIT and ROLLBACK (without the TO SAVEPOINT clause) statements must only be specified within the body of an SQL procedure.

Description

SQL-control-statement
Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL routines.

SQL-statement
Specifies an SQL statement. These statements are described in Chapter 7, “Statements,” on page 999.

Notes

Comments: Comments can be included within the body of an SQL routine. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:

- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.

Detecting and processing error and warning conditions: As an SQL statement is executed, Db2 stores information about the processing of the statement in a diagnostics area (including the SQLSTATE and SQLCODE), unless otherwise noted in the description of the SQL statement. A completion condition can indicate that the SQL statement completed successfully, completed with a warning condition, or completed with a not found condition. An exception condition indicates that the SQL statement was not successful.

A condition handler can be defined to execute when an exception condition, a warning condition, or a not found condition occurs in a compound statement. The declaration of a condition handler includes the code that is executed when the condition handler is activated. When a condition other than a successful completion occurs in the processing of *SQL-procedure-statement* and a condition handler that can handle the condition is within scope, one such condition handler will be activated to process the condition. See "compound-statement" on page 2014 for information about defining condition handlers. The code in the condition handler can check for a warning condition, a not found condition, or an exception condition and can take the appropriate action. Use one of the following methods at the beginning of the body of a condition handler to check the condition in the diagnostics area that caused the handler to be activated.

- Issue a GET DIAGNOSTICS statement to request the information from the diagnostics area. See "GET DIAGNOSTICS" on page 1763.
- Test the SQLSTATE and SQLCODE SQL variables.

If the condition is a warning and no handler exists for the condition, the previous two methods can be used outside of the body of a condition handler, if they are used immediately following the statement for which the condition is wanted. If the condition is an error and no handler exists for the condition, the routine terminates with the error condition.

assignment-statement

The assignment statement assigns a value to variables or array elements. The target value can be an SQL parameter or an SQL variable.

Syntax

Description

label

Specifies the label for *assignment-statement*. The label name cannot be the same as the name of the SQL routine, or another label within the same scope. For additional information, see "References to labels" on page 2005.

See "SET assignment-statement" on page 1928 for details.

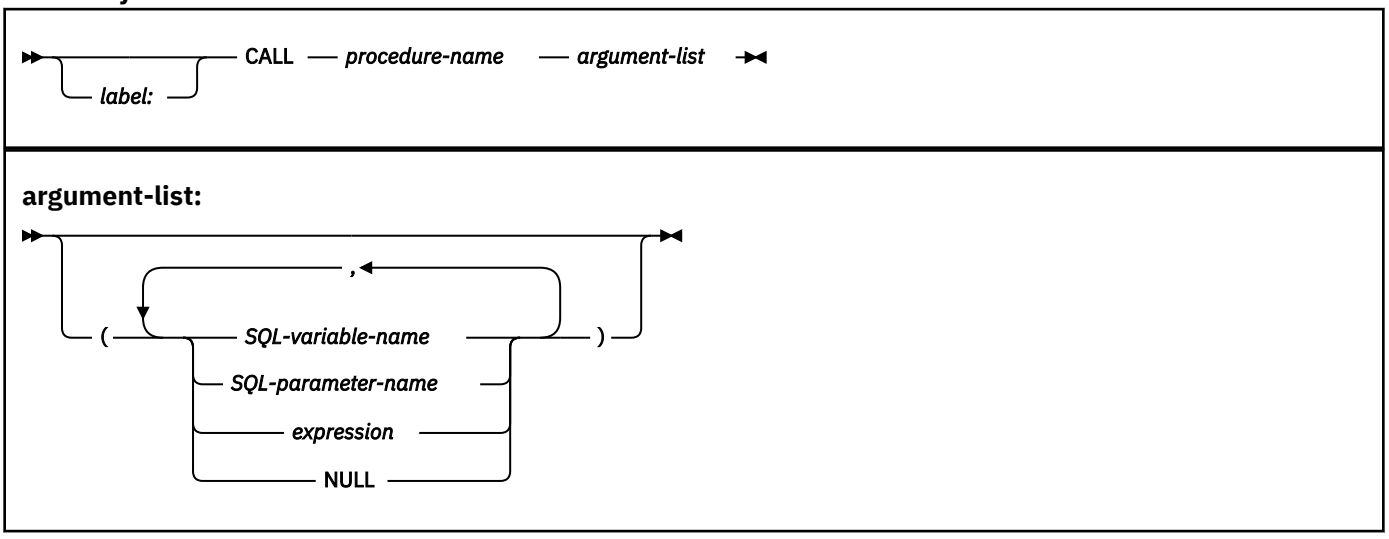
Notes

Assignment rules: Assignment statements in SQL routines and triggers must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 135 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

Assignments involving SQL parameters for SQL procedures: An IN parameter can appear on the left or right side in an assignment statement. When control returns to the caller, the original value of the IN parameter is retained. An OUT parameter can also appear on the left or right side in an assignment statement. If used without first being assigned a value, the value is undefined. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller. For an INOUT parameter, the first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.



Multiple assignments: If more than one assignment is included in the same assignment statement, all *expressions* are evaluated before the assignments are performed. Thus, references to an SQL variable or SQL parameter in an expression always use the value of the SQL variable or SQL parameter prior to any assignment in the assignment statement.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

CALL statement

The CALL statement invokes a stored procedure.

Syntax

Description

label

Specifies the label for the CALL statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

procedure-name

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list

Identifies a list of values to be passed as parameters to the stored procedure. The *n*th value corresponds to the *n*th parameter in the procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1261 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL routines. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name

Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 2004.

SQL-parameter-name

Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 2004.

expression

The parameter is the result of the specified *expression*, which is evaluated before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

- IN *expression* can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 229 for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- INOUT or OUT *expression* can only be a single SQL parameter or variable.

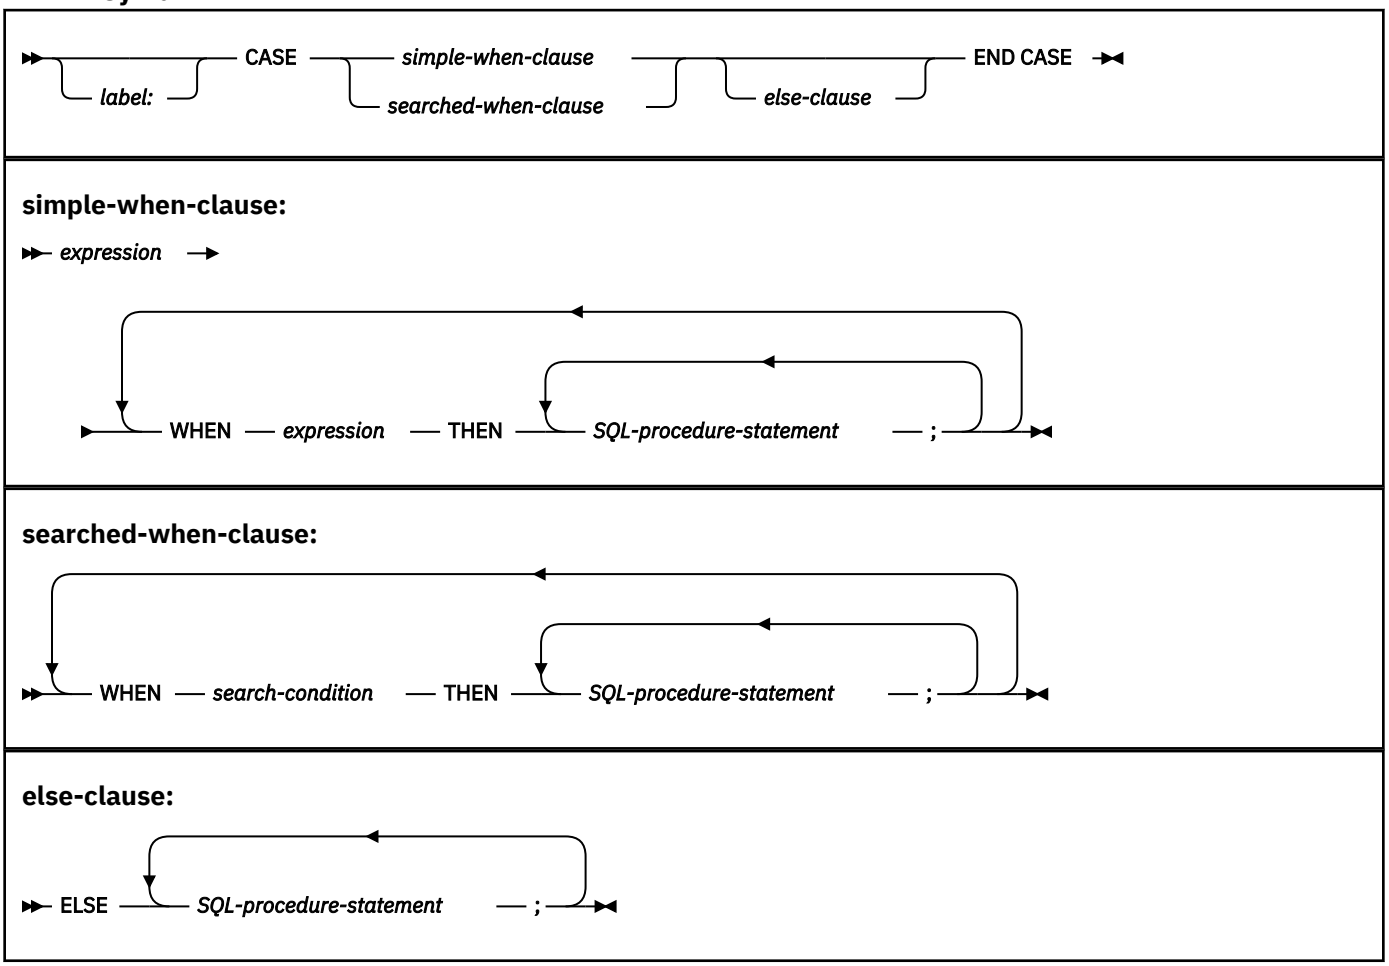
NULL

The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

Notes

See "CALL" on page 1261 for more information on the SQL CALL statement.

Examples



Call stored procedure proc1 and pass SQL variables as parameters.

```
CALL proc1(v_empno, v_salary)
```

CASE statement

The CASE statement selects an execution path based on multiple conditions. A CASE statement operates in the same way as a CASE expression.

Syntax

Description

label

Specifies the label for the CASE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

CASE

Begins a *case-expression*.

simple-when-clause

The value of the *expression* prior to the first WHEN keyword is tested for equality with the value of the *expression* that follows each WHEN keyword. If the comparison is true, the statements in the associated THEN clause are executed and processing of the CASE statement ends. If the result is unknown or false, processing continues to the next comparison. If the result does not match any of the comparisons, and an ELSE clause is present, the statements in the ELSE clause are executed.

searched-when-clause

The *search-condition* following the WHEN keyword is evaluated. If it evaluates to true, the statements in the associated THEN clause are executed and processing of the CASE statement ends. If it evaluates to false, or unknown, the next *search-condition* is evaluated. If no *search-condition* evaluates to true and an ELSE clause is present, the statements in the ELSE clause are executed.

When *searched-when-clause* is used, *search-condition* cannot contain a *fullselect*.

SQL-procedure-statement
Specifies a statement to execute. See"SQL-procedure-statement" on page 2007.

search-condition
Specifies a condition that is true, false, or unknown about a row or group of table data.

ELSE *SQL-procedure-statement*
If none of the conditions specified in the *simple-when-clause* or *searched-when-clause* are true, the statements specified in *SQL-procedure-statement* are executed.

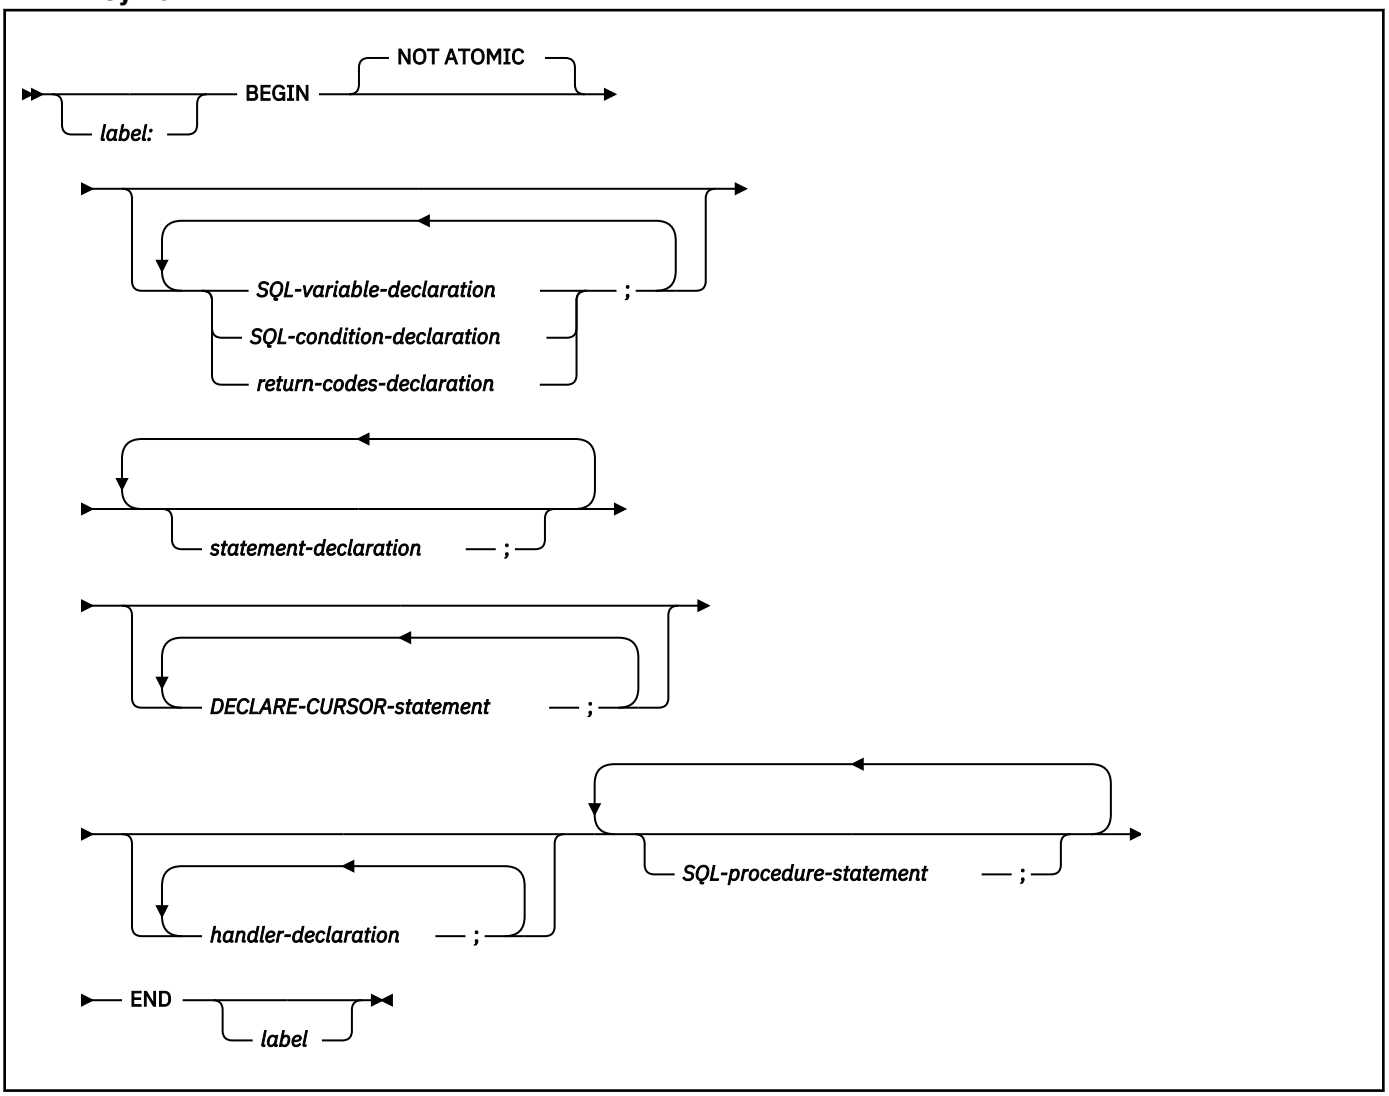
If none of the conditions specified in the WHEN clauses are true and an ELSE is not specified, an error is issued when the statement executes, and the execution of the CASE statement is terminated.

END CASE
Ends a *case-statement*.

Examples

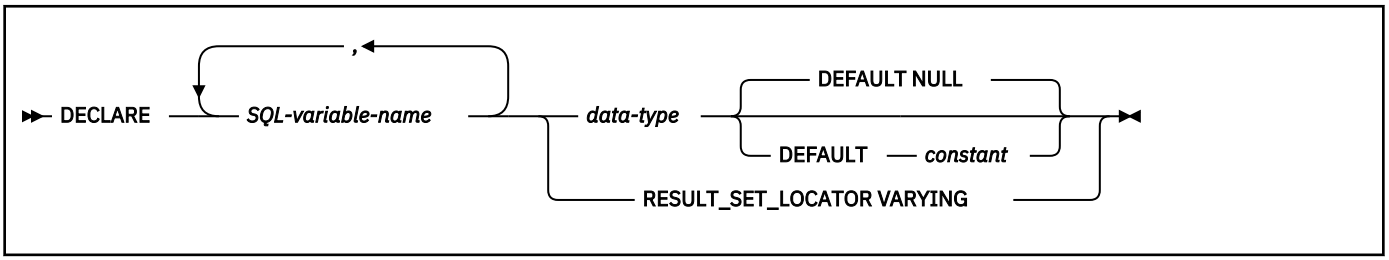
Example 1: Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE v_workdept
 WHEN 'A00'
  THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 1';
 WHEN 'B01'
  THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 3';
END CASE
```



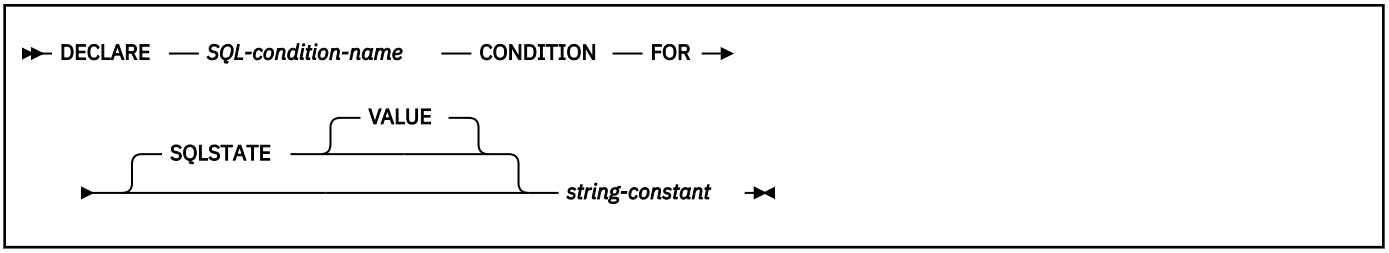
Example 2: Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE
 WHEN v_workdept < 'B01'
  THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 1';
 WHEN v_workdept < 'C01'
  THEN UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
    DEPTNAME = 'DATA ACCESS 3';
END CASE
```

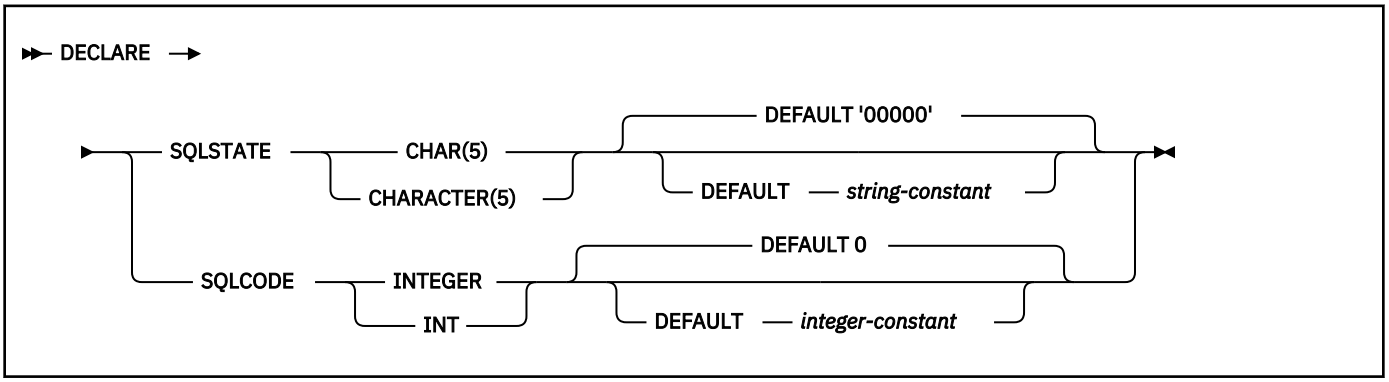


compound-statement

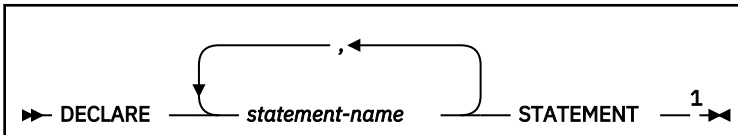
A compound statement groups other statements together in an SQL routine. A compound statement allows the declaration of SQL variables, cursors, and condition handlers.



Syntax

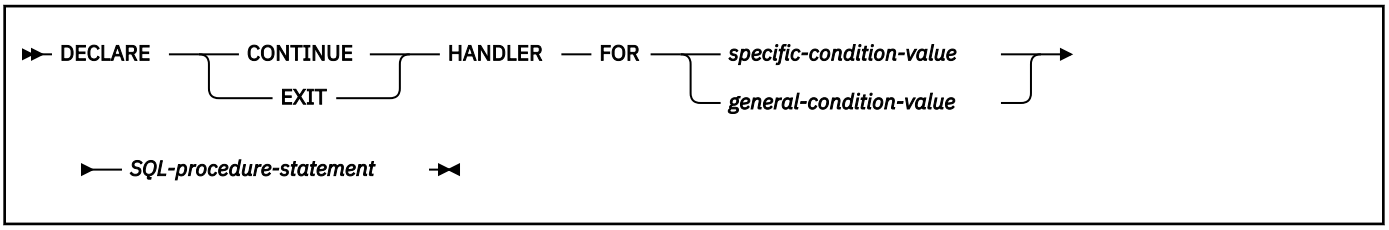


SQL-variable-declaration:

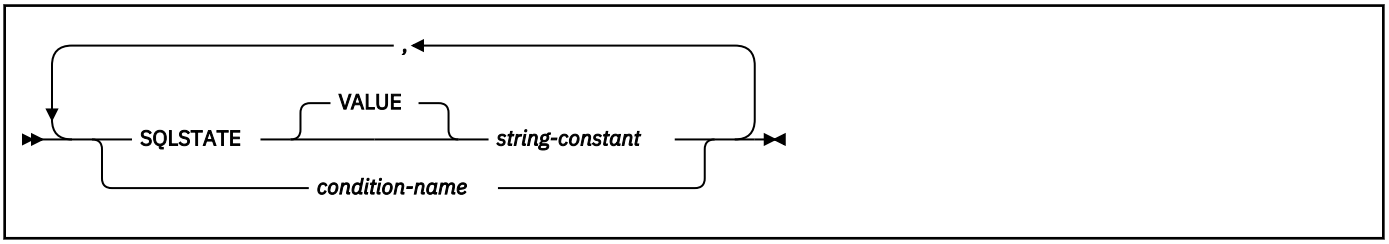


SQL-condition-declaration:

return-codes-declaration:



statement-declaration:



Notes:

[1] The statement is not allowed in an *SQL-routine-body* for an SQL function.

handler-declaration:

specific-condition-value:

general-condition-value:

Description

label
Specifies the label for the compound-statement. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified as the target on a LEAVE statement. If the ending label is specified, it must be the same as beginning label. The label name cannot be the same as the routine name or another label within the same scope.

NOT ATOMIC
NOT ATOMIC indicates that an unhandled exception condition within the compound-statement does not cause the compound-statement to be rolled back.

SQL-variable-declaration
Declares a variable that is local to the compound statement.

SQL-variable-name
Defines the name of a variable. Db2 converts all SBCS SQL variable names that are not delimited to uppercase. *SQL-variable-name* must be unique within the compound statement in which is it declared, excluding any declarations in compound statements that are nested within that compound statement. *SQL-variable-name* must not be the same as a parameter name. See "References to SQL parameters and SQL variables" on page 2004 for information about how SQL variable names are resolved when there are columns with the same name as an SQL variable involved in a statement, or when multiple SQL variables exist with the same name in the routine body.

SQL-variable-name can only be referenced within the compound statement in which it is declared, including any compound statement that is nested within that compound statement. If the compound statement where the variable is declared has a label, references to the variable name can be qualified with that label. For example, an SQL variable V that is declared in a compound statement that is labeled C can be referenced as C.V.

data-type
Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL routine parameters. See "CREATE FUNCTION (compiled SQL scalar)" on page 1304 for descriptions of SQL data types and lengths.

DEFAULT *constant* or NULL
Defines the default for the SQL variable. The specified constant must represent a value that could be assigned to the variable in accordance with the rules of assignment as described in "Assignment and comparison" on page 135. The variable is initialized when the compound statement begins processing. If a default value is not specified, the SQL variable is initialized to NULL. Only DEFAULT NULL can be explicitly specified if *array-type-name* is specified.

RESULT_SET_LOCATOR VARYING
Specifies the data type for a result set locator variable.

SQL-condition-declaration
Declares a condition name and corresponding SQLSTATE value.

SQL-condition-name
Specifies the name of the condition. The condition name must be unique within the compound statement in which it is declared, excluding any declarations that are in compound statements that are nested within that compound statement. A condition name can only be referenced within

the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

FOR SQLSTATE ***string-constant***
Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and the SQLSTATE class (the first two characters) must not be '00'.

return-codes-declaration
Declares special variables named SQLSTATE and SQLCODE. These variables are automatically set to the SQLSTATE and SQLCODE values for the first condition in the diagnostics area after executing an SQL statement other than GET DIAGNOSTICS or an empty compound statement.

The SQLSTATE and SQLCODE SQL variables are only intended to be used as a means of obtaining the SQL return codes that resulted from processing the previous SQL statement other than GET DIAGNOSTICS. If there is any intention to use the SQLSTATE and SQLCODE values, save the values immediately to other SQL variables to avoid having the values replaced by the SQL return codes returned after executing the next SQL statement. If a handler is defined that handles an SQLSTATE, you can use an assignment statement to save that SQLSTATE (or the associated SQLCODE) value in another SQL variable, if the assignment is the first statement in the handler.

Assignment to these variables is not prohibited; however, it is not recommended. Assignment to these variables is ignored by condition handlers, and processing an assignment to these special variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment. The SQLSTATE and SQLCODE SQL variables cannot be set to NULL.

statement-declaration
Declares a list of one or more names that are local to the compound statement. A statement name cannot be the same as another statement name within the same compound statement.

DECLARE-CURSOR-statement
Declares a cursor in the procedure body. Each cursor must have a unique name within the routine. The cursor can only be referenced from within the compound statement in which it is declared, including any compound statements that are nested within that compound statement. Use an OPEN statement to open the cursor, a FETCH statement to read a row using the cursor, and a CLOSE statement to close the cursor. If the cursor is intended for use as a result set cursor:

- Specify WITH RETURN when the cursor is declared
- Create the procedure using the DYNAMIC RESULT SETS clause with a non-zero value
- Do not specify a CLOSE statement for the cursor in the compound statement

For additional information about declaring a cursor, see “DECLARE CURSOR” on page 1643.

handler-declaration
Specifies a condition handler, an *SQL-procedure-statement* to execute when an exception or completion condition occurs in the compound-statement. The *SQL-procedure-statement* executes when a condition handler receives control.

A condition handler declaration cannot reference the same condition value or SQLSTATE value more than one time. It cannot reference an SQLSTATE value and a condition name that represent the same SQLSTATE value.

When two or more condition handlers are declared in a compound statement, no two condition handler declarations can specify the same:

- general condition category
- specific condition, either as an SQLSTATE value or as a condition name that represents the same value

A condition handler is active for the set of *SQL-procedure-statements* that follow the condition handler declarations within the compound statement in which the condition handler is declared, including any nested compound statements.

CONTINUE
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, FOR, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END FOR, END IF, END REPEAT, or END WHILE.

EXIT
Specifies that after the condition handler is activated and completes successfully, control is returned to the end of the compound statement that declared the condition handler.

The conditions that can cause the handler to gain control are:

SQLSTATE ***string-constant***
Specifies that the handler is invoked when the specific SQLSTATE occurs. The first two characters of the SQLSTATE value must not be '00'.

SQL-condition-name
Specifies that the handler is invoked when the specific SQLSTATE that is associated with the condition name occurs. The *SQL-condition-name* must be declared within the compound statement that contains the handler declarations, or within a compound statement in which that compound statement is nested.

SQLEXCEPTION
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see *Db2 Codes*.

SQLWARNING
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

NOT FOUND
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

Nesting compound statements: Compound statements can be nested. Nested compound statements can be used to scope variable definitions, condition names, condition handlers, and cursors to a subset of the statements in a routine. This can simplify the processing that is done for each SQL routine statement. Nested compound statements enable the use of a compound statement within the declaration of a condition handler.

The scope of a cursor: The scope of a cursor name is the compound statement in which it is declared, including any compound statements that are nested within that compound statement. A cursor name can only be referenced within the compound statement in which it is declared, including any compound statements that are nested within that compound statement.

Considerations for statement-name: The scope of a *statement-name* that is declared in a compound statement is the compound statement and any nested compound statements (unless the same *statement-name* is declared in a nested compound statement). If a *statement-name* is used in a DECLARE CURSOR statement or a PREPARE statement and has not been declared in the compound statement where it is used or any outer compound statements in which it is nested, the statement-name is assumed to be declared globally for the routine.

Condition handlers: Condition handlers in SQL routines are similar to WHENEVER statements that are used in external SQL application programs. A condition handler can be defined to automatically get control when an exception, warning, or not found condition occurs. The body of a condition handler contains code that is executed when the condition handler is activated. A condition handler can be activated as the result of an exception, a warning, or a not found condition that is returned by Db2 for the

processing of an SQL statement. Or the condition that activates the handler can be the result of a SIGNAL or RESIGNAL statement that is issued within the SQL routine body.

A condition handler is declared within a compound statement, and it is active for the set of *SQL-procedure-statements* that follow all of the condition handler declarations within the compound statement in which the condition handler is declared. For example, the scope of a condition handler declaration H is the list of *SQL-procedure-statements* that follow the condition handler declarations that are contained within the compound statement in which H appears. This means that the scope of H does not include the statements that are contained in the body of the condition handler H, implying that a condition handler cannot handle conditions that arise inside its own body. Similarly, for any two condition handlers H1 and H2 that are declared in the same compound statement, H1 will not handle conditions that arise in the body of H2, and H2 will not handle conditions that arise in the body of H1.

The declaration of a condition handler specifies the condition that activates it, the type of condition handler (CONTINUE or EXIT), and the handler action. The type of condition handler determines to where control is returned after the handler action successfully completes.

Condition handler activation: When a condition other than a successful completion occurs in the processing of *SQL-procedure-statement*, if a condition handler that could handle the condition is within scope, one such condition handler will be activated to process the condition.

In a routine with nested compound statements, condition handlers that could handle a specific condition might exist at several levels of the nested compound statements. The condition handler that is activated is a condition handler that is declared innermost to the scope in which the condition was encountered. If more than one condition handler at the nesting level could handle the condition, the condition handler that is activated is the most appropriate handler that is declared in that compound statement.

The most appropriate handler is the condition handler that most closely matches the SQLSTATE or the exception or completion condition. For a given compound statement, when both a specific handler for a condition and a general handler are declared that address the same condition, the specific handler takes precedence over the general handler.

For example, if the innermost compound statement declares a specific handler for SQLSTATE '22001', as well as a general handler for SQLEXCEPTION, the specific handler for SQLSTATE '22001' is the most appropriate handler when SQLSTATE '22001' is encountered. In this case, the specific handler is activated.

When a condition handler is activated, the condition handler action is executed. If the handler action completes successfully or with an unhandled warning, the diagnostics area is cleared, and the type of the condition handler (CONTINUE or EXIT handler) determines to where control is returned. Additionally, the SQLSTATE and SQLCODE SQL variables are cleared when a handler completes successfully or with an unhandled warning.

If the handler action does not complete successfully and an appropriate handler exists for the condition that is encountered in the handler action, that condition handler is activated. Otherwise, the condition that is encountered within the condition handler is unhandled.

Unhandled conditions: If a condition is encountered and an appropriate handler does not exist for that condition, the condition is unhandled.

- If the unhandled condition is an exception, the SQL routine that contains the failing statement is terminated with an unhandled exception condition.
- If the unhandled condition is a warning or is a not found condition, processing continues with the next statement. Note that the processing of the next SQL statement will cause information about the unhandled condition in the diagnostics area to be overwritten, and evidence of the unhandled condition will no longer exist.

Considerations for using SIGNAL and RESIGNAL statements with nested compound statements: If an *SQL-procedure-statement* that is specified in the condition handler is either a SIGNAL or RESIGNAL statement with an exception SQLSTATE, the compound statement terminates with the specified exception. This happens even when this condition handler or another condition handler in the same compound statement specifies CONTINUE, since these condition handlers are not in the scope of this exception. If a compound statement is nested in another compound statement, condition handlers in the

higher level compound statement can handle the exception because those condition handlers are within the scope of the exception.

SQLSTATE and SQLCODE variables in SQL routines: To help debug your SQL routines, you might find it useful to check the SQLSTATE and SQLCODE value after executing a statement. An SQLCODE or SQLSTATE variable can be declared and subsequently referenced in an SQL routine. You could insert the value of the SQLCODE and SQLSTATE into a table at various points in the SQL routine, or return the SQLCODE and SQLSTATE values in a diagnostics string as an OUT parameter. To use the SQLCODE and SQLSTATE values, you must declare the following SQL variables in the SQL routine body:

```
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE SQLSTATE CHAR(5) DEFAULT '00000';
```

When you reference the SQLCODE or SQLSTATE variables in an SQL routine, Db2 sets the value of SQLCODE to 0 and SQLSTATE to '00000' for the subsequent statement. You can also use CONTINUE condition handlers to assign the value of the SQLSTATE and SQLCODE variables to variables in your SQL routine body. You can then use these SQL variables to control your routine logic, or pass the value back as an output parameter. In the following example, the SQL routine returns control to the statement following each SQL statement with the SQLCODE set in a SQL variable called RETCODE:

```
DECLARE SQLCODE INTEGER DEFAULT 0;
DECLARE retcode INTEGER DEFAULT 0;
DECLARE CONTINUE HANDLER FOR SQLEXCEPTION SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR SQLWARNING SET retcode = SQLCODE;
DECLARE CONTINUE HANDLER FOR NOT FOUND SET retcode = SQLCODE;
```

The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

Null values in SQL parameters and SQL variables: If the value of an SQL parameter or SQL variable is null and it is used in an SQL statement that does not allow an indicator variable, an error is returned.

Effect on open cursors: At the end of the compound statement, all open cursors that are declared in that compound statement, except cursors that are used to return result sets, are closed.

Atomic processing of a compound statement: Atomic processing is not supported for a compound statement. If atomic behavior is needed for a block of code in a compound statement, set a savepoint before the nested compound statement is entered. This will allow changes to be undone with a ROLLBACK TO SAVEPOINT statement.

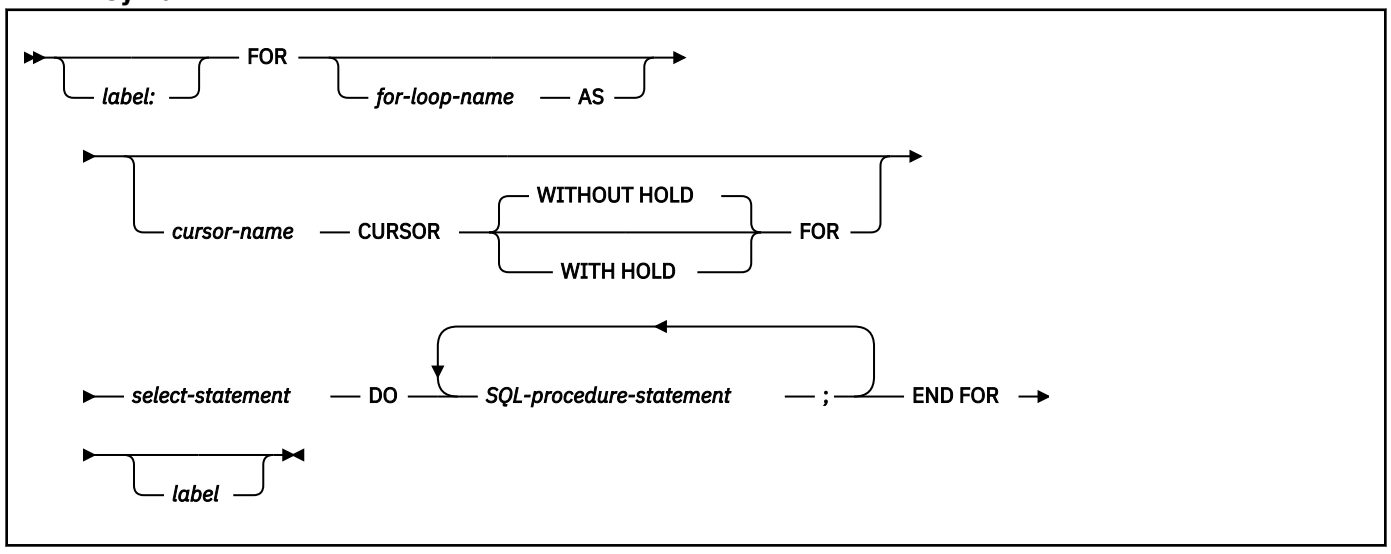
Examples

Example 1: Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables.
- Declares a cursor to return the salary of employees in a department determined by an IN parameter.
- Declares an EXIT handler for the condition NOT FOUND (end of file) which assigns the value 6666 to the OUT parameter *medianSalary*.
- Select the number of employees in the given department into the SQL variable *v_numRecords*.
- Fetch rows from the cursor in a WHILE loop until 50% + 1 of the employees have been retrieved.
- Return the median salary.

```
CREATE PROCEDURE DEPT_MEDIAN
   (IN deptNumber SMALLINT,
    OUT medianSalary DOUBLE)
   LANGUAGE SQL
   BEGIN
```

```
    DECLARE v_numRecords INTEGER DEFAULT 1;
    DECLARE v_counter INTEGER DEFAULT 0;
    DECLARE c1 CURSOR FOR
       SELECT salary FROM staff
         WHERE DEPT = deptNumber
         ORDER BY salary;
    DECLARE EXIT HANDLER FOR NOT FOUND
       SET medianSalary = 6666;
       /* initialize OUT parameter */
       SET medianSalary = 0;
       SELECT COUNT(*) INTO v_numRecords FROM staff
          WHERE DEPT = deptNumber;
       OPEN c1;
       WHILE v_counter < (v_numRecords / 2 + 1) DO
          FETCH c1 INTO medianSalary;
          SET v_counter = v_counter + 1;
       END WHILE;
       CLOSE c1;
  END
```



Example 2: Define an exit handler for any error, warning, or case of end of data. When this procedure is invoked and it returns to the caller, the value 45000 is returned for the output parameter:

```
CREATE PROCEDURE JMBLIB.PROCL(OUT MEDIANSALARY INT)
  LANGUAGE SQL
  BEGIN
   DECLARE CHAR1 CHAR;
   DECLARE C1 CURSOR FOR SELECT *
     FROM SYSIBM.SYSDUMMY1;
   DECLARE EXIT HANDLER FOR NOT FOUND,
        SQLEXCEPTION,
        SQLWARNING;
   OPEN C1;
   FETCH C1 INTO CHAR1;
   SET MEDIANSALARY = 45000;
   FETCH C1 INTO CHAR1;
   SET MEDIANSALARY = 50000;
  END
```

FOR statement

The FOR statement executes a statement for each row of a table. An implicit compound statement is generated to implement the FOR statement.

Syntax

Description

label
Specifies the label for the FOR statement. If the ending label is specified, it must be the same as the beginning label. The label name cannot be the same as the routine name or another label within the same scope. For more information, see "References to labels" on page 2005.

for-loop-name
Specifies the label for the implicit compound statement that is generated to implement the FOR statement. *for-loop-name* follows the rules for the label of a compound statement except that it cannot be used with an ITERATE, GOTO, or LEAVE statement within the FOR statement. *for-loop-name* must not be the same as any label within the same scope.

for-loop-name can be used to qualify generated SQL variables that correspond to the columns that are returned by *select-statement*.

cursor-name
Names a cursor that is generated to select rows from the result table of *select-statement*. If *cursor-name* is not specified, a unique cursor name is generated.

cursor-name cannot be referenced outside of the FOR statement and cannot be specified on an OPEN, FETCH, or CLOSE statement.

WITH HOLD or WITHOUT HOLD
Specifies whether the cursor should be prevented from being closed as a consequence of a commit operation.

WITHOUT HOLD
Specifies that the cursor is not prevented from being closed as a consequence of a commit operation. WITHOUT HOLD is the default.

WITH HOLD
Specifies that the cursor should not be closed as a consequence of a commit operation. A cursor that is declared using the WITH HOLD clause is implicitly closed at commit time only if the connection that is associated with the cursor is ended during the commit operation. For more information, see "DECLARE CURSOR" on page 1643.

select-statement
Specifies the select statement of the cursor. Each expression in the SELECT list must have a name. If an expression is not a simple column name, the AS clause must be used to name the expression. If the AS clause is specified, that name is used for the variable and must be unique.

select-statement must not include a *values-clause*.

The SELECT list must not include an untyped array value.

SQL-procedure-statement
Specifies the SQL statements to be executed for each row of the table. The SQL statements must not include an OPEN, FETCH, or CLOSE statement that specifies the cursor name of the FOR statement.

Notes

FOR statement rules: The FOR statement executes one or multiple statements for each row in the result table of the cursor. The cursor is defined by specifying a SELECT list that describes the columns and rows selected. The statements within the FOR statement are executed for each row selected.

The SELECT list must consist of unique column names, and the objects referenced in the *select-statement* must exist at the current server when the routine is created. If the FOR statement is contained in a routine that is defined with the WITH EXPLAIN attribute, the PLAN_TABLE must exist when the routine is created.

The cursor specified in a FOR statement cannot be referenced outside the FOR statement and cannot be specified on an OPEN, FETCH, or CLOSE statement.

Handler warning: Handlers can be used to handle errors that might occur on the open of the cursor or fetch of a row using the cursor in the FOR statement. Handlers defined to handle these open or fetch conditions should not be CONTINUE handlers as they might cause the FOR statement to loop indefinitely.

Examples

In the following example, the FOR statement is used to specify a cursor that selects three columns from the employee table. For every row selected, SQL variable *fullname* is set to the last name followed by a comma, the first name, a blank, and the middle initial. Each value for *fullname* is inserted into table TNAMES.

```
BEGIN
  DECLARE fullname CHAR(40);
  FOR v1 AS
      c1 CURSOR FOR
   SELECT firstname, midinit, lastname FROM employee
    DO
      SET fullname =
          lastname CONCAT ', '
                   CONCAT firstname
                   CONCAT ' '
                   CONCAT midinit;
      INSERT INTO TNAMES VALUES ( fullname );
  END FOR;
END;
```

GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See “GET DIAGNOSTICS” on page 1763.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL routine, you would use either *SQL-variable-name* or *SQL-parameter-name*. In an embedded GET DIAGNOSTICS statement, you would use a *host-variable*. You can replace the instances of *host-variable* in the description of “GET DIAGNOSTICS” on page 1763 with *SQL-variable-name* or *SQL-parameter-name*.

Effects of the statement: The GET DIAGNOSTICS statement does not change the contents of the diagnostics area except for DB2_GET_DIAGNOSTICS_DIAGNOSTICS.

Considerations for the SQLSTATE and SQLCODE SQL variables: The GET DIAGNOSTICS statement does not change the value of the SQLSTATE and SQLCODE SQL variables.

The stacked diagnostics area: The stacked diagnostics area is only available within a handler in a native SQL procedure and non-inline SQL functions.

GOTO statement

Syntax

Description

label
Specifies the label for the GOTO statement. The label name cannot be the same as the name of the SQL routine in which the label is used or another label in the same scope.

target-label
Specifies a label of the statement where processing is to continue. *target-label* must be defined as a label for an SQL procedure statement. The target label must be accessible to the GOTO statement as defined in “References to labels” on page 2005, subject to the following restrictions:

- If the GOTO statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the GOTO statement is not defined in a condition handler, *target-label* must not be defined in a condition handler.

Notes

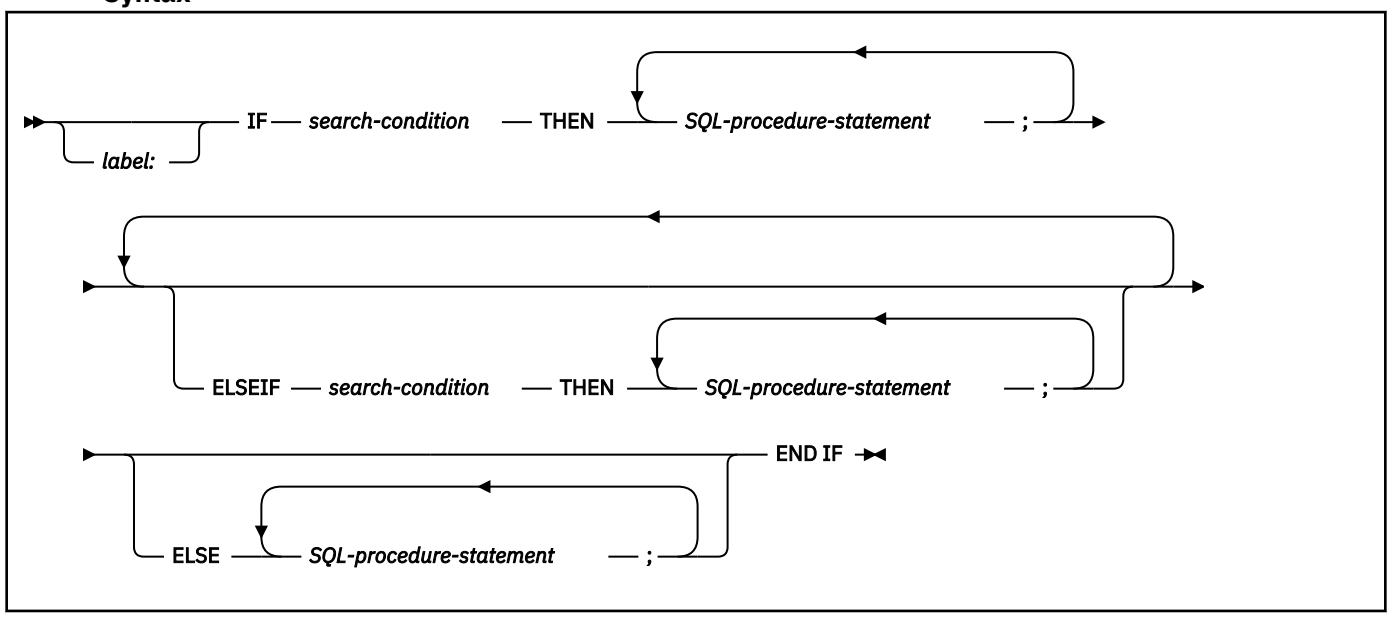
Using a GOTO statement: It is recommended that the GOTO statement be used sparingly. This statement interferes with the normal sequence of processing SQL statements, thus making a routine more difficult to read and maintain. Before using a GOTO statement, determine whether another statement, such as IF or LEAVE, can be used in place, to eliminate the need for a GOTO statement.

Effect on open cursors: When a GOTO statement transfers control out of a compound statement, all open cursors that are declared in the compound statement that contains the GOTO statement are closed, except cursors that are used to return result sets.

Examples

Example 1: In the following procedure, the GOTO statement branches outside of the current compound statement to a higher level:

```
CREATE PROCEDURE TESTGOTO5 ( )
P1: BEGIN
   DECLARE I ,A INTEGER;
     SET I = 1;
  LAB1: SET A = 1;
    BEGIN
      LAB2: SET A = 2;
         BEGIN
           SET I = I+1;
           IF I<3 THEN GOTO LAB1;
           END IF;
         END;
    END;
END P1
```



Example 2: In the following example, cursors are declared at multiple levels. The GOTO statement that specified TargLabel as the target label, results in the closing of cursors C1, C2, and C3. This is because cursors C1, C2, and C3 are all declared directly or indirectly in the compound statement with the label L1. The GOTO statement causes control to transfer out of the compound statement with label L1, so the cursors that are defined within that compound statement (at any level) are closed.

```
L0: BEGIN
      DECLARE CURSOR C0 ...
  ...
  TARGLABEL: ...
  ...
  L1: BEGIN
        DECLARE CURSOR C1 ...
        ...
      L2: BEGIN
            DECLARE CURSOR C2 ...
            ...
            GOTO TARGLABEL;
            ...
          L3: BEGIN
               DECALUE CURSOR C3 ...
            ...
          END L3;
      END L2;
   END L1;
END L0
```

IF statement

The IF statement executes different sets of SQL statements based on the result of search conditions.

Syntax

Description

label

Specifies the label for the IF statement. The label name cannot be the same as the name of the SQL routine or another label name within the same scope. For additional information, see "References to labels" on page 2005.

search-condition

Specifies the *search-condition* for which an SQL statement should be executed. If the condition is unknown or false, processing continues to the next search condition, until either a condition is true or processing reaches the ELSE clause.

SQL-procedure-statement

Specifies an SQL statement to be executed if the preceding *search-condition* is true. See "SQL-procedure-statement" on page 2007.

Examples

Assign a value to the SQL variable *new_salary* based on the value of SQL variable rating.

```
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
 ELSEIF rating = 2
  THEN SET new_salary =
   new_salary + (new_salary * .05);
 ELSE SET new_salary =
  new_salary + (new_salary * .02);
END IF;
```

ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

Syntax

Description

label

Specifies the label for the ITERATE statement. The label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

target-label

Specifies the label of the FOR, LOOP, REPEAT, or WHILE statement to which the flow of control is passed. *target-label* must be defined as a label for a FOR, LOOP, REPEAT, or WHILE statement. The ITERATE statement must be in that FOR, LOOP, REPEAT, or WHILE statement, or in the block of code that is directly or indirectly nested within that statement, subject to the following restrictions:

- If the ITERATE statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the ITERATE statement is not in a condition handler, *target-label* must not be defined in a condition handler.

Examples

Example 1: This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of *v_dept* is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.

```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admrdept
        FROM department
        ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    OPEN c1;
    ins_loop:
    LOOP
      FETCH c1 INTO v_dept, v_deptname, v_admdept;
      IF at_end = 1 THEN
        LEAVE ins_loop;
      ELSEIF v_dept = 'D11' THEN
        ITERATE ins_loop;
      END IF;
      INSERT INTO department (deptno,deptname,admrdept)
                      VALUES('NEW', v_deptname, v_admdept);
    END LOOP;
    CLOSE c1;
  END
```

Example 2: An ITERATE statement can be issued from a nested block to cause that flow of control to return to the beginning of a loop at a higher level. In the following example, the ITERATE statement within the LAB2 compound statement causes the flow of control to return to the beginning of the LAB1 LOOP statement:

```
LAB1: LOOP
   SET A = 0;
   LAB2: BEGIN
     ...
     LAB3: BEGIN
        ...
        ITERATE LAB1;  --    Multilevel ITERATE
        ...
     END LAB3;
     ...
     ITERATE LAB1;   --  Multilevel ITERATE
     ...
   END LAB2;
END LOOP;S
```

LEAVE statement

The LEAVE statement transfers program control out of a FOR, LOOP, REPEAT, WHILE, or compound statement.

Syntax

Description

label

Specifies the label for the LEAVE statement. The label name cannot be the same as the name of the SQL routine or the same as another label that is within the same scope. For additional information, see "References to labels" on page 2005.

target-label

Specifies the label of the compound, FOR, LOOP, REPEAT, or WHILE statement to exit. *target-label* must be defined as a label for a compound, FOR, LOOP, REPEAT, or WHILE statement, or in a block of code that is directly or indirectly nested within that statement, subject to the following rules:

- If the LEAVE statement is in a condition handler, *target-label* must be defined in that condition handler.
- If the LEAVE statement is not in a condition handler, *target-label* must not be defined in a condition handler.

Notes

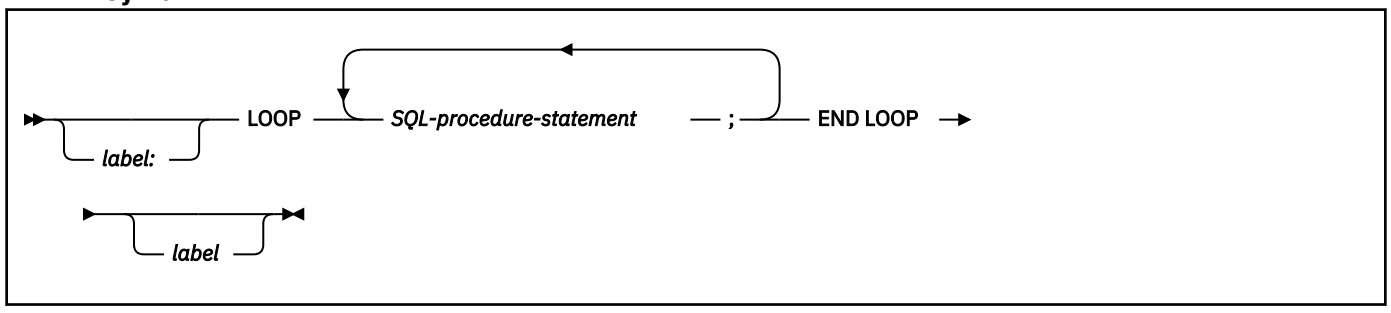
Effect on open cursors: When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples

Example 1: The example contains a loop that fetches data for cursor c1. If the value of SQL variable *at_end* is not zero, the LEAVE statement transfers control out of the loop.

```
CREATE PROCEDURE LEAVE_LOOP (OUT COUNTER INTEGER)
  LANGUAGE SQL
  BEGIN
    DECLARE v_counter INTEGER;
    DECLARE v_firstnme VARCHAR(12);
```

```
    DECLARE v_midinit CHAR(1);
    DECLARE v_lastname VARCHAR(15);
    DECLARE at_end SMALLINT DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT firstnme, midinit, lastname
      FROM employee;
    DECLARE CONTINUE HANDLER FOR not_found
      SET at_end = 1;
    SET v_counter = 0;
    OPEN c1;
   fetch_loop:
    LOOP
      FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
      IF at_end <> 0 THEN
       LEAVE fetch_loop;
      END IF;
      SET v_counter = v_counter + 1;
    END LOOP fetch_loop;
    SET counter = v_counter;
    CLOSE c1;
  END
```



Example 2: A LEAVE statement can be issued from a nested block to leave a statement at a higher level. In the following example, the LEAVE statement within the LAB2 compound statement causes the LAB1 LOOP statement to terminate:

```
LAB1: LOOP
    ...
    LAB2: BEGIN
     SET A = 0;
     ...
     LAB3: BEGIN
        ...
        LEAVE LAB1;  --    Multilevel LEAVE
        ...
     END LAB3;
     ...
     LEAVE LAB1;   --  Multilevel LEAVE
     ...
   END LAB2;
END LOOP;S
```

LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax

Description

label

Specifies the label for the LOOP statement. If the ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

SQL-procedure-statement

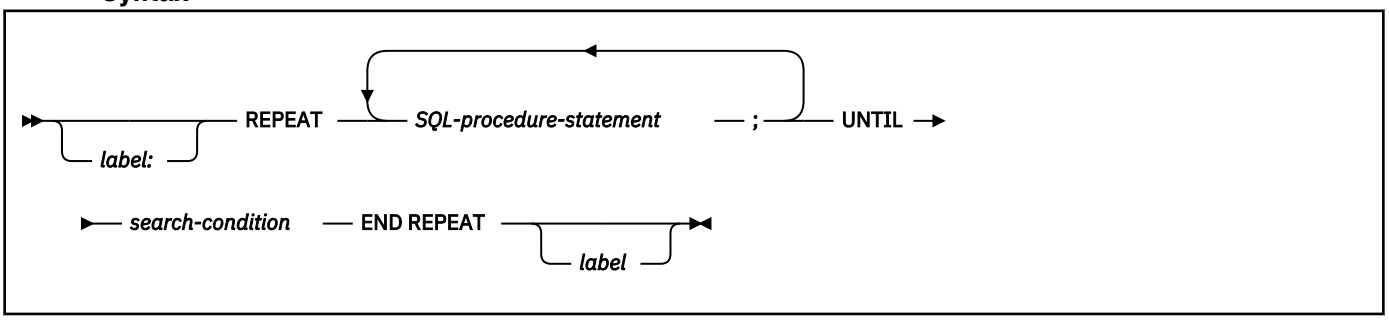
Specifies an SQL statement to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2007.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the LOOP statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: Prior to executing the first SQL-procedure-statement within that LOOP statement, the SQLSTATE and SQLCODE values reflect the last values that were set prior to the LOOP statement. If the loop is terminated with a GOTO or a LEAVE statement, the SQLSTATE and SQLCODE values reflect successful completion of that statement. When the LOOP statement iterates, the SQLSTATE and SQLCODE values reflect the result of the last SQL statement that is executed within the LOOP statement.

Examples



This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of *v_midinit* is checked to ensure that the value is not a single space (' '). If *v_midinit* is a single space, the LEAVE statement passes the flow of control outside of the loop.

```
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
   LANGUAGE SQL
   BEGIN
      DECLARE v_counter INTEGER DEFAULT 0;
      DECLARE v_firstnme VARCHAR(12);
      DECLARE v_midinit CHAR(1);
      DECLARE v_lastname VARCHAR(15);
      DECLARE c1 CURSOR FOR
         SELECT firstnme, midinit, lastname
           FROM employee;
      DECLARE EXIT HANDLER FOR NOT FOUND
         SET counter = -1;
      OPEN c1;
      fetch_loop:
      LOOP
        FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
        IF v_midinit = ' ' THEN
           LEAVE fetch_loop;
        END IF;
        SET v_counter = v_counter + 1;
      END LOOP fetch_loop;
      SET counter = v_counter;
      CLOSE c1;
   END
```

REPEAT statement

The REPEAT statement executes a statement or group of statements until a search condition is true.

Syntax

Description

label
Specifies the label for the REPEAT statement. If an ending label is specified, a matching beginning label must be specified. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

SQL-procedure-statement
Specifies an SQL statement to be executed within the REPEAT loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2007.

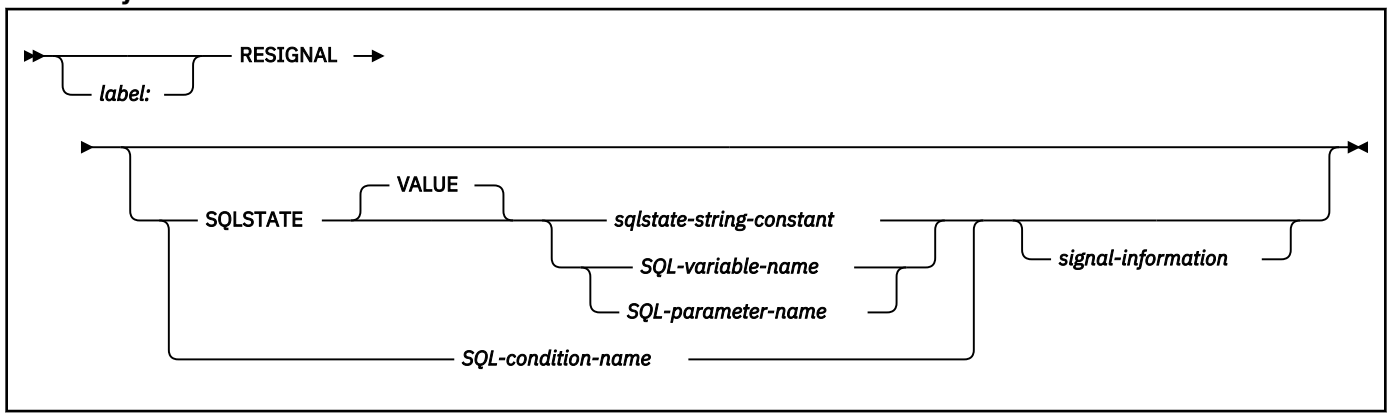
search-condition
Specifies a condition that is evaluated after each execution of the REPEAT loop. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the looping continues.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the REPEAT statement, and with every subsequent iteration, the diagnostics area is cleared.

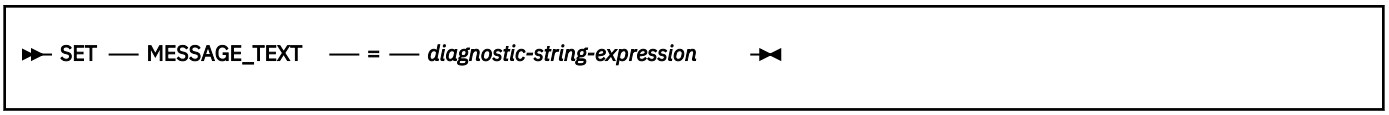
Considerations for the SQLSTATE and SQLCODE SQL variables: At the beginning of the first iteration of the REPEAT statement, the SQLSTATE and SQLCODE values reflect the values that were set prior to the REPEAT statement. At the beginning of iterations 2 through *n* of the REPEAT statement, the SQLSTATE and SQLCODE SQL values reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END REPEAT of the REPEAT statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating the search condition in the UNTIL clause of that REPEAT statement.

Examples



Use a REPEAT statement to fetch rows from a table.

```
fetch_loop:
REPEAT
 FETCH c1 INTO
  v_firstnme, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop
```



RESIGNAL statement

The RESIGNAL statement is used within a condition handler to resignal the condition that activated the handler, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Syntax

signal-information:

Description

label
Specifies the label for the RESIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

SQLSTATE VALUE
Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant
A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

SQL-variable-name* or *SQL-parameter-name
Specifies an SQL variable or SQL parameter that is defined for the routine.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement* that contains the RESIGNAL statement or within a compound statement in which that compound statement is nested. *SQL-variable-name* must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL_parameter-name
Specifies an SQL parameter that is defined for the routine that contains the SQLSTATE value. The SQL parameter must be defined as CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *SQL-condition-name* must be declared within the *compound-statement* that contains the RESIGNAL statement, or within a compound statement in which that compound statement is nested.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1763.

Notes

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled (SQLSTATE class other than '01' or '02'):

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If an SQLSTATE or a condition indicates that a warning or a not found condition is signaled:

- If a condition handler exists in the same compound statement as the RESIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is returned to that condition handler.
- Otherwise, the warning is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The RESIGNAL statement might modify the contents of the current diagnostics area. If an SQLSTATE or *condition-name* is specified as part of the RESIGNAL statement, the RESIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or *condition-name*. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or *condition-name*.

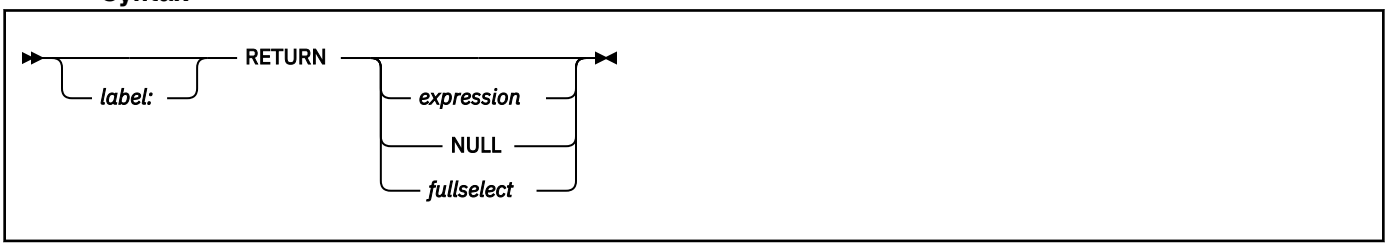
Processing a RESIGNAL statement: If the RESIGNAL statement is specified without an SQLSTATE clause or a *condition-name*, the SQL routine resignals the identical condition that invoked the handler and the SQLCODE is not changed.

When a RESIGNAL statement is issued and an SQLSTATE or *condition-name* is specified, the SQLCODE is based on he SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or ‘02', a warning or not found is signaled and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

Examples

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.



```
CREATE PROCEDURE divide (IN numerator INTEGER,
        IN denominator INTEGER,
        OUT divide_result INTEGER)
  LANGUAGE SQL
  CONTAINS SQL
  BEGIN
   DECLARE overflow CONDITION for SQLSTATE '22003';
   DECLARE CONTINUE HANDLER FOR overflow
     RESIGNAL SQLSTATE '22375';
   IF denominator = 0 THEN
     SIGNAL overflow;
   ELSE
     SET divide_result = numerator / denominator;
   END IF;
  END
```

RETURN statement

The RETURN statement is used to return from the routine.

- For an SQL scalar function, the scalar result of the function is returned. The body of an SQL scalar function must contain at least one RETURN statement and a RETURN statement must be executed when the function is invoked.
- For an SQL table function, the result table of the function is returned. A RETURN statement must be specified in the body of an SQL table function.
- For an SQL procedure, the RETURNS statement optionally returns an integer status value.

Syntax

Description

label

Specifies the label for the RETURN statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

expression

Specifies a value that is returned from the routine.

- If the routine is a scalar function, the data type of the result must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 135. The RETURN statement must not contain a period specification.

  The body of any SQL function must not contain a reference to an aggregate function, or a reference to a user-defined function that is sourced on an aggregate function, or an OLAP specification.

  In the body of an inlined SQL function, the RETURN statement must not contain a scalar fullselect. If the expression does not conform to this rule, Db2 attempts to define a compiled function. To determine what type of SQL scalar function is created, refer to the INLINE column of the SYSIBM.SYSROUTINES catalog table. For more information about creating the two types of SQL scalar functions, see "CREATE FUNCTION (inlined SQL scalar)" on page 1364 and "CREATE FUNCTION (compiled SQL scalar)" on page 1304.
- If the routine is a table function, a scalar expression (other than a scalar fullselect) cannot be specified. The data type of the result column of the fullselect must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 135. The RETURN statement must not contain a period specification.
- If the routine is a procedure, the data type of *expression* must be INTEGER.

NULL

The null value is returned from the SQL routine.

- If the routine is a scalar function, the null value is returned.
- If the routine is a table function, NULL must not be specified.
- If the routine is a procedure, NULL must not be specified.

fullselect

Specifies the row or rows that are returned from the routine.

- If the routine is a scalar function, the function is a compiled function and the fullselect must return one column and, at most, one row. The data type of the result column must be assignable to the data type that is defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 135.
- If the routine is a table function, the fullselect can return zero or more rows with one or more columns. The number of columns in the fullselect must match the number of columns in the function result. In addition, the data types of the result table columns of the fullselect must be assignable to the data types of the columns that are defined for the function result, using the storage assignment rules as described in "Assignment and comparison" on page 135.
- If the routine is a procedure, fullselect must not be specified.

Notes

Considerations for SQL functions: A RETURN statement in an SQL function must specify *expression*, NULL, or *fullselect*. For an inlined SQL scalar function, only a single *expression* can be specified in the RETURN statement, and the *expression* must not include a scalar fullselect. Only a single RETURN statement can be specified in the routine body of an SQL table function. The execution of an SQL function must end with a RETURN statement.

A data change table reference is not allowed in a RETURN statement in an SQL function.

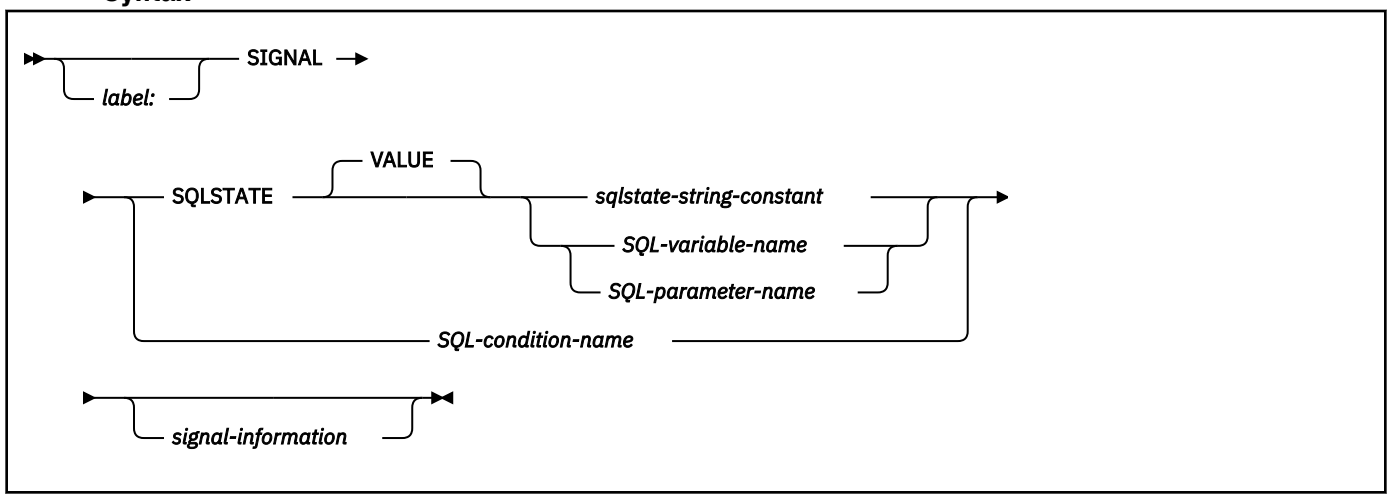
Considerations for SQL procedures:

- **When a RETURN statement is used within an SQL procedure:** If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.
- **When a RETURN statement is not used within an SQL procedure or when no value is specified:** If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:
  - If the procedure returns with an SQLCODE that is greater or equal to zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of zero.
  - If the procedure returns with an SQLCODE that is less than zero, the specified target for DB2_RETURN_STATUS in a GET DIAGNOSTICS statement will be set to a value of '-1'.
- **When the value is returned from an SQL procedure:** When a value is returned from a procedure, the caller may access the value using one of the following methods:
  - The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
  - The parameter bound for the return value parameter marker in the escape clause CALL syntax (? =CALL...) in a CLI application.
  - Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

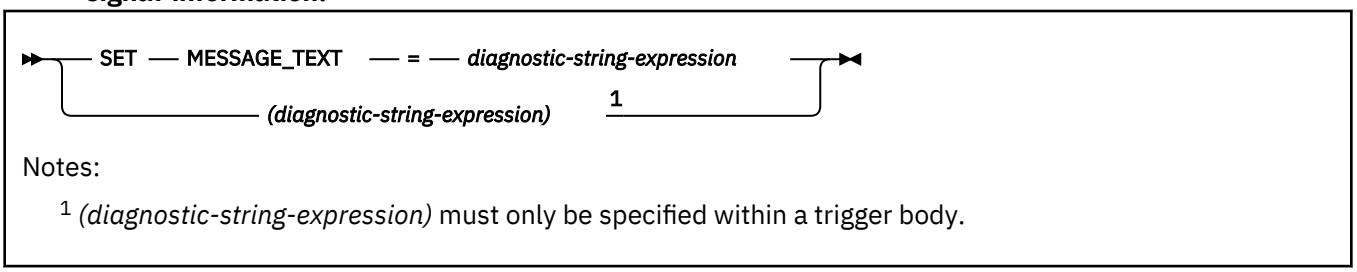
Example 1: Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```
BEGIN
       . . .
           GOTO FAIL;
       . . .
SUCCESS: RETURN 0;
   FAIL: RETURN -200;
END
```



Example 2: Define a scalar function that returns the tangent of a value using the existing sine and cosine functions:

```
CREATE FUNCTION TAN (X DOUBLE)
      RETURNS DOUBLE
      LANGUAGE SQL CONTAINS SQL NO EXTERNAL ACTION
      DETERMINISTIC
      RETURN SIN(x)/COS(x)
```



SIGNAL statement

The SIGNAL statement is used to return an exception or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text. The SIGNAL statement places the specified condition information in the cleared diagnostics area.

Syntax

signal-information:

Notes:

1 *(diagnostic-string-expression)* must only be specified within a trigger body.

Description

label

Specifies the label for the SIGNAL statement. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

SQLSTATE VALUE

Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant
A character string constant with an actual length of five bytes that is a valid SQLSTATE value.

SQL-variable-name* or *SQL-parameter-name
Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement* that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name
Specifies an SQL parameter that is defined for the routine and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR data type with an actual length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. The *SQL-condition-name* must be declared within the compound statement that contains the SIGNAL statement, or within a compound statement in which that compound statement is nested.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1763.

(diagnostic-string-expression)
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see "GET DIAGNOSTICS" on page 1763.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of Db2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the SQLSTATE or condition indicates that an exception is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- If the compound statement is nested and the outer level compound statement has a condition handler for SQLEXCEPTION or the specified SQLSTATE or condition, the exception is handled and control is transferred to that condition handler.
- Otherwise, the exception is not handled and control is immediately returned to the end of the compound statement.

If the SQLSTATE or condition indicates that a warning or not found condition is signaled:

- If a condition handler exists in the same compound statement as the SIGNAL statement, and the compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.

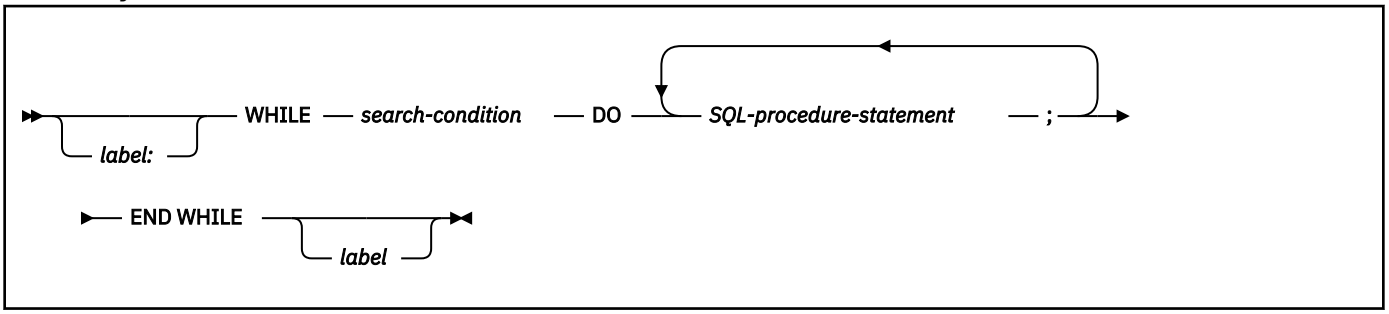
- If the compound statement is nested and an outer level compound statement contains a condition handler for SQLWARNING, NOT FOUND, or the specified SQLSTATE or condition, the warning or not found condition is handled and control is transferred to that condition handler.
- Otherwise, the warning or not found condition is not handled and processing continues with the next statement.

Considerations for the diagnostics area: The SIGNAL statement starts with a clear diagnostics area and sets the RETURNED_SQLSTATE to reflect the specified SQLSTATE or *condition-name*. If message text is specified, the MESSAGE_TEXT item of the condition area is assigned the specified value. DB2_RETURNED_SQLCODE is set to +438 or -438 corresponding to the specified SQLSTATE or *condition-name*.

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
            (IN ONUM INTEGER, IN CNUM INTEGER,
             IN PNUM INTEGER, IN QNUM INTEGER)
 LANGUAGE SQL
 SPECIFIC SUBMIT_ORDER
 MODIFIES SQL DATA
BEGIN
   DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
     SIGNAL SQLSTATE '75002'
         SET MESSAGE_TEXT = 'Customer number is not known';
   INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
      VALUES (ONUM, CNUM, PNUM, QNUM);
END
```



Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```
  CREATE TRIGGER CK_AVAIL
        NO CASCADE BEFORE INSERT ON ORDERS
        REFERENCING NEW AS NEW_ORDER
        FOR EACH ROW MODE DB2SQL
        WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                                    WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
          BEGIN ATOMIC
            SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
          END
```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax

Description

label
Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label. A label name cannot be the same as the name of the SQL routine or another label within the same scope. For additional information, see "References to labels" on page 2005.

search-condition
Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statements in the loop are executed.

SQL-procedure-statement
Specifies a statement to be run within the WHILE loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2007.

Notes

Considerations for the diagnostics area: At the beginning of the first iteration of the WHILE statement, and with every subsequent iteration, the diagnostics area is cleared.

Considerations for the SQLSTATE and SQLCODE SQL variables: With each iteration of the WHILE statement, when the first SQL-procedure-statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search condition of that WHILE statement. If the loop is terminated with a GOTO, ITERATE, or LEAVE statement, the SQLSTATE and SQLCODE values reflect the successful completion of that statement. Otherwise, after the END WHILE of the WHILE statement completes, the SQLSTATE and SQLCODE reflect the result of evaluating that search condition of that WHILE statement.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable *at_end*, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN SET at_end=1;
 END IF;
END WHILE;
```

Appendix A. Additional information for Db2 SQL

These topics contain additional information for Db2 SQL.

Limits in Db2 for z/OS

Db2 for z/OS has system limits, object and SQL limits, length limits for identifiers and strings, and limits for certain data type values.

System storage limits might preclude the limits specified in this section. The limit for items not that are not specified below is limited by system storage.

The following table shows the length limits for identifiers.

Table 229. Identifier length limits. The term *byte(s)* in this table means the number of bytes for the UTF-8 representation unless noted otherwise.

Item	Limit
External-java-routine-name	1305 bytes
Name of an alias [1], auxiliary table, collection, clone table, constraint, correlation, cursor (except for DECLARE CURSOR WITH RETURN or the EXEC SQL utility), distinct type (both parts of two-part name), function (both parts of two-part name), host identifier, index, JARs, parameter, procedure, role, schema, sequence, specific, statement, storage group, savepoint, SQL condition, SQL label, SQL parameter, SQL variable, synonym, table, trigger, view, XML attribute name, XML element name	128 bytes
Name of an authorization ID or name of a security label.	8 bytes
Routine version identifier	64 EBCDIC bytes, and the UTF-8 representation of the name must not exceed 122 bytes.
Name of a column	30 bytes [1]
Name of cursor that is created with DECLARE CURSOR WITH RETURN	30 bytes
Name of cursor that is created with the EXEC SQL utility	8 bytes
Name of a location	16 bytes
Name of buffer pool name, catalog, database, plan, program, table space	8 bytes
Name of package	8 bytes (Only 8 EBCDIC characters are used for packages that are created with the BIND PACKAGE command. 128 bytes can be used for packages that are created as a result of the CREATE FUNCTION (SQL scalar) statement, the CREATE PROCEDURE (SQL - native) statement, the CREATE TRIGGER statement, or a BIND command that specifies a zFS file as DBRM library.)

© Copyright IBM Corp. 1982, 2020

Table 229. Identifier length limits. The term *byte(s)* in this table means the number of bytes for the UTF-8 representation unless noted otherwise. *(continued)*

Item	Limit
Name of a profile that is created with CREATE TRUSTED CONTEXT or ALTER TRUSTED CONTEXT	127 bytes

Notes:

1. If the column name length or the distinct type schema or name length is greater than 30 Unicode bytes, truncation occurs in the sqlname field of the SQLDA when those objects are described in an application.

Table 230 on page 2040 shows the minimum and maximum limits for numeric values.

Table 230. Numeric limits

Item	Limit
Smallest SMALLINT value	-32768
Largest SMALLINT value	32767
Smallest INTEGER value	-2147483648
Largest INTEGER value	2147483647
Smallest BIGINT value	-9223372036854775808
Largest BIGINT value	9223372036854775807
Smallest REAL value	About -7.2×10^{75}
Largest REAL value	About 7.2×10^{75}
Smallest positive REAL value	About 5.4×10^{-79}
Largest negative REAL value	About -5.4×10^{-79}
Smallest FLOAT value	About -7.2×10^{75}
Largest FLOAT value	About 7.2×10^{75}
Smallest positive FLOAT value	About 5.4×10^{-79}
Largest negative FLOAT value	About -5.4×10^{-79}
Smallest DECIMAL value	$1 - 10^{31}$
Largest DECIMAL value	$10^{31} - 1$
Largest decimal precision	31
Smallest DECFLOAT(16) value[1]	$-9.999999999999999 \times 10^{384}$
Largest DECFLOAT(16) value[1]	$9.999999999999999 \times 10^{384}$
Smallest positive DECFLOAT(16) value[1]	$1.000000000000000 \times 10^{-383}$
Largest negative DECFLOAT(16) value[1]	$-1.000000000000000 \times 10^{-383}$
Smallest DECFLOAT(34) value[1]	$-9.999999999999999999999999999999999 \times 10^{6144}$.
Largest DECFLOAT(34) value[1]	$9.999999999999999999999999999999999 \times 10^{6144}$.
Smallest positive DECFLOAT(34) value[1]	$1.000000000000000000000000000000000 \times 10^{-6143}$

Table 230. Numeric limits (continued)

Item	Limit
Largest negative DECFLOAT(34) value[1]	-1.000000000000000000000000000000000x10^{-6143}
Coefficient length for DECFLOAT values	DECFLOAT(16) is 16 digits; DECFLOAT(34) is 34 digits
Maximum Exponent (E_{max}) for DECFLOAT values	DECFLOAT(16) is 384; DECFLOAT(34) is 6144
Minimum Exponent (E_{min}) for DECFLOAT values	DECFLOAT(16) is -383; DECFLOAT(34) is -6143
Bias for DECFLOAT values	DECFLOAT(16) is 398; DECFLOAT(34) is 6176

Note:

1. These are the limits for normal numbers in DECFLOAT. DECFLOAT also contains special values such as NaN and Infinity that are also valid. DECFLOAT also supports subnormal numbers that are outside of the documented range.

The following table shows the length limits for strings.

Table 231. String length limits

Item	Limit
Maximum length of CHAR	255 bytes
Maximum length of GRAPHIC	127 double-byte characters
Maximum length of BINARY	255 bytes
Maximum length[1] of VARCHAR	• 4046 bytes for a column in a table in a table space with 4 KB pages • 8128 bytes for a column in a table in a table space with 8 KB pages • 16320 bytes for a column in a table in a table space with 16 KB pages • 32704 bytes for a column in a table in a table space with 32 KB pages Otherwise, 32704 bytes
Maximum length of VARCHAR that can be indexed by an XML index	1000 bytes after conversion to UTF-8
Maximum length[1] of VARGRAPHIC	• 2023 double-byte characters for a column in a table in a table space with 4 KB pages • 4064 double-byte characters for a column in a table in a table space with 8 KB pages • 8160 double-byte characters for a column in a table in a table space with 16 KB pages • 16352 double-byte characters for a column in a table in a table space with 32 KB pages Otherwise, 16352 double-byte characters

Table 231. String length limits (continued)

Item	Limit
Maximum length[1] of VARBINARY	• 4046 bytes for a column in a table in a table space with 4 KB pages • 8128 bytes for a column in a table in a table space with 8 KB pages • 16320 bytes for a column in a table in a table space with 16 KB pages • 32704 bytes for a column in a table in a table space with 32 KB pages Otherwise, 32704 bytes
Maximum length of CLOB	2147483647 bytes (2 GB - 1 byte)
Maximum length of DBCLOB	1073741823 double-byte characters
Maximum length of BLOB	2147483647 bytes (2 GB - 1 byte)
Maximum length of a character constant	32704 UTF-8 bytes
Maximum length of a hexadecimal character constant	32704 hexadecimal digits
Maximum length of a graphic string constant	16352 double-byte characters (32704 bytes when expressed in UTF-8)
Maximum length of a hexadecimal graphic string constant	32704 hexadecimal digits
Maximum length of a text string used for a scalar expression	4000 UTF-8 bytes
Maximum length of a concatenated character string	2147483647 bytes (2 GB - 1 byte)
Maximum length of a concatenated graphic string	1073741824 double-byte characters
Maximum length of a concatenated binary string	2147483647 bytes (2 GB - 1 byte)
Maximum length of XML pattern text	4000 bytes after conversion to UTF-8
Maximum length of an XML element or attribute name in an XML document	1000 bytes
Maximum length of a namespace uri	1000 bytes
Maximum length of a namespace prefix	998 bytes
Largest depth of an internal XML tree	128 levels

Note:

1. The maximum length can be achieved only if the column is the only column in the table. Otherwise, the maximum length depends on the amount of space remaining on a page.

The following table shows the minimum and maximum limits for datetime values.

Table 232. Datetime limits

Item	Limit
Smallest DATE value (shown in ISO format)	0001-01-01
Largest DATE value (shown in ISO format)	9999-12-31

Table 232. Datetime limits (continued)

Item	Limit
Smallest TIME value (shown in ISO format)	00.00.00
Largest TIME value (shown in ISO format)	24.00.00
Smallest TIMESTAMP WITHOUT TIME ZONE value	0001-01-01-00.00.00.000000000000
Largest TIMESTAMP WITHOUT TIME ZONE value	9999-12-31-24.00.00.000000000000 [1]
Smallest TIMESTAMP WITH TIME ZONE value	0001-01-01-00.00.00.000000000000 +00:00
Largest TIMESTAMP WITH TIME ZONE value	9999-12-31-24.00.00.000000000000 +00:00 [1]
TIMESTAMP precision range	0 to 12
TIME ZONE hour range	-24 to 24
TIME ZONE minute range	0 to 59

Note:

1. The maximum value is stated as a UTC value. When a timestamp without a time zone is compared to a timestamp with time zone, a necessary adjustment is made using the implicit time zone. During that adjustment, the timestamp without time zone could be converted to a value that is greater than the maximum value for a timestamp with time zone value (this could occur on operations such as comparison and assignment). This situation can be avoided by using '9999-12-30-00.00.00.000000000000' as the maximum value for timestamp without time zone and '9999-12-30-00.00.00.000000000000 +00:00' as the maximum value for timestamp with time zone columns.

The following table shows the Db2 limits on SQL statements.

Table 233. Db2 limits on SQL statements

Item	Limit
Maximum number of columns that are in a table or view (the value depends on the complexity of the CREATE VIEW statement) or columns returned by a table function.	750 or fewer (including hidden columns) 749 if the table is a dependent
Maximum number of columns that can be referenced in the target of MERGE statement.	749
Maximum number of expressions that can be referenced in the source of a MERGE statement.	750
Approximate maximum number of base tables in a view, SELECT, UPDATE, INSERT, MERGE, or DELETE	225
Maximum number of rows that can be inserted with a single INSERT or MERGE statement	32767
Maximum row and record sizes for a table	See the maximum record size table under CREATE TABLE.
Maximum number of volume IDs in a storage group	133
Maximum number of partitions in a partitioned table space or partitioned index	64 for table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB. 4096, depending on what is specified for DSSIZE or LARGE and the page size.

Table 233. Db2 limits on SQL statements (continued)

Item	Limit
Maximum sum of the lengths of limit key values of a partition boundary	765 UTF-8 bytes
Maximum size of a partition (table space or index)	For table spaces that are not defined with LARGE or a DSSIZE greater than 2 GB: 4 GB, for 1 to 16 partitions 2 GB, for 17 to 32 partitions 1 GB, for 33 to 64 partitions For table spaces that are defined with LARGE or a DSSIZE of 4 GB: 4 GB, for 1 to 4096 partitions For table spaces that are defined with a DSSIZE greater than 4 GB: 256 GB, depending on the page size (for 1 to 64 partitions for 4 KB pages, for 1 to 128 partitions for 8 KB pages, for 1 to 256 partitions for 16 KB pages, and 1 to 512 partitions for 32 KB pages)
Maximum size of a non-partitioned index for a partitioned table space	For 5-byte EA table spaces: 16 TB for 4 KB pages 32 TB for 8 KB pages 64 TB for 16 KB pages 128 TB for 32 KB pages For table spaces that are defined with LARGE: 16 TB
Maximum length of an index key	• Partitioning index: 255-*n* • Nonpartitioning index that is padded: 2000-*n* • Nonpartitioning index that is not padded: 2000-*n*-2*m* **n** Number of columns in the key that allow nulls **m** Number of varying-length columns in the key
Maximum number of bytes used in the partitioning of a partitioned index	255 (This maximum limit is subject to additional limitations, depending on the number of partitions in the table space. The number of partitions * (106 + limit key size) must be less than 65394.)
Maximum number of columns in an index key	64
Maximum number of expressions in an index key	64
Maximum number of tables in a FROM clause	225 or fewer, depending on the complexity of the statement
Maximum number of subqueries in a statement	224

Table 233. Db2 limits on SQL statements (continued)

Item	Limit
Maximum total length of host and indicator variables pointed to in an SQLDA	32767 bytes 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum size of application SQLDA for any statement that references host variables or parameter markers	99016 bytes
Maximum length of host variable used for insert or update operation	32704 bytes for a non-LOB 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations that are imposed by the application environment and host language
Maximum number of host variables or parameter markers in a statement	16000
Maximum length of an SQL statement	2097152 bytes
Maximum number of elements in a select list	750 or fewer, depending on whether the select list is for the result table of static scrollable cursor[1]
Maximum number of elements in an IN list	32767
Maximum number of predicates in a WHERE or HAVING clause	Limited by storage
Maximum total length of columns of a query operation requiring sort and evaluating aggregate functions (MULTIPLE DISTINCT and GROUP BY)	65529 bytes
Maximum length of a sort key	32707 bytes
Maximum length of a check constraint	3800 bytes
Maximum number of bytes that can be passed in a single parameter of an SQL CALL statement	32765 bytes for a non-LOB 2147483647 bytes (2 GB - 1 byte) for a LOB, subject to the limitations imposed by the application environment and host language
Maximum number of stored procedures, triggers, and user-defined functions that an SQL statement can implicitly or explicitly reference	64 nesting levels
Maximum number of parameters in a procedure or function	statement
Maximum length of the SQL path	2048 bytes
Maximum length of a WLM environment name in a CREATE PROCEDURE, CREATE FUNCTION, ALTER PROCEDURE, or ALTER FUNCTION statement.	32 bytes
Maximum number of XPath level in the XMLPATTERN clause of the CREATE INDEX statement.	50 nesting levels

Note:

1. If the scrollable cursor is read-only, the maximum number is 749 less the number of columns in the ORDER BY that are not in the select list. If the scrollable cursor is not read-only, the maximum number is 747.

The following table shows the Db2 system limits.

Table 234. Db2 system limits

Item	Limit
Maximum number of concurrent Db2 or application agents	Limited by the EDM pool size, buffer pool size, and the amount of storage that is used by each Db2 or application agent
Maximum number of concurrently active audit policies	32
Maximum size of a non-LOB table or table space	128 terabytes (TB)
Maximum size of a simple or segmented table space	64 GB
Maximum size of a log space	6-byte format: 2^{48} bytes 10-byte format: 2^{80} bytes
Maximum size of an active log data set	4 GB minus 1 byte
Maximum size of an archive log data set	4 GB minus 1 byte
Maximum number of active log copies	2
Maximum number of archive log copies	2
Maximum number of active log data sets (each copy)	93
Maximum number of archive log volumes (each copy)	10000
Maximum number of databases accessible to an application or user	Limited by system storage and EDM pool size
Maximum number of databases	65217
Maximum number of implicitly created databases	Maximum value of the sequence SYSIBM.DSNSEQ_IMPLICITDB, with a default of 10000
Maximum number of internal objects for each database [1]	32767
Maximum number of indexes on declared global temporary tables	10000
Maximum size of an EDM pool	The installation parameter maximum depends on available space
Maximum number of rows per page	255 for all table spaces except catalog and directory tables spaces, which have a maximum of 127
Maximum simple or segmented data set size	2 GB
Maximum partitioned data set size	See item "maximum size of a partition" in Table 233 on page 2043
Maximum LOB data set size	256 GB
Maximum number of data sets for a LOB table space	254
Maximum number of table spaces that can be defined in a work file database	500
Maximum number of tables and triggers that can be defined in a work file database	11767

Table 234. Db2 system limits (continued)

Item	Limit

Note:

1. The number of internal object descriptors (OBDs) for external objects are as follows:
   - Table space: 2
   - Table: 1
   - Index: 2
   - Check constraint: 1
   - Referential integrity relationship: 2
   - Auxiliary relationship for each LOB column: 1
   - XML relationship for each XML column: 1
   - Trigger: 1
   - View that has an INSTEAD OF trigger: 1

Reserved schema names and reserved words

Restrictions exist on the use of certain names that are used by Db2. In some cases, names are reserved and cannot be used by application programs. In other cases, certain names are not recommended for use by application programs though not prevented by the database manager.

Reserved schema names

In general, for certain objects, schema names that begin with the prefix SYS are reserved. The schema name for these objects cannot begin with SYS except for certain exceptions.

The schema name for the objects listed in the following table must follow the restrictions listed in the table.

Recommendations:

- Do not to use SESSION as a schema name.
- Do not use SYSPUBLIC as a schema name for a table or view.

Table 235. Objects with schema name restrictions and exceptions.

Object	Schema name restriction	Schema name exceptions
Distinct types	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1]
User-defined functions	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1] • SYSFUN[2]

Table 235. Objects with schema name restrictions and exceptions. (continued)

Object	Schema name restriction	Schema name exceptions
Stored procedures	Cannot begin with SYS	The schema name can be: • SYSADM • SYSFUN[2] • SYSIBM • SYSIBMADM • SYSPROC • SYSTOOLS[1]
Sequences	Cannot begin with SYS	The schema name can be: • SYSADM
Triggers	Cannot begin with SYS	The schema name can be: • SYSADM • SYSTOOLS[1]
Column masks	Cannot begin with SYS	The schema name can be: • SYSADM
Row permissions	Cannot begin with SYS	The schema name can be: • SYSADM

Notes:

1. If the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.
2. For external user-defined scalar functions or external user-defined table functions if the user who executes the CREATE statement has the SYSADM or SYSCTRL privilege.

Reserved words

Keywords can be used as ordinary identifiers, except in a context where they could also be interpreted as SQL syntax. When a keyword can be interpreted as SQL syntax the keyword is considered a *reserved word* in that context, which means that it cannot be used as an ordinary identifier.

However, a keyword can be used as an identifier in a context where it is a reserved word, by specifying it as a delimited identifier. For example:

- ALL cannot be a column name in a SELECT statement, unless it is delimited. However, if the quotation mark (") is the escape character that begins and ends delimited identifiers, “ALL” can be used as a column name in a SELECT statement.
- COUNT cannot be used as a column name in a SELECT statement, unless it is also specified as delimited.

New reserved words for Db2 11 are identified by note “1” on page 2055 in the following list. Some topics in this information might also indicate words that cannot be used in the specific context that is being described.

IBM SQL has additional reserved words that Db2 for z/OS does not enforce. Therefore, you should not use these additional reserved words as ordinary identifiers in names that have a continuing use. See *IBM Db2 SQL Reference for Cross-Platform Development* for a list of the words.

Characteristics of SQL statements in Db2 for z/OS

Db2 allows specific actions on each SQL statement, and only certain SQL statements are allowed in external routines and SQL procedures.

Actions allowed on SQL statements

Specific Db2 statements can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor.

The following table shows whether a specific Db2 statement can be executed, prepared interactively or dynamically, or processed by the requester, the server, or the precompiler or coprocessor. The letter **Y** means *yes*.

Table 236. Actions allowed on SQL statements in Db2 for z/OS

VALUES INTO[7]	**Y**			**Y**	
WHENEVER					**Y**

Note:

1. The statement can be dynamically prepared. It cannot be issued dynamically.
2. The statement can be dynamically prepared only if DYNAMICRULES run behavior is implicitly or explicitly specified.
3. The statement can be dynamically prepared, but only from an ODBC or CLI driver that supports dynamic CALL statements.
4. The requesting system processes the PREPARE statement when the statement being prepared is ALLOCATE CURSOR or ASSOCIATE LOCATORS.
5. The value to which special register CURRENT SQLID is set is used as the SQL authorization ID for dynamic SQL statements only when DYNAMICRULES run behavior is in effect. The CURRENT SQLID value is ignored for the other DYNAMICRULES behaviors.
6. This statement can be used only in the triggered action of a trigger.
7. Local special registers can be referenced in a VALUES INTO statement if it results in the assignment of a single host-variable, not if it results in setting more than one value.
8. Some processing also occurs at the requester.

SQL statement data access classification for routines

Certain SQL statements can be executed in a stored procedure or in a user-defined function. Whether the statements can be executed depends on the level of SQL data access with which the routine is defined.

The following table indicates whether an SQL statement (specified in the first column) is allowed to execute in a routine with the specified SQL data access classification. The letter **Y** means *yes*.

In general, if an executable SQL statement is encountered in a routine defined as NO SQL, SQLSTATE 38001 is returned. If the routine is defined to allow some level of SQL access, SQL statements that are not supported in any context return SQLSTATE 38003. SQL statements not allowed for routines defined as CONTAINS SQL return SQLSTATE 38004, and SQL statements not allowed for READS SQL DATA return SQLSTATE 38002.

Table 237. SQL data access classification for routines

	Level of SQL data access

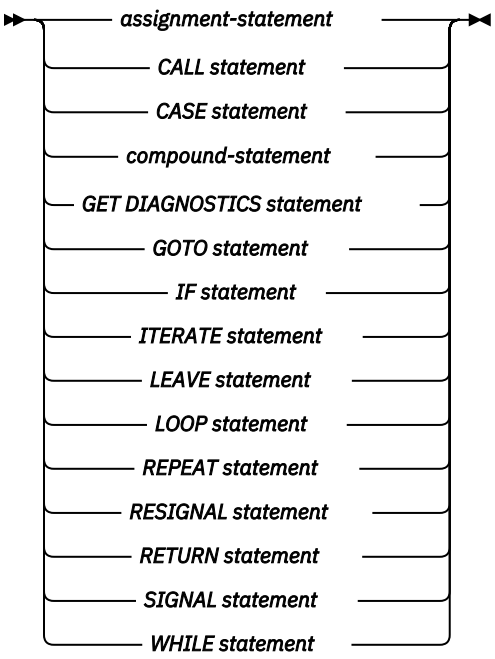
SET assignment-statement		Y"4" on page 2062	Y	Y
SET special register		Y	Y	Y

Table 237. SQL data access classification for routines (continued)

SQL statement	Level of SQL data access			
	NO SQL	CONTAINS SQL	READS SQL DATA	MODIFIES SQL DATA
SIGNAL		Y	Y	Y
TRUNCATE				Y
UPDATE				Y
VALUES			Y	Y
VALUES INTO		Y"4" on page 2062	Y	Y
WHENEVER	Y"1" on page 2062	Y	Y	Y

Notes:



1. Although the SQL option implies that no SQL statements can be specified, non-executable statements are not restricted.
2. The stored procedure that is called must have the same or more restrictive level of SQL data access than the current level in effect. For example, a routine defined as MODIFIES SQL DATA can call a stored procedure defined as MODIFIES SQL DATA, READS SQL DATA, CONTAINS SQL, or NO SQL. A routine defined as CONTAINS SQL can call a procedure defined as CONTAINS SQL or NO SQL.
3. The statement specified for the EXECUTE statement must be a statement that is allowed for the particular level of SQL data access in effect. For example, if the level in effect is READS SQL DATA, the statement must not be an INSERT, UPDATE, MERGE, or DELETE statement.
4. The statement is supported only if it does not contain a subquery or query-expression.

SQL control statements for external SQL procedures

SQL control statements for external SQL procedures can be used only with SQL procedures that are created with the FENCED or EXTERNAL clause. *SQL control statements* provide the capability to control the logic flow, declare and set variables, and handle warnings and exceptions. Some SQL control statements include other nested SQL statements.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see Creating native SQL procedures (Db2 Application programming and SQL) and Migrating an external SQL procedure to a native SQL procedure (Db2 Application programming and SQL).

SQL-control-statement:

Control statements are supported in SQL procedures. External SQL procedures are created by specifying either FENCED or EXTERNAL, LANGUAGE SQL, and an SQL routine body on the "CREATE PROCEDURE (SQL - external) (deprecated)" on page 1464 statement. The SQL routine body must be a single SQL statement which may be an SQL control statement.

The remainder of this section contains a description of the control statements that are supported for external SQL procedures, and includes syntax diagrams, semantic descriptions, usage notes, and examples of the use of the statements that constitute the SQL routine body. In addition, you can find information about referencing SQL parameters and variables in "References to SQL parameters and SQL variables" on page 2063.

The two common elements that are used in describing specific SQL control statements are:

- SQL control statements as described above
- "SQL-procedure-statement" on page 2064

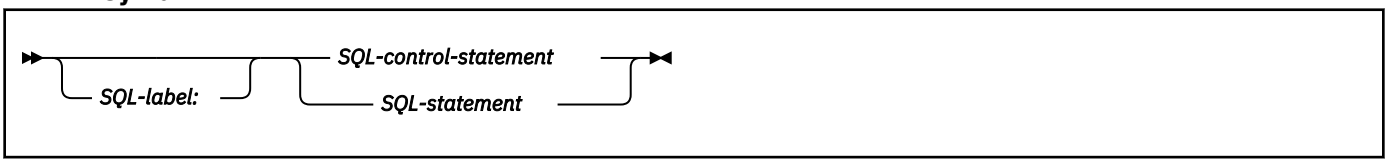
References to SQL parameters and SQL variables

SQL parameters and SQL variables can be referenced anywhere in the statement where an expression or a host variable can be specified. Host variables can be specified in SQL routines. SQL parameters and SQL variables can be referenced anywhere in the compound statement in which they are declared and can be qualified with the label name that is specified at the beginning of the compound statement.

All SQL parameters and SQL variables are considered nullable. The name of an SQL parameter or SQL variable in an SQL routine can be the same as the name of a column in a table or view that the SQL routine references. Names that are the same should be explicitly qualified. Qualifying a name clearly indicates whether the name refers to a column, SQL variable, or SQL parameter.

If the name is not qualified, the following rules describe whether the name refers to the column, the SQL variable, or the SQL parameter:

- The name is checked first as an SQL variable name and then as an SQL parameter name.
- If an SQL variable or SQL parameter by that name is not found, the name is assumed to be a column name.



The name of an SQL variable or SQL parameter in an SQL routine can be the name of an identifier that is used in certain SQL statements. If the name is not qualified, the following rules describe whether the name refers to the identifier, the SQL variable, or the SQL parameter:

- In the SET PATH and SET SCHEMA statements, the name is checked as an SQL variable name or an SQL parameter name. If an SQL variable or SQL parameter by that name is not found, the name is assumed to be an identifier.
- In the ASSOCIATE LOCATORS, CONNECT statement, the SET CONNECTION statement, and the RELEASE (connection) statement the name is used as an identifier.

SQL-procedure-statement

An SQL control statement may allow multiple SQL statements to be specified within the SQL control statement. These statements are defined as SQL procedure statements.

Syntax

Description

SQL-label
Specifies a label for the statement. *SQL-label* must not be a delimited identifier that includes lowercase letters or special characters. The label must be unique within the procedure.

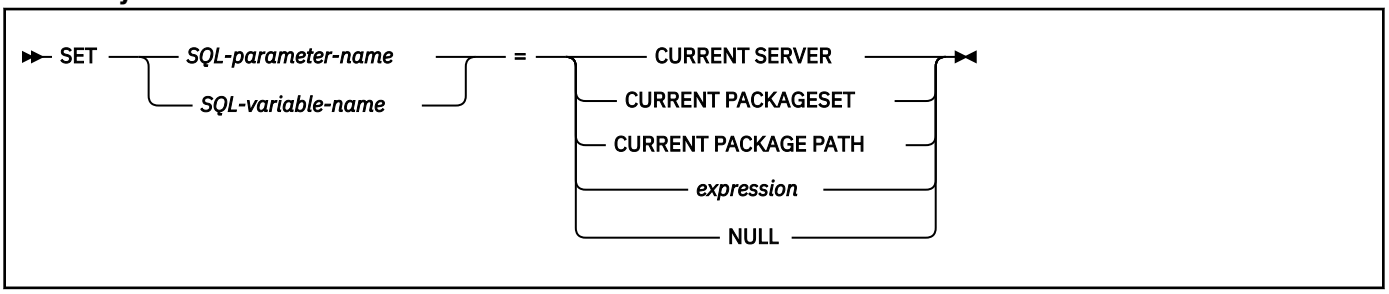
SQL-control-statement
Specifies an SQL statement that provides the capability to control logic flow, declare and set variables, and handle warnings and exceptions, as defined in this section. Control statements are supported in SQL procedures.

SQL-statement
Specifies an SQL statement. These statements are described in Chapter 7, “Statements,” on page 999.

Notes

Comments: Comments can be included within the body of an SQL procedure. In addition to the double-dash form of comments (--), a comment can begin with /* and end with */. The following rules apply to this form of comment:

- The beginning characters /* must be adjacent and on the same line.
- The ending characters */ must be adjacent and on the same line.
- Comments can be started wherever a space is valid.
- Comments can be continued to the next line.



Handling errors and warnings: Conditions can be detected within an SQL procedure by using the following methods:

- Test the special SQL variables SQLSTATE and SQLCODE.
- Issue a GET DIAGNOSTICS statement to request the condition information. See “GET DIAGNOSTICS” on page 1763.
- Define condition handlers to detect and process conditions. See “compound-statement” on page 2070 for information about defining condition handlers.

assignment-statement (SQL control statements for external routines)

The assignment statement assigns a value to an SQL parameter or to an SQL variable.

Syntax

Description

SQL-parameter-name

Identifies the parameter that is the assignment target. The parameter must be specified in *parameter-declaration* in the CREATE PROCEDURE statement and must be defined as OUT or INOUT.

SQL-variable-name

Identifies the SQL variable that is the assignment target. SQL variables can be declared in a compound-statement and must be declared before it is used. For information on declaring SQL variables, see "compound-statement" on page 2070.

***expression* or NULL**

Specifies the expression or value that is the assignment source. The expression can be any expression of the type described in "Expressions" on page 229 except it cannot contain a reference to local special registers (CURRENT SERVER, CURRENT PACKAGESET, or CURRENT PACKAGE PATH).

Notes

Assignment rules: Assignment statements in SQL procedures must conform to the SQL assignment rules. For example, the data type of the target and source must be compatible. See "Assignment and comparison" on page 135 for assignment rules.

When a string is assigned to a fixed-length variable and the length of the string is less than the length attribute of the target, the string is padded on the right with the necessary number of single-byte or double-byte blanks. When a string is assigned to a variable and the string is longer than the length attribute of the variable, the value is truncated and a warning is returned.

The ENCODING bind option is not used during processing of assignments to string variables. For example, assume that the system does not use mixed or DBCS, and the system EBCDIC SBCS CCSID is 37. Character conversion will not occur on assignment even if CCSID 500 is specified for the ENCODING bind parameter for the package for the procedure.

If truncation of the whole part of a number occurs on assignment to a numeric variable, the value is truncated and a warning is returned.

Assignments involving SQL parameters:

- An IN parameter can appear on the left side of an assignment statement. When control returns to the caller, the original value of an IN parameter is passed to the caller.
- An OUT parameter can appear on the left or right side of an assignment statement. When control returns to the caller, the last value that is assigned to an OUT parameter is returned to the caller.
- An INOUT parameter can appear on the left or right side of an assignment statement. The first value of the parameter is determined by the caller, and the last value that is assigned to the parameter is returned to the caller.
- A LOB parameter can not be used as an output value in an SQL statement in an SQL procedure when connected to a remote site. To circumvent the restriction, use a LOB SQL variable instead of a LOB parameter.

Considerations for SQLSTATE and SQLCODE SQL variables: Assignment to these variables is not prohibited. However, it is not recommended as assignment does not affect the diagnostic area or result in the activation of condition handlers. Furthermore, processing an assignment to these SQL variables causes the specified values for the assignment to be overlayed with the SQL return codes returned from executing the statement that does the assignment.

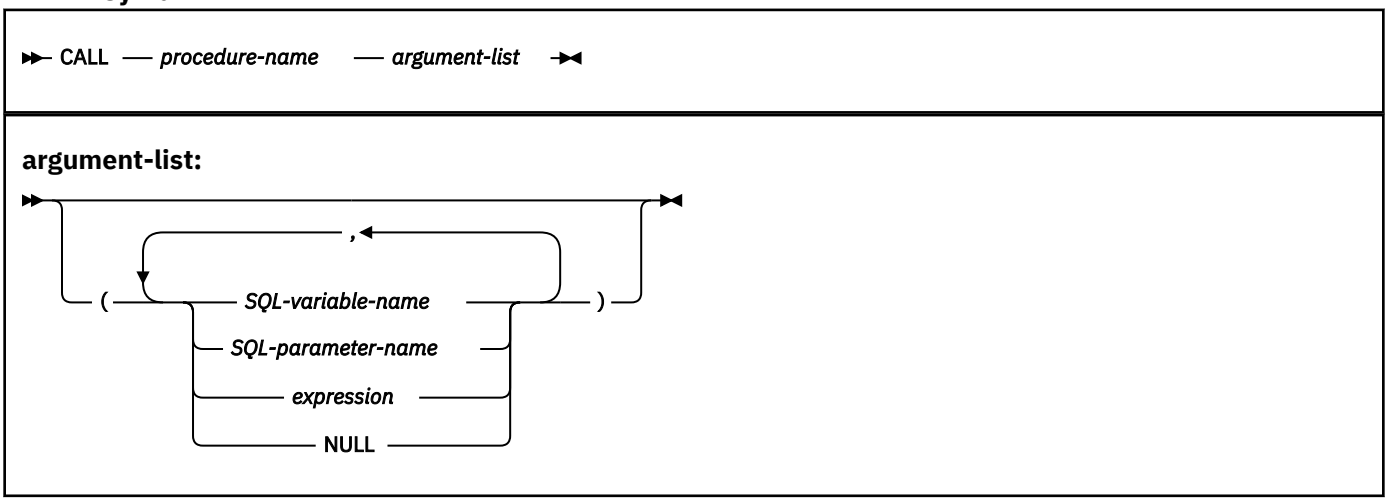
Examples

Increase the SQL variable *p_salary* by 10 percent.

```
SET p_salary = p_salary + (p_salary * .10)
```

Set SQL variable *p_salary* to the null value.

```
SET p_salary = NULL
```



Set SQL variable *midinit* to the first character of SQL variable *midname*.

```
SET midinit = SUBSTR(midname,1,1)
```

CALL statement

The CALL statement invokes a stored procedure.

Syntax

Description

procedure-name

Identifies the stored procedure to call. The procedure name must identify a stored procedure that exists at the current server.

argument-list

Identifies a list of values to be passed as parameters to the stored procedure. The number of parameters must be the same as the number of parameters defined for the stored procedure. See "CALL" on page 1261 for more information.

Control is passed to the stored procedure according to the calling conventions for SQL procedures. When execution of the stored procedure is complete, the value of each parameter of the stored procedure is assigned to the corresponding parameter of the CALL statement defined as OUT or INOUT.

SQL-variable-name
Specifies an SQL variable as an argument to the stored procedure. For an explanation of references to SQL variables, see "References to SQL parameters and SQL variables" on page 2063.

SQL-parameter-name
Specifies an SQL parameter as an argument to the stored procedure. For an explanation of references to SQL parameters, see "References to SQL parameters and SQL variables" on page 2063.

expression
The parameter is the result of the specified *expression*, which is evaluated before the stored procedure is invoked. If *expression* is a single *SQL-parameter-name* or *SQL-variable-name*, the corresponding parameter of the procedure can be defined as IN, INOUT, or OUT. Otherwise, the corresponding parameter of the procedure must be defined as IN. If the result of the *expression* can be the null value, either the description of the procedure must allow for null parameters or the corresponding parameter of the stored procedure must be defined as OUT.

The following additional rules apply depending on how the corresponding parameter was defined in the CREATE PROCEDURE statement for the procedure:

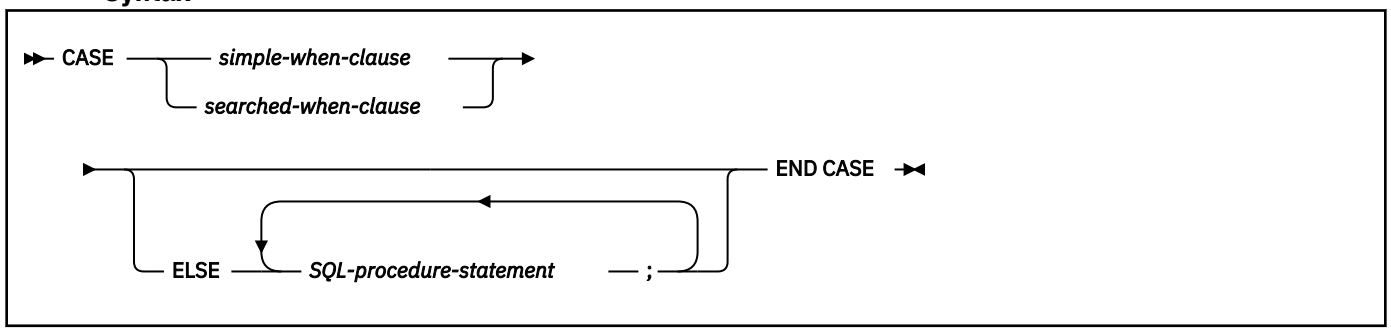
- IN *expression* can contain references to multiple SQL parameters or variables. In addition to the rules stated in "Expressions" on page 229 for *expression*, *expression* cannot include a column name, an aggregate function, or a user-defined function that is sourced on an aggregate function.
- INOUT or OUT *expression* can only be a single SQL parameter or variable.

NULL
The parameter is a null value. The corresponding parameter of the procedure must be defined as IN and the description of the procedure must allow for null parameters.

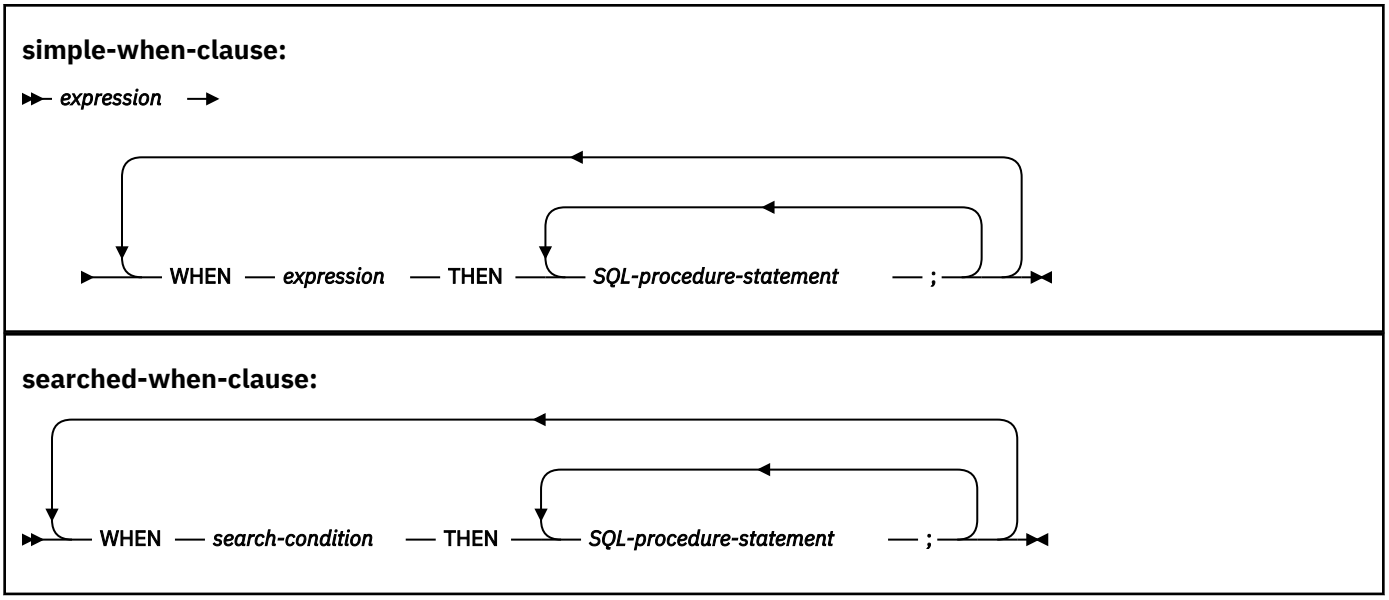
Notes

See "CALL" on page 1261 for more information on the SQL CALL statement.

Examples



Call stored procedure proc1 and pass SQL variables as parameters.



```
CALL proc1(v_empno, v_salary)
```

CASE statement

The CASE statement selects an execution path based on the evaluation of one or more conditions. A CASE statement operates in the same way as a CASE expression.

Syntax

Description

CASE
Begins a *case-expression*.

simple-when-clause
Specifies the *expression* prior to the first WHEN keyword that is tested for equality with the value of each *expression* that follows the WHEN keyword, and the result to be executed when those expressions are equal. If the comparison is true, the THEN statement is executed. If the result is unknown or false, processing continues to the next expression or the ELSE statement.

The data type of the *expression* prior to the first WHEN keyword must be comparable to the data types of each *expression* that follows the WHEN keywords.

searched-when-clause
Specifies the *search-condition* that is applied to each row or group of table data presented for evaluation, and the result when that condition is true. *search-condition* cannot contain a *fullselect*. If the search condition is true, the THEN statement is executed. If the condition is unknown or false, processing continues to the next search condition or the ELSE statement.

SQL-procedure-statement
Specifies a statement that follows the THEN and ELSE keyword. The statement specifies the result of a *searched-when-clause* or a *simple-when-clause* that is true, or the result if no case is true. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2064.

search-condition
Specifies a condition that is true, false, or unknown about a row or group of table data.

ELSE *SQL-procedure-statement*
If none of the conditions specified in the *simple-when-clause* or *searched-when-clause* are true, the statements in the *else-clause* are executed.

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

END CASE
Ends a *case-statement*.

Notes

If none of the conditions specified in the WHEN clause are true and an ELSE clause is not specified, an error is returned at run time, and the execution of the CASE statement is terminated.

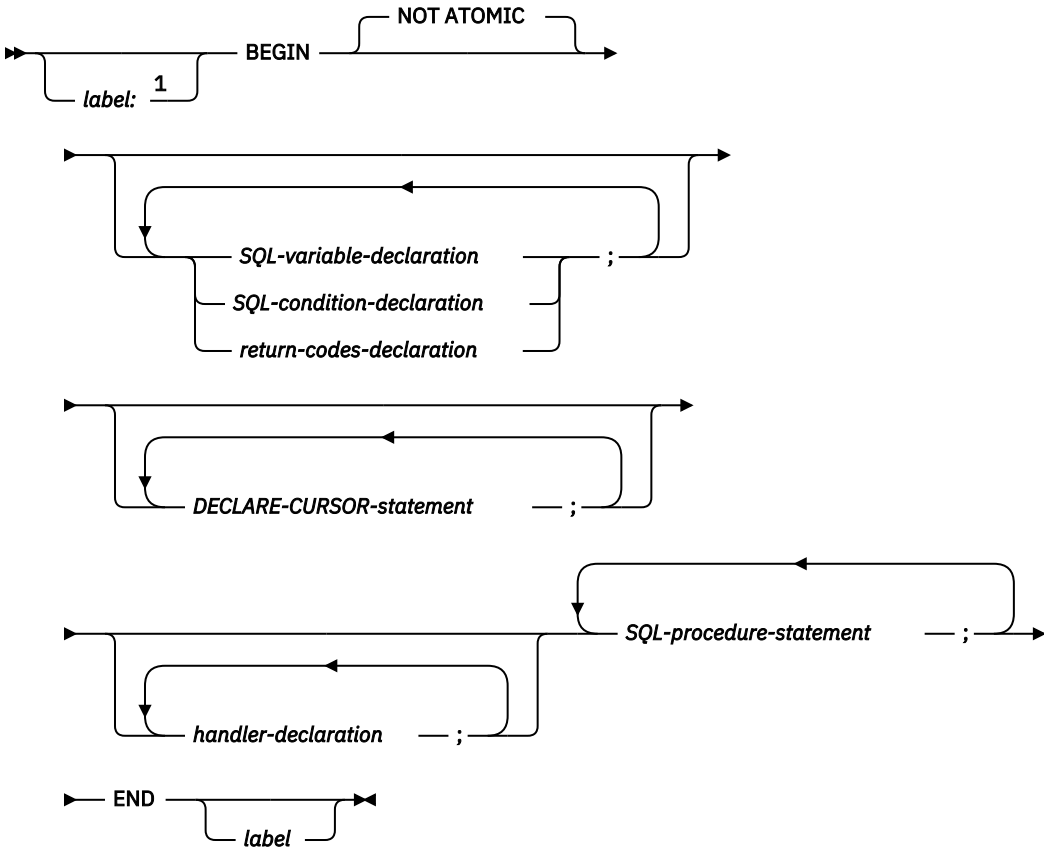
CASE statements that use a simple case statement WHEN clause can be nested up to three levels. CASE statements that use a searched statement WHEN clause have no limit to the number of nesting levels.

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the CASE statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the expression or search conditions of that CASE statement. If a CASE statement does not include an ELSE clause and none of the search conditions evaluate to true, an error is returned.

Examples

Example 1: Use a simple case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

```
CASE v_workdept
 WHEN 'A00'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 1';
 WHEN 'B01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 3';
END CASE
```

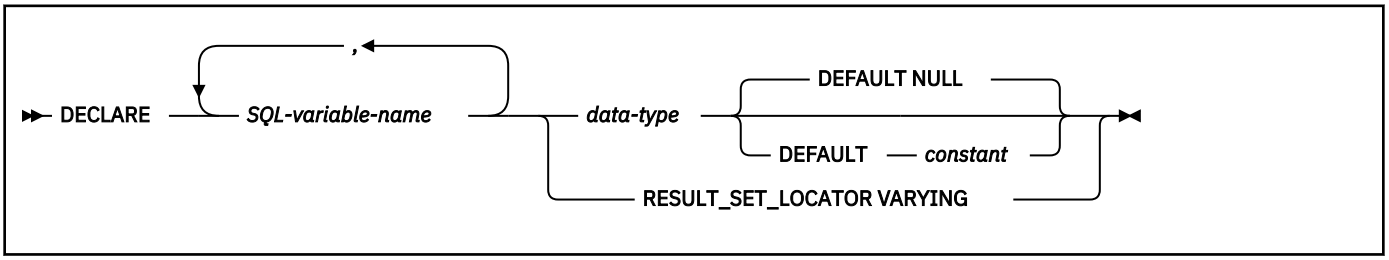


Example 2: Use a searched case statement WHEN clause to update column DEPTNAME in table DEPT, depending on the value of SQL variable *v_workdept*.

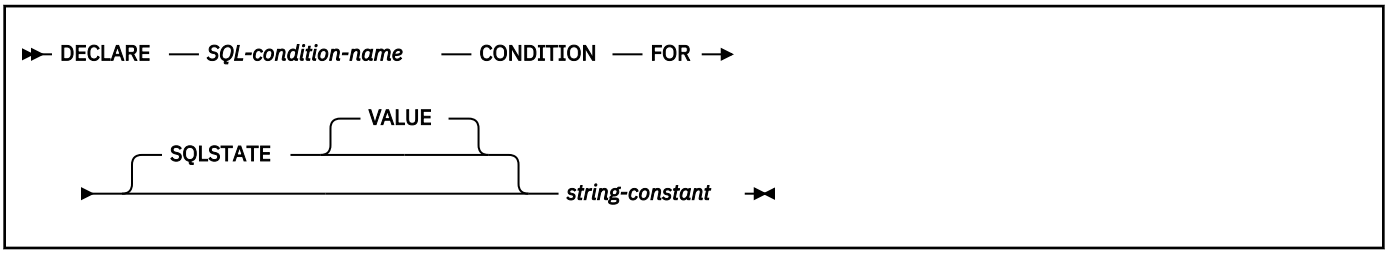
```
CASE
 WHEN v_workdept < 'B01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 1';
 WHEN v_workdept < 'C01'
  THEN UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 2';
 ELSE UPDATE DEPT SET
   DEPTNAME = 'DATA ACCESS 3';
END CASE
```

compound-statement

A compound statement contains a group of statements and declarations for SQL variables, cursors, and condition handlers.

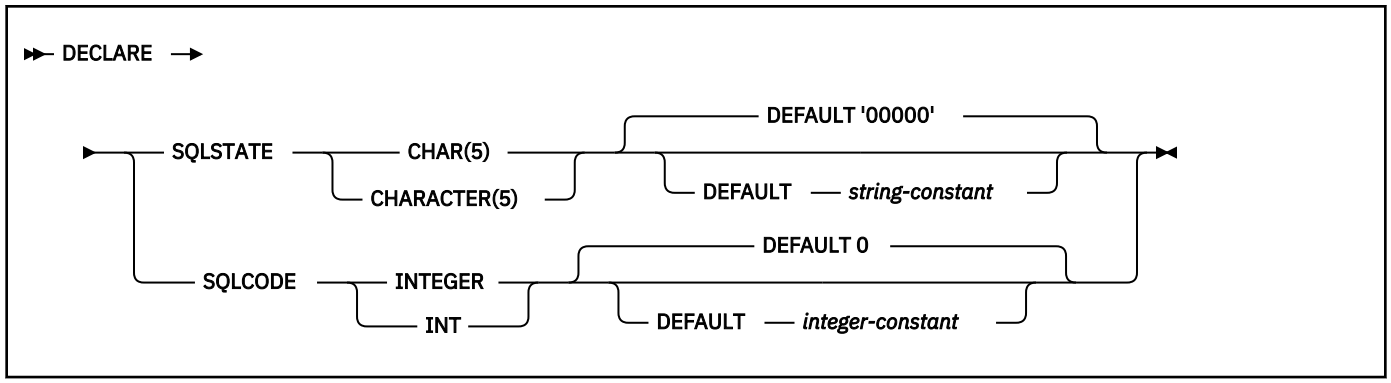


Syntax

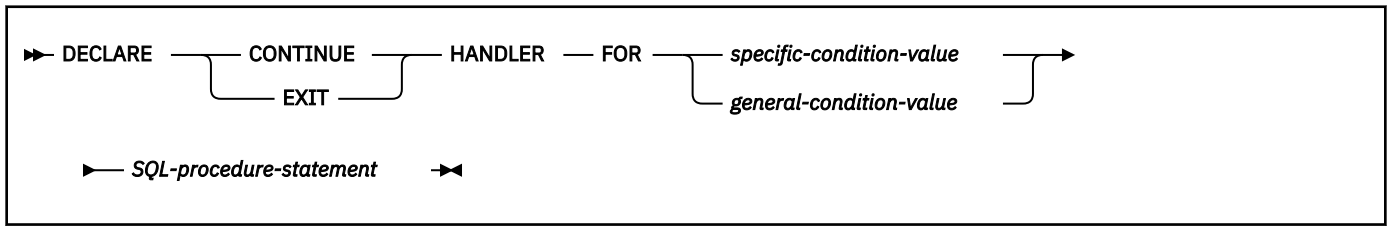


Notes:

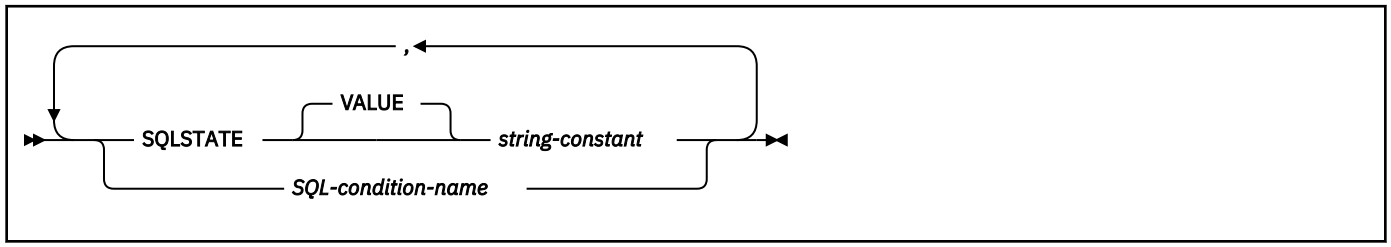
[1] Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.



SQL-variable-declaration:



SQL-condition-declaration:



return-codes-declaration:

handler-declaration:

specific-condition-value:

general-condition-value:

Description

label

Defines the label for the code block. If the beginning label is specified, it can be used to qualify SQL variables declared in the compound statement and can also be specified on a LEAVE statement. If the ending label is specified, it must be the same as the beginning label.

NOT ATOMIC

NOT ATOMIC indicates that an error within the compound statement does not cause the compound statement to be rolled back.

SQL-variable-declaration

Declares a variable that is local to the compound statement.

SQL-variable-name

A qualified or unqualified name that designates a variable in an SQL procedure body. The unqualified form of *SQL-variable-name* is an SQL identifier and must not be a delimited identifier that contains lowercase letters or special characters. The qualified form is an SQL procedure statement label followed by a period (.) and an SQL identifier.

Db2 folds all SBCS SQL variable names to uppercase. SQL variable names should not be the same as column names. If an SQL statement contains an SQL variable or parameter and a column reference with the same name, Db2 interprets the name as an SQL variable or parameter name. To refer to the column, qualify the column name with the table name. Further, to avoid ambiguous variable references and to ensure compatibility with other Db2 platforms, qualify the SQL variable or parameter name with the label of the SQL procedure statement.

data-type
Specifies the data type and length of the variable. SQL variables follow the same rules for default lengths and maximum lengths as SQL procedure parameters. See "CREATE PROCEDURE (SQL - external) (deprecated)" on page 1464 for a description of SQL data types and lengths.

DEFAULT *constant* or NULL
Defines the default for the SQL variable. The variable is initialized when the SQL procedure is called. If a default value is not specified, the variable is initialized to NULL.

RESULT_SET_LOCATOR VARYING
Specifies the data type for a result set locator variable.

SQL-condition-declaration
Declares a condition name and corresponding SQLSTATE value.

SQL-condition-name
Specifies the name of the condition. The condition name is an SQL identifier and must not be a delimited identifier that includes lowercase letters or special characters. *SQL-condition-name* must be unique within the procedure body and can be referenced only within the compound statement in which it is declared.

FOR SQLSTATE *string-constant*
Specifies the SQLSTATE that is associated with the condition. The string must be specified as five characters enclosed in single quotes, and cannot be '00000'.

return-codes-declaration
Declares special variables called SQLSTATE and SQLCODE that are set automatically to the value returned after processing an SQL statement. Both the SQLSTATE and SQLCODE variables can be declared only in the outermost compound statement of the SQL procedure. Assignment to these variables is not prohibited; however, assignment is ignored by exception handlers, and processing the next SQL statement replaces the assigned value.

DECLARE-CURSOR-statement
Declares a cursor. Each cursor in the procedure body must have a unique name. An OPEN statement must be specified to open the cursor, and a FETCH statement can be specified to read rows. The cursor can be referenced only from within the compound statement. For more information on declaring a cursor, see "DECLARE CURSOR" on page 1643.

handler-declaration
Specifies a set of statements to execute when an exception or completion condition occurs in the compound statement. *SQL-procedure-statement* is the set of statements that execute when the handler receives control. See "SQL-procedure-statement" on page 2064 for information on *SQL-procedure-statement*.

A handler is active only within the compound statement in which it is declared.

The actions that a handler can perform are:

CONTINUE
Specifies that after the condition handler is activated and completes successfully, control is returned to the SQL statement that follows the statement that raised the condition. However, if the condition is an error condition and it was encountered while evaluating a search condition, as in a CASE, IF, REPEAT or WHILE statement, control returns to the statement that follows the corresponding END CASE, END IF, END REPEAT, or END WHILE.

EXIT
After the handler is invoked successfully, control is returned to the end of the compound statement.

The conditions that can cause the handler to gain control are:

SQLSTATE *string-constant*
Specifies an SQLSTATE for which the handler is invoked. The SQLSTATE cannot be '00000'.

SQL-condition-name
Specifies a condition name for which the handler is invoked. The condition name must be previously defined in a condition declaration.

SQLEXCEPTION
Specifies that the handler is invoked when an SQLEXCEPTION occurs. An SQLEXCEPTION is an SQLSTATE in which the class code is a value other than '00', '01', or '02'. For more information on SQLSTATE values, see *Db2 Codes*.

SQLWARNING
Specifies that the handler is invoked when an SQLWARNING occurs. An SQLWARNING is an SQLSTATE value with a class code of '01'.

NOT FOUND
Specifies that the handler is invoked when a NOT FOUND condition occurs. NOT FOUND corresponds to an SQLSTATE value with a class code of '02'.

Notes

The order of statements in a compound statement must be:

1. SQL variable, condition declarations, and return codes declarations
2. Cursor declarations
3. Handler declarations
4. SQL procedure statements

Compound statements cannot be nested.

Unlike host variables, SQL variables are not preceded by colons when they are used in SQL statements.

The following rules apply to handlers:

- A handler declaration that contains SQLEXCEPTION, SQLWARNING, or NOT FOUND cannot contain additional SQLSTATE or condition names.
- Handler declarations within the same compound statement cannot contain duplicate conditions.
- A handler declaration cannot contain the same condition code or SQLSTATE value more than once, and cannot contain an SQLSTATE value and a condition name that represent the same SQLSTATE value.
- A handler is activated when it is the most appropriate handler for an exception or completion condition.
- If there is no handler for an SQL error, the error is passed to the caller in the SQLCA.
- A handler cannot be activated by an assignment statement that assigns a value to SQLSTATE.

The following rules and recommendations apply to the SQLCODE and SQLSTATE SQL variables:

- A null value cannot be assigned to SQLSTATE or SQLCODE.
- The SQLSTATE and SQLCODE variable values should be saved immediately to temporary variables if there is any intention to use the values. If a handler exists for SQLSTATE, this assignment must be done as the first statement to be processed in the handler to avoid having the value replaced by the next SQL procedure statement. If the condition raised by the SQL statement is handled, the value is changed by the first SQL statement contained in the handler.

Considerations for the SQLSTATE and SQLCODE SQL variables: The compound statement itself does not affect the SQLSTATE and SQLCODE SQL variables. However, SQL statements contained within the compound statement can affect the SQLSTATE and SQLCODE SQL variables. At the end of the compound statement, the SQLSTATE and SQLCODE SQL variables reflect the result of the last SQL statement executed within the compound statement that caused a change to the SQLSTATE and SQLCODE SQL variables. If the SQLSTATE and SQLCODE SQL variables were not changed within the compound statement, they contain the same values as when the compound statement was entered.

Examples

Create a procedure body with a compound statement that performs the following actions:

- Declares SQL variables, a condition for SQLSTATE '02000', a handler for the condition, and a cursor
- Opens the cursor, fetches a row, and closes the cursor

```
CREATE PROCEDURE PROC1(OUT NOROWS INT) LANGUAGE SQL
BEGIN
 DECLARE v_firstnme VARCHAR(12);
 DECLARE v_midinit CHAR(1);
 DECLARE v_lastname VARCHAR(15);
 DECLARE v_edlevel SMALLINT;
 DECLARE v_salary DECIMAL(9,2);
 DECLARE at_end INT DEFAULT 0;
 DECLARE not_found
  CONDITION FOR '02000';
 DECLARE c1 CURSOR FOR
  SELECT FIRSTNME, MIDINIT, LASTNAME,
   EDLEVEL, SALARY
  FROM EMP;
 DECLARE CONTINUE HANDLER FOR not_found SET NOROWS=1;
 OPEN c1;
 FETCH c1 INTO v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
END
```

GET DIAGNOSTICS statement

The GET DIAGNOSTICS statement obtains information about the previous SQL statement that was executed.

See “GET DIAGNOSTICS” on page 1763.

When you need to specify a variable in a GET DIAGNOSTICS statement that is used within an SQL procedure, you would use either *SQL-variable-name* or *SQL-parameter-name*. In an embedded GET DIAGNOSTICS statement, you would use a *host-variable*. You can replace the instances of *host-variable* in the description of “GET DIAGNOSTICS” on page 1763 with *SQL-variable-name* or *SQL-parameter-name*.

GOTO statement

The GOTO statement is used to branch to a user-defined label within an SQL procedure.

Syntax

Description

label

Specifies a labeled statement at which processing is to continue.

The labeled statement and the GOTO statement must be in the same scope. The following rules apply to the scope:

- If the GOTO statement is defined in a compound statement, *label* must be defined inside the same compound statement.
- If the GOTO statement is defined in a handler, *label* must be defined in the same handler and follow the other scope rules.
- If the GOTO statement is defined outside of a handler, *label* must not be defined within a handler.

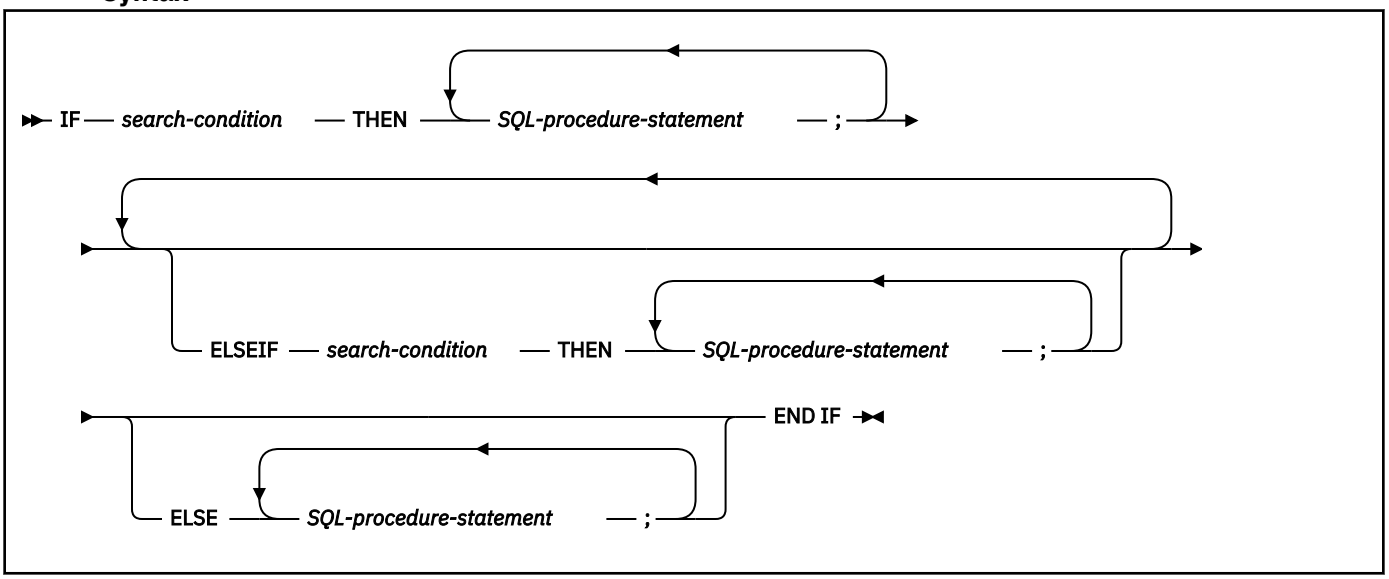
If *label* is not defined within a scope that the GOTO statement can reach, an error is returned.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

Use the GOTO statement sparingly. Because the GOTO statement interferes with the normal sequence of processing, it makes an SQL procedure more difficult to read and maintain. Before using a GOTO statement, determine whether some other statement, such as an IF statement or LEAVE statement, can be used instead.

Examples



Use a GOTO statement to transfer control to the end of a compound statement if the value of an SQL variable is less than 600.

```
BEGIN
 DECLARE new_salary DECIMAL(9,2);
 DECLARE service DECIMAL(8,2);
 SELECT SALARY, CURRENT_DATE - HIREDATE
  INTO new_salary, service
 FROM EMP
WHERE EMPNO = v_empno;
IF service < 600
 THEN GOTO EXIT;
END IF;
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
ELSEIF rating = 2
 THEN SET new_salary =
  new_salary + (new_salary * .05);
END IF;
UPDATE EMP
SET SALARY = new_salary
WHERE EMPNO = v_empno;
EXIT: SET return_parm = service;
END
```

IF statement

The IF statement selects an execution path based on the evaluation of a condition.

Syntax

Description

search-condition

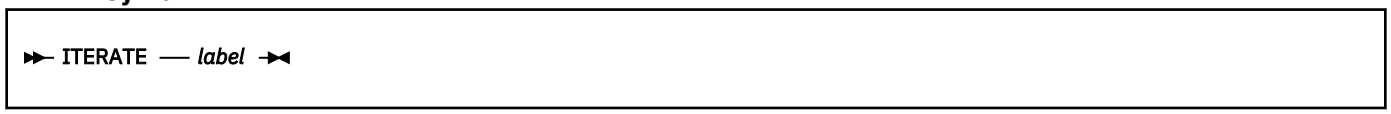
Specifies the condition for which an SQL statement should be invoked. If the condition is unknown or false, processing continues to the next search condition until either a condition is true or processing reaches the ELSE clause.

SQL-procedure-statement
Specifies the statement to be invoked if the preceding *search-condition* is true. If no *search-condition* evaluates to true, then the *SQL-procedure-statement* following the ELSE keyword is invoked. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2064.

Notes

Considerations for the SQLSTATE and SQLCODE SQL variables: When the first SQL-procedure-statement in the IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement. If an IF statement does not include an ELSE clause and none of the search conditions evaluate to true, then when the statement that follows that IF statement is executed, the SQLSTATE and SQLCODE SQL variables reflect the result of evaluating the search conditions of that IF statement.

Examples



Assign a value to the SQL variable *new_salary* based on the value of SQL variable rating.

```
IF rating = 1
 THEN SET new_salary =
  new_salary + (new_salary * .10);
 ELSEIF rating = 2
  THEN SET new_salary =
   new_salary + (new_salary * .05);
 ELSE SET new_salary =
  new_salary + (new_salary * .02);
END IF
```

ITERATE statement

The ITERATE statement causes the flow of control to return to the beginning of a labeled loop.

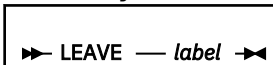
Syntax

Description

label
Specifies the label of the LOOP, REPEAT, or WHILE statement to which the flow of control is passed.

Examples

This example uses a cursor to return information for a new department. If the not_found condition handler is invoked, the flow of control passes out of the loop. If the value of *v_dept* is 'D11', an ITERATE statement causes the flow of control to be passed back to the top of the LOOP statement. Otherwise, a new row is inserted into the table.



```
CREATE PROCEDURE ITERATOR ()
  LANGUAGE SQL
  MODIFIES SQL DATA
  BEGIN
    DECLARE v_dept CHAR(3);
    DECLARE v_deptname VARCHAR(29);
    DECLARE v_admdept CHAR(3);
    DECLARE at_end INTEGER DEFAULT 0;
    DECLARE not_found CONDITION FOR SQLSTATE '02000';
    DECLARE c1 CURSOR FOR
      SELECT deptno,deptname,admrdept
        FROM department
        ORDER BY deptno;
    DECLARE CONTINUE HANDLER FOR not_found
    SET at_end = 1;
    OPEN c1;
    ins_loop:
```

```
    LOOP
      FETCH c1 INTO v_dept, v_deptname, v_admdept;
      IF at_end = 1 THEN
        LEAVE ins_loop;
      ELSEIF v_dept = 'D11' THEN
        ITERATE ins_loop;
      END IF;
      INSERT INTO department (deptno,deptname,admrdept)
                      VALUES('NEW', v_deptname, v_admdept);
    END LOOP;
    CLOSE c1;
  END
```

LEAVE statement

The LEAVE statement transfers program control out of a loop or a compound statement.

Syntax

Description

label

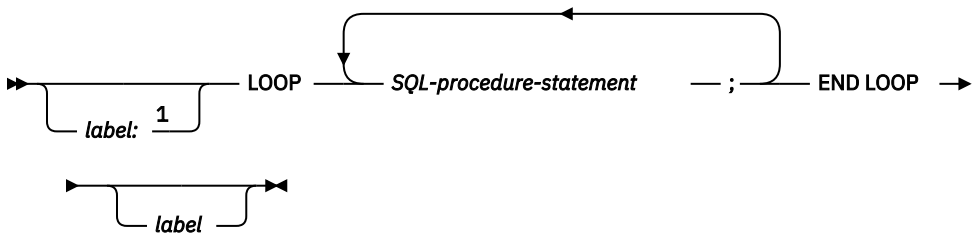
Specifies the label of the compound statement or loop to exit.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

Notes

When a LEAVE statement transfers control out of a compound statement, all open cursors in the compound statement, except cursors that are used to return result sets, are closed.

Examples



Use a LEAVE statement to transfer control out of a LOOP statement when a negative SQLCODE occurs.

```
ftch_loop: LOOP
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN LEAVE ftch_loop;
 END IF;
END LOOP
```

LOOP statement

The LOOP statement executes a statement or group of statements multiple times.

Syntax

Notes:

[1] Only one *label:* can be specified for each *SQL-procedure-statement*.

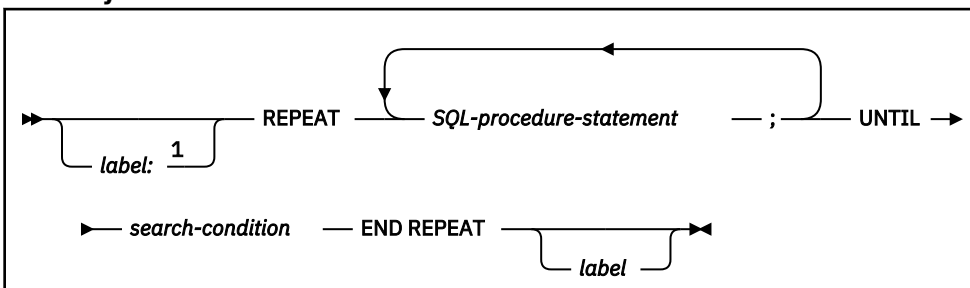
Description

label
Specifies the label for the LOOP statement. If the ending label is specified, the beginning label must be specified, and the two must match.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement
Specifies the statements to be executed in the loop. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2064.

Examples



This procedure uses a LOOP statement to fetch values from the employee table. Each time the loop iterates, the OUT parameter counter is incremented and the value of *v_midinit* is checked to ensure that the value is not a single space (' '). If *v_midinit* is a single space, the LEAVE statement passes the flow of control outside of the loop.

```
CREATE PROCEDURE LOOP_UNTIL_SPACE(OUT counter INTEGER)
   LANGUAGE SQL
   BEGIN
      DECLARE v_counter INTEGER DEFAULT 0;
      DECLARE v_firstnme VARCHAR(12);
      DECLARE v_midinit CHAR(1);
      DECLARE v_lastname VARCHAR(15);
      DECLARE c1 CURSOR FOR
         SELECT firstnme, midinit, lastname
           FROM employee;
      DECLARE EXIT HANDLER FOR NOT FOUND
         SET counter = -1;
      OPEN c1;
      fetch_loop:
      LOOP
        FETCH c1 INTO v_firstnme, v_midinit, v_lastname;
        IF v_midinit = ' ' THEN
           LEAVE fetch_loop;
        END IF;
        SET v_counter = v_counter + 1;
      END LOOP fetch_loop;
      SET counter = v_counter;
      CLOSE c1;
   END
```

REPEAT statement

The REPEAT statement executes a statement or group of statements until a search condition is true.

Syntax

Notes:

[1] Only one *label*: can be specified for each *SQL-procedure-statement*.

Description

label
Specifies the label for the REPEAT statement. If the ending label is specified, the beginning label must be specified, and the two must match.

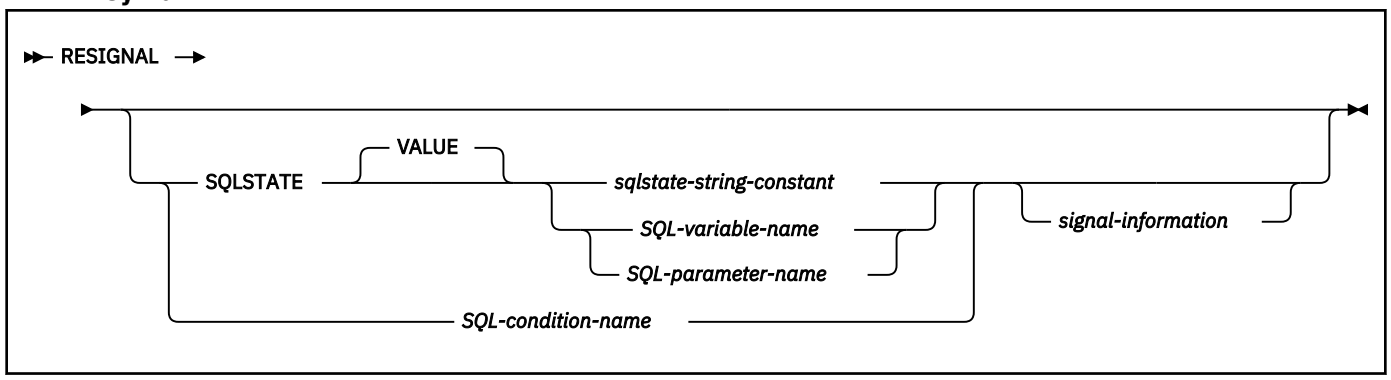
A label name cannot be the same as the name of the SQL procedure in which the label is used.

SQL-procedure-statement
Specifies the statements to be executed. The statement must be one of the statements listed under "SQL-procedure-statement" on page 2064.

search-condition
Specifies a condition that is evaluated after each execution of the REPEAT statement. If the condition is true, the REPEAT loop will exit. If the condition is unknown or false, the REPEAT loop continues.

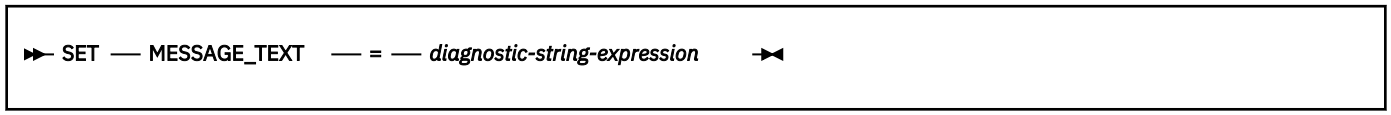
Examples

Use a REPEAT statement to fetch rows from a table.



```
fetch_loop:
REPEAT
 FETCH c1 INTO
  v_firstnme, v_midinit, v_lastname;
UNTIL
    SQLCODE <> 0
END REPEAT fetch_loop
```

RESIGNAL statement



The RESIGNAL statement is used within a condition handler to re-raise the current condition, or to raise an alternate condition so that it can be processed at a higher level. It causes an exception, warning, or not found condition to be returned along with optional message text.

Issuing the RESIGNAL statement without an operand causes the current condition to be passed upwards.

Syntax

signal-information:

Description

SQLSTATE VALUE
Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATE values:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant
A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name* or *SQL-parameter-name
Specifies an SQL variable or SQL parameter that is defined for the procedure.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement* that contains the RESIGNAL statement. *SQL-variable-name* must be defined as CHAR or VARCHAR data type with a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL_parameter-name
Specifies an SQL parameter that is defined for the procedure that contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value and have a length of five bytes and must not be null. The SQL parameter must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see “GET DIAGNOSTICS” on page 1763.

Notes

While any valid SQLSTATE value can be used in the RESIGNAL statement, programmers should define new SQLSTATE values based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If the RESIGNAL statement is issued without an SQLSTATE clause or a *condition-name*, the RESIGNAL statement must be in a handler and the identical condition that activated the handler is returned. The SQLSTATE, SQLCODE, and the SQLCA associated with the condition are unchanged.

If an SQLSTATE clause or a *condition-name* was specified, the SQLCODE returned is based on the SQLSTATE value as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRD*x* fields are set to zero.
- SQLWARN*x* fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception is returned (an SQLSTATE class other than '01' or '02'), the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '02') is returned, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, the not-found condition is not handled, and processing continues with the next statement.

Examples

The following example detects a division by zero error. The IF statement uses a SIGNAL statement to invoke the overflow condition handler. The condition handler uses a RESIGNAL statement to return a different SQLSTATE to the client application.

```
CREATE PROCEDURE divide (  IN numerator INTEGER,
                                IN denominator INTEGER,
                                OUT divide_result INTEGER)
 LANGUAGE SQL
 CONTAINS SQL
BEGIN
   DECLARE overflow CONDITION for SQLSTATE '22003' ;
     DECLARE CONTINUE HANDLER FOR overflow
     RESIGNAL SQLSTATE '22375';
   IF denominator = 0 THEN
   SIGNAL overflow;
ELSE
  SET divide_result = numerator / denominator;
END IF;
END
```

RETURN statement

The RETURN statement is used to return from the routine. For SQL functions, it returns the result of the function. For an SQL procedure, it optionally returns an integer status value.

Syntax

Description

expression
Specifies a value that is returned from the routine.

- If the routine is a function, *expression* must be specified and the value of *expression* must conform to the SQL assignment rules as described in “Assignment and comparison” on page 135. If the value is being assigned to a string variable, storage assignment rules apply.
- If the routine is a procedure, the data type of *expression* must be INTEGER. If *expression* evaluates to the null value, a value of 0 is returned.

The *expression* cannot include a column name or a host variable. See “Expressions” on page 229 for information on expressions. The *expression* cannot contain a scalar fullselect.

NULL
The null value is returned from the SQL function. NULL is not allowed in SQL procedures.

Notes

When a RETURN statement is not used within an SQL procedure or when no value is specified: If a RETURN statement was not used to return from a procedure or if a value is not specified on the RETURN statement, one of the following values is set:

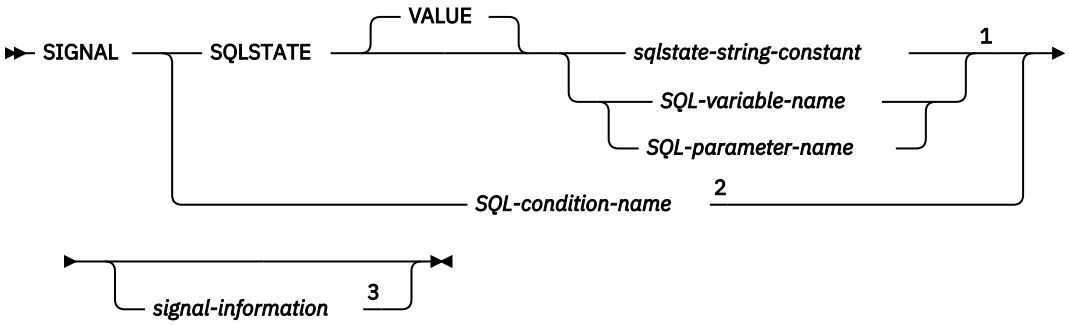
- If the procedure returns with an SQLCODE that is greater or equal to zero, the return status is set to a value of '0'.
- If the procedure returns with an SQLCODE that is less than zero, the return status is set to a value of '-1'.

When a RETURN statement is used within an SQL procedure: If a RETURN statement with a specified return value was used to return from a procedure, the SQLCODE, SQLSTATE, and message length in the SQLCA are initialized to zeros and the message text is set to blanks. An error is not returned to the caller.

When the value is returned: When a value is returned from a procedure, the caller may access the value using one of the following methods:

- The GET DIAGNOSTICS statement to retrieve the RETURN_STATUS when the SQL procedure was called from another SQL procedure.
- The parameter bound for the return value parameter marker in the escape clause CALL syntax (? =CALL...) in a CLI application.
- Directly from the SQLCA returned from processing the CALL of an SQL procedure by retrieving the value of sqlerrd[0]. When the SQLCODE is less than zero, the sqlerrd[0] value is not set. The application should assume a return status value of '-1'.

Examples

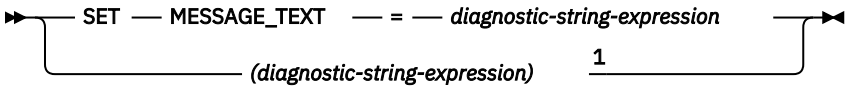


Use a RETURN statement to return from an SQL procedure with a status value of zero if successful or '-200' if not successful.

```
BEGIN
       . . .
           GOTO FAIL;
       . . .
SUCCESS: RETURN 0;
   FAIL: RETURN -200;
END
```

SIGNAL statement

The SIGNAL statement is used to return an error or warning condition. It causes an error or warning to be returned with the specified SQLSTATE, along with optional message text.



Syntax

Notes:

[1] The SQLSTATE variation must be used within a trigger body.
[2] *SQL-condition-name* must not be specified within a trigger body.
[3] *signal-information* must be specified within a trigger body

signal-information:

Notes:

1 *(diagnostic-string-expression)* must only be specified within a trigger body.

Description

SQLSTATE VALUE
Specifies the SQLSTATE that will be returned. Any valid SQLSTATE value can be used. It must be a character string constant with exactly five characters that follow the rules for SQLSTATEs:

- Each character must be from the set of digits ('0' through '9') or non-accented upper case letter ('A' through 'Z').
- The SQLSTATE class (the first two characters) cannot be '00' because it represents successful completion.

If the SQLSTATE does not conform to these rules, an error occurs.

sqlstate-string-constant
A character string constant with a length of five bytes that is a valid SQLSTATE value.

SQL-variable-name* or *SQL-parameter-name
Specifies an SQL variable or SQL parameter that contains a valid SQLSTATE value.

SQL-variable-name
Specifies an SQL variable that is declared within the *compound-statement*. *SQL-variable-name* must be defined as a CHAR or VARCHAR data type, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-parameter-name
Specifies an SQL parameter that is defined for the procedure and contains the SQLSTATE value. The SQL parameter must be defined as a CHAR or VARCHAR value, have a length of five bytes, must not be null, and must contain a valid SQLSTATE value.

SQL-condition-name
Specifies the name of the condition that will be returned. *condition-name* must be declared within the *compound-statement*.

SET MESSAGE_TEXT
Specifies a string that describes the error or warning. The string is returned in the SQLERRMC field of the SQLCA or with the GET DIAGNOSTICS statement.

diagnostic-string-expression
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see “GET DIAGNOSTICS” on page 1763.

(diagnostic-string-expression)
An expression with a data type of CHAR or VARCHAR that returns a character string of up to 1000 bytes that describes the error or warning condition. For information on how to obtain the complete message text, see “GET DIAGNOSTICS” on page 1763.

This syntax variation is only provided within the scope of a CREATE TRIGGER statement for compatibility with previous versions of Db2. To conform with the ANS and ISO standards, this form should not be used.

Notes

While any valid SQLSTATE value can be used in the SIGNAL statement, programmers should define new SQLSTATEs based on ranges reserved for applications. This practice prevents the unintentional use of an SQLSTATE value that might be defined by the database manager in a future release.

If a SIGNAL statement is issued, the SQLCODE that is returned is based on the SQLSTATE as follows:

- If the specified SQLSTATE class is either '01' or '02', a warning or not-found message is returned, and the SQLCODE is set to +438.
- Otherwise, an exception is returned and the SQLCODE is set to -438.

The other fields of the SQLCA are set as follows:

- SQLERRDx fields are set to zero.
- SQLWARNx fields are set to blank.
- SQLERRMC is set to the first 70 bytes of MESSAGE_TEXT.
- SQLERRML is set to the length of SQLERRMC.
- SQLERRP is set to ROUTINE.

When the SQLSTATE or condition indicates that an exception (an SQLSTATE class other than '01' or '02') is returned, one of the following actions occurs:

- If a handler exists for the specified SQLSTATE, condition, or SQLEXCEPTION, the exception is handled, and control is transferred to that handler.
- Otherwise, the exception is not handled, and control is immediately returned to the end of the compound statement.

When the SQLSTATE or condition indicates that a warning (SQLSTATE class '01') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or SQLWARNING, the warning is handled, and control is transferred to that handler.
- Otherwise, the warning is not handled, and processing continues with the next statement.

When the SQLSTATE or condition indicates that a not-found condition (SQLSTATE class '02') is returned, one of the following actions occurs:

- If an active handler exists for the specified SQLSTATE, condition, or not-found condition, the not-found condition is handled, and control is transferred to that handler.
- Otherwise, the not-found condition is not handled, and processing continues with the next statement.

When the SIGNAL statement is issued in a handler, no active handler exists.

Using a SIGNAL statement in the body of a trigger: Within the triggered action of a CREATE TRIGGER statement, the message text can be specified using only these variations:

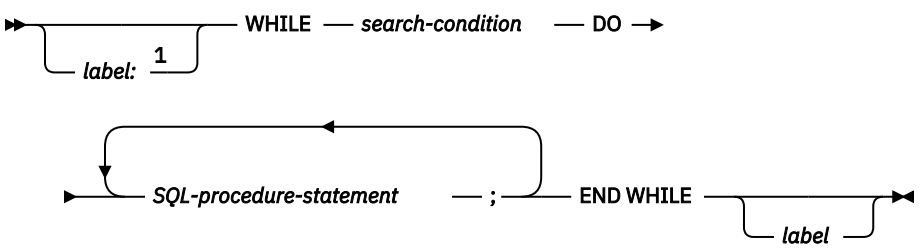
```
SIGNAL SQLSTATE sqlstate-string-constant
    SET MESSAGE_TEXT = diagnostic-string-expression
SIGNAL SQLSTATE sqlstate-string-constant
   (diagnostic-string-expression)
```

Examples

Example 1: The following example shows an SQL procedure for an order system that signals an application error when a customer number is not known to the application. The ORDERS table includes a foreign key to the CUSTOMER table, requiring that the CUSTNO exist before an order can be inserted.

```
CREATE PROCEDURE SUBMIT_ORDER
            (IN ONUM INTEGER, IN CNUM INTEGER,
             IN PNUM INTEGER, IN QNUM INTEGER)
 LANGUAGE SQL
 SPECIFIC SUBMIT_ORDER
 MODIFIES SQL DATA
```

```
BEGIN
   DECLARE EXIT HANDLER FOR SQLSTATE VALUE '23503'
     SIGNAL SQLSTATE '75002'
         SET MESSAGE_TEXT = 'Customer number is not known';
   INSERT INTO ORDERS (ORDERNO, CUSTNO, PARTNO, QUANTITY)
      VALUES (ONUM, CNUM, PNUM, QNUM);
END
```



Example 2: The following example shows a trigger for an order system that allows orders to be recorded in an ORDERS table (ORDERNO, CUSTNO, PARTNO, QUANTITY) only if there is sufficient stock in the PARTS tables. When there is insufficient stock for an order, SQLSTATE '75001' is returned along with an appropriate error description.

```
  CREATE TRIGGER CK_AVAIL
        NO CASCADE BEFORE INSERT ON ORDERS
        REFERENCING NEW AS NEW_ORDER
        FOR EACH ROW MODE DB2SQL
        WHEN (NEW_ORDER.QUANTITY > (SELECT ON_HAND FROM PARTS
                                    WHERE NEW_ORDER.PARTNO = PARTS.PARTNO))
          BEGIN ATOMIC
            SIGNAL SQLSTATE '75001' ('Insufficient stock for order');
          END
```

WHILE statement

The WHILE statement repeats the execution of a statement or group of statements while a specified condition is true.

Syntax

Notes:

[1] Only one *label:* can be specified for each *SQL-procedure-statement*. If an ending label is specified for this beginning label, the labels must be the same.

Description

label

Specifies the label for the WHILE statement. If the ending label is specified, it must be the same as the beginning label.

A label name cannot be the same as the name of the SQL procedure in which the label is used.

search-condition

Specifies a condition that is evaluated before each execution of the loop. If the condition is true, the SQL procedure statement in the loop is executed.

SQL-procedure-statement

Specifies the statements to be executed in the loop. The statement must be one of the statements listed under “SQL-procedure-statement” on page 2064.

Examples

Use a WHILE statement to fetch rows from a table while SQL variable at_end, which indicates whether the end of the table has been reached, is 0.

```
WHILE at_end = 0 DO
 FETCH c1 INTO
  v_firstnme, v_midinit,
  v_lastname, v_edlevel, v_salary;
 IF SQLCODE=100 THEN SET at_end=1;
 END IF;
END WHILE
```

SQL communication area (SQLCA)

An SQLCA is a structure or collection of variables that is updated after each SQL statement executes. An application program that contains executable SQL statements must provide exactly one SQLCA, with a few exceptions.

The following exceptions exist:

- A program that is precompiled with the STDSQL(YES) option must not provide an SQLCA
- In some cases a Fortran program must provide more than one SQLCA.

In all host languages except REXX, the SQL INCLUDE statement can be used to provide the declaration of the SQLCA.

In COBOL and assembler:
The name of the storage area must be SQLCA.

In PL/I, and C:
The name of the structure must be SQLCA. Every executable SQL statement must be within the scope of its declaration.

Unless noted otherwise, *C* is used to represent C/370 and C/C++ programming languages.

In Fortran:
The name of the COMMON area for the INTEGER variables of the SQLCA must be SQLCA1; the name of the COMMON area for the CHARACTER variables must be SQLCA2. An SQLCA definition is required for every subprogram that contains SQL statements. One is also needed for the main program if it contains SQL statements.

In Java:
The DB2Sqlca class, which is an encapsulation of the SQLCA, should be used.

In REXX:
Db2 generates the SQLCA automatically. A REXX procedure cannot use the INCLUDE statement. The REXX SQLCA has a somewhat different format from SQLCAs for the other languages.

Related reference

DB2Sqlca class (Db2 Application Programming for Java)

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. Db2 makes the SQLCA available to your application automatically.

Description of SQLCA fields

For the most part, COBOL, C, PL/I, and assembler use the same names for the SQLCA fields, and Fortran uses different names. However, there is one instance where C, PL/I, and assembler names differ from COBOL.

The names in the following table are those provided by the SQL INCLUDE statement.

Table 238. Fields of SQLCA

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLCAID	sqlcaid	Not used.	CHAR(8)	An "eye catcher" for storage dumps, containing the text 'SQLCA'. The sixth byte is 'L' if line number information is returned from parsing a dynamic statement or a native SQL procedure. The sixth byte is not set when processing an external SQL procedure.
SQLCABC	sqlcabc	Not used.	INTEGER	Contains the length of the SQLCA: 136.
SQLCODE (See note 1)	SQLCODE	SQLCOD	INTEGER	Contains the SQL return code. (See note 2) **Code** **Means** **0** Successful execution (though there might have been warning messages). **positive** Successful execution, but with a warning condition or other information. **negative** Error condition.
SQLERRML (See note 3)	sqlerrml (See note 3)	SQLTXL	SMALLINT	Length indicator for SQLERRMC, in the range 0 through 70. 0 means that the value of SQLERRMC is not pertinent.
SQLERRMC (See note 3)	sqlerrmc (See note 3)	SQLTXT	VARCHAR(70)	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It may contain truncated tokens. A message length of 70 bytes indicates a possible truncation.
SQLERRP	sqlerrp	SQLERP	CHAR(8)	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. In all cases, the first three characters are 'DSN' for Db2 for z/OS.
SQLERRD(1)	sqlerrd[0]	SQLERR(1)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). On successful return from an SQL procedure, contains the return status value from the SQL procedure. SQLERRD(1) can also contain an internal error code.

Table 238. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(2)	sqlerrd[1]	SQLERR(2)	INTEGER	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.

Table 238. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(3)	sqlerrd[2]	SQLERR(3)	INTEGER	Contains the number of rows that qualified to be deleted, inserted, or updated after a DELETE, INSERT, UPDATE, or MERGE statement. The number excludes rows affected by triggers, referential integrity constraints, or inserted rows that are the result of processing a FOR PORTION OF clause for a BUSINESS_TIME period. For the OPEN of a cursor for a SELECT with a data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. The value is 0 if the SQL statement fails, indicating that all changes made in executing the statement canceled. For a DELETE statement the value will be -1 if the operation is a mass delete from a table in a segmented table space and the DELETE statement did not include selection criteria. If the delete was against a view, neither the DELETE statement nor the definition of the view included selection criteria. For a TRUNCATE statement, the value will be -1. For a PREPARE statement, contains the estimated number of rows selected. If the number of rows is greater than 2,147,483,647, a value of 2,147,483,647 is returned. For a REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. For a rowset-oriented FETCH, contains the number of rows fetched. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.

Table 238. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLERRD(4)	sqlerrd[3]	SQLERR(4)	INTEGER	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required (See note 4). It does not reflect an estimate of the time required. When preparing a dynamically defined SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. It is also subject to change between releases of Db2 for z/OS.
SQLERRD(5)	sqlerrd[4]	SQLERR(5)	INTEGER	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD(6)	sqlerrd[5]	SQLERR(6)	INTEGER	Contains an internal error code.
SQLWARN0	SQLWARN0	SQLWRN(0)	CHAR(1)	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.
SQLWARN1	SQLWARN1	SQLWRN(1)	CHAR(1)	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN2	SQLWARN2	SQLWRN(2)	CHAR(1)	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.
SQLWARN3	SQLWARN3	SQLWRN(3)	CHAR(1)	Contains a W if the number of result columns is larger than the number of host variables. Contains a Z if fewer locators were provided in the ASSOCIATE LOCATORS statement than the stored procedure returned.
SQLWARN4	SQLWARN4	SQLWRN(4)	CHAR(1)	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; blank if cursor is not scrollable.

Table 238. Fields of SQLCA (continued)

assembler, COBOL, or PL/I Name	C Name	Fortran Name	Data type	Purpose
SQLWARN5	SQLWARN5	SQLWRN(5)	CHAR(1)	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in Db2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN6	SQLWARN6	SQLWRN(6)	CHAR(1)	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN7	SQLWARN7	SQLWRN(7)	CHAR(1)	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number used as the operand of a decimal multiply or divide operation.
SQLWARN8	SQLWARN8	SQLWRX(1)	CHAR(1)	Contains a W if a character that could not be converted was replaced with a substitute character. Contains a Y if there was an unsuccessful attempt to establish a trusted connection.
SQLWARN9	SQLWARN9	SQLWRX(2)	CHAR(1)	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARNA	SQLWARNA	SQLWRX(3)	CHAR(1)	Contains a W if at least one character field of the SQLCA or the SQLDA names or labels is invalid due to a character conversion error.
SQLSTATE	sqlstate	SQLSTT	CHAR(5)	Contains a return code for the outcome of the most recent execution of an SQL statement (See note 5).

Notes:

1. With the precompiler option STDSQL(YES) in effect, SQLCODE is replaced by SQLCADE in SQLCA.
2. For the specific meanings of SQL return codes, see *Db2 Codes*.
3. In COBOL, SQLERRM includes SQLERRML and SQLERRMC. In PL/I and C, the varying-length string SQLERRM is equivalent to SQLERRML prefixed to SQLERRMC. In assembler, the storage area SQLERRM is equivalent to SQLERRML and SQLERRMC. See the examples for the various host languages in "The included SQLCA" on page 2092.
4. The use of timerons may require special handling because they are floating-point values in an INTEGER array. In PL/I, for example, you could first copy the value into a BIN FIXED(31) based variable that coincides with a BIN FLOAT(24) variable.
5. For a description of SQLSTATE values, see *Db2 Codes*.

The included SQLCA

The description of the SQLCA that is given by INCLUDE SQLCA is shown for each of the host languages.

assembler:

```
SQLCA    DS   0F
SQLCAID  DS   CL8        ID
SQLCABC  DS   F          BYTE COUNT
SQLCODE  DS   F          RETURN CODE
SQLERRM  DS   H,CL70     ERR MSG PARMS
SQLERRP  DS   CL8        IMPL-DEPENDENT
SQLERRD  DS   6F
SQLWARN  DS   0C         WARNING FLAGS
SQLWARN0 DS   C'W' IF ANY
SQLWARN1 DS   C'W' = WARNING
SQLWARN2 DS   C'W' = WARNING
SQLWARN3 DS   C'W' = WARNING
SQLWARN4 DS   C'W' = WARNING
SQLWARN5 DS   C'W' = WARNING
SQLWARN6 DS   C'W' = WARNING
SQLWARN7 DS   C'W' = WARNING
SQLEXT   DS   0CL8
SQLWARN8 DS   C
SQLWARN9 DS   C
SQLWARNA DS   C
SQLSTATE DS   CL5
```

C:

```

The REXX SQLCA

The REXX SQLCA consists of a set of variables, rather than a structure. Db2 makes the SQLCA available to your application automatically.

The following table lists the variables in a REXX SQLCA.

Table 239. Variables in a REXX SQLCA

Variable	Contents
SQLCODE	Contains the SQL return code.
SQLERRMC	Contains one or more tokens, separated by X'FF', that are substituted for variables in the descriptions of error conditions. It might contain truncated tokens. A message length of 70 bytes indicates a possible truncation.

Table 239. Variables in a REXX SQLCA (continued)

Variable	Contents
SQLERRP	Provides a product signature and, in the case of an error, diagnostic information such as the name of the module that detected the error. For Db2 for z/OS, the product signature is 'DSN'.
SQLERRD.1	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(1) can also contain an internal error code.
SQLERRD.2	For a sensitive static cursor, contains the number of rows in a result table when the cursor position is after the last row (that is, when SQLCODE is equal to +100). SQLERRD(2) can also contain an internal error code.
SQLERRD.3	Contains the number of rows that qualified for the operation after an SQL data change statement (but not rows deleted as a result of CASCADE delete). For the OPEN of a cursor for a SELECT with an SQL data change statement or for a SELECT INTO, SQLERRD(3) contains the number of rows affected by the embedded data change statement. Set to 0 if the SQL statement fails, indicating that all changes made in executing the statement were canceled. Set to -1 for a mass delete from a table in a segmented table space, for a truncate operation, or a delete from a view when neither the DELETE statement nor the definition of the view included selection criteria. For rowset-oriented FETCH statements, contains the number of rows returned in the rowset. For SQLCODES -911 and -913, SQLERRD(3) contains the reason code for the timeout or deadlock. After successful execution of the REFRESH TABLE statement, SQLERRD(3) contains the number of rows inserted into the materialized query table. When an error is encountered in parsing a dynamic statement, or when parsing, binding, or executing a native SQL procedure, SQLERRD(3) will contain the line number where the error was encountered. The sixth byte of SQLCAID must be 'L' for this to be a valid line number. This value will be meaningful only if the statement source contains new line control characters. This information is not returned for an external SQL procedure.
SQLERRD.4	Generally, contains timerons, a short floating-point value that indicates a rough relative estimate of resources required. This value does not reflect an estimate of the time required to execute the SQL statement. After you prepare an SQL statement, you can use this field as an indicator of the relative cost of the prepared SQL statement. For a particular statement, this number can vary with changes to the statistics in the catalog. This value is subject to change between releases of Db2 for z/OS.
SQLERRD.5	Contains the position or column of a syntax error for a PREPARE or EXECUTE IMMEDIATE statement.
SQLERRD.6	Contains an internal error code.
SQLWARN.0	Contains a blank if no other indicator is set to a warning condition (that is, no other indicator contains a W or Z). Contains a W if at least one other indicator contains a W or Z.

Table 239. Variables in a REXX SQLCA (continued)

Variable	Contents
SQLWARN.1	Contains a W if the value of a string column was truncated when assigned to a host variable. Contains an N for non-scrollable cursors and S for scrollable cursors after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.2	Contains a W if null values were eliminated from the argument of an aggregate function; not necessarily set to W for the MIN function because its results are not dependent on the elimination of null values.
SQLWARN.3	Contains a W if the number of result columns is larger than the number of host variables. Contains Z if the ASSOCIATE LOCATORS statement contains fewer locators than the stored procedure returned.
SQLWARN.4	Contains a W if a prepared UPDATE or DELETE statement does not include a WHERE clause. For a scrollable cursor, contains a D for sensitive dynamic cursors, I for insensitive cursors, and S for sensitive static cursors after the OPEN CURSOR or ALLOCATE CURSOR statement; otherwise, blank if cursor is not scrollable.
SQLWARN.5	Contains a W if the SQL statement was not executed because it is not a valid SQL statement in Db2 for z/OS. Contains a character value of 1 (read only), 2 (read and delete), or 4 (read, delete, and update) to reflect capability of the cursor after the OPEN CURSOR or ALLOCATE CURSOR statement.
SQLWARN.6	Contains a W if the addition of a month or year duration to a DATE or TIMESTAMP value results in an invalid day (for example, June 31). Indicates that the value of the day was changed to the last day of the month to make the result valid.
SQLWARN.7	Contains a W if one or more nonzero digits were eliminated from the fractional part of a number that was used as the operand of a decimal multiply or divide operation.
SQLWARN.8	Contains a W if a character that could not be converted was replaced with a substitute character.
SQLWARN.9	Contains a W if arithmetic exceptions were ignored during COUNT or COUNT_BIG processing. Contains a Z if the stored procedure returned multiple result sets.
SQLWARN.10	Contains a W if at least one character field of the SQLCA is invalid due to a character conversion error.
SQLSTATE	Contains a return code for the outcome of the most recent execution of an SQL statement.

SQL descriptor area (SQLDA)

An SQLDA is a collection of variables that is required for execution of the SQL DESCRIBE statement, and can be optionally used by the PREPARE, OPEN, FETCH, EXECUTE, and CALL statements. An SQLDA can be used in a DESCRIBE or PREPARE INTO statement, modified with the addresses of host variables, and then reused in a FETCH statement.

The meaning of the information in an SQLDA depends on the context in which it is used. For DESCRIBE and PREPARE INTO, Db2 sets the fields in the SQLDA to provide information to the application program. For OPEN, EXECUTE, FETCH, and CALL, the application program sets the fields in the SQLDA to provide Db2 with information:

DESCRIBE *statement-name* or PREPARE INTO
With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about a prepared statement. Each SQLVAR occurrence describes a column of the result table.

DESCRIBE TABLE
With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the columns of a table or view. Each SQLVAR occurrence describes a column of the specified table or view.

DESCRIBE CURSOR
With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the result set that is associated with the specified cursor. Each SQLVAR occurrence describes a column of the result set.

DESCRIBE INPUT
With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the input parameter markers of a prepared statement. Each SQLVAR occurrence describes an input parameter marker.

DESCRIBE PROCEDURE
With the exception of SQLN, Db2 sets fields of the SQLDA to provide information to an application program about the result sets returned by the specified stored procedure. Each SQLVAR occurrence describes a returned result set.

OPEN, EXECUTE, FETCH, and CALL
The application program sets fields of the SQLDA to provide information about host variables or output buffers in the application program to Db2. Each SQLVAR occurrence describes a host variable or output buffer.

- For OPEN and EXECUTE, each SQLVAR occurrence describes an input value that is substituted for a parameter marker in the associated SQL statement that was previously prepared.
- For FETCH, each SQLVAR occurrence describes a host variable or buffer in the application program that is to be used to contain an output value from a row of the result.
- For CALL, each SQLVAR occurrence describes a host variable that corresponds to a parameter in the parameter list for the stored procedure.

For information on the way to use the SQLDA, see *Db2 Application Programming and SQL Guide*.

Description of SQLDA fields

An SQLDA consists of four variables, a header, and an arbitrary number of occurrences of a sequence of variables collectively named SQLVAR.

In DESCRIBE and PREPARE INTO, each occurrence of the SQLVAR describes the column of a table. In FETCH, OPEN, EXECUTE, and CALL, each occurrence describes a host variable.

The order of the SQLVAR entries matches the order of the columns in the table or the order of the parameter markers in the SQL statement.

The SQLDA Header

The fields in the SQLDA header have different usage depending on whether the SQLDA is being used in a DESCRIBE or PREPARE INTO statement or the SQLDA is being used in a FETCH, INSERT, OPEN, EXECUTE, or CALL statement.

The following table describes the fields in the SQLDA header.

Table 240. Fields of the SQLDA header

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH,INSERT, OPEN, EXECUTE, and CALL
sqldaid SQLDAID	CHAR(8)	An "eye catcher" for storage dumps, containing the text 'SQLDA '. The 7th byte of the field is a flag that can be used to determine if more than one SQLVAR entry is needed for each column. For details, see "Determining how many SQLVAR occurrences are needed" on page 2099. For DESCRIBE CURSOR, the field is set to 'SQLRS'. If the cursor is declared WITH HOLD in a stored procedure, the high-order bit of the 8th byte is set to 1. For DESCRIBE PROCEDURE, it is set to 'SQLPR'.	A plus sign (+) in the 6th byte indicates that SQLNAME contains an overriding CCSID. A '2' in the 7th byte indicates the two SQLVAR entries were allocated for each column or parameter. A '3' in the 7th byte indicates that three SQLVAR entries were allocated for each column or parameter. Although three entries are never needed on input to Db2, an SQLDA with three entries might be used when the SQLDA was initialized by a DESCRIBE or PREPARE INTO with a USING BOTH clause. Otherwise, SQLDAID is not used.
sqldabc SQLDABC	INTEGER	Length of the SQLDA, equal to SQLNx * 44+16.	Length of the SQLDA, greater than or equal to SQLNx * 44+16.
sqln SQLN	SMALLINT	Unchanged by Db2. The field must be set to a value greater than or equal to zero before the statement is executed. The field indicates the total number of occurrences of SQLVAR. At the very least, the number should be: • For DESCRIBE INPUT, the number of parameter markers to be described. • For other DESCRIBEs or PREPARE INTO: the number of columns of the result, or a multiple of the columns of the result when there are multiple sets of SQLVAR entries because column labels are returned in addition to column names.	Total number of occurrences of SQLVAR provided in the SQLDA. SQLN must be set to a value greater than or equal to zero.

Table 240. Fields of the SQLDA header (continued)

C name assembler, COBOL or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH,INSERT, OPEN, EXECUTE, and CALL
sqld SQLD	SMALLINT	The number of columns described by occurrences of SQLVAR. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables described by occurrences of SQLVAR.

Note:

1. The third column of this table represents several forms of the DESCRIBE statement:
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLVAR entries
For each column or host variable described by the SQLDA, there are both base SQLVAR entries and extended SQLVAR entries.

Base SQLVAR entry
The base SQLVAR entry is always present. The fields of this entry contain the base information about the column or host variable such as data type code, length attribute (except for LOBs), column name (or label), host variable address, and indicator variable address.

Extended SQLVAR entry
The extended SQLVAR entry is needed (for each column) if the result includes any LOB or distinct type[41] columns. For distinct types, the extended SQLVAR contains the distinct type name. For LOBs, the extended SQLVAR contains the length attribute of the host variable and a pointer to the buffer that contains the actual length. If locators are used to represent LOBs, an extended SQLVAR is not necessary.

The extended SQLVAR entry is also needed for each column when the USING BOTH clause was specified, which indicates that both columns names and labels are returned. (DESCRIBE *output* is the only statement with the USING BOTH clause).

The fields in the extended SQLVAR that return LOB and distinct type information do not overlap, and the fields that return LOB and label information do not overlap. Depending on the combination of labels, LOBs and distinct types, more than one extended SQLVAR entry per column may be required to return the information. See "Determining how many SQLVAR occurrences are needed" on page 2099.

The following table shows how to map the base and extended SQLVAR entries. For an SQLDA that contains both base and extended SQLVAR entries, the base SQLVAR entries are in the first block, followed by a block of extended SQLVAR entries, which if necessary, are followed by a second block of extended

[41] DESCRIBE INPUT does not return information about distinct types.

SQLVAR entries. In each block, the number of occurrences of the SQLVAR entry is equal to the value in SQLD[42] even though many of the extended SQLVAR entries might be unused.

Table 241. Contents of SQLVAR arrays

					Set of SQLVAR entries		
LOBs	**Distinct types[1]**	**7th byte of SQLDAID**	**SQLD**	**Minimum for SQLN[2]**	**First set (Base)**	**Second set (Extended)**	**Third set (Extended)**
USING BOTH clause not specified:							
No	No	Space	*n*	*n*	Column names, labels	Not Used	Not Used
Yes[3]	Yes[3]	2	*n*	*2n*	Column names, labels	LOBs, distinct types, or both	Not used
USING BOTH clause was specified:							
No	No	Space	*2n*	*2n*	Column names	Labels	Not used
Yes	No	2	*n*	*2n*	Column names	LOBs and labels	Not used
No	Yes	3	*n*	*3n*	Column names	Distinct types	Labels
Yes	Yes	3	*n*	*3n*	Column names	LOBs and distinct types	Labels

Notes:

1. DESCRIBE INPUT does not return information about distinct types.
2. The number of columns or host variables that the SQLDA describes.
3. Either LOBs, distinct types, or both are present.
4. Here, the 7th byte is set to a space and SQLD is set to two times the number of columns in the result. For all other values of the 7th byte for USING BOTH, SQLD is set to the number of columns in the result, and the 7th byte can be used to determine how many SQLVAR entries are needed for each column of the result.

Determining how many SQLVAR occurrences are needed

The number of SQLVAR occurrences needed depends on the statement that the SQLDA was provided for and the data types of the columns or parameters being described.

If the USING BOTH clause was not specified for the statement and neither LOBs nor distinct types are present in the result, only one SQLVAR entry (a base entry) is needed for each column. The 7th byte of SQLDAID is set to a space. The SQLD is set to the number of columns in the result and represents the number of SQLVAR occurrences needed. If an insufficient number of SQLVAR occurrences were provided, Db2 returns a +236 warning in SQLCODE if the standards option was set. Otherwise, SQLCODE is zero.

If USING BOTH is specified and neither LOBs nor distinct types are present in the result, an extended SQLVAR entry per column is needed for the labels in addition to the base SQLVAR entry. The 7th byte of the SQLDAID is set to space. SQLD is set to the twice the number of columns in the result and represents the combined number of base and extended SQLVAR occurrences needed.

If LOBs, distinct types, or both are present in the results, one extended SQLVAR entry is needed per column in addition to the base SQLVAR entry with one exception. The exception is that when the USING

[42] When an extended SQLVAR entry is present for each column for *labels* (and there are no LOB or distinct type columns in the result),

BOTH clause is specified and distinct types are present in the results, two extended SQLVAR entries per column are needed. When a sufficient number of SQLVAR entries are provided in the SQLDA for both the base and extended SQLVARs, information for the LOBs and distinct types is returned. The 7th byte of SQLDAID is set to the number of SQLVAR entries that were used for each column:

2
Two SQLVAR entries per column (a base and an extended)

3
Three SQLVAR entries per column (a base and two extended)

SQLD is set to the number of columns in the result. Therefore, the value of the 7th byte of SQLDAID multiplied by the value of SQLD is the total number SQLVAR entries that were provided.

Otherwise, when an insufficient number of SQLVAR entries have been provided when LOBs or distinct types are present, Db2 indicates that by returning one of the following warnings in SQLCODE. Db2 also sets the 7th byte of SQLDAID to indicate how many SQLVAR entries are needed for each column of the result.

+237
There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. In this case, there were enough base SQLVAR entries to describe the data, so the base SQLVAR entries are set. However, sufficient extended SQLVAR entries were not provided so the distinct type names are not returned.

+238
There are insufficient SQLVAR entries to describe the data, and the data includes LOBs. In this case no information is returned in the SQLVAR entries.

+239
There are insufficient SQLVAR entries to describe the data, and the data includes distinct types. There weren't even enough base SQLVAR entries. In this case no information is returned in the SQLVAR entries.

Field descriptions of an occurrence of a base SQLVAR
The fields of a base SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of a base SQLVAR.

Table 242. Fields in an occurrence of a base SQLVAR

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqltype SQLTYPE	SMALLINT	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see Table 244 on page 2106. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type. For a Unicode column (defined with CCSID 1208) that is in an EBCDIC table, SQLTYPE reflects VARCHAR, even though the column is recorded in the catalog as VARBINARY with CCSID 1208. For a Unicode column (defined with CCSID 1200) that is in an EBCDIC table, SQLTYPE reflects VARGRAPHIC, even though the column is recorded in the catalog as VARBINARY with CCSID 1200.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2106.
sqllen SQLLEN	SMALLINT	The length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See "SQLTYPE and SQLLEN" on page 2106 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. For XML, the value is 0. Field SQLLONGLEN in the extended SQLVAR contains the length attribute.	The length attribute of the host variable. See "SQLTYPE and SQLLEN" on page 2106 for a description of allowable values. For LOBs, the value is 0 regardless of the length attribute of the LOB. Field SQLLONGLEN in the extended SQLVAR contains the length attribute. For XML AS BLOB, CLOB, or DBCLOB, sqllen is 0 as for LOB types.

Table 242. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqldata SQLDATA	pointer	For string columns or parameters, SQLDATA contains X'0000*zzzz*', where *zzzz* is the associated CCSID. For character strings, SQLDATA can alternatively contain X'FFFF', which indicates bit data. Not used for other types of data. For datetime columns, SQLDATA can contain the CCSID of the string representation of the datetime value. For DESCRIBE PROCEDURE, the result set locator value associated with the result set. For a Unicode column (defined with CCSID 1208) that is in an EBCDIC table, SQLDATA is 1208, even though the column might be recorded in the catalog as VARBINARY. For a Unicode column (defined with CCSID 1200) that is in an EBCDIC table, SQLDATA contains 1200, even though the column might be recorded in the catalog as VARBINARY.	Contains the address of the host variable.
sqlind SQLIND	pointer	Reserved For DESCRIBE PROCEDURE, it is set to -1.	Contains the address of an associated indicator variable, if SQLTYPE is odd. Otherwise, the field is not used.

Table 242. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqlname SQLNAME	VARCHAR(30)	Contains the unqualified name or label of the column, or a string of length zero if the name or label does not exist. If the name is longer than 30 bytes, it is truncated at a byte boundary. For more information about column names, see Names of result columns. For DESCRIBE PROCEDURE, SQLNAME contains the cursor name used by the stored procedure to return the result set. The values for SQLNAME appear in the order the cursors were opened by the stored procedure. For DESCRIBE INPUT, SQLNAME is not used.	Can contain CCSID and/or host-variable-array dimension information. Db2 interprets the third and fourth byte of the data portion of SQLNAME as the CCSID of the host variable if all of the following are true and the third and fourth byte are not X'0000': • The 6th byte of SQLDAID is '+' (x'4E') • SQLTYPE indicates the host variable is a string variable • The length of SQLNAME is 8 • The first two bytes of the data portion of SQLNAME are X'0000'. If the third and fourth byte of the data portion of SQLNAME are X'0000', Db2 uses the appropriate default CCSID. For FETCH, OPEN, INSERT, and EXECUTE, if the length of SQLNAME is 8, and the first two bytes of the data portion of SQLNAME are X'0000', Db2 interprets the fifth through eighth bytes of the data portion of the SQLNAME field as follows:

Table 242. Fields in an occurrence of a base SQLVAR (continued)

C name assembler COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
(cont.) sqlname SQLNAME			• **fifth and sixth bytes:** a flag field that indicates the type of host variable that is being described by the current SQLDA entry. The values of this field are as follows: – X'0000' - host variable – X'0100' - XML host variable (XML AS BLOB, XML AS CLOB, XML AS DBCLOB) – X'0001' - host variable array – X'0101' - XML host variable array – X'0002' - special host variable that represents the value for 'n' in a multiple-row INSERT statement. • **seventh and eighth bytes:** if the sixth byte is X'01', a binary small integer (halfword) that represents the dimension of the host-variable-array, and the corresponding indicator-array if one is specified.

Notes:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

Field descriptions of an occurrence of an extended SQLVAR

The fields of an extended SQLVAR have different uses depending on the SQL statement.

The following table describes the contents of the fields of an extended SQLVAR entry.

Table 243. Fields in an occurrence of an extended SQLVAR

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
len.sqllonglen SQLLONGL SQLLONGLEN	INTEGER	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) column.	The length attribute of a LOB (BLOB, CLOB, or DBCLOB) host variable. Db2 ignores the SQLLEN field in the base SQLVAR for these data types. The length attribute indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB.
*	INTEGER	Reserved.	Reserved.
sqldatalen SQLDATAL SQLDATALEN	pointer	Not used.	Used only for LOB (BLOB, CLOB, and DBCLOB) host variables. If the value of the field is null, the actual length of the LOB is stored in the 4 bytes immediately before the start of the data, and SQLDATA points to the first byte of the field length. The actual length indicates the number of bytes for a BLOB or CLOB, and the number of characters for a DBCLOB. If the value of the field is not null, the field contains a pointer to a 4-byte long buffer that contains the actual length *in bytes* (even for DBCLOBs) of the data in the buffer pointed to from the SQLDATA field in the matching base SQLVAR. Regardless of whether this field is used, field SQLLONGLEN must be set.

Table 243. Fields in an occurrence of an extended SQLVAR (continued)

C name assembler, COBOL, or PL/I name	Data type	Usage in DESCRIBE[1] and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
sqldatatype_name SQLTNAME SQLDATATYPE-NAME	VARCHAR(30)	A SQLTNAME field of the extended SQLVAR is set to one of the following: • For a distinct type column, the database manager sets this field to the fully qualified distinct type name. If the qualified name is longer than 30 bytes, it is truncated. • For a label, the database manager sets this field to label. In the case that both a distinct type name and a label need to be returned in extended SQLVAR entries (USING BOTH has been specified), the distinct type name is returned in the first extended SQLVAR entry and the label in the second extended SQLVAR entry.	Not used.

Note:

1. The third column of this table represents several forms of the DESCRIBE statement.
   - For DESCRIBE *output* and PREPARE INTO, the column pertains to columns of the result table.
   - For DESCRIBE CURSOR, the column pertains to a result set associated with a cursor.
   - For DESCRIBE INPUT, the column pertains to parameter markers.
   - For DESCRIBE PROCEDURE, the column pertains to the result sets returned by the stored procedure.

SQLTYPE and SQLLEN

The contents of the SQLTYPE and SQLLEN fields of the SQLDA depends on the SQL statement that is returning the value.

The following table shows the values that can appear in the SQLTYPE and SQLLEN fields of the SQLDA. In DESCRIBE and PREPARE INTO, an even value of SQLTYPE means the column does not allow nulls, and an odd value means the column does allow nulls. In DESCRIBE INPUT statements, only odd values are returned for SQLTYPE. In FETCH, OPEN, EXECUTE, and CALL, an even value of SQLTYPE means no indicator variable is provided, and an odd value means that SQLIND contains the address of an indicator variable.

Table 244. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	Column or parameter data type	SQLLEN	Host variable data type	SQLLEN
384/385	date	10 [1]	fixed-length character string representation of a date	length attribute of the host variable

Table 244. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	**Column or parameter data type**	**SQLLEN**	**Host variable data type**	**SQLLEN**
388/389	time	8 [2]	fixed-length character string representation of a time	length attribute of the host variable
392/393	timestamp without time zone	19 for TIMESTAMP(0) otherwise 20+*p* for TIMESTAMP(*p*) [5]	fixed-length character string representation of a timestamp	length attribute of the host variable
400/401	N/A	N/A	NUL-terminated graphic string	length attribute of the host variable
404/405	BLOB	0 [3]	BLOB or XML AS BLOB	Not used. [3]
408/409	CLOB	0 [3]	CLOB or XML AS CLOB	Not used. [3]
412/413	DBCLOB	0 [3]	DBCLOB or XML AS DBCLOB	Not used. [3]
448/449	varying-length character string	length attribute of the column	varying-length character string	length attribute of the host variable
452/453	fixed-length character string	length attribute of the column	fixed-length character string	length attribute of the host variable
456/457	long varying-length character string SQLTYPE values 448/449 are returned instead of 456/457 for statements that are bound in Version 9 or later.	length attribute of the column	long varying-length character string	length attribute of the host variable
460/461	N/A	N/A	NUL-terminated character string	length attribute of the host variable
464/465	varying-length graphic string	length attribute of the column	varying-length graphic string	length attribute of the host variable
468/469	fixed-length graphic string	length attribute of the column	fixed-length graphic string	length attribute of the host variable
472/473	long graphic string SQLTYPE values 464/465 are returned instead of 472/473 for statements that are bound in Version 9 or later.	length attribute of the column	long graphic string	length attribute of the host variable
480/481	floating point	4 for single precision, 8 for double precision	floating point	4 for single precision, 8 for double precision

Table 244. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	**Column or parameter data type**	**SQLLEN**	**Host variable data type**	**SQLLEN**
484/485	packed decimal	precision in byte 1; scale in byte 2	packed decimal	precision in byte 1; scale in byte 2
492/493	big integer[4]	8	big integer	8
496/497	large integer	4	large integer	4
500/501	small integer	2	small integer	2
504/505	N/A	N/A	DISPLAY SIGN LEADING SEPARATE, NATIONAL SIGN LEADING SEPARATE	precision in byte 1; scale in byte 2
904/905	ROWID	40	ROWID	40
908/909	varying-length binary string	length attribute of the column	varying-length binary string	length attribute of the host variable
912/913	fixed-length binary string	length attribute of the column	fixed-length binary string	length attribute of the host variable
916/917	BLOB_FILE	267		
920/921	CLOB_FILE	267		
924/925	DBCLOB_FILE	267		
960/961	BLOB locator	4	BLOB_LOCATOR	4
964/965	CLOB locator	4	CLOB_LOCATOR	4
968/969	DBCLOB locator	4	DBCLOB_LOCATOR	4
972	Not applicable	Not applicable	Result set locator	4
988/989	XML	0	Invalid. Instead, use one of the following: XML AS BLOB, XML AS CLOB, XML AS DBCLOB	Not used
996/997	DECFLOAT(16) DECFLOAT(34)	8 16	DECFLOAT(16) DECFLOAT(34)	8 16
2448/2449	timestamp with time zone	147 for TIMESTAMP(0) WITH TIME ZONE otherwise 148+*p* for TIMESTAMP(*p*) WITH TIME ZONE [5]	varying-length character string representation of a timestamp with time zone	length attribute of the host variable

Table 244. SQLTYPE and SQLLEN values for DESCRIBE, PREPARE INTO, FETCH, OPEN, EXECUTE, and CALL (continued)

	For DESCRIBE and PREPARE INTO		For FETCH, OPEN, EXECUTE, and CALL	
SQLTYPE	**Column or parameter data type**	**SQLLEN**	**Host variable data type**	**SQLLEN**

Note:

1. SQLLEN might be different if a date installation exit is specified.
2. SQLLEN might be different if a time installation exit is specified.
3. Field SQLLONGLEN in the extended SQLVAR contains the length attribute of the column. In REXX, the SQLVAR length attribute field name is SQLLONGL and SQLLEN is not used.
4. BIGINT is supported by other Db2 platforms.
5. *p* is the timestamp precision.

SQLDATA
Depending on the data type of the string column that the SQLVAR is describing, the SQLDATA field can contain different CCSID values.

The following table identifies the CCSID values that appear in the SQLDATA field when the SQLVAR element describes a string column.

Table 245. CCSID values for SQLDATA

Data type	Subtype	Bytes 1 and 2	Bytes 3 and 4
Character	SBCS data	X'0000'	CCSID
Character	mixed data	X'0000'	CCSID
Character	BIT data	X'0000'	X'FFFF'
Graphic	N/A	X'0000'	CCSID
Any other data type	N/A	N/A	N/A

Unrecognized and unsupported SQLTYPES

The values that appear in the SQLTYPE field of the SQLDA are dependent on the level of data type support available at the sender as well as at the receiver of the data. This support is particularly important as new data types are added to the product.

New data types might not be supported by the sender or receiver of the data and might not be recognized by the sender or receiver of the data. Depending on the situation, the new data type might be returned, a compatible data type that is agreed to by both the sender and the receiver of the data might be returned, or an error might occur.

When the sender and receiver agree to use a compatible data type, the following table indicates the mapping that takes place. This mapping takes place when at least one of the sender or receiver does not support the data type provided. The unsupported data type can be provided by either the application or the database manager.

Table 246. Compatible data types for unsupported data types

Data type	Compatible data type
ROWID	VARCHAR(40) FOR BIT DATA

No indication is given in the SQLDA that the data type is substituted.

The included SQLDA

Only assembler, C, C++, COBOL, and PL/I C are supported for the SQLDA that is given by INCLUDE SQLDA.

assembler:

```
SQLTRIPL EQU    C'3'
SQLDOUBL EQU    C'2'
SQLSINGL EQU    C' '
*
         SQLSECT SAVE
*
SQLDA    DSECT
SQLDAID  DS    CL8      ID
SQLDABC  DS    F        BYTE COUNT
SQLN     DS    H        COUNT SQLVAR/SQLVAR2 ENTRIES
SQLD     DS    H        COUNT VARS (TWICE IF USING BOTH)
*
SQLVAR   DS    0F       BEGIN VARS
SQLVARN  DSECT ,        NTH VARIABLE
SQLTYPE  DS    H        DATA TYPE CODE
SQLLEN   DS    0H       LENGTH
SQLPRCSN DS    X        DEC PRECISION
SQLSCALE DS    X        DEC SCALE
SQLDATA  DS    A        ADDR OF VAR
SQLIND   DS    A        ADDR OF IND
SQLNAME  DS    H,CL30   DESCRIBE NAME
SQLVSIZ  EQU   *-SQLDATA
SQLSIZV  EQU   *-SQLVARN
*
SQLDA    DSECT
SQLVAR2  DS     0F      BEGIN EXTENDED FIELDS OF VARS
SQLVAR2N DSECT  ,       EXTENDED FIELDS OF NTH VARIABLE
SQLLONGL DS     F       LENGTH
SQLRSVDL DS     F       RESERVED
SQLDATAL DS     A       ADDR OF LENGTH IN BYTES
SQLTNAME DS     H,CL30  DESCRIBE NAME
*
         SQLSECT RESTORE
```

In the above declaration, SQLSECT SAVE is a macro invocation that remembers the current CSECT name. SQLSECT RESTORE is a macro invocation that continues that CSECT.

C and C++:

```
#ifndef  SQLDASIZE                /* Permit duplicate Includes      */
 /**/
 struct sqlvar
        { short  sqltype;

Identifying an SQLDA in C or C++

A *descriptor-name* can be specified in the CALL, DESCRIBE, EXECUTE, FETCH, and OPEN statements. When the host application is written in C or C++, *descriptor-name* can be a pointer variable with pointer notation.

For example, *descriptor-name* could be declared as

```
sqlda *outsqlda;
```

Afterwords, it could be used in a statement like the following:

```
EXEC SQL DESCRIBE STMT1 INTO DESCRIPTOR :*outsqlda;
```

The REXX SQLDA

A REXX SQLDA consists of a set of REXX variables with a common stem. The stem must be a REXX variable name that contains no periods and is the same as the value of *descriptor-name* that you specify when you use the SQLDA in an SQL statement. Db2 does not support the INCLUDE SQLDA statement in REXX.

The following table shows the variable names in a REXX SQLDA. The values in the second column of the table are values that Db2 inserts into the SQLDA when the statement executes. Except where noted otherwise, the values in the third column of the table are values that the application must put in the SQLDA before the statement executes.

Table 247. Fields of a REXX SQLDA

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
stem.SQLD	The number of columns that are described in the SQLDA. Double that number if USING BOTH appears in the DESCRIBE or PREPARE INTO statement. Contains a 0 if the statement string is not a query. For DESCRIBE PROCEDURE, the number of result sets returned by the stored procedure. Contains a 0 if no result sets are returned.	The number of host variables that are used by the SQL statement.
Each SQLDA contains *stem*.SQLD of the following variables. Therefore, 1<=*n*<=*stem*.SQLD. There is one occurrence of each variable for each column of the result table or host variable that is described by the SQLDA. This set of variables is equivalent to the SQLVAR structure in the SQLDA for other languages.		

Table 247. Fields of a REXX SQLDA (continued)

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
stem.n.SQLTYPE	Indicates the data type of the column or parameter and whether it can contain null values. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2106. For a distinct type, the data type on which the distinct type was based is placed in this field. The base SQLVAR provides no indication that this is part of the description of a distinct type.	Indicates the data type of the host variable and whether an indicator variable is provided. Host variables for datetime values must be character string variables. For FETCH, a datetime type code means a fixed-length character string. For a description of the type codes, see "SQLTYPE and SQLLEN" on page 2106.
stem.n.SQLLONGL	For a LOB column, the length of the string representation of the value or parameter.	For a host variable that has a LOB data type, the length attribute of the host variable. For a description of supported values, see "SQLTYPE and SQLLEN" on page 2106.
stem.n.SQLLEN	For a column other than a DECIMAL, NUMERIC, or LOB column, the length attribute of the column or parameter. For datetime data, the length of the string representation of the value. See "SQLTYPE and SQLLEN" on page 2106 for a description of allowable values.	For a host variable that does not have a decimal or LOB data type, the length attribute of the host variable. See "SQLTYPE and SQLLEN" on page 2106 for a description of allowable values.
stem.n.SQLLEN.SQLPRECISION	For a DECIMAL or NUMERIC column, the precision of the column or parameter.	For a host variable with a decimal data type, the precision of the host variable.
stem.n.SQLLEN.SQLSCALE	For a DECIMAL or NUMERIC column, the scale of the column or parameter.	For a host variable with a decimal data type, the scale of the host variable.
stem.n.SQLCCSID	For a string column or parameter, the CCSID of the column or parameter.	For a string host variable, the CCSID of the host variable.
stem.n.SQLUSECCSID	Not used.	Set to a new CCSID. If set, REXX will change the CCSID of the SQLDATA.
stem.n.SQLLOCATOR	For DESCRIBE PROCEDURE, the value of a result set locator.	Not used.
stem.n.SQLDATA	Not used.	Before EXECUTE or OPEN, contains the value of an input host variable. The application must supply this value. After FETCH, contains the values of an output host variable.

Table 247. Fields of a REXX SQLDA (continued)

Variable name	Usage in DESCRIBE and PREPARE INTO	Usage in FETCH, OPEN, EXECUTE, and CALL
stem.n.SQLIND	Not used.	Before EXECUTE or OPEN, contains a negative number to indicate that the input host variable in *stem.n*.SQLDATA is null. The application must supply this value. After FETCH, contains a negative number if the value of the output host variable in *stem.n*.SQLDATA is null.
stem.n.SQLNAME	The name of the *n*th column in the result table. For DESCRIBE PROCEDURE, contains the cursor name that is used by the stored procedure to return the result set. The values for SQLNAME appear in the order that the cursors were opened by the stored procedure.	Not used.

Db2 catalog tables

Db2 for z/OS maintains a set of tables (in database DSNDB06) called the Db2 catalog.

About these topics

These topics describe that catalog by describing the columns of each catalog table.

The catalog tables describe such things as table spaces, tables, columns, indexes, privileges, application plans, and packages. Authorized users can query the catalog; however, it is primarily intended for use by Db2 and is therefore subject to change. All catalog tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The catalog tables are updated by Db2 during normal operations in response to certain SQL statements, commands, and utilities.

Catalog changes in Db2 11

Db2 11 introduces new Db2 catalog objects and changes to existing catalog objects. For a summary of the changes, see Catalog changes in Db2 11 (Db2 for z/OS What's New?).

Release dependency indicators

Some objects depend on functions in particular releases of Db2. If you are running on a release of Db2 and fall back to a previous release, an object that depends on the more recent release becomes frozen. The object is marked with a release dependency indicator and is unavailable until remigration.

The release dependency indicator, which is listed in the IBMREQD, RELCREATED, and RELBOUND columns of the catalog tables, shows the release of Db2 upon which the objects depend.

Important: The IBMREQD column is not a reliable indicator for indicating release dependencies. Where possible, the RELCREATED and RELBOUND columns should be used instead.

Release dependency indicators in IBMREQD, RELCREATED, and RELBOUND are defined by the following values:

Value
Meaning

B
Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape

C
Version 2R1 dependency indicator, not from MRM tape

D
Version 2R2 dependency indicator, not from MRM tape

E
Version 2R3 dependency indicator, not from MRM tape

F
Version 3R1 dependency indicator, not from MRM tape

G
Version 4 dependency indicator, not from MRM tape

H
Version 5 dependency indicator, not from MRM tape

I
Version 6 dependency indicator, not from MRM tape

J
Version 6 dependency indicator, not from MRM tape

K
DB2 Version 7 dependency indicator, not from MRM tape

L
DB2 Version 8 dependency indicator, not from MRM tape

M
DB2 9 dependency indicator, not from MRM tape

O
DB2 10 dependency indicator, not from MRM tape

P
Db2 11 dependency indicator, not from MRM tape

N
Not from MRM tape, no dependency

Programming interface information

Not all catalog table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the table that describes the column. The values that "Use" can assume are as follows:

Value
Meaning

G
Column is part of the general-use programming interface

S
Column is part of the product-sensitive interface

I
Column is for internal use only

N
Column is not used

For columns for which "Use" is N or I, the name of the column and its description do not appear in the explanation of the column.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM.

Table	Table space	Indexes (Type "2" on page 2128)	Description
IPLIST	SYSDDF	DSNDUX01 (U)	Contains a row for each IP address that corresponds to a remote DRDA server
IPNAMES	SYSDDF	DSNFPX01 (UC)	Contains a row for each remote DRDA server that Db2 can access using TCP/IP
LOCATIONS	SYSDDF	DSNFCX01 (UC)	Contains a row for every accessible remote server
LULIST	SYSDDF	DSNFLX01 DSNFLX02	Contains a row for each real LU name that is associated with the dummy LU name for a data sharing group
LUMODES	SYSDDF	DSNFMX01 (UC)	Contains a row for the conversation limit for each combination of LU name and VTAM logon mode description
LUNAMES	SYSDDF	DSNFNX01 (UC)	Contains a row for each remote SNA client or server
MODESELECT	SYSDDF	DSNFDX01 (UC)	Contains a row for each VTAM logon mode and combination of authorization ID, plan name, and LU name
SYSAUDITPOLICIES	SYSTSADT	DSNAPX03 (UC)	Each row represents an audit policy.
SYSAUTOALERTS	SYSTSATS	DSNALX01 (UC) DSNALX02 (N) DSNALX03 (N) DSNALX04 (N) DSNALX05 (N) DSNALX06 (N)	Contains a row for each recommendation from the autonomic procedures
SYSAUTOALERTS_OUT	SYSTSATX	DSNALX07 (A)	Contains the LOB data for the OUTPUT column of SYSIBM.SYSAUTOALERTS
SYSAUTORUNS_HIST	SYSTSPRH	DSNPHX01 (UC) DSNPHX02 (N) DSNPHX03 (N)	Contains a row for each execution of an autonomic procedure.
SYSAUTORUNS_HISTOU	SYSTSPHX	DSNPHX04 (A)	Contains the LOB data for the OUTPUT column of SYSIBM.SYSAUTORUNS_HIST
SYSAUTOTIMEWINDOWS	SYSTSATW	DSNTWX01 (UC)	Contains a row for each time period during which autonomic procedures can be run
SYSAUXRELS	SYSTSAUX	DSNOXX01 (NC) DSNOXX02 (N)	Contains one row for each auxiliary table for a LOB column

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type"2" on page 2128)	Description
SYSCHECKDEP	SYSTSCKD	DSNSDX01 (UC)	Contains one row for each reference to a column in a table check constraint
SYSCHECKS2	SYSTSCHX	DSNCHX01 (UC)	Contains one row for each table check constraint
SYSCHECKS	SYSTSCKS	DSNSCX01 (UC)	Contains one row for each table check constraint
SYSCOLAUTH	SYSTSFAU	DSNACX01 (N) DSNACX02 (N) DSNACX03 (N) DSNACX04 (N)	Records the UPDATE privileges that are held by users on individual columns of a table or view
SYSCOLDIST	SYSSTATS	DSNTNX01 (NC)	Contains cardinality, frequency, and histogram statistics for a single column or a column group.
SYSCOLDIST_HIST	SYSHIST	DSNHFX01 (N)	Contains accumulated rows from SYSCOLDIST
SYSCOLDISTSTATS	SYSSTATS	DSNTPX01 (NC)	Contains cardinality, frequency, and histogram statistics for a single column or a column group. Each partition can have 0 or more rows.
SYSCOLSTATS	SYSSTATS	DSNTCX01 (NC)	Contains partition statistics for selected columns. Each column contains a row for each partition in the table
SYSCOLUMNS	SYSTSCOL	DSNDCX01 (U) DSNDCX02 (N) DSNDCX05 (N) DSNDCX06 (N)	Contains one row for every column of each table and view
SYSCOLUMNS_HIST	SYSHIST	DSNHEX01 (N)	Contains accumulated rows from SYSCOLUMNS
SYSCONSTDEP	SYSTSCON	DSNCCX01 (N) DSNCCX02 (N)	Records dependencies on check constraints or user-defined defaults for a column
SYSCONTEXTAUTHIDS	SYSCONTX	DSNCDX01 (UC) DSNCDX02 (N)	Contains the authorization ID under which a trusted context can be used.
SYSCONTEXT	SYSCONTX	DSNCTX01 (UC) DSNCTX02 (U) DSNCTX03 (U) DSNCTX04 (N)	Contains one row for each trusted context.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSCONTROLS	SYSTSCTL	DSNCLX01 (U) DSNCLX02 (U) DSNCLX03 (N) DSNCLX04 (N) DSNCLX05 (N)	Contains one row for each row permission and column mask.
SYSCONTROLS_DESC	SYSTSCTD	DSNTRX02 (A)	Contains the LOB data for the DESCRIPTOR column of SYSIBM.SYSCONTROLS
SYSCONTROLS_RTXT	SYSTSCTR	DSNTRX01 (A)	Contains the LOB data for the RULETEXT column of SYSIBM.SYSCONTROLS.
SYSCOPY	SYSTSCPY	DSNUCH01 (N) DSNUCX01 (U)	Contains information that is needed for recovery
SYSCTXTTRUSTATTRS	SYSCONTX	DSNCAX01 (UC)	Contains the attributes for a given trusted context
SYSCTXTTRUSTATTR_H	SYSTSTAH		Not used.
SYSDATABASE	SYSTSDBA	DSNDDH01 (U) DSNDDX02 (N)	Contains one row for each database, except for database DSNDB01
SYSDATATYPES	SYSTSDAT	DSNODX01 (U) DSNODX02 (U)	Contains one row for each distinct data type
SYSDBAUTH	SYSTSDBU	DSNADH01 (N) DSNADX01 (N) DSNADH02 (N)	Records the privileges held by users over databases
SYSDBRM	SYSTSDBR	DSNDBX01 (N) DSNDBX02 (U)	Contains one row for each DBRM of each application plan
SYSDEPENDENCIES	SYSTSDEP	DSNONX01 (U) DSNONX02 (N)	Records the dependencies between objects
SYSDUMMY1	SYSEBCDC	—	Contains one row. This table is used by SQL statements that do not use any tables but must specify a table name.
SYSDUMMYA	SYSTSASC	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSTSASC is an ASCII table space.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSDUMMYE	SYSEBCDC	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSEBCDIC is an EBCDIC table space.
SYSDUMMYU	SYSTSUNI	—	Contains one row and is used for SQL statements in which a table reference is required, but the contents of the table are not important. SYSTSUNI is a UNICODE table space.
SYSENVIRONMENT	SYSTSENV	DSNOEX01 (U)	Records the environment variables when an object is created
SYSFIELDS	SYSTSFLD	DSNDFX01 (N)	Contains one row for every column that has a field procedure
SYSFOREIGNKEYS	SYSTSFOR	DSNDRH01 (N)	Contains one row for every column of every foreign key
SYSINDEXCLEANUP	SYSTSIXC	DSNICX01 (N)	Contains time window data to control index cleanup processing.
SYSINDEXES	SYSTSIXS	DSNDXX01 (U) DSNDXX02 (U) DSNDXX03 (U) DSNDXX04 (N) DSNDXX07	Contains one row for every index
SYSINDEXES_RTSECT	SYSTSIXR	DSNDXX06 (A)	Contains the LOB data for the RTSECTION column of SYSIBM.SYSINDEXES.
SYSINDEXES_TREE	SYSTSIXT	DSNDXX05 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSINDEXES.
SYSINDEXES_HIST	SYSHIST	DSNHHX01 (NC) DSNHHX02 (N)	Contains accumulated rows from SYSINDEXES
SYSINDEXPART	SYSTSIPT	DSNDRX01 (U) DSNDRX02 (N) DSNDRX03 (N)	Contains one row for each nonpartitioned index and one row for each partition of a partitioning index or DPSI
SYSINDEXPART_HIST	SYSHIST	DSNHGX01 (N)	Contains accumulated rows from SYSINDEXPART
SYSINDEXSPACESTATS	SYSTSISS	DSNRTX02 (U) DSNRTX03 (N)	Contains Real-time Statistics for index spaces.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSINDEXSTATS	SYSSTATS	DSNTXX01 (UC)	Contains one row for each partition of a partitioning index or data-partitioned secondary index (DPSI)
SYSINDEXSTATS_HIST	SYSHIST	DSNHIX01 (NC)	Contains accumulated rows from SYSINDEXSTATS
SYSJARCLASS_SOURCE	SYSJAUXB	DSNJSX01 (A)	Contains the source code for a Java stored procedure
SYSJARCONTENTS	SYSJAVA	DSNJCX01 (NC)	Records the classes for each JAR file for a Java stored procedure
SYSJARDATA	SYSJAUXA	DSNJDX01 (A)	Contains the contents of the JAR file for each Java stored procedure
SYSJAROBJECTS	SYSJAVA	DSNJOX01 (UC)	Records the contents of each JAR file for a Java stored procedure
SYSJAVAOPTS	SYSJAVA	DSNJVX01 (UC)	Records the build options for a Java stored procedure
SYSJAVAPATHS	SYSJAVA	DSNJPX01 (U) DSNJPX02 (N)	Contains the complete JAR class resolution path, and records the dependencies that one JAR has on the JARs in its Java path.
SYSKEYS	SYSTSKEY	DSNDKX01 (U) DSNDKX02 (N) DSNDKX03 (U)	Contains one row for each column of an index key
SYSKEYCOLUSE	SYSTSKYC	DSNCUX01 (N)	Contains a row for every column in a unique constraint (primary key or unique key)
SYSKEYTARGETS	SYSTARG	DSNRKX01 (UC) DSNRKX02 (N)	Contains one row for each key-target participating in an extended index definition
SYSKEYTARGETS_HIST	SYSHIST	DSNHKX01 (N)	Contains accumulated rows from SYSKEYTARGETS
SYSKEYTARGETSTATS	SYSSTATS	DSNTKX01 (U)	Contains partition statistics for selected key-targets
SYSKEYTGTDIST	SYSSTATS	DSNTDX01 (N)	Contains one or more rows for the first key-target of an extended index key
SYSKEYTGTDIST_HIST	SYSHIST	DSNTDX02 (N)	Contains accumulated rows from SYSKEYTGTDIST
SYSKEYTGTDISTSTATS	SYSSTATS	DSNTSX01 (N)	Contains zero or more rows per partition for the first key-target of a data-partitioned secondary index (DPSI)

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSLOBSTATS	SYSSTATS	DSNLNX01 (UC)	Contains one row for each LOB table space
SYSLOBSTATS_HIST	SYSHIST	DSNHJX01 (NC)	Contains accumulated rows from SYSLOBSTATS
SYSOBDS "1" on page 2127	SYSALTER	DSNDOB01 (N) DSNDOB02 (N)	Contains one row for each table space or index that can be recovered to an image copy that was made before the first version was generated. **Important:** Do not manipulate data in the SYSIBM.SYSOBDS catalog table, except at the direction of IBM Support.
SYSOBD_AUX "1" on page 2127	SYSTSOBX	DSNOB03 (A)	Contains the LOB data for the OBD_IMAGE column of SYSIBM.SYSOBDS.
SYSOBJROLEDEP	SYSROLES	DSNRDX01 (UC) DSNRDX02 (N)	Contains one row for each dependent role
SYSPACKAGE	SYSTSPKG	DSNKKX01 (U) DSNKKX02 (U)	Contains one row for each package
SYSPACKAUTH	SYSTSPKA	DSNKAX01 (N) DSNKAX02 (N) DSNKAX03 (N)	Contains the privileges that are held by users over packages
SYSPACKCOPY	SYSTSPKC	DSNPCX01 (UC)	
SYSPACKDEP	SYSTSPKD	DSNKDX01 (N) DSNKDX02 (N) DSNKDX03 (N)	Records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, and triggers
SYSPACKLIST	SYSTSPKL	DSNKLX01 (N) DSNKLX02 (U)	Contains one row for every package list entry for a plan
SYSPACKSTMT	SYSTSPKS	DSNKSX01 (UC)	Contains one row for every SQL statement that belongs to a package
SYSPACKSTMT_STMB	SYSTSPVR	DSNKSX02 (A)	Contains the LOB data for the STMTBLOB column of SYSIBM.SYSPACKSTMT.
SYSPACKSTMT_STMT	SYSTSPKX	DSNPKX01 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSPACKSTMT.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type"2" on page 2128)	Description
SYSPARMS	SYSTSPRM	DSNOPX01 (U) DSNOPX02 (N) DSNOPX03 (N) DSNOPX04 (N)	Contains a row for each parameter of a routine or a row for each column of a table that is passed as a parameter to a routine
SYSPENDINGDDL	SYSTSPEN	DSNPDX01 (N) DSNPDX02 (N)	Contains information about which objects have pending definition changes. The entries exist only during the window between when the pending option is run and when the utility materializes these pending options.
SYSPENDINGDDLTEXT	SYSTSPDT	DSNPDX03 (A)	Contains the LOB data for the STATEMENT_TEXT column of SYSIBM.SYSPENDINGDDL.
SYSPENDINGOBJECTS	SYSTSPDO	DSNPOX01 (N) DSNPOX02 (N) DSNPOX03 (N)	Contains name and OBID information about the pending-CREATE objects, whose data sets are created but object definitions have not been materialized to the real catalog.
SYSPKSYSTEM	SYSTSPKY	DSNKYX01 (N)	Contain one row of system information for each package
SYSPLAN	SYSTSPLN	DSNPPH01 (U)	Contains one row for each application plan
SYSPLANAUTH	SYSTSPLA	DSNAPH01 (N) DSNAPX01 (N) DSNAPX02 (N)	Records the privileges that are held by users over application plans
SYSPLANDEP	SYSTSPLD	DSNGGX01 (N) DSNGGX05 (N)	Records the dependencies of plans on tables, views, aliases, synonyms, table spaces, and indexes
SYSPLSYSTEM	SYSTSPLY	DSNKPX01 (N)	Contains one row of system information for each plan
SYSQUERY	SYSTSQRY	DSNQYX01 (N) DSNQYX02 (U) DSNQYX03 (N)	Contains a set of queries
SYSQUERY_AUX	SYSTSQRA	DSNQSX01 (A)	Contains the LOB data for the STMTTEXT column of SYSIBM.SYSQUERY
SYSQUERYOPTS	SYSTSQRO	DSNQPX01 (N)	Contains optimization parameters for the queries in SYSIBM.SYSQUERY.
SYSQUERYPLAN	SYSTSQRP	DSNQNX01 (N)	Contains the plan hint information for the queries in the SYSIBM.SYSQUERY table

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSQUERYPREDICATE	SYSTSQRE	DSNQEX01 (UC) DSNQEX02 (N)	Contains rows that describe the predicates within a query. Rows are added to this table by using the BIND QUERY command. Rows are removed from this table by using the FREE QUERY command.
SYSQUERYSEL	SYSTSQRS	—	Contains rows that describe the selectivity of predicates. Rows are added to this table by using the BIND QUERY command. Rows are removed from this table by using the FREE QUERY command.
SYSRELS	SYSTSREL	DSNDLX01 (N) DSNDLX02 (N) DSNDLX03 (N) DSNDLX04 (U)	Contains one row for every relationship
SYSRESAUTH	SYSGPAUT	DSNAGH01 (N) DSNAGX01 (N)	Records the privileges that are held by users over buffer pools, storage groups, table spaces, and collections
SYSROLES	SYSROLES	DSNRLX01 (UC)	Contains one row for each role
SYSROUTINES	SYSTSROU	DSNOFX01 (U) DSNOFX02 (U) DSNOFX03 (N) DSNOFX04 (U) DSNOFX05 (N) DSNOFX06 (N) DSNOFX07 (U) DSNOFX08 (N)	Contains a row for every routine
SYSROUTINESTEXT	SYSPLUXA	DSNPLX01 (A)	Contains LOB data for the column SYSIBM.SYSROUTINES.TEXT
SYSROUTINES_TREE	SYSPLUXB	DSNPLX02 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSROUTINES.
SYSROUTINEAUTH	SYSTSRAU	DSNOAX01 (N) DSNOAX02 (U) DSNOAX03 (N)	Records the privileges that users hold on routines
SYSROUTINES_OPTS	SYSGRTNS	DSNROX01 (UC)	Contains one row to record the build options for each generated routine
SYSROUTINES_SRC	SYSGRTNS	DSNRSX01 (N) DSNRSX02 (U)	Contains one or more rows for the source code for each generated routine

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type"2" on page 2128)	Description
SYSSCHEMAAUTH	SYSTSSCM	DSNSKX01 (N) DSNSKX02 (N)	Contains one or more rows for each grantee of a privilege on a schema
SYSSEQUENCEAUTH	SYSSEQ2	DSNWCX01 (N) DSNWCX02 (N) DSNWCX03 (N)	Records the privileges that users hold on sequences
SYSSEQUENCES	SYSSEQ	DSNSQX01 (U) DSNSQX02 (UD) DSNSQX03 (N)	Contains one row for each identity column or user-defined sequence.
SYSSEQUENCESDEP	SYSSEQ2	DSNSRX01 (N) DSNSRX02 (N)	Records the dependencies of identity columns on the corresponding entries in SYSIBM.SYSSEQUENCES
SYSSTATFEEDBACK	SYSTSSFB	DSNSFX01 (UC)	Contains one row for every missing or conflicting statistic that is identified during query optimization.
SYSSTMT	SYSTSSTM	DSNPSX01 (N) DSNPSX02 (N)	Contains one or more rows for each SQL statement of each DBRM
SYSSTOGROUP	SYSTSSTG	DSNSSH01 (U)	Contains one row for each storage group
SYSSTRINGS	SYSTSSRG	DSNSSX01 (U)	Contains information necessary to perform string translations
SYSSYNONYMS	SYSTSSYN	DSNDYX01 (U) DSNDYX02 (N)	Contains one row for each synonym of a table or view
SYSTABAUTH	SYSTSTAU	DSNATX01 (N) DSNATX02 (N) DSNATX03 (N) DSNATX04 (N) DSNATX05 (U)	Records the privileges that are held by users on tables, views, and triggers
SYSTABCONST	SYSTSTBC	DSNCNX01 (U) DSNCNX02 (N)	Contains one row for each unique constraint that was created in Db2 for z/OS DB2 Version 7 or later
SYSTABLES	SYSTSTAB	DSNDTX01 (U) DSNDTX02 (N) DSNDTX03 (N) DSNDTX05	Contains one row for each table, view, and alias
SYSTABLES_HIST	SYSHIST	DSNHDX01 (N)	Contains accumulated rows from SYSTABLES

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type"2" on page 2128)	Description
SYSTABLES_PROFILES	SYSTSTPF	DSNPRX01 (UC)	Contains a row for each profile that is associated with a table in SYSIBM.SYSTABLES
SYSTABLES_PROFILE_TEXT	SYSTSPTX	DSNPRX02 (UC)	Contains the LOB data for the PROFILE_TEXT column of SYSIBM.SYSTABLES_PROFILES
SYSTABLEPART	SYSTSTPT	DSNDPX01 (U) DSNDPX02 (N) DSNDPX03 (N) DSNDPX04 (N) DSNDPX05 (N)	Contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space
SYSTABLEPART_HIST	SYSHIST	DSNHCX01 (N)	Contains accumulated rows from SYSTABLEPART
SYSTABLESPACE	SYSTSTSP	DSNDSX01 (U)	Contains one row for each table space
SYSTABLESPACESTATS	SYSTSTSS	DSNRTX01 (U)	Contains Real Time Statistics for table spaces.
SYSTABSTATS	SYSSTATS	DSNTTX01 (U) DSNTTX02 (N)	Contains one row for each partition of a partitioned table space and no rows for nonpartitioned table spaces
SYSTABSTATS_HIST	SYSHIST	DSNHBX01 (NC)	Contains accumulated rows from SYSTABSTATS
SYSTRIGGERS	SYSTSTRG	DSNOTX01 (UC) DSNOTX02 (N) DSNOTX03 (N)	Contains one row for each trigger
SYSTRIGGERS_STMT	SYSTSTRT	DSNOTX04 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSTRIGGERS
SYSUSERAUTH	SYSUSER	DSNAUH01 (N) DSNAUX02 (N)	Records the system privileges that are held by users
SYSVARIABLEAUTH	SYSTSVAU	DSNVAX01 (N) DSNVAX02 (N) DSNVAX03 (N)	Contains one row for each authorization ID that has privileges for each global variable.
SYSVARIABLES	SYSTSVAR	DSNOVX01 (U)	Contains one row for each global variable that has been created.
SYSVARIABLES_DESC	SYSTSVAD	DSNOVX03 (A)	Contains the LOB data for the DESCRIPTOR column of SYSIBM.SYSVARIABLES.

Table 248. Db2 catalog tables. The qualifier for all catalog table names is SYSIBM. *(continued)*

Table	Table space	Indexes (Type "2" on page 2128)	Description
SYSVARIABLES_TEXT	SYSTSVAT	DSNOVX02 (A)	Contains the LOB data for the DEFAULTTEXT column of SYSIBM.SYSVARIABLES.
SYSVIEWS	SYSTSVEW	DSNVVX01 (U)	Contains one or more rows for each view
SYSVIEWS_STMT	SYSTSVWT	DSNVWX01 (A)	Contains the LOB data for the STATEMENT column of SYSIBM.SYSVIEWS
SYSVIEWS_TREE	SYSTSVTR	DSNVWX02 (A)	Contains the LOB data for the PARSETREE column of SYSIBM.SYSVIEWS
SYSVIEWDEP	SYSTSVWD	DSNGGX02 (N) DSNGGX03 (N) DSNGGX04 (N) DSNGGX06	Records the dependencies of views on tables and other views
SYSVOLUMES	SYSTSVOL	DSNSSH02 (N)	Contains one row for each volume of each storage group
SYSXMLRELS	SYSXML	DSNXRX01 (N) DSNXRX02 (N)	Contains one row for each XML table that is created for an XML column
SYSXMLSTRINGS	SYSXML	DSNXSX01 (UC) DSNXSX02 (U)	Each row holds a single string and its unique ID. They are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a name space URI.
SYSXMLTYPMOD	SYSTSXTM	DSNTMX01 (U)	Contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated, and deleted.
SYSXMLTYPMSCHEMA	SYSTSXTS	DSNMSX01 (U) DSNMSX02 (N)	Contain rows about XML schemas for the XML type modifiers that are stored in SYSXMLTYPMOD. Each row contains one XML schema specification for one XML type modifier. Rows in this table can be inserted, updated, and deleted.
USERNAMES	SYSDDF	DSNFEX01 (U)	Contains a row for each authorization ID to be translated or checked as it is sent to or from this Db2

Notes:

1. The descriptions of the SYSIBM.SYSOBDS and SYSIBM.SYSOBD_AUX catalog tables are available only to users who work in enterprises with a Db2 11 license. For more information see Obtaining Db2 Diagnosis Guide and Reference ().

2. The following index types are indicated:

   A
   Auxiliary

   N
   Nonunique

   U
   Unique

   UC
   Unique clustering

   UD
   Unique descending

Related concepts

Reorganizing the catalog
The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

Related reference

SQL statements allowed on the catalog
Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

IPLIST catalog table

The IPLIST table allows multiple IP addresses to be specified for a given LOCATION. The schema is SYSIBM.

Insert rows into this table when you want to define a remote Db2 data sharing group. The same value for the IPADDR column cannot appear in both the IPNAMES table and the IPLIST table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	This column is associated with the value specified in the LINKNAME column in the SYSIBM.LOCATIONS table and the SYSIBM.IPNAMES table. The values of the other columns in the SYSIBM.IPNAMES table apply to the server identified by the LINKNAME column in this row.	G

Column name	Data type	Description	Use
IPADDR	VARCHAR(254) NOT NULL	This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host of the server. If WLM Domain Name Server workload balancing is used, this column must contain the member specific domain name. If Dynamic VIPA workload balancing is used, this column must contain the member specific Dynamic VIPA address. The IPADDR column must be specified as follows: • An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.912' would be interpreted as an IPv4 address. • An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. • A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

IPNAMES catalog table

The IPNAMES catalog table defines the remote DRDA servers Db2 can access using TCP/IP. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value specified in this column must match the value specified in the LINKNAME column of the associated row in SYSIBM.LOCATIONS.	G

Column name	Data type	Description	Use
SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the DRDA security option that is used when local Db2 SQL applications connect to any remote server associated with this TCP/IP host: **A** The option is "already verified". Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. The authorization ID is not encrypted when it is sent to the partner. For encryption, refer to 'D'. **D** The option is "userid and security-sensitive data encryption". Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. This option indicates that the user ID and security-sensitive data are to be encrypted. Security-sensitive data is any input or output data. Examples are rows that are retrieved from a remote server, rows that are sent to the remote server, and SQL statement text. For non-encryption, refer to 'A'. **E** The option is "userid, password, and security-sensitive data encryption". Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify 'O'. This option indicates that the user ID, password, and security-sensitive data are to be encrypted. Security-sensitive data is any input or output data. Examples are rows that are retrieved from a remote server, rows that are sent to the remote server, and SQL statement text. If security-sensitive data is not to be encrypted, refer to 'P'. If the applications connect to any remote server as trusted, the USERNAMES column must specify 'O' or 'S'.	G

Column name	Data type	Description	Use
SECURITY_OUT (continued)		**P** The option is "password". Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table. The USERNAMES column must specify 'O'. This option indicates that the user ID and the password are to be encrypted if cryptographic services are available at the requester and if the server supports encryption. Otherwise, the user ID and the password are sent to the partner in clear text. For security-sensitive data encryption, see 'E'. If the applications connect to any remote server as trusted, the USERNAMES column must specify 'O' or 'S'. **R** The option is "RACF PassTicket". Outbound connection requests contain a user ID and a RACF PassTicket. The value specified in the LINKNAME column is used as the RACF PassTicket application name for the remote server. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. The authorization ID is not encrypted when it is sent to the partner.	
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls outbound authorization ID translation. Outbound translation is performed when an authorization ID is sent by Db2 to a remote server. **O** An outbound ID is subject to translation. Rows in the SYSIBM.USERNAMES table are used to perform ID translation. No translation or "come from" checking is performed on inbound IDs. **S** Row in the SYSIBM.USERNAMES table is used to obtain the system AUTHID used to establish a trusted connection. **blank** No translation occurs.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
IPADDR	VARCHAR(254) NOT NULL WITH DEFAULT	This column contains an IPv4 or IPv6 address, or domain name of a remote TCP/IP host. The IPADDR column must be specified as follows: • An IPv4 address must be left justified and is represented as a dotted decimal address. For example, '123.456.78.91' would be interpreted as an IPv4 address. • An IPv6 address must be left justified and is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in compressed form as '2001:DB8::8:800:200C:417A'. • A domain name is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. An example of a domain name is 'stlmvs1.svl.ibm.com'.	G

LOCATIONS catalog table

The LOCATIONS catalog table contains a row for every accessible remote server. The schema is SYSIBM. The row associates a LOCATION name with the TCP/IP or SNA network attributes for the remote server. Requesters are not defined in this table.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	A unique location name for the accessible server. This is the name by which the remote server is known to local Db2 SQL applications.	G
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM or TCP/IP attributes associated with this location. For any LINKNAME specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the VTAM communication attributes for the remote location. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. This row specifies the TCP/IP communication attributes for the remote location. For accelerators that are defined with an alias (logical name), specify a LINKNAME value of DSNACCELERATORALIAS.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
PORT	VARCHAR(96) NOT NULL WITH DEFAULT	TCP/IP is used for outbound DRDA connections when the following statement is true: • A row exists in SYSIBM.IPNAMES, where the LINKNAME column matches the value specified in the SYSIBM.LOCATIONS LINKNAME column. If the above mentioned row is found, the value of the PORT column is interpreted as follows: • If PORT is blank, the default DRDA port (446) is used. • If PORT is nonblank, the value specified for PORT can take one of two forms: – If the value in PORT is left justified with 1-5 numeric characters, the value is assumed to be the TCP/IP port number of the remote database server. – Any other value is assumed to be a TCP/IP service name, which can be converted to a TCP/IP port number using the TCP/IP `getservbyname` socket call. TCP/IP service names are not case sensitive.	G
TPN	VARCHAR(192) NOT NULL WITH DEFAULT	Used only when the local Db2 begins an SNA conversation with another server. When used, TPN indicates the SNA LU 6.2 transaction program name (TPN) that will allocate the conversation. A length of zero for the column indicates the default TPN. For DRDA conversations, this is the DRDA default, which is X'07F6C4C2'. For Db2 private protocol conversations, this column is not used. When the server is Db2 Server for VSE & VM, TPN should contain the resource ID of that machine.	G
DBALIAS	VARCHAR(128) NOT NULL	Database alias. The name associated with the server. This name is used to access a remote database server. If DBALIAS is blank, the location name is used to access the remote database server. This column does not change the name of any database objects sent to the remote site that contains the location qualifier. This column applies only to DRDA connections. For information about accelerators that are defined with an alias, see Using an alias for an accelerator (Db2 Performance).	G
TRUSTED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the connection to the remote server can be trusted. This is restricted to TCP/IP only. This column is ignored for connections using SNA. **Y** Location is trusted. Access to the remote location requires trusted context defined at the remote location. **N** Location is not trusted.	G

Column name	Data type	Description	Use
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates the use of the Secure Socket Layer (SSL) protocol for outbound DRDA connections when local Db2 applications connects to the remote database server using TCP/IP. **Y** Indicates a secure connection using SSL is required for the outbound DRDA connection. **N** Indicates a secure connection is not required for the outbound DRDA connection.	G

SYSIBM.LULIST catalog table

The LULIST catalog table allows multiple LU names to be specified for a given LOCATION. The schema is SYSIBM.

Insert rows into this table when you want to define a remote Db2 data sharing group. The same value for LUNAME column cannot appear in both the SYSIBM.LUNAMES table and the SYSIBM.LULIST table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LINKNAME	VARCHAR(24) NOT NULL	The value of the LINKNAME column in the SYSIBM.LOCATIONS table with which this row is associated. This is also the value of the LUNAME column in the SYSIBM.LUNAMES table. The values of the other columns in the SYSIBM.LUNAMES row apply to the LU identified by the LUNAME column in this row of SYSIBM.LULIST.	G
LUNAME	VARCHAR(24) NOT NULL	The VTAM logical unit name (LUNAME) of the remote database system. This LUNAME must not exist in the LUNAME column of SYSIBM.LUNAMES.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

LUMODES catalog table

Each row of the LUMODES table provides VTAM with conversation limits for a specific combination of LUNAME and MODENAME. The schema is SYSIBM. The table is accessed only during the initial conversation limit negotiation between Db2 and a remote LU. This negotiation is called *change-number-of-sessions* (CNOS) processing.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	LU name of the server involved in the CNOS processing.	G
MODENAME	VARCHAR(24) NOT NULL	Name of a logon mode description in the VTAM logon mode table.	G

Column name	Data type	Description	Use
CONVLIMIT	SMALLINT NOT NULL	Maximum number of active conversations between the local Db2 and the other system for this mode. Used to override the number in the DSESLIM parameter of the VTAM APPL definition statement for this mode.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

LUNAMES catalog table

The LUNAMES table must contain a row for each remote SNA client or server that communicates with Db2. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
LUNAME	VARCHAR(24) NOT NULL	Name of the LU for one or more accessible systems. A blank string indicates the row applies to clients whose LU name is not specifically defined in this table. All other column values for a given row in this table are for clients and servers associated with the row's LU name.	G
SYSMODENAME	VARCHAR(24) NOT NULL WITH DEFAULT	Mode used to establish inter-system conversations. A blank indicates the default mode IBMDB2LM (Db2 private protocol access and for collecting sysplex balancing information from remote data sharing groups). If private protocols are used to access a remote Db2 LU or if the remote LU is a member of a Db2 data sharing group, use a separate mode other than the default mode.	G

Column name	Data type	Description	Use
SECURITY_IN	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security options that are accepted by this Db2 when an SNA client connects to Db2: **V** The option is "verify". An incoming connection request must include one of the following: a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. **A** The option is "already verified". A request does not need a password, although a password is checked if it is sent. With this option, an incoming connection request is accepted if it includes any of the following: a userid, a userid and password, a userid and RACF PassTicket, or a Kerberos security ticket. If the USERNAMES column contains 'I' or 'B', RACF is not invoked to validate incoming connection requests that contain only a userid unless one of the following situations is true: • The RACF access control authorization exit (DSNX@XAC) is enabled • The IBM supplied RACF SECLABEL resource class is active.	G

Column name	Data type	Description	Use
SECURITY_OUT	CHAR(1) NOT NULL WITH DEFAULT 'A'	This column defines the security option that is used when local Db2 SQL applications connect to any remote server associated with this LUNAME: **A** The option is "already verified". Outbound connection requests contain an authorization ID and no password. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. **R** The option is "RACF PassTicket". Outbound connection requests contain a userid and a RACF PassTicket. The server's LU name is used as the RACF PassTicket application name. The authorization ID used for an outbound request is either the Db2 user's authorization ID or a translated ID, depending upon the value of the USERNAMES column. **P** The option is "password". Outbound connection requests contain an authorization ID and a password. The password is obtained from the SYSIBM.USERNAMES table or RACF, depending upon the value specified in the ENCRYPTPSWDS column. The USERNAMES column must specify 'B' or 'O'.	G
ENCRYPTPSWDS	CHAR(1) NOT NULL WITH DEFAULT 'N'	This column only applies to Db2 for z/OS partners. It is provided to support connectivity to prior releases of Db2 that are unable to support RACF PassTickets. For connections between Version 5 and later, use the SECURITY_OUT='R' option instead of the ENCRYPTPSWDS='Y' option. **N** No, passwords are not in internal RACF encrypted format. This is the default. **Y** Yes for outbound requests, the encrypted password is extracted from RACF and sent to the server. For inbound requests, the password is treated as encrypted.	G
MODESELECT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether to use the SYBIBM.MODESELECT table: **N** Use default modes: IBMDB2LM (for Db2 private protocol) and IBMRDB (for DRDA). **Y** Searches SYSIBM.MODESELECT for appropriate mode name.	G

Column name	Data type	Description	Use
USERNAMES	CHAR(1) NOT NULL WITH DEFAULT	This column controls inbound and outbound authorization ID translation, and "come from" checking. Inbound translation and "come from" checking are performed when an authorization ID is received from a remote client. Outbound translation is performed when an authorization ID is sent by Db2 to a remote server. When 'I', 'O', or 'B' is specified in this column, rows in the SYSIBM.USERNAMES table are used to perform ID translation. **I** An inbound ID is subject to translation and "come from" checking. No translation is performed on outbound IDs. **O** No translation or "come from" checking is performed on inbound IDs. An outbound ID is subject to translation. **B** An inbound ID is subject to translation and "come from" checking. An outbound ID is subject to translation. **blank** No translation occurs.	G
GENERIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether Db2 should use its real LU name or generic LU name to identify itself to the partner LU, which is identified by this row. **N** The real VTAM LU name of this Db2 subsystem **Y** The VTAM generic LU name of this Db2 subsystem	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

MODESELECT catalog table

The MODESELECT catalog table associates a mode name with any conversation created to support an outgoing SQL request. The schema is SYSIBM. Each row represents one or more combinations of LUNAME, authorization ID, and application plan name.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all authorization IDs.	G
PLANNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Plan name associated with the SQL request. Blank (the default) indicates that the MODENAME specified for the row is to apply to all plan names.	G
LUNAME	VARCHAR(24) NOT NULL	LU name associated with the SQL request.	G
MODENAME	VARCHAR(24) NOT NULL	Name of the logon mode in the VTAM logon mode table to be used in support of the outgoing SQL request. If blank, IBMDB2LM is used for Db2 private protocol connections and IBMRDB is used for DRDA connections.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSAUDITPOLICIES catalog table

The SYSAUDITPOLICIES table contains one row for each audit policy. The schema is SYSIBM.

A user with SECADM authority has the privilege to select from, insert, update, or delete from this catalog table. A user with SQLADM, system DBADM, DATAACCESS, ACCESSCTRL, SYSCTRL or SYSADM authority has the privilege to select from this catalog table.

If a view is created on this catalog table, the DATAACCESS authority can perform insert, update, and delete on the view to indirectly insert, update, and delete on the catalog table.

Column name	Data type	Description	Use
AUDITPOLICYNAME	VARCHAR(128) NOT NULL	Name of the audit policy. The name must be an identifier of 1 to 128 characters and must begin with a letter. Any other values result in an error being returned when audit policy is started.	G
OBJECTSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of the audited object. The object schema only applies to categories, OBJMAINT and EXECUTE.	G
OBJECTNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the object. The object name only applies to categories, OBJMAINT and EXECUTE. Object name can be specified using an SQL LIKE predicate. If the object name is specified using an SQL LIKE predicate, it has to be specified as a delimited identifier. The escape character to be used for the SQL LIKE predicate is obtained from RGFESCP subsystem parameter. If not specified, the default escape character is '+'.	G

Column name	Data type	Description	Use
OBJECTTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of the object. **C** Clone table **P** Implicit table created for XML columns **T** Table **blank** All of the above object types **All other values** Error when audit policy is started The object type only applies to categories, OBJMAINT and EXECUTE	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was inserted.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the row was last updated.	G
CHECKING	CHAR(1) NOT NULL WITH DEFAULT	Indicates if authorization and authentication failures are audited: **A** Audit all failures (Authorization and authentication failures) **blank** Audit none **All other values** Error when audit policy is started	G
VALIDATE	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when a trusted connection is established or used by a different user: **A** Audit all **blank** Audit none **All other values** Error when audit policy is started	G

Column name	Data type	Description	Use
OBJMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when the table that is identified by OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns is altered or dropped: **A** Audit when the specified table is altered or dropped **blank** Audit none **All other values** Error when audit policy is started	G
EXECUTE	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when the table identified that is by the OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE columns is accessed during the first operation performed by each unit of work. Also, records bind time information about SQL statements that involve tables that are identified by the OBJECTSCHEMA, OBJECTNAME, and OBJECTTYPE. **A** Audit when the specified table is accessed during the first operation of any kind performed by each unit of work of a utility or application process. **C** Audit when the specified table is accessed during the first insert, update, or delete operation performed by each unit of work. **blank** Audit none **All other values** Error when audit policy is started	G
CONTEXT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for the start of a utility, a change to a utility object or phase, and the end of utility: **A** Audit all utilities **blank** Audit none **All other values** Error when audit policy is started	G
SECMAINT	CHAR(1) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when a grant or revoke is made or a trusted context is created or altered: **A** Audit all **blank** Audit none **All other values** Error when audit policy is started	G

Column name	Data type	Description	Use
SYSADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform system administration tasks: **blank** Audit none ***** Audit all the authorities **I** Installation SYSADM **L** SYSCTRL **O** SYSOPR **R** Installation SYSOPR **S** SYSADM **All other values** Error when audit policy is started The value of SYSADMIN can be a concatenated string of all supported values. For example, 'LOS' would indicate auditing of any operation that is performed using the administrative authorities: SYSCTRL, SYSOPR, and SYSADM. Multiple occurrences of a value are ignored.	G

Column name	Data type	Description	Use
DBADMIN	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates if auditing is enabled for when an operation is performed using an administrative authority to perform database administration tasks: **blank** Audit none ***** Audit all the authorities **B** System DBADM **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **M** DBMAINT **P** PACKADM **T** DATAACCESS **All other values** Error when audit policy is started The value of DBADMIN can be a concatenated string of all supported values. For example, 'BMP' would indicate auditing of any operation that is performed using the administrative authorities: System DBADM, DBMAINT, and PACKADM. Multiple occurrences of a value are ignored.	G
DBNAME	VARCHAR(24) NOT NULL WITH DEFAULT	Database name. The database name can be used to specify the database for auditing DBADM, DBCTRL, and DBMAINT authorities. If the database name is not specified, then all the databases, including implicit databases are audited. If the database name is specified, it only applies to DBADM, DBCTRL, and DBMAINT authorities in category, DBADMIN.	G
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	Name of the package collection. The package collection can be used to specify the collection name for auditing PACKADM authority. If specified, all packages in that collection are audited. If the collection name is not specified, packages in all collections are audited. If the package collection is specified, it only applies to PACKADM authority in category, DBADMIN.	G

Column name	Data type	Description	Use
DB2START	CHAR(1) NOT NULL WITH DEFAULT	Indicates if audit policies are to be started automatically during Db2 start up. Up to 8 audit policies can be specified. **Y** Audit policy will be started automatically during Db2 startup. **S** Audit policy will be started automatically during Db2 startup. The audit policy can be stopped only by a user with SECADM authority. **N** Audit policy will not be started automatically during Db2 startup.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSAUTOALERTS catalog table

The SYSAUTOALERTS table contains one row for each recommendation from autonomic procedures. The schema is SYSIBM.

Column name	Data type	Description	Use
ALERT_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the alert described in this row.	G
HISTORY_ENTRY_ID	BIGINT NOT NULL	The ID of the entry in the ADMIN_UTLPROCEDURES_HIST procedure that produced this alert.	G
ACTION	VARCHAR(32) NOT NULL	The type of action requested by this alert.	G
TARGET_QUALIFIER	VARCHAR(128) NOT NULL	The qualifier name of the Db2 object (the database name) to which this alert applies.	G
TARGET_OBJECT	VARCHAR(128) NOT NULL	The name of the Db2 object (the table space name) to which this alert applies.	G
TARGET_PARTITION	SMALLINT NOT NULL	The partition number of the Db2 object to which this alert applies. Zero, if this alert applies to all partitions or if the object is not partitioned.	G

Column name	Data type	Description	Use
OPTIONS	VARCHAR(4000)	The options that should be specified when the corresponding action is run: **USE PROFILE** Use the options specified in the profile **TABLE** Options only apply for this table **COLUMNS** Options only apply for these columns **SAMPLE** The table space is too big and sampling is allowed	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the alert was issued.	G
DURATION	INTEGER	An estimate of the time, in seconds, that would be needed to run the corresponding action. If this column contains NULL, the execution plan might overwrite the time window.	G
STATUS	VARCHAR(32)	The status of the actual planned task. Valid values are: **OPEN** The alert is not yet resolved **INPROGRESS** The alert execution is in progress **COMPLETED** The alert execution is complete	G
STARTTS	TIMESTAMP	The timestamp for when the alert execution started. This column contains NULL if the task execution has not yet started.	G
ENDTS	TIMESTAMP	The timestamp for when the alert execution ended. This column contains NULL if the task execution has not yet ended.	G
RETURN_CODE	INTEGER	The return code that is written directly by the autonomic stored procedure that resolved the alert. This column contains NULL if the alert is not yet resolved, if the autonomic stored procedure failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the alert was not resolved successfully. This column contains NULL if the alert is not yet resolved, or if the autonomic stored procedure that executes the alert does not write any error message. No ERROR_MESSAGE text is expected in case of a successful execution.	G

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output that is written directly by the autonomic stored procedure that executes the planned task. This column contains NULL if the task is not yet executed, if the execution failed, or if the autonomic stored procedure does not write any output.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the CLOB column of this table.	G

SYSAUTOALERTS_OUT catalog table

The SYSAUTOALERTS_OUT catalog table is an auxiliary table for the OUTPUT column of the SYSAUTOALERTS catalog table. The schema is SYSIBM.

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSAUTORUNS_HIST catalog table

The SYSAUTORUNS_HIST table contains one row for each time an autonomic procedures has been run. The schema is SYSIBM.

Column name	Data type	Description	Use
HISTORY_ENTRY_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the entry in the history table.	G
PROC_NAME	VARCHAR(128) NOT NULL	The name of the autonomic stored procedure that produced this entry.	G
STARTTS	TIMESTAMP	The timestamp when the autonomic stored procedure started.	G
ENDTS	TIMESTAMP	The timestamp when the autonomic stored procedure ended.	G
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G
ERROR_MESSAGE	VARCHAR(1331)	An error message that indicates why the autonomic stored procedure was not successful. No ERROR_MESSAGE text is expected in case of a successful execution.	G
RETURN_CODE	INTEGER	The return code written directly by the autonomic stored procedure. This column contains NULL if the autonomic stored procedure execution failed, or if the autonomic stored procedure does not write any return code. A RETURN_CODE of 0 is expected in case of a successful execution.	G

Column name	Data type	Description	Use
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the OUTPUT column of this table.	G

SYSAUTORUNS_HISTOU catalog table

The SYSAUTORUNS_HISTOU catalog table is an auxiliary table for the OUTPUT column of the SYSIBM.SYSAUTORUNS_HIST table. The schema is SYSIBM.

Column name	Data type	Description	Use
OUTPUT	CLOB(2M)	The output of the autonomic stored procedure.	G

SYSAUTOTIMEWINDOWS catalog table

The SYSAUTOTIMEWINDOWS table contains one row for each time period during which autonomic procedures can be run. The schema is SYSIBM.

Column name	Data type	Description	Use
WINDOW_ID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The ID of the time window described in this row.	G
DB2_SSID	CHAR(4)	The Db2 member name on which the planned tasks have to be run. If this column contains NULL, the tasks in this time window can be run on any Db2 member.	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates how the value of the DAY column is interpreted: **M** The value of the DAY column is interpreted as a day of the month **W** The value of the DAY column is interpreted as a day of the week	G
MONTH	INTEGER	Month in which the time window applies. The value will be from 1 (January) to 12 (December). If this column contains NULL, the time window applies to all months. If MONTH_WEEK is 'W', this column must be NULL.	G
DAY	INTEGER	Day of the month or day of the week for which the time window applies. If this column contains NULL, the time window applies to every day of the month or to every day of the week (depending on the value of the MONTH_WEEK column).	G

Column name	Data type	Description	Use
FROM_TIME	TIME	The time of day at which the time window begins. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the TO_TIME column contains NULL.	G
TO_TIME	TIME	The time of day at which the time window ends. If this column contains NULL, no limitation on the time exists. This column will contain NULL if the FROM_TIME column contains NULL.	G
ACTION	VARCHAR(256)	The comma-separated list of actions that are allowed during this time window. If this column contains NULL, all actions are allowed.	G
MAX_TASKS	INTEGER	The number of concurrent actions that are allowed during this time window. If this column contains NULL, any number of actions are allowed concurrently.	G

SYSAUXRELS catalog table

The SYSAUXRELS table contains one row for each auxiliary table created for a LOB column. A base table space that is partitioned must have one auxiliary table for each partition of each LOB column. The schema is SYSIBM.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the LOB column in the base table.	G
PARTITION	SMALLINT NOT NULL	Partition number if the base table space is partitioned. Otherwise, the value is 0.	G
AUXTBOWNER	VARCHAR(128) NOT NULL	The schema of the auxiliary table.	G
AUXTBNAME	VARCHAR(128) NOT NULL	Name of the auxiliary table.	G
AUXRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the auxiliary table.	S

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSCHECKDEP catalog table

The SYSCHECKDEP table contains one row for each reference to a column in a check constraint. The schema is SYSIBM.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Name of the check constraint.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column that the check constraint refers to.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSCHECKS catalog table

The SYSIBM.SYSCHECKS table contains one row for each check constraint. The schema is SYSIBM.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the check constraint.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database for the check constraint.	S
OBID	SMALLINT NOT NULL	Internal identifier of the check constraint.	S

Column name	Data type	Description	Use
TIMESTAMP	TIMESTAMP NOT NULL	Time when the check constraint was created.	G
RBA	CHAR(10) NOT NULL FOR BIT DATA	The log RBA when the check constraint was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G
CHECKCONDITION	VARCHAR(7400) NOT NULL	Text of the check constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	The type of period associated with the check constraint: **B** BUSINESS_TIME check constraint **S** SYSTEM_TIME check constraint **blank** Not applicable	G

SYSCHECKS2 catalog table

The SYSCHECKS2 table contains one row for each check constraint for catalog tables created in or after Version 7. The schema is SYSIBM. Check constraints for catalog tables created before Version 7 are not included in this table.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table on which the check constraint is defined.	G

Column name	Data type	Description	Use
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the check constraint is defined.	G
CHECKNAME	VARCHAR(128) NOT NULL	Check constraint name.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL	SQL path at the time the check constraint was created. The path is used to resolve unqualified cast function names that are used in the constraint definition.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSCOLAUTH catalog table

The SYSCOLAUTH table records the UPDATE or REFERENCES privileges that are held by users on individual columns of a table or view. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privilege or the name of an application plan or package that uses the privilege. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or a package. The grantee is a package if COLLID is not blank.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table or view on which the update privilege is held.	G
TNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
—	CHAR(12) NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
COLNAME	VARCHAR(128) NOT NULL	Name of the column to which the UPDATE privilege applies.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S
PRIVILEGE	CHAR(1) NOT NULL WITH DEFAULT	Indicates which privilege this row describes: **R** Row pertains to the REFERENCES privilege. **blank** Row pertains to the UPDATE privilege.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **L** Role **blank** Authorization ID that is not a role	G

SYSCOLDIST catalog table

The SYSCOLDIST catalog table contains one or more rows for the cardinality, frequency, and histogram statistics for a single column or a column group. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
FREQUENCY	SMALLINT NOT NULL	Not used.	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram Statistics **N** Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S

Column name	Data type	Description	Use
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls at the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSCOLDISTSTATS catalog table

The SYSCOLDISTSTATS catalog table contains zero or more rows per partition for the cardinality, frequency, and histogram statistics for a single column or a column group. The schema is SYSIBM.

No row is inserted if the index is a non-partitioned index. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
FREQUENCY	SMALLINT NOT NULL	Not used.	N

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram statistics **N** Non-padded frequent value	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	If TYPE is C, the value is the number of distinct values for the column group. If TYPE is N or TYPE is F, the value is the number of rows or keys in the partition for which the FREQUENCYF value applies. If TYPE is H, the number of distinct values for the column group in a quantile indicated by QUANTILENO.	S

Column name	Data type	Description	Use
COLGROUPCOLNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS. This is an updatable column.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column.	G
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSCOLDIST_HIST catalog table

The SYSCOLDIST_HIST catalog table contains rows from the SYSCOLDIST catalog table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
TBOWNER	VARCHAR(128) NOT NULL	The schema of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column. If NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.	G
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics gathered: **C** Cardinality **F** Frequent value **H** Histogram Statistics **N** Non-padded frequent value	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	When TYPE='C', this is the number of distinct values for the column group. When TYPE='H', this is he number of distinct values for the column group in a quantile indicated by QUANTILENO. The value is -1 if statistics have not been gathered.	S
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	Identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.	S
NUMCOLUMNS	SMALLINT NOT NULL WITH DEFAULT 1	Identifies the number of columns associated with the statistics.	G

Column name	Data type	Description	Use
FREQUENCYF	FLOAT(8) NOT NULL DEFAULT -1	Gives the percentage of rows in the table with the value specified in COLVALUE when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%. When TYPE='H', this is the percentage of rows in table which falls in the quantile indicated by QUANTILENO whose range is limited by [LOWVALUE, HIGHVALUE]. Statistics are not collected for an index on a ROWID column. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	Ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by QUANTILENO. Not used if TYPE is not 'H'. This column is not updatable.	G

SYSCOLSTATS catalog table

The SYSCOLSTATS table contains partition statistics for selected columns. The schema is SYSIBM. For each column, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects either indexed column statistics or non-indexed column statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
HIGHKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S

Column name	Data type	Description	Use
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOWKEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column within the partition. Blank if statistics have not been gathered or the column is an indicator column, a node ID column, or a column of an XML table. If the column has a non-character data type, the data might not be printable. If the partition is empty, the value is a string of length 0.	S
COLCARD	INTEGER NOT NULL	Number of distinct column values in the partition.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number for the table space that contains the table in which the column is defined.	G
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G

Column name	Data type	Description	Use
—	VARCHAR(1000) NOT NULL FOR BIT DATA	Internal use only.	I
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G

SYSCOLUMNS catalog table

The SYSCOLUMNS table contains one row for every column of each table and view. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view which contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view; for example 4 (out of 10).	G

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **LONGVAR** Varying-length character string (for columns that were added before Version 9) **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string **LONGVARG** Varying-length graphic string (for columns that were added before Version 9) **DATE** Date **TIME** Time **TIMESTMP** Timestamp **TIMESTZ** Timestamp with time zone **BLOB** Binary large object **CLOB** Character large object **DBCLOB** Double-byte character large object **ROWID** Row ID data type **DISTINCT** Distinct type **XML** XML data type **BIGINT** Big integer **BINARY** Fixed-length binary string **VARBIN** Varying-length binary string, or a Db2 11 VARCHAR or VARGRAPHIC Unicode column in an EBCDIC table. **DECFLOAT**	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. **INTEGER** 4 **SMALLINT** 2 **BIGINT** 8 **FLOAT** 4 or 8 **CHAR** Length of string **VARCHAR** Maximum length of string **LONGVAR** Maximum length of string (for columns that were added before Version 9) **DECIMAL** Precision of number **DECFLOAT** 8 or 16 **GRAPHIC** Number of DBCS characters **VARGRAPHIC** Maximum number of DBCS characters. For a Db2 11 VARGRAPHIC Unicode column in an EBCDIC table, this value is the maximum number of bytes. **LONGVARG** Maximum number of DBCS characters (for columns that were added before Version 9) **BINARY** Length of string **VARBINARY** Maximum length of string **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((*p*+1)/2) + 7 where *p* is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((*p*+1)/2) + 9 where *p* is the precision of the timestamp	G

Column name	Data type	Description	Use
LENGTH (continued)	SMALLINT NOT NULL	**LOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **INLINE LOB** Greater than 4 - For a table, a field of length 4 plus the inline length (in byte) is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **BLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **CLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the CLOB column is found in LENGTH2. **DBCLOB** 4 - For a table, a field of length of 4 is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. **ROWID** 17 - The maximum length of the stored portion of the identifier. **XML** 6 - If column cannot contain multiple versions of an XML document. 14 - If column can contain multiple versions of an XML document. **Related information:** See XML versions (Db2 Programming for XML). **DISTINCT** The length of the source data type.	G
SCALE	SMALLINT NOT NULL	If the column type is DECIMAL, this value represents the scale. If the column type is timestamp or timestamp with time zone, this value represents the number of fractional second digits. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G

Column name	Data type	Description	Use
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: **N** No **Y** Yes The value can be N for a view column that is derived from an expression that is not a simple column name or constant, or from a function. Nevertheless, such a column allows nulls when an outer select list refers to it.	G
COLCARD	INTEGER NOT NULL	Not used	N
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable. If the table is empty, the value is a string of length 0. This is an updatable column.	S
UPDATES	CHAR(1) NOT NULL	Whether the column can be updated: **N** No **Y** Yes The value is N if the column is: • Derived from a function or expression • A column with a row ID data type (or a distinct type based on a row ID type) • A read-only view	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G

Column name	Data type	Description	Use
DEFAULT	CHAR(1) NOT NULL	The contents of this column are meaningful only if the TYPE column for the associated SYSTABLES row indicates that this is for a table (T) or a created temporary table (G). Default indicator: **A** The column is defined as a ROWID with the GENERATED ALWAYS attribute. **B** The column is defined as a built-in data type with a default value that depends on the data type of the column. **D** The column is defined as a ROWID with the GENERATED BY DEFAULT attribute. **E** The column is defined with the FOR EACH ROW ON UPDATE and GENERATED ALWAYS attributes. **F** The column is defined with the FOR EACH ROW ON UPDATE and GENERATED BY DEFAULT attributes. **I** The column is defined with the AS IDENTITY and GENERATED ALWAYS attributes. **J** The column is defined with the AS IDENTITY and GENERATED BY DEFAULT attributes. **K** The column is defined for the implicit DOCID column for a base table that contains XML data. **L** The column is defined with the AS SECURITY LABEL attribute. **N** The column has no default value. **Q** The column is defined with the AS ROW BEGIN attribute. **R** The column is defined with the AS ROW END attribute.	G

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: **S** The column has a default value that is the value of the SQL authorization ID of the process at the time a default value is used. **U** The column has a default value that is the value of the SESSION_USER special register at the time a default value is used. **X** The column is defined with the AS TRANSACTION START ID attribute. **Y** If the NULLS column is Y, the column has a default value of null. If the NULLS column is N, the default value depends on the data type of the column. **Data type** **Default Value** **Numeric** 0 **Fixed-length character string** Blanks **Fixed-length graphic string** Blanks **Fixed-length binary string** Hexadecimal blanks **Varying-length string** A string length of 0 **Date** The current date **Time** The current time **Timestamp** The current timestamp **Timestamp with time zone** The current timestamp with time zone **1** The column has a default value that is the string constant found in the DEFAULTVALUE column of this table row. The column has a graphic data type and has a default value that is the graphic string found in the DEFAULTVALUE column of this table row. **2** The column has a default value that is the floating-point constant found in the DEFAULTVALUE column of this table row. **3** The column has a default value that is the decimal constant found in the DEFAULTVALUE column of this table row.	G

Column name	Data type	Description	Use
DEFAULT (continued)	CHAR(1) NOT NULL	Default indicator: **6** The column has a default value that is the UX string found in the DEFAULTVALUE column of this table row. **7** The column has a graphic data type and has a default value that is the character string constant found in the DEFAULTVALUE column of this table row. **8** The column has a character data type and has a default value that is the graphic string constant found in the DEFAULTVALUE column of this table row. **9** The column has a default value that is the DECFLOAT constant found in the DEFAULTVALUE column of this table row. **a** The column is defined with an expression that specifies a special register. The default value is the value of the special register. **b** The column is defined with an expression that specifies a built-in session variable. The default value is the value of the built-in session variable. **d** The column is defined with the DATA CHANGE OPERATION clause. The default value is an I, U, or D character indicating which data change operation the row represents.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the column within the primary key of the table. The value is 0 if it is not part of a primary key.	G

Column name	Data type	Description	Use
FOREIGNKEY	CHAR(1) NOT NULL	Applies to character or CLOB columns, where it indicates the subtype of the data: **B** BIT data **M** MIXED data **S** SBCS data **blank** Indicates one of the following subtypes: • MIXED data if the encoding scheme is UNICODE, or if the encoding scheme is not UNICODE and the value of MIXED DATA on installation panel DSNTIPS is YES • SBCS data if the encoding scheme is not UNICODE and the value of MIXED DATA on the installation panel DSNTIPS is NO. For views defined prior to Version 7, subtype information is not available and the default (MIXED or SBCS) is used.	G
FLDPROC	CHAR(1) NOT NULL	Whether the column has a field procedure: **N** No **Y** Yes **blank** The column is for a view defined prior to Version 7. Views defined after Version 7 contain Y or N.	G
LABEL	VARCHAR(90) NOT NULL	The column label provided by the user with a LABEL statement; otherwise, the value is an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G

Column name	Data type	Description	Use
DEFAULTVALUE	VARCHAR(1536) NOT NULL WITH DEFAULT	This field is meaningful only if the column being described is for a table (the TYPE column of the associated SYSTABLES row is T for table or G for created temporary table). When the DEFAULT column is 1, 2, 3, 4, 5, 6, 7, 8, or 9, this field contains the default value of the column. If the default value is a string constant or a hexadecimal constant (DEFAULT is 1, 5, 6, 7, or 8 respectively), the value is stored without delimiters. If the default value is a numeric constant (DEFAULT is 2, 3, 4, or 9), the value is stored as specified by the user, including sign and decimal point representation, or special constant values, as appropriate for the constant. When the DEFAULT column is S or U and the default value was specified when a new column was defined with the ALTER TABLE statement, this field contains the value of the CURRENT SQLID or SESSION_USER special register at the time the ALTER TABLE statement was executed. Remember that this default value applies only to rows that existed before the ALTER TABLE statement was executed. When the DEFAULT column is L and the column was added as a new column with the ALTER TABLE statement, this field contains the security label of the user at the time the ALTER TABLE statement was executed. Remember that this default value applies only to rows that existed before the ALTER TABLE statement was executed. When the DEFAULT column contains a, this field contains the name of the special register. When the DEFAULT column contains b, this field contains the qualified name of the session variable. When the DEFAULT column contains d, this field contains DATA CHANGE OPERATION.	G
COLCARDF	FLOAT NOT NULL WITH DEFAULT	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column. This is an updatable column.	S
COLSTATUS	CHAR(1) NOT NULL WITH DEFAULT	Indicates the status of the definition of a column: **I** The definition is incomplete because a LOB table space, auxiliary table, or index on an auxiliary table has not been created for the column. **blank** The definition is complete.	G

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL WITH DEFAULT	Maximum length of the data retrieved from the column. Possible values are: **0** Column is not a LOB or ROWID column **40** For a ROWID column, the length of the returned value **1 to 2,147,483,647 bytes** For a LOB column, the maximum length	G
DATATYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. If the column was created prior to DB2 Version 6, the value is 0.	S
SOURCETYPEID	INTEGER NOT NULL WITH DEFAULT	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. If the column was created prior to DB2 Version 6, the value is 0.	S
TYPESCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT 'SYSIBM'	If COLTYPE is 'DISTINCT', the schema of the distinct type. Otherwise, the value is 'SYSIBM'.	G
TYPENAME	VARCHAR(128) NOT NULL WITH DEFAULT	If COLTYPE is 'DISTINCT', the name of the distinct type. Otherwise, the value is the same as the value of the COLTYPE column. TYPENAME is set only for columns created in DB2 Version 6 or later. The value for columns created earlier is not filled in.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the column was created. The value is '0001-01-01.00.00.00.000000' if the column was created prior to migration to DB2 Version 6 or if the column is in a catalog table.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G
PARTKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The numeric position of the column within the partitioning key of the table. The value is 0 if it is not part of the partitioning key. This column is applicable only if the table uses table-controlled partitioning.	G

Column name	Data type	Description	Use
PARTKEY_ORDERING	CHAR(1) NOT NULL WITH DEFAULT	Order of the column in the partitioning key: **A** Ascending **D** Descending **blank** Column is not used as part of a partitioning key This column is applicable only if the table uses table-controlled partitioning.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when alter occurred.	G
CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the column. 0 if the object was created prior to Version 8, or is not a character of graphic string column. CCSID is not 0 if COLTYPE is VARBINARY because the object is a Db2 11 Unicode column in an EBCDIC table.	G
HIDDEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the column is implicitly hidden: **P** Partially hidden. The column is implicitly hidden from SELECT *. **R** Partially hidden. The column is a ROWID column that was explicitly defined with the IMPLICITLY HIDDEN attribute. **N** Not hidden. The column is visible to all SQL statements.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
CONTROL_ID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the column access control mask defined for this column. 0 if no column access control mask is defined for the column.	S
XML_TYPEMOD_ID	INTEGER NOT NULL WITH DEFAULT	The ID of the XML type modifier. It is set to 0 if the column is not an XML column or has no XML type modifier.	G

Column name	Data type	Description	Use
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or the end of the period for a SYSTEM_TIME or BUSINESS_TIME period: **B** Column is the start of period BUSINESS_TIME. **C** Column is the end of period BUSINESS_TIME. **S** Column is the start of period SYSTEM_TIME. **T** Column is the end of period SYSTEM_TIME. **blank** Column is not used as either the start or the end of a period.	G
GENERATED_ ATTR	CHAR(1) NOT NULL WITH DEFAULT	Indicates the columns generated attribute: **A** Column is defined as GENERATED_ALWAYS. **D** Column is defined as GENERATED BY DEFAULT. **blank** Not applicable or the value of the DEFAULT column is A, D, E, F, I, or J or defined from a prior release of Db2.	G
HASHKEY_COLSEQ	SMALLINT NOT NULL WITH DEFAULT	The column's numeric position within the table's hash key. The value is 0 if the column is not part of the hash key. This column is applicable only if the table that use hash organization.	G

SYSCOLUMNS_HIST catalog table

The SYSCOLUMNS_HIST catalog table contains rows from SYSCOLUMNS. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view that contains the column.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table or view that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in the table or view. For example 4 (out of 10).	G

Column name	Data type	Description	Use
COLTYPE	CHAR(8) NOT NULL	The type of the column specified in the definition of the column: **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **LONGVAR** Varying-length character string (for columns that were added before Version 9) **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string **LONGVARG** Varying-length graphic string (for columns that were added before Version 9) **DATE** Date **TIME** Time **TIMESTAMP** Timestamp **TIMESTZ** Timestamp with time zone **BLOB** Binary large object **CLOB** Character large object **DBCLOB** Double-byte character large object **ROWID** Row ID data type **DISTINCT** Distinct type **XML** XML data type **BIGINT** Big integer **BINARY** Fixed-length binary string **VARBIN** Varying-length binary string **DECFLOAT** Decimal floating point	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	Length attribute of the column or, in the case of a decimal column, its precision. The number does not include the internal prefixes that are used to record the actual length and null state, where applicable. **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** Length of string **VARCHAR** Maximum length of string **LONGVAR** Maximum length of string (for columns that were added before Version 9) **DECIMAL** Precision of number **GRAPHIC** Number of DBCS characters **VARGRAPHIC** Maximum number of DBCS characters **LONGVARG** Maximum number of DBCS characters (for columns that were added before Version 9) **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((*p*+1)/2) + 7 where *p* is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((*p*+1)/2) + 9 where *p* is the precision of the timestamp **BLOB** 4 - The length of the field that is stored in the base table. The maximum length of the LOB column is found in LENGTH2. **CLOB** 4 - The length of the field that is stored in the base table. The maximum length of the CLOB **DBCLOB** 4 - The length of the field that is stored in the base table. The maximum length of the DBCLOB column is found in LENGTH2. **ROWID** 17 - The maximum length of the stored portion of the identifier. **DISTINCT** The length of the source data type. **XML** 6	G

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL	Maximum length of the data retrieved from the column. Possible values are: **0** Column is not a LOB or ROWID column **40** For a ROWID column, the length of the returned value **1 - 2,147,483,647 bytes** For a LOB column, the maximum length	G
NULLS	CHAR(1) NOT NULL	Whether the column can contain null values: **N** No **Y** Yes	G
HIGH2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second highest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S
LOW2KEY	VARCHAR(2000) NOT NULL FOR BIT DATA	Second lowest value of the column. Blank if statistics have not been gathered, or the column is an indicator column or a column of an auxiliary table. If the column has a non-character data type, the data might not be printable.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. The value '0001-01-02-00.00.00.000000' indicates that an ALTER TABLE statement was executed to change the length of a VARCHAR column and RUNSTATS should be run to update the statistics before they are used.	G
COLCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Estimated number of distinct values in the column. For an indicator column, this is the number of LOBs that are not null and have a length greater than zero. The value is -1 if statistics have not been gathered. The value is -2 if the column is a LOB column.	S
IBMREQD	CHAR(1) NOT NULL DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics gathered: **blank** Statistics have not been collected or varchar column statistical values are padded. **N** Varchar column statistical values are not padded. This is an updatable column.	G

SYSCONSTDEP catalog table

The SYSCONSTDEP table records dependencies on check constraints or user-defined defaults for a column. The schema is SYSIBM.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the dependency exists.	G
BSCHEMA	VARCHAR(128) NOT NULL	Schema of the object on which the dependency exists.	G
BTYPE	CHAR(1) NOT NULL	Type of object on which the dependency exists: **F** Function instance	G
DTBNAME	VARCHAR(128) NOT NULL	Name of the table to which the dependency applies.	G
DTBCREATOR	VARCHAR(128) NOT NULL	The schema of the table to which the dependency applies.	G
DCONSTNAME	VARCHAR(128) NOT NULL	If DTYPE = 'C', the unqualified name of the check constraint. If DTYPE = 'D', a column name.	G
DTYPE	CHAR(1) NOT NULL	Type of object: **C** Check constraint **D** User-defined default constant	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DTBOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table or a zero length string for tables that were created in a Db2 release prior to Version 9.	G

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **R** Role	G

SYSCONTEXT catalog table

The SYSCONTEXT table contains one row for each trusted context. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trusted context.	G
CONTEXTID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal context ID.	G
DEFINER	VARCHAR(128) NOT NULL	Authorization ID or role that defined the trusted context.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of the definer: **L** Role **blank** Authorization ID	G
SYSTEMAUTHID	VARCHAR(128) NOT NULL	The Db2 primary authorization ID that is used to establish the connection. For remote requests, SYSTEMAUTHID is derived from the system user ID that is provided by an external entity, such as a middleware server. For local requests, SYSTEMAUTHID depends on one of the following sources of the address space: **BATCH** USER parameter on JOB statement **RRSAF** USER parameter on JOB statement or RACF user **TSO** TSO logon ID	G
DEFAULTROLE	VARCHAR(128) NOT NULL	Name of the trusted context default role.	G

Column name	Data type	Description	Use
OBJECTOWNERTYPE	CHAR(1) NOT NULL	Whether the ROLE AS OBJECT OWNER AND QUALIFIER clause is specified in the definition of this trusted context: **L** ROLE AS OBJECT OWNER AND QUALIFIER is specified. A role owns any object created in the trusted context. The role is used as the default for the CURRENT SCHEMA special register. The role is included in the SQL PATH. **blank** ROLE AS OBJECT OWNER is not specified. An authorization ID owns any object created in the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the trusted context is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The time when the trusted context is last altered.	G
ENABLED	CHAR(1) NOT NULL	The status of the trusted context: **Y** Enabled **N** Disabled	G
ALLOWPUBLIC	CHAR(1) NOT NULL	Whether the connection is allowed to be reused for PUBLIC: **Y** Connection reuse is allowed **N** Connection reuse is not allowed	G
AUTHENTICATEPUBLIC	CHAR(1) NOT NULL	Whether authentication is required for PUBLIC when ALLOWPUBLIC is Y: **Y** Authentication token is required for PUBLIC. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a KERBEROS token **N** Authentication is not required	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
DEFAULTSECURITYLABEL	VARCHAR(24) NOT NULL	Name of the context default RACF security label.	G

SYSCONTEXTAUTHIDS catalog table

The SYSCONTEXTAUTHIDS table contains one row for each authorization ID with which the trusted context can be used. The schema is SYSIBM.

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G
AUTHID	VARCHAR(128) NOT NULL	The primary authorization ID that can reuse a connection. When RACF is used, this is a RACF profile name that contains the primary authorization IDs that are permitted to use the connection in the identified trusted context. A RACF profile name in this column has an ampersand (&) sign as the first character, to distinguish it from an authorization ID.	G
AUTHENTICATE	CHAR(1) NOT NULL	Whether authentication is required for the authorization ID in the AUTHID column: **Y** Authentication token is required for the authorization ID. For local requests, the token is the password. For remote requests, the token can be a password, a RACF passticket, or a Kerberos token **N** Authentication is not required	G
ROLE	VARCHAR(128) NOT NULL	The role for the authorization ID in the AUTHID column. The role supersedes the default role that is defined for the trusted context.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the authorization ID is added to the trusted context.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
SECURITYLABEL	VARCHAR(24) NOT NULL	RACF security label for AUTHID. The security label supersedes the default security label, if any, that is defined for the context.	G

SYSCONTROLS catalog table

The SYSCONTROLS table contains one row for each row permission and column mask. The schema is SYSIBM.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the row permission or column mask.	G
NAME	VARCHAR(128) NOT NULL	Name of the row permission or column mask.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the row permission or column mask.	G
OWNERTYPE	CHAR(1) NOT NULL	Indicates the type of the owner: **blank** An authorization ID **L** Role	G
TBSCHEMA	VARCHAR(128) NOT NULL	Schema of the table for which the row permission or column mask is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table for which the row permission or column mask is defined.	G
TBCORRELATION	VARCHAR(128) NOT NULL WITH DEFAILT	If specified, the correlation name of the table for which the row permission or column mask is defined. Otherwise, the value is an empty string.	G
COLNAME	VARCHAR(128) NOT NULL	Column name for which the column mask is defined. Blank if this is a row permission.	G
COLNO	SMALLINT NOT NULL	Column number for which the column mask is defined. 0 if this is a row permission.	G

Column name	Data type	Description	Use
CONTROL_ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Internal access control ID.	S
CONTROL_TYPE	CHAR(1) NUT NULL	Indicates the type of the access control object: **R** Row permission **M** Column mask	G
ENFORCED	CHAR(1) NUT NULL	Indicates the type of the access enforced by the row permission. Column mask always has a value of 'A'. **A** All access	G
IMPLICIT	CHAR(1) NUT NULL	Indicates whether the row permission was implicitly created: **N** The row permission was explicitly created or this is a column mask **Y** The row permission was implicitly created	G
ENABLE	CHAR(1) NUT NULL	Indicates whether the row permission or the column mask is enabled for access control: **N** Not enabled **Y** Enabled	G
STATUS	CHAR(1) NUT NULL	Indicates the status of the row permission or column mask definition: **blank** The definition of the row permission or column mask is complete. **R** An error occurred when an attempt was made to regenerate the row permission or column mask.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was created.	G
RELCREATED	CHAR(1) NUT NULL	The release of Db2 in which the row permission or column mask was created. See Release dependency indicators for values.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when the row permission or column mask was last changed.	G

Column name	Data type	Description	Use
REMARKS	VARCHAR(762) NOT NULL	A character string provided by using the COMMENT ON statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ENVID	INTEGER NOT NULL	Internal identifier of the environment.	G
ROWID	ROWID	Row identifier to support LOB columns in the table.	G
RULETEXT	CLOB(2MB) NOT NULL	The source text of the search condition or expression portion of the CREATE PERMISSION or CREATE MASK statement. **Note:** The lowercase letters in ordinary tokens are folded to uppercase in the text. However, lowercase letters in ordinary tokens are folded to uppercase in a C or Java program only if the appropriate precompiler option is specified.	G
DESCRIPTOR	BLOB(2MB) NOT NULL	Internal description of the row permission or column mask	S

SYSCOPY catalog table

The SYSCOPY table contains information needed for recovery. The schema is SYSIBM.

Column name	Data type	Description	Use
DBNAME	CHAR(8) NOT NULL	Name of the database.	G
TSNAME	CHAR(8) NOT NULL	Name of the target table space or index space.	G
DSNUM	INTEGER NOT NULL	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space.	G

Column name	Data type	Description	Use
ICTYPE	CHAR(1) NOT NULL	Type of operation: **A** ALTER **B** REBUILD INDEX **C** CREATE **D** CHECK DATA LOG(NO) (no log records for the range are available for RECOVER utility) **E** RECOVER (to current point) **F** COPY FULL YES **I** COPY FULL NO **J** REORG TABLESPACE or LOAD REPLACE compression dictionary write to log **L** SQL (type of operation) **M** MODIFY RECOVERY utility **P** RECOVER TOCOPY, RECOVER TOLOGPOINT, or RECOVER TORBA (to a point in time) **Q** QUIESCE **R** LOAD REPLACE LOG(YES) **S** LOAD REPLACE LOG(NO) **T** TERM UTILITY command **V** REPAIR VERSIONS utility **W** REORG LOG(NO) **X** REORG LOG(YES) **Y** LOAD LOG(NO) **Z** LOAD LOG(YES)	G
ICDATE	CHAR(6) NOT NULL	Date of the last image copy	N

Column name	Data type	Description	Use
START_RBA	CHAR(10) NOT NULL FOR BIT DATA	An 80-bit positive integer that contains the RBA/LRSN of a point in the Db2 recovery log. (The LRSN is the RBA in a data-sharing environment.) • For ICTYPE I or F, the starting point for all updates since the image copy was taken • For ICTYPE J, the RBA/LRSN of the compression dictionary • For ICTYPE M, the RBA of the highest deleted SYSCOPY or SYSLGRNX record • For ICTYPE P, the point after the log-apply phase of point-in-time recovery • For ICTYPE Q, the point after all data sets have been successfully quiesced • For ICTYPE R or S, the end of the log before the start of the LOAD utility and before any data is changed • For ICTYPE T, the end of the log when the utility is terminated • For other values of ICTYPE, the end of the log before the start of the RELOAD phase of the LOAD or REORG utility. A SELECT from SYSIBM.SYSCOPY displays the START_RBA and PIT_RBA columns in either 6-byte or 10-byte format. Before CATENFM of SYSCOPY, the data and the display are in 6-byte format but in all migration modes in utility-output, SYSCOPY columns are displayed in 10-byte format. After CATENFM of SYSCOPY the data and the display are in 10-byte format with non-zero digits in low order 3 bytes. Digits in the low order 3 bytes are unrelated to the conversion of the BSDS or conversion of individual objects to EXTENDED format.	G
FILESEQNO	INTEGER NOT NULL	Tape file sequence number of the copy.	G
DEVTYPE	CHAR(8) NOT NULL	Device type the copy is on.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
DSNAME	CHAR(44) NOT NULL	For ICTYPE='P' (RECOVER TOCOPY only), ''I'', or 'F', DSNAME contains the data set name. Otherwise, DSNAME contains the name of the database and table space or index space in the form, *database-name.space-name*, or DSNAME is blank for any row migrated from a release prior to Version 4.	G

Column name	Data type	Description	Use
ICTIME	CHAR(6) NOT NULL	Time of the last image copy.	N
SHRLEVEL	CHAR(1) NOT NULL	SHRLEVEL parameter value on COPY (for ICTYPE F or I only): **C** CHANGE **R** REFERENCE **blank** Does not describe an image copy or was migrated from Version 1 Release 1 of Db2.	G
DSVOLSER	VARCHAR(1784) NOT NULL	If the operation is not an image copy operation that creates a FlashCopy image copy with consistency (an image copy operation with the FLASHCOPY CONSISTENT option), this value is: • A comma-separated list of 6-byte volume serial numbers of the data set, if the data set is not cataloged. • Blank if the data set is cataloged. If the operation is an image copy operation that creates a FlashCopy image copy with consistency (an image copy operation with the FLASHCOPY CONSISTENT option), this value is a comma-separated list of values of the following form: `memberID-ckptrba` *memberID* is a 3-digit ID for a member of a data sharing group. *ckptrba* is the 12-byte hexadecimal checkpoint RBA for the member.	G
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	The date and time when the row was inserted. For the COPYTOCOPY utility, this value is the date and time when the row was inserted for the primary local site or primary recovery site copy. For an EXCHANGE DATA statement, this is the time that the statement is run.	G

Column name	Data type	Description	Use
ICBACKUP	CHAR(2) NOT NULL WITH DEFAULT	Specifies the type of image copy contained in the data set: **blank** LOCALSITE primary copy (first data set named with COPYDDN) **FC** FlashCopy copy **LB** LOCALSITE backup copy (second data set named with COPYDDN) **RP** RECOVERYSITE primary copy (first data set named with RECOVERYDDN) **RB** RECOVERYSITE backup copy (second data set named with RECOVERYDDN)	G
ICUNIT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the media that the image copy data set is stored on: **D** DASD **T** Tape **blank** Medium is neither tape nor DASD, the image copy is from a Db2 release prior to Version 2 Release 3, or ICTYPE is not 'I' or 'F'.	G

Column name	Data type	Description	Use
STYPE	CHAR(1) NOT NULL WITH DEFAULT	When **ICTYPE=A**, the values are: **A** A partition was added or inserted to a table. **B** The MEMBER CLUSTER value was changed. **C** A column was added to a table and an index in different commit scopes, or a column was dropped from a table. **D** Either the DSSIZE attribute of the table space was altered or the default value of a column of a table was altered. **E** The data set numbers of a base table and its associated clone table are exchanged. **F** The page size attribute of the table space or index was altered. **G** An index was regenerated **H** The table was altered to hash organization, the size of the hash space was changed, or the hash organization was dropped. The value of the TTYPE column indicates the action taken. **I** The inline length attribute of the LOB column was altered by REORG. **L** The logging attribute of the table space was altered to LOGGED. **M** The MAXPARTITIONS attribute of the table space was altered. **N** An index was altered to not padded **O** The logging attribute of the table space was altered to NOT LOGGED. **P** An index was altered to padded **R** A table was altered to rotate partitions. **S** The SEGSIZE attribute of the table space was altered. **U** An ALTER TABLE ALTER COLUMN DROP DEFAULT statement was executed on a column that was previously added with an ALTER TABLE ADD COLUMN statement. **V** A column in a table was altered for a numeric data	G

Column name	Data type	Description	Use
STYPE (continued)		When **ICTYPE=A**, the values are (continued): **Z** A column that is in the key of an index that was versioned prior to DB2 Version 8 was altered. When **ICTYPE=C**, the values are: **L** The logging attribute of the table space was LOGGED. **O** The logging attribute of the table space was NOT LOGGED. When **ICTYPE=E**, the values are: **B** RECOVER utility with the BACKOUT keyword. **blank** RECOVER utility without the BACKOUT keyword. When **ICTYPE=F**, the values are: **C** DFSMS concurrent copy ("I" instance of the table space) **J** DFSMS concurrent copy ("J" instance of the table space) **N** A FlashCopy copy is not consistent. **Q** Sequential copy is consistent	

Column name	Data type	Description	Use
STYPE (continued)		When **ICTYPE=F**, the values are (continued): **R** LOAD REPLACE(YES) **S** LOAD REPLACE(NO) **T** FlashCopy copy is consistent. **U** Sequential copy is not consistent **V** ALTER INDEX NOT PADDED **W** REORG LOG(NO) **X** REORG LOG(YES) **Y** LOAD RESUME YES LOG(NO) **Z** LOAD RESUME YES LOG(YES) **blank** Db2 image copy When **ICTYPE=L**, the value is: **M** Mass DELETE, TRUNCATE TABLE, DROP TABLE, or ALTER TABLE ROTATE PARTITION. The LOWDSNUM column contains the table OBID of the affected table. The MERGECOPY utility, when used to merge an embedded copy with subsequent incremental copies, also produces a record that contains ICTYPE=F and the STYPE of the original image copy (R, S, W, or X). When **ICTYPE = M** and the MODIFY RECOVERY utility was executed to delete SYSCOPY and/or SYSLGRNX records, the value is R. When **ICTYPE=O**, the values are: **B** A table space or partition that was in reordered row format was recovered to a point in time when it was in basic row format. **R** A table space or partition was converted to reordered row format as a result of REORG or LOAD REPLACE. When **ICTYPE=P**, the values are: **B** RECOVER with the BACKOUT YES option. **C** RECOVER without using LOGONLY with consistency. **J** RECOVER using LOGONLY without consistency and using the ENFORCE NO option.	

Column name	Data type	Description	Use
STYPE (continued)		When **ICTYPE=T**, the values are (continued): **I** COPY FULL NO When **ICTYPE=W or X**, the values are: **A** Resetting REORG pending status or REBALANCE **T** First materializing the default value for a row change timestamp column For other values of ICTYPE, the value is blank.	

Column name	Data type	Description	Use
PIT_RBA	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The meaning of the value depends on the value of the ICTYPE column: **ICTYPE='P'** The LRSN for the point in the Db2 log. (The LRSN is the RBA in a non-data-sharing environment) The value indicates the stop location of a point-in-time recovery. If a record contains ICTYPE='P' and PIT_RBA=X'000000000000', the copy pending status is active and a full image copy is required. If such a record is encountered during fallback processing of RECOVER, the recover job fails, and a point-in-time recovery is required. PIT_RBA can be zero if the point-in-time recovery is completed by the fall-back processing of RECOVER, or if ICTYPE=P from a prior release of Db2. **ICTYPE='F' or 'I' and SHRLEVEL='C'** The current RBA or LRSN that corresponds to the point in the Db2 log when the SHRLEVEL CHANGE copy completes. **ICTYPE='F', SHRLEVEL='R' or 'C', and ICBACKUP='FC'** The RBA or LRSN that corresponds to the point in the Db2 log when the FlashCopy completes. **CTYPE='F' and SHRLEVEL 'R' or 'C', STYPE= 'T', 'N', 'Q', or 'U'** The RBA or LRSN that corresponds to the point in the Db2 log when the FlashCopy completes. **ICTYPE=J** The RBA where the compression dictionary is written to the log. In data sharing environments, it is the RBA of the member writing to the log. **ICTYPE='M'** The RBA/LRSN for the end of the log when the utility completes. For other all other ICTYPE values, this field contains X'00000000000000000000'. A SELECT from SYSIBM.SYSCOPY displays the START_RBA and PIT_RBA columns in either 6-byte or 10-byte format. Before CATENFM of SYSCOPY, the data and the display are in 6-byte format but in all migration modes in utility-output, SYSCOPY columns are displayed in 10-byte format. After CATENFM of SYSCOPY the data and the display are in 10-byte format with non-zero digits in low order 3 bytes. Digits in the low order 3 bytes are unrelated to the conversion of the BSDS or conversion of individual objects to EXTENDED format.	G

Column name	Data type	Description	Use
GROUP_MEMBER	CHAR(8) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the operation. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment at the time the operation was performed.	G
OTYPE	CHAR(1) NOT NULL WITH DEFAULT 'T'	Type of object that the recovery information is for: **I** Index space **T** Table space	G
LOWDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the lowest partition in the range for SYSCOPY records created for REORG and LOAD REPLACE for resetting a REORG pending status. Version number of an index for SYSCOPY records created for a COPY (ICTYPE=F) of an index space (OTYPE=I). (An index is versioned when a VARCHAR column in the index key is lengthened.) When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, LOWDSNUM = 1. When ICTYPE=A and STYPE=X, this value is the lowest partition number that was dropped by REORG.	G
HIGHDSNUM	INTEGER NOT NULL WITH DEFAULT	Partition number of the highest partition in the range. This column is valid only for SYSCOPY records created for REORG and LOAD REPLACE for resetting REORG pending status. When ICTYPE = F or I, DSNUM = 0 and OTYPE is not equal to I, this value is the number of the highest partition that is copied. When ICTYPE=A and STYPE=X, this value is the highest partition number that was dropped by REORG.	G
COPYPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages written to the copy data set. For inline copies, this number might include pages appearing more than once in the copy data set.	G
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	The number of pages in the table space or index at the time of COPY. This number might include pre-formatted pages that are not actually copied. When **ICTYPE=A, SYTPE=H, and TTYPE=S or D**, this column contains the previous HASHDATAPAGES value. When **ICTYPE=A, SYTPE=H, and TTYPE=A** this column contains zero.	G
CPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of changed pages since last copy.	G
JOBNAME	CHAR(8) NOT NULL WITH DEFAULT	Job name of the utility. For changes that cause pending definition changes to object, this column might not be accurate.	G

Column name	Data type	Description	Use
AUTHID	CHAR(8) NOT NULL WITH DEFAULT	Authorization ID of the utility.For changes that cause pending definition changes to object, this column might not be accurate.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	When ICTYPE= B, F, I, R, S, W, or X: • For a single-table table space, this value is the version number of the oldest format of data for an object. • For a multiple-table table space: – A value of zero indicates that there is a least one table in the table space that has data rows in version 0 format. – When ICTYPE=B, F, I, W, or X, a value greater than 0 is the oldest version for tables that are not at version 0. Any tables that are at version 0 have system pages for a version 0 format. – When ICTYPE=R or S: - A value greater than 0 is the oldest version for tables that are not at version 0. Any tables that are at version 0 have system pages for a version 0 format. - A value of -1 means that the oldest version number cannot be determined. For other values of ICTYPE, the value is -1. The default value of this column is 0.	G
LOGICAL_PART	INTEGER NOT NULL WITH DEFAULT	Logical partition number.	G
LOGGED	CHAR(1) NOT NULL WITH DEFAULT	Indicates the logging attribute of the table space at the time the SYSCOPY record is written: • Y — indicates that the logging attribute of the table space is LOGGED • N — indicates that the logging attribute of the table spaces is NOT LOGGED • blank — indicates that the row was inserted prior to DB2 9 or is not specified. For non-LOB table spaces or an index space, blank indicates that the logging attribute is LOGGED.	G

Column name	Data type	Description	Use
TTYPE	CHAR(8) NOT NULL WITH DEFAULT	When **ICTYPE=A and STYPE=B**, this column indicates if the previous value for the MEMBER CLUSTER attribute is being used: **Y** The previous member cluster attribute of the table space is being used. **N** The previous member cluster attribute of the table space is not being used. When **ICTYPE=A and STYPE=C**, this column indicates if a column is added or dropped from a table: **blank** A column was added to a table. **D** A column was dropped from a table. When **ICTYPE=A and STYPE=D**, this column contains the previous DSSIZE attribute value for the table space in units of G, M, or K when the DSSIZE attribute is altered. This column is blank if the default value of a column of a table was altered. When **ICTYPE=A and STYPE=F**, this column indicates the previous page size attribute value for the table space in units of K. When **ICTYPE=A and STYPE=H** this column indicates a change that was applied to the hash organization of the table: **A** Hash organization was added. The record is written when the hash space is materialized at REORG. **D** Hash organization was dropped. The record is written immediately when the ALTER statement is issued. **S** The size of the hash space was changed. The value of the NAPGESF column contains the previous HASHDATAPAGES value. The record is written when the hash space is materialized at REORG.	G

Column name	Data type	Description	Use
TTYPE (continued)		When **ICTYPE=A and STYPE=I**, this column indicates that the inline length of a LOB column was altered: **D** Indicates that REORG decremented the inline length of the LOB column **I** Indicates that REORG incremented the inline length of the LOB column When **ICTYPE=A and STYPE=M**, this column indicates either the previous value of the MAXPARTITIONS attribute for the table space or the type of table space conversion that was performed on the table space. **I** The table space was converted from a single-table simple table space to a partition-by-growth table space. **n** The previous value of the MAXPARTITIONS attribute for the table space. **S** The table space was converted from single-table segmented table space to a partition-by-growth table space.	

Column name	Data type	Description	Use
TTYPE (continued)		When **ICTYPE=A and STYPE=S**, this column indicates either the previous value of the SEGSIZE attribute for the table space or the type of table space conversion that was performed on the table space. **n** The previous value of the SEGSIZE attribute for the table space. **P** The table space was converted from a partitioned (non-UTS) table space to a partition-by-range table space. When **ICTYPE=E**, this column indicates if the full recovery reset the object: **blank** The full recovery reset the object **N** The full recovery did not reset the object When **ICTYPE=F and OTYPE=I**, TTYPE of S indicates that the directory pages for the index image copy are at the front of each partition and are indicated with a 'V' or '8'. When **ICTYPE=F and STYPE=N, Q, T, or U**, this column indicates the utility that made the FlashCopy: **A** LOAD RESUME LOG NO **B** REBUILD **C** COPY **D** LOAD RESUME LOG YES **E** LOAD SHRLEVEL CHANGE **L** LOAD **P** REPAIR **R** LOAD REPLACE LOG YES **S** LOAD REPLACE LOG NO **T** COPYTOCOPY **W** REORG TABLESPACE LOG NO **X** REORG TABLESPACE LOG YES When **ICTYPE=I**, this column provides information about the system pages: **N** Indicates that no system pages are in this incremental image copy.	

Column name	Data type	Description	Use
TTYPE (cont)		When **ICTYPE=P, R, S, W, X**, this column provides additional diagnostic information (continued): **E** Indicates that the RBA or LRSN format changed to extended 10-byte format. **F** Indicates that the REORG utility was run with the FASTSWITCH YES option. **RRF I** Indicates that the row format is the reordered row format, and the FORMAT INTERNAL option was specified. **S** Indicates that the REORG utility was run with the FASTSWITCH NO option. When **ICTYPE=M and STYPE=R**, this column indicates whether the MODIFY RECOVERY utility deleted rows from SYSIBM.SYSLGRNX. **blank** MODIFY RECOVERY deleted rows from SYSIBM.SYSLGRNX. **N** MODIFY RECOVERY did not delete rows from SYSIBM.SYSLGRNX. When **ICTYPE=T**, TTYPE of B indicates that a broken page was detected during copy. When **ICTYPE=W or X and STYPE=H**, this column indicates the prior value of HASHDATAPAGES. When **ICTYPE=Y or Z**, this column indicates whether the object was loaded when the FORMAT INTERNAL option was specified. **blank** Indicates that the FORMAT INTERNAL option was not specified during LOAD. **I** Indicates that the FORMAT INTERNAL option was specified during LOAD. When **ICTYPE=A-A, A-R, B, C, P, R, S, W, or X** and the page format was changed by the ALTER ADD PARTITION, ALTER ROTATE PARTITION, CREATE, LOAD REPLACE, REBUILD, REORG, or RECOVER utilities: **B** Indicates that the page format was created or converted to basic page format with 6-byte RBA or LRSN values. **E** Indicates that the page format was created or converted to extended page format with 10-byte RBA or LRSN values. When **ICTYPE=A and STYPE=A or R:** **B** Indicates that the page format was converted to basic page format with 6-byte RBA or LRSN values.	

Column name	Data type	Description	Use
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	When STYPE = E and ICTYPE = A, INSTANCE indicates the data set instance number of a base object after an EXCHANGE statement completes. The value of the INSTANCE column for the last data exchange will match the value of the INSTANCE column for the SYSIBM.SYSTABLESPACE table. For an image copy, INSTANCE indicates the instance number of the current base objects (table and index).	G
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
MODECREATED	CHAR(2) NOT NULL WITH DEFAULT	The latest mode to which the Db2 subsystem had been migrated when the SYSCOPY record was written: **C** Conversion mode or CM* **E** Enabling-new-function mode or ENFM* **N** New-function mode **blank** Prior to Db2 11	G

SYSCTXTTRUSTATTRS catalog table

The SYSCTXTTRUSTATTRS table contains one row for each list of attributes for a given trusted context. The schema is SYSIBM.

Column name	Data type	Description	Use
CONTEXTID	INTEGER NOT NULL	The internal trusted context ID.	G

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trust attribute. Possible values including the following attributes: • An IPv4 address is represented as a dotted decimal IP address. An example of an IPv4 address is '9.112.46.111'. • An IPv6 address is represented as a colon hexadecimal address. An example of an IPv6 address is '2001:0DB8:0000:0000:0008:0800:200C:417A', which can also be expressed in a compressed form as '2001:DB8::8:800:200C:417A'. • A domain name which is converted to an IP address by the domain name server where a resulting IPv4 or IPv6 address is determined. • A job or started task name for local applications. If the job name ends with *, any job name that matches the characters prior to * in the specified job name are considered for establishing the trusted connection. • A network access security zone name in the RACF SERVAUTH class.	G
VALUE	VARCHAR(254) NOT NULL	The value of the trust attribute.	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the attribute is created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSDATABASE catalog table

The SYSDATABASE table contains one row for each database. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Database name.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the database.	G
STGROUP	VARCHAR(128) NOT NULL	Name of the default storage group of the database; blank for a system database.	G
BPOOL	CHAR(8) NOT NULL	Name of the default buffer pool of the table space; blank for a system table space.	G

Column name	Data type	Description	Use
DBID	SMALLINT NOT NULL	Internal identifier of the database. If there were 32511 databases or more when this database was created, the DBID is a negative number.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the database.	G
ROSHARE	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	Not used.	N
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of database: **blank** Not a work file database or a TEMP database. **T** A TEMP file database. **W** A work file database. The database is DSNDB07, or it was created with the WORKFILE clause and used as a work file database by a member of a Db2 data sharing group.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that uses this work file database. This column is blank if the work file database was not created in a Db2 data sharing environment, or if the database is not a work file database as indicated by the TYPE column.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the database. For DSNDB04 and DSNDB06, the value is '1985-04-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER DATABASE statement was applied. If no ALTER DATABASE statement has been applied, ALTEREDTS has the value of CREATEDTS.	G

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the database: **E** EBCDIC **A** ASCII **U** UNICODE **blank** For DSNDB04, a work file database, and a TEMP database.	G
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the database. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the database. If mixed data is not used and the CCSID for the database is defined as EBCDIC or ASCII, the default value is 0. For a TEMP database, a work file database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
INDEXBP	CHAR(8) NOT NULL WITH DEFAULT 'BP0'	Name of the default buffer pool for indexes.	G
IMPLICIT	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates whether the database was implicitly created: **Y** The database was implicitly created **N** The database was explicitly created	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSDATATYPES catalog table

The SYSDATATYPES table contains one row for each user-defined type defined to the system. The schema is SYSIBM.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the data type.	G
NAME	VARCHAR(128) NOT NULL	Name of the data type.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the data type.	G
SOURCESCHEMA	VARCHAR(128) NOT NULL	Schema of the source data type.	G
SOURCETYPE	VARCHAR(128) NOT NULL	Name of the source type.	G
METATYPE	CHAR(1) NOT NULL	The class of data type: **A** User-defined ordinary array type **L** User-defined associative array type **T** Distinct type	G
DATATYPEID	INTEGER NOT NULL	Internal identifier of the data type.	S
SOURCETYPEID	INTEGER NOT NULL	Internal ID of the built-in data type on which the distinct type or array elements are based.	S
LENGTH	INTEGER NOT NULL	Maximum length or precision for a data type that is based on the IBM-defined DECIMAL data type. The data type can be a distinct type or an array type.	G

Column name	Data type	Description	Use
SCALE	SMALLINT NOT NULL	One of the following values: • For a data type that is based on the IBM-defined DECIMAL data type, the scale. The data type can be a distinct type or an array type. Number of fractional second digits for a data type that is based on the IBM-defined timestamp or timestamp with time zone type. • For a data type that is based on the IBM-defined TIMESTAMP or TIMESTAMP WITH TIME ZONE type, the number of fractional-second digits. • For any other data type, the value is 0. If the value is a timestamp, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
SUBTYPE	CHAR(1) NOT NULL	Subtype of the data type, if the source type is one of the character types. The data type can be a distinct type or an array type. Possible values are: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The source type is not a character type.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the data type was created.	G
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the data type: **A** ASCII **E** EBCDIC **U** UNICODE	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
INLINE_LENGTH	INTEGER NOT NULL WITH DEFAULT -1	The inline length attribute of the type if it is based on a LOB source type: **-1** This type does not specify INLINE LENGTH **greater than or equal to 0** The inline length attribute (in byte) of the type if it is based on a LOB source type	G
ARRAYLENGTH	BIGINT NOT NULL WITH DEFAULT	Maximum cardinality, if the data type is an array type. For all other data types, the value is 0.	G
ARRAYINDEXTYPEID	INTEGER NOT NULL WITH DEFAULT	Data type of the index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEXTYPELEN	BIGINT NOT NULL WITH DEFAULT	Maximum length of the array index, if the data types is an associative array type. For all other data types, the value is 0.	G
ARRAYINDEXSUBTYPE	CHAR(1) NOT NULL WITH DEFAULT	Subtype of the array index: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The array index is not a character type.	G

SYSDBAUTH catalog table

The SYSDBAUTH table records the privileges that are held by users over databases. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Application ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Database name.	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **S** SYSADM	G
CREATETABAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create tables within the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
CREATETSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create table spaces within the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DBADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBADM authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DBCTRLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBCTRL authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DBMAINTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has DBMAINT authority over the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
DISPLAYDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the DISPLAY command for the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
DROPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the ALTER DATABASE and DROP DATABASE statement: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
IMAGCOPYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the COPY, MERGECOPY, MODIFY, and QUIESCE utilities on the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
LOADAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the LOAD utility to load tables in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
REORGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the REORG utility to reorganize table spaces and indexes in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
RECOVERDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER and REPORT utilities on table spaces in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
REPAIRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DIAGNOSE and REPAIR utilities on table spaces and indexes in the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
STARTDBAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the START command against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
STATSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the CHECK and RUNSTATS utilities against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOPAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the STOP command against the database: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G

Column name	Data type	Description	Use
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSDBRM catalog table

The SYSDBRM table contains one row for each DBRM of each application plan. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
TIMESTAMP	CHAR(8) NOT NULL FOR BIT DATA	Consistency token.	S
PDSNAME	VARCHAR(132) NOT NULL	Name of the partitioned data set of which the DBRM is a member.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan of which this DBRM is a part.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
PRECOMPTIME	CHAR(8) NOT NULL	Not used.	N
PRECOMPDATE	CHAR(6) NOT NULL	Not used.	N
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for the SQL statements in the DBRM: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in the DBRM: **N** Period **Y** Comma	G

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	The host language used: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **P** PL/I **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CHARSET	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **A** No **K** Yes	G
MIXED	CHAR(1) NOT NULL WITH DEFAULT	Indicates if mixed data was in effect when the application program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 99): **N** No **Y** Yes	G
DEC31	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether DEC31 was in effect when the program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 232): **blank** No **Y** Yes	G

Column name	Data type	Description	Use
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	Version identifier for the DBRM.	G
PRECOMPTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the DBRM was precompiled.	G
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSDEPENDENCIES catalog table

The SYSDEPENDENCIES table records the dependencies between objects. The schema is SYSIBM.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which another object is dependent. If BTYPE is F, the name is the specific name of the function. If BTYPE is W or Z, the name is the name of the table for which the period is defined.	G
BSCHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object on which another object is dependent.	G
BCOLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Column name of the object on which another object is dependent.	G
BCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object on which another object is dependent.	G

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	The type of object that is identified by BNAME, BSCHEMA, and BCOLNAME: **C** Column **E** INSTEAD OF trigger **F** Function **G** Global temporary table **H** Global variable **I** Index **M** Materialized query table **O** Procedure **P** Partitioned table space **Q** Sequence **R** Table space **S** Synonym **T** Table **U** Distinct type **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period **0 (zero)** Alias	G
BOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object on which another object is dependent.	G

Column name	Data type	Description	Use
BOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object on which another object is dependent: **L** Role **blank** Authorization ID that is not a role	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that has dependencies on another object.	G
DSCHEMA	VARCHAR(128) NOT NULL	Schema or qualifier of the object that has dependencies on another object.	G
DVERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier of the object that is identified by DSCHEMA and DNAME if the object has a version. This column contains a zero length string for the objects that are created prior to Version 10 and for the rows that correspond to objects without versions.	G
DCOLNAME	VARCHAR(128) NOT NULL	Column name of the object that has dependencies on another object.	G
DCOLNO	SMALLINT NOT NULL WITH DEFAULT	Column number of the object that has dependencies on another object.	G
DTYPE	CHAR(1) NOT NULL	The type of the object that is identified by DSCHEMA, DNAME, DCOLNAME, and DVERSION: **B** Trigger **C** Generated column **F** Function **I** Index **M** Materialized query table **O** Procedure **V** View **X** Row permission **Y** Column mask	G
DOWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the object that has dependencies on another object.	G

Column name	Data type	Description	Use
DOWNERTYPE	CHAR(1) NOT NULL	Type of creator of the object that has dependencies on another object: **L** Role **blank** Authorization ID if not a role	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
BAUTH	SMALLINT NOT NULL WITH DEFAULT	The privilege that is held on the object on which another object is dependent.	G

SYSDUMMY1 catalog table

The SYSDUMMY1catalog table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

Unlike the other catalog tables, which reside in Unicode table spaces, SYSIBM.SYSDUMMY1 resides in table space SYSEBCDC, which is an EBCDIC table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYA catalog table

The SYSDUMMYA table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYA resides in table space SYSTSASC, which is a ASCII table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYE catalog table

The SYSDUMMYE table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYE resides in table space SYSEBCDC, which is a EBCDIC table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSDUMMYU catalog table

The SYSDUMMYU table contains one row. It is used for SQL statements in which a table reference is required, but the contents of the table are not important. The schema is SYSIBM.

SYSIBM.SYSDUMMYU resides in table space SYSTSUNI, which is a UNICODE table space.

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSENVIRONMENT catalog table

The SYSENVIRONMENT table records the environment variables when an object is created. The schema is SYSIBM.

Column name	Data type	Description	Use
ENVID	INTEGER NOT NULL	Internal identifier of the environment.	G
CURRENT_SCHEMA	VARCHAR(128) NOT NULL	The current schema.	G
RELCREATED	CHAR(1) NOT NULL	The release when the environment information is created. SeeRelease dependency indicators for values.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL	The schema path.	G
APPLICATION_ ENCODING_CCSID	INTEGER NOT NULL	The CCSID of the application environment.	G
ORIGINAL_ ENCODING_CCSID	INTEGER NOT NULL	The original CCSID of the statement text string.	G
DECIMAL_POINT	CHAR(1) NOT NULL	The decimal point indicator: **C** Comma **P** Period	G

Column name	Data type	Description	Use
MIN_DIVIDE_SCALE	CHAR(1) NOT NULL	The minimum divide scale: **N** The usual rules apply for decimal division in SQL **Y** Retain at lease three digits to the right of the decimal point after any decimal division.	G
STRING_DELIMITER	CHAR(1) NOT NULL	The string delimiter that is used in COBOL string constants: **A** Apostrophe (') **Q** Quote (")	G
SQL_STRING_ DELIMITER	CHAR(1) NOT NULL	The SQL string delimiter that is used in string constants: **A** Apostrophe (') **Q** Quote (")	G
MIXED_DATA	CHAR(1) NOT NULL	Uses mixed DBCS data: **N** No mixed data **Y** Mixed data	G
DECIMAL_ ARITHMETIC	CHAR(1) NOT NULL	The rules that are to be used for CURRENT PRECISION and when both operands in a decimal operation have a precision of 15 or less: **1** DEC15 specifies that the rules do not allow a precision greater than 15 digits **2** DEC31 specifies that the rules allow a precision of up to 31 digits	G
DATE_FORMAT	CHAR(1) NOT NULL	The date format: **I** ISO - yyyy-mm-dd **J** JIS - yyyy-mm-dd **U** USA - mm/dd/yyyy **E** EUR - dd.mm.yyyy **L** Locally defined by an installation exit routine	G

Column name	Data type	Description	Use
TIME_FORMAT	CHAR(1) NOT NULL	The time format: **I** ISO - hh.mm.ss **J** JIS - hh.mm.ss **U** USA - hh:mm AM or hh:mm PM **E** EUR - hh.mm.ss **L** Locally defined by an installation exit routine	G
FLOAT_FORMAT	CHAR(1) NOT NULL	The floating point format: **I** IEEE floating point format **S** System/390 floating point format	G
HOST_LANGUAGE	CHAR(8) NOT NULL	The host language: • ASM • C • CPP • IBMCOB • JAVA • PLI • FORTRAN	G
CHARSET	CHAR(1) NOT NULL	The character set: **A** Alphanumeric	G
FOLD	CHAR(1) NOT NULL	FOLD is only applicable when HOST_LANGUAGE is C or CPP. Otherwise FOLD is blank. **N** Lower case letters in SBCS ordinary identifiers are not folded to uppercase **Y** Lower case letters in SBCS ordinary identifiers are folded to uppercase **blank** Not applicable	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The rounding mode that is used when arithmetic and casting operations are performed on DECFLOAT data: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP	G

SYSFIELDS catalog table

The SYSFIELDS table contains one row for every column that has a field procedure. The schema is SYSIBM.

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of this column in the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the column.	G

Column name	Data type	Description	Use
FLDTYPE	VARCHAR(24) NOT NULL	Data type of the encoded values in the field (This columns might contain statistical values from a prior release.): **INTEGER** Large integer **SMALLINT** Small integer **FLOAT** Floating-point **CHAR** Fixed-length character string **VARCHAR** Varying-length character string **DECIMAL** Decimal **GRAPHIC** Fixed-length graphic string **VARG** Varying-length graphic string	G
LENGTH	SMALLINT NOT NULL	The length attribute of the field; or, for a decimal field, its precision.(This columns might contain statistical values from a prior release.) The number does not include the internal prefixes that can be used to record actual length and null state. **INTEGER** 4 **SMALLINT** 2 **FLOAT** 8 **CHAR** Length of string **VARCHAR** Maximum length of string **DECIMAL** Precision of number **GRAPHIC** Number of DBCS characters **VARG** Maximum number of DBCS characters	G
SCALE	SMALLINT NOT NULL	Scale if FLDTYPE is DECIMAL; otherwise, the value is 0.	G
FLDPROC	VARCHAR(24) NOT NULL	For a row describing a field procedure, the name of the procedure. (This columns might contain statistical values from a prior release.)	G

Column name	Data type	Description	Use
WORKAREA	SMALLINT NOT NULL	For a row describing a field procedure, the size, in bytes, of the work area required for the encoding and decoding of the procedure. (This columns might contain statistical values from a prior release.)	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
EXITPARML	SMALLINT NOT NULL	For a row describing a field procedure, the length of the field procedure parameter value block. (This columns might contain statistical values from a prior release.)	G
PARMLIST	VARCHAR(735) NOT NULL	For a row describing a field procedure, the parameter list following FIELDPROC in the statement that created the column, with insignificant blanks removed. (This columns might contain statistical values from a prior release.)	G
EXITPARM	VARCHAR(1530) NOT NULL FOR BIT DATA	For a row describing a field procedure, the parameter value block of the field procedure (the control block passed to the field procedure when it is invoked). (This columns might contain statistical values from a prior release.)	G

SYSFOREIGNKEYS catalog table

The SYSFOREIGNKEYS table contains one row for every column of every foreign key. The schema is SYSIBM.

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table that contains the column.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table that contains the column.	G
RELNAME	VARCHAR(128) NOT NULL	Constraint name for the constraint for which the column is part of the foreign key.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column.	G
COLNO	SMALLINT NOT NULL	Numeric place of the column in its table.	G
COLSEQ	SMALLINT NOT NULL	Numeric place of the column in the foreign key.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSINDEXCLEANUP catalog table

The rows in the SYSIBM.SYSINDEXCLEANUP table specify time windows to control index cleanup processing. Each row specifies a time window to enable or disable the cleanup of pseudo-deleted index entries for specific database objects. The schema is SYSIBM.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24)	The name of the database that contains the index space.	G
INDEXSPACE	VARCHAR(24)	The name of the index space.	G
ENABLE_DISABLE	CHAR(1) NOT NULL	Specifies whether the row enables or disables cleanup for the specified index space. **'E'** Enabled **'D'** Disabled	G
MONTH_WEEK	CHAR(1) NOT NULL	Indicates the meaning of the value of the DAY column: **'M'** The value indicates the day of the month. **'W'** The value indicates a day of the week.	G
MONTH	SMALLINT	The month in which the time window applies. For example a 1 value indicates January and a 12 value indicates December. If this column contains NULL, the time window applies to all months. If the value of the MONTH_WEEK column is 'W', this value must be NULL.	G
DAY	SMALLINT	The day of the month or the day of the week for which the time window applies, as specified by the value of the MONTH_WEEK column. For example, if MONTH_WEEK='W', a 1 value indicates Monday and 7 indicates Sunday. If the value of this column is NULL, the time window applies to every day of the month or every day of the week.	G
START_TIME	TIME	The local time at the beginning of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the END_TIME column contains NULL.	G

Column name	Data type	Description	Use
END_TIME	TIME	The local time at the end of the time window specified by the row. When this column contains a null value, the row applies at all times on the specified days. This column must contain NULL if the START_TIME column contains NULL.	G

SYSINDEXES catalog table

The SYSINDEXES table contains one row for every index. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G

Column name	Data type	Description	Use
UNIQUERULE	CHAR(1) NOT NULL	Whether the index is unique: **C** Yes, and it is used to enforce the uniqueness of a UNIQUE constraint or hash key columns. **D** No (duplicates are allowed) **U** Yes **P** Yes, and it is a primary index (As in prior releases of Db2, a value of P is used for primary keys that are used to enforce a referential constraint.) **N** Yes, and it is defined with UNIQUE WHERE NOT NULL **R** Yes, and it is an index used to enforce the uniqueness of a non-primary parent key **G** Yes, and it is an index used to enforce the uniqueness of values in a column defined as ROWID GENERATED BY DEFAULT **X** Yes, and it is an index used to enforce the uniqueness of values in a column that is used to identify or find XML values associated with a specific row.	G
COLCOUNT	SMALLINT NOT NULL	The number of columns in the key.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified for the index: **N** No **Y** Yes	G
CLUSTERED	CHAR(1) NOT NULL	Whether the table is actually clustered by the index: **N** A significant number of rows are not in clustering order, or statistics have not been gathered. **Y** Most of the rows are in clustering order. **blank** Not applicable. This is an updatable column that can also be changed by the RUNSTATS utility. For a sparse index, the statistic is based on the actual contents of the index.	G

Column name	Data type	Description	Use
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
OBID	SMALLINT NOT NULL	Internal identifier of the index fan set descriptor.	S
ISOBID	SMALLINT NOT NULL	Internal identifier of the index page set descriptor.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the index.	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space.	G
FIRSTKEYCARD	INTEGER NOT NULL	Not used	N
FULLKEYCARD	INTEGER NOT NULL	Not used	N
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered. This is an updatable column.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered. This is an updatable column.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the index.	G
PGSIZE	SMALLINT NOT NULL	Contains the value 4, 8, 16, or 32 which indicates the size, in KB, of the leaf pages in the index. If the index was created prior to DB2 9, the value will be 4096 for a 4 KB page size.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are erased when dropped. The value is meaningless if the index is partitioned: **N** No **Y** Yes	G
DSETPASS	VARCHAR(24) NOT NULL	Not used	N

Column name	Data type	Description	Use
CLOSERULE	CHAR(1) NOT NULL	Whether the data sets are candidates for closure when the limit on the number of open data sets is reached: **N** No **Y** Yes	G
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the index, as determined by the last execution of the STOSPACE utility. The value is 0 if the index is not related to a storage group, or if STOSPACE has not been run. If the index space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are defined in a storage group.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CLUSTERRATIO	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the index.	G
IOFACTOR	SMALLINT NOT NULL	Internal use only.	I
PREFETCHFACTOR	SMALLINT NOT NULL	Not used	N
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G

Column name	Data type	Description	Use
INDEXTYPE	CHAR(1) NOT NULL WITH DEFAULT	The index type: **2** Type 2 index or a hash overflow index on non-partitioned tables. **blank** Type 1 index **D** Data-partitioned secondary index **P** An index that is both partitioned and is a partitioning index (index that is on a table that uses table-controlled partitioning).	G
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	S
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the index. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
PIECESIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in kilobytes for non-partitioned indexes. A value of zero (0) indicates that the index is a partitioned index or that the index was created in a Db2 release prior to Version 5.	G
COPY	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether COPY YES was specified for the index, which indicates if the index can be copied and if SYSIBM.SYSLGRNX recording is enabled for the index. **N** No **Y** Yes	G

Column name	Data type	Description	Use
COPYLRSN	CHAR(10) NOT NULL WITH DEFAULT X'000000000000 00000000' FOR BIT DATA	The value can be either an RBA or LRSN. (LRSN is only for data sharing.) If the index is currently defined as COPY YES, the value is the RBA or LRSN when the index was created with COPY YES or altered to COPY YES, not the current RBA or LRSN. If the index is currently defined as COPY NO, the value is set to X'00000000000000000000' if the index was created with COPY NO; otherwise, if the index was altered to COPY NO, the value in COPYLRSN is not changed when the index is altered to COPY NO.	G
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	When multiplied by 100, the value of the column is the percentage of rows that are in clustering order. For example, a value of '.9125' indicates 91.25%. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table, a node ID index or an XML index. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character field string provided by the user with the COMMENT statement.	G
PADDED	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether keys within the index are padded for varying-length column data: **Y** The index contains varying-length character or graphic data and is PADDED (the varying-length columns are padded to their maximum length). **N** The index contains varying-length character or graphic data and is NOT PADDED (the varying-length columns are not padded to their maximum length). Index-only access to all column data is possible. **blank** The index does not contain varying-length character or graphic data, or the index was created or altered prior to DB2 Version 8.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this index. A value of zero indicates that a version-creating alter has never occurred against this index.	G

Column name	Data type	Description	Use
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index space and any image copies of the index.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the index space. A zero indicates that the index space has never had been versioned. After the version number reaches the maximum value, the number will wrap back to one.	G
RELCREATED	CHAR(1) NOT NULL WITH DEFAULT	Release of Db2 that was used to create the object, blank for indexes created before Version 8. For all other values, see Release dependency indicators.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
KEYTARGET_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of key-targets for an extended index. The value is 0 for a simple index.	G
UNIQUE_COUNT	SMALLINT NOT NULL WITH DEFAULT	The number of columns or key-targets that make up the unique constraint of an index, when other non-constraint enforcing columns or key-targets exist. Otherwise the value is 0.	G
IX_EXTENSION_TYPE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the type of extended index: **N** Node ID index **S** Index on a scalar expression **T** Spatial index **V** XML index **blank** Simple index	G
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT ' N'	Indicates whether index compression is active: **N** Index compression is not active **Y** Index compression is active	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the index. The value is an empty string for indexes created in a Db2 release prior to DB2 9.	G

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
DATAREPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
HASH	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is the hash overflow index for a hash table. **N** No. N is the default. **Y** Yes	G
SPARSE	CHAR(1) NOT NULL WITH DEFAULT N	Whether the index is sparse or not. **N** No. N is the default. Every data row has an index entry. **Y** Yes. This index might not have an entry for each data row in the table. **X** Excluded. This index will not have an index entry when every data row for a key column contains the NULL value.	G
PARSETREE	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I
RTSECTION	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSINDEXES_HIST catalog table

The SYSINDEXES_HIST catalog table contains rows from SYSINDEXES. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the index is defined.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
CLUSTERING	CHAR(1) NOT NULL	Whether CLUSTER was specified when the index was created: **N** No **Y** Yes	G
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. If the index is partitioned, it is the maximum of the number of levels in the index tree for all the partitions. The value is -1 if statistics have not been gathered.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the first key column. This number is an estimate if updated while collecting statistics on a single partition. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of distinct values of the key. The value is -1 if statistics have not been gathered.	S

Column name	Data type	Description	Use
CLUSTERRATIOF	FLOAT(8) NOT NULL	Percentage of rows that are in clustering order. For a partitioning index, it is the weighted average of all index partitions in terms of the number of rows in the partition. The value is 0 if statistics have not been gathered. The value is -2 if the index is for an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
DATAREPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXES_RTSECT catalog table

The SYSINDEXES_RTSECT catalog table is an auxiliary table for the RTSECTION column of the SYSIBM.SYSINDEXES table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSINDEXES_TREE catalog table

The SYSINDEXES_TREE catalog table is an auxiliary table for the PARSETREE column of the SYSINDEXES table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSINDEXPART catalog table

The SYSINDEXPART table contains one row for each nonpartitioned secondary index (NPSI) and one row for each partition of a partitioning index or a data-partitioned secondary index. The schema is SYSIBM.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G

Column name	Data type	Description	Use
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: **E** Explicit, and STORNAME names an integrated catalog facility catalog **I** Implicit, and STORNAME names a storage group	G
STORNAME	VARCHAR(128) NOT NULL	Name of storage group or integrated catalog facility catalog used for space allocation. Blank for the catalog indexes.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation.	G
CARD	INTEGER NOT NULL	Not used	N
FAROFFPOS	INTEGER NOT NULL	Not used	N
LEAFDIST	INTEGER NOT NULL	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index.	S
NEAROFFPOS	INTEGER NOT NULL	Not used	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
LIMITKEY	VARCHAR(512) NOT NULL FOR BIT DATA	The high value of the limit key of the partition in an internal format. An empty string if the index is not partitioned or for a data-partitioned secondary index (DPSI). If any column of the key has a field procedure, the internal format is the encoded form of the value.	S
FREEPAGE	SMALLINT NOT NULL	Number of pages that are loaded before a page is left as free space.	G
PCTFREE	SMALLINT NOT NULL	Percentage of each leaf or nonleaf page that is left as free space.	G

Column name	Data type	Description	Use
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage allocated to the index space partition, as determined by the last execution of the STOSPACE utility. **0** The STOSPACE or RUNSTATS utility has not been run or the data set for the index has been created during the first insert operation or when the LOAD utility was run. **-1** The index was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into the index, and data has yet to be inserted into the index. **A non-negative value** Indicates that the data sets for the index space are defined with the underlying data sets allocated. The STOSPACE utility updates this value if the index is related to a storage group. The RUNSTATS utility updates this value if run with RUNSTATS INDEX and UPDATE(ALL) or UPDATE(SPACE).	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
INDEXTYPE	CHAR(1) NOT NULL	Not used.	N
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option specified for this index or index partition. **blank** Only changed pages are cached in the group buffer pool. **A** Changed and unchanged pages are cached in the group buffer pool. **N** No data is cached in the group buffer pool.	G
FAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S

Column name	Data type	Description	Use
NEAROFFPOSF	FLOAT NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. The value is -2 if the index is an auxiliary index, a node ID index, or an XML index. Not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for this index's data set name. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER INDEX statement was executed for the index. If no ALTER INDEX statement has been applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics have not been gathered. This is an updatable column.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This is an updatable column. This value is only for the last DSNUM for the object.	G
PSEUDO_DEL_ ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries (entries that are logically deleted but still physically present in the index). For a non-unique index, value is the number of RIDs that are pseudo deleted. For a unique index, the value is the number of keys and RIDs that are pseudo deleted. The value is -1 if statistics have not been gathered. This is an updatable column.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S

Column name	Data type	Description	Use
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the oldest format of data in the index part and any image copies of the index part.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT -1	Time when the partition was created.	G
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The RBA and LRSN format for the page sets of the index partition: **B** The page sets are still in the basic 6-byte format. **E** The page sets are converted to the extended 10-byte format. **U** The format is undefined because DEFINE NO was specified when the index was created. **blank** The page sets are still in the basic 6-byte format, the index was created before Db2 11 new-function mode (NFM), and no utility that sets the RBA_FORMAT value has run for the index partition in Db2 11 NFM or higher.	G

SYSINDEXPART_HIST catalog table

The SYSINDEXPART_HIST catalog table contains rows from SYSINDEXPART. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. Zero if index is not partitioned.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G

Column name	Data type	Description	Use
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER INDEX statement. Unlike PQTY, however, PRIQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS INDEX with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER INDEX statement. Unlike SQTY, however, SECQTY asks for space in 1KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE INDEX statement or for any subsequent ALTER INDEX statements. • -1 was the most recently specified value for SECQTY, either on the CREATE INDEX statement or a subsequent ALTER INDEX statement. If a storage group is not used, the value is 0.	G
LEAFDIST	INTEGER NOT NULL WITH DEFAULT -1	100 times the average number of leaf pages between successive active leaf pages of the index. The value is -1 if statistics have not been gathered.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the index space partition. The value is -1 if statistics have not been gathered.	G

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
FAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows far from optimal position because of an insert into a full page. The value is -1 if statistics have not been gathered. The column is not applicable for an index on an auxiliary table. For a sparse index, the statistic is based on the actual contents of the index.	S
NEAROFFPOSF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of referred to rows near, but not at optimal position, because of an insert into a full page. Not applicable for an index on an auxiliary table. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of RIDs in the index that refer to data rows or LOBs. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This value is only for the last DSNUM for the object.	G
PSEUDO_DEL_ ENTRIES	INTEGER NOT NULL WITH DEFAULT -1	Number of pseudo deleted entries. The value is -1 if statistics have not been gathered.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned index spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned index space. The value is -1 if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
LEAFNEAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages physically near previous leaf page for successive active leaf pages. The value is -1 if statistics have not been gathered. This is an updatable column.	S

Column name	Data type	Description	Use
LEAFFAR	INTEGER NOT NULL WITH DEFAULT -1	Number of leaf pages located physically far away from previous leaf pages for successive (active leaf) pages accessed in an index scan. The value is -1 if statistics have not been gathered. This is an updatable column.	S
AVGKEYLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of keys within the index. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXSPACESTATS catalog table

The SYSINDEXSPACESTATS table contains real time statistics for index spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

In data sharing environments, the values in SYSIBM.SYSINDEXSPACESTATS can be negative for short periods of time for certain situations.

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSINDEXSPACESTATS table is inserted or last updated.	G
NLEVELS	SMALLINT	The number of levels in the index tree. A null value indicates that the number of levels is unknown.	G
NPAGES	INTEGER	The number of pages in the index tree that contain only pseudo-deleted index entries. This is an updatable column.	G
NLEAF	INTEGER	The number of leaf pages in the index. This is an updatable column.	G
NACTIVE	INTEGER	The number of active pages in the index space or partition. This value is equivalent to the number of pre-formatted pages. A null value indicates that the number of active pages is unknown.	G
SPACE	INTEGER	The amount of space, in KB, that is allocated to the index space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G
EXTENTS	SMALLINT	The number of extents in the index space or partition. For multi-piece index spaces, this value is the number of extents for the last data sets. For a data set that is stripped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G

Column name	Data type	Description	Use
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the index space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the index space or partition or that the timestamp is unknown.	G
REBUILDLASTTIME	TIMESTAMP	The timestamp that the REBUILD INDEX utility was last run on the index space or partition. A null value indicates that the timestamp that the REBUILD INDEX was last run is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp when the REORG INDEX utility was last run on the index space or partition, or if the REORG INDEX utility has not been run, the time when the index space or partition was created. A null value indicates that the timestamp is unknown.	G
REORGINSERTS	INTEGER	The number of index entries that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G
REORGDELETES	INTEGER	The number of index entries that have been deleted from the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted index entries is unknown.	G
REORGAPPENDINSERT	INTEGER	The number of index entries that have a key value that is greater than the maximum key value in the index or partition that have been inserted into the index space or partition since the last time the REORG, REBUILD INDEX, or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted index entries is unknown.	G
REORGPSEUDODELETES	INTEGER	The number of pseudo-deleted index entries stored in the index space or partition. A pseudo-delete is a RID entry that has been marked as deleted. A null value indicates that the number of pseudo-deleted index entries is unknown.	G

Column name	Data type	Description	Use
REORGMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
REORGLEAFNEAR	INTEGER	The net number of leaf pages located physically near previous pages for successive active leaf pages that occurred since the last REORG, REBUILD INDEX, or LOAD REPLACE, or since the object was created. The distance between leaf pages is optimal if the difference is 1 and considered near if the distance is 2-16. An index page is added during a page split and the distance between the predecessor and successor pages can lower this count if the distance between the two was near. The distance between the predecessor and new page increase the count if they are near. The distance between the new page and successor increment the count if they are near. If a leaf page is deleted the distance between the new predecessor and successor pages can increment this count if the distance between the two is near. The distance between the predecessor and the deleted page decrement the count if it was near. The distance between the successor and the deleted page decrement the count if it was near. A null value means that the value is unknown. A negative value is possible in some cases.	G

Column name	Data type	Description	Use
REORGLEAFFAR	INTEGER	The net number of leaf pages located physically far away from previous leaf pages for successive active leaf pages that occurred since the last REORG, REBUILD INDEX, or LOAD REPLACE, or since the object was created. The distance between leaf pages is optimal if the difference is 1 and considered far if the distance is greater than 16. An index page is added during a page split and the distance between the predecessor and successor pages can decrement this count if the distance between the two was far. The distance between the predecessor and new page increment the count if they are far. The distance between the new page and successor increment the count if they are far. If a leaf page is deleted the distance between the new predecessor and successor pages can increment this count if the distance between the two is far. The distance between the predecessor and the deleted page decrement the count if it was far. The distance between the successor and the deleted page decrement the count if it was far. A null value means that the value is unknown.	G
REORGNUMLEVELS	INTEGER	The number of levels in the index tree that were added or removed since the last REORG, REBUILD INDEX, or LOAD REPLACE, or the object was created. A null value means that the number of added or deleted levels is unknown.	G
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the index space or partition. A null value means that RUNSTATS has never been run on the index space or partition, or that the timestamp of the last RUNSTATS is unknown.	G
STATSINSERTS	INTEGER	The number of index entries that have been inserted into the index space or partition since the last time that the RUNSTATS utility was run. A null value indicates that the number of inserted index entries is unknown.	G
STATSDELETES	INTEGER	The number of index entries that have been deleted since the last RUNSTATS on the index space or partition. A null value means that the number of deleted index entries is unknown.	G

Column name	Data type	Description	Use
STATSMASSDELETE	INTEGER	The number of times that the index or index space partition was mass deleted since the last RUNSTATS, or the object was created. A null value indicates that the number of mass deletes is unknown.	G
COPYLASTTIME	TIMESTAMP	The timestamp of the last full image copy on the index space or partition. A null value means that COPY has never been run on the index space or partition, or that the timestamp of the last full image copy is unknown.	G
COPYUPDATEDPAGES	INTEGER	The number of distinct pages that have been updated since the last time that the COPY utility was run. A null value indicates that the number of updated pages is unknown.	G
COPYCHANGES	INTEGER	The number of insert, update, and delete operations since the last time that the COPY utility was run. A null value indicates that the number of insert, update, and delete operations is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run. A null value indicates that the LRSN or RBA is unknown.	G
COPYUPDATETIME	TIMESTAMP	The timestamp of the first update that occurs after the last time that the COPY utility was run. A null value indicates that the timestamp is unknown.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database.	G
ISOBID	SMALLINT NOT NULL	The internal identifier of the index space page set descriptor.	I
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor for the table space that is associated with the index.	G

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	The data set number within the index space. For partitioned index spaces, this value corresponds to the partition number for a single partition. For non-partitioned index spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set 1 or 2. This is an updatable column.	G
TOTALENTRIES	BIGINT	The number of entries, including duplicate entries, in the index space or partition. A null value indicates that the number of entries is unknown.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database.	G
NAME	VARCHAR(128) NOT NULL	The name of the index.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the index.	G
INDEXSPACE	VARCHAR(24) NOT NULL	The name of the index space.	G
LASTUSED	DATE	The date when the index was last used in an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement, or was used to enforce referential integrity constraints. If this field value indicates that an index has not been used for an extended period of time, consider dropping the index. For a data-partitioned secondary index, this column is only updated for one partition, even though more than one partition is accessed. The default value is NULL.	G

Column name	Data type	Description	Use
REORGINDEXACCESS	BIGINT	The number of times since the object was created, or since the last REORG, REBUILD INDEX, or LOAD REPLACE, that the index was used in one of the following situations: • In an access path for a SELECT, FETCH, searched UPDATE, or searched DELETE statement • For enforcement of referential integrity constraints For hash overflow indexes, this value is the number of times that Db2 used the hash overflow index. Use this value with other recommendations to determine when to run REORG INDEX. For example, when the ratio of SYSTABLESPACESTATS.TOTALROWS to SYSINDEXSPACESTATS.TOTALENTRIES indicates that REORG INDEX needs to be run, but this value is very low, REORG INDEX might not yet be necessary. A null value indicates that the number of times the index was used is unknown.	G
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the index or index partition data set is defined. **HDD** Hard Disk Drive **SSD** Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used.	G
—	BIGINT	Reserved for future IBM use.	R

SYSINDEXSTATS catalog table

The SYSINDEXSTATS table contains one row for each partition of a partitioning index or a data-partitioned secondary index. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
FIRSTKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARD	INTEGER NOT NULL	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
NLEAF	INTEGER NOT NULL	Number of active leaf pages in the index partition.	S
NLEVELS	SMALLINT NOT NULL	Number of levels in the index tree.	S
IOFACTOR	SMALLINT NOT NULL	Not used.	N
PREFETCHFACTOR	SMALLINT NOT NULL	Not used.	N
CLUSTERRATIO	SMALLINT NOT NULL	For the index partition, the percentage of rows that are in clustering order. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	N
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G

Column name	Data type	Description	Use
KEYCOUNT	INTEGER NOT NULL	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
FIRSTKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. For a sparse index, the statistic is based on the actual contents of the index.	S
FULLKEYCARDF	FLOAT NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. For a sparse index, the statistic is based on the actual contents of the index.	S
KEYCOUNTF	FLOAT WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT NOT NULL WITH DEFAULT	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '.9125' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
DATAREPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSINDEXSTATS_HIST catalog table

The SYSINDEXSTATS_HIST catalog table contains rows from the SYSINDEXSTATS table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NLEAF	INTEGER NOT NULL WITH DEFAULT -1	Number of active leaf pages in the index partition. The value is -1 if statistics have not been gathered.	S
NLEVELS	SMALLINT NOT NULL WITH DEFAULT -1	Number of levels in the index tree. The value is -1 if statistics have not been gathered.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
PARTITION	SMALLINT NOT NULL	Partition number of the index.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the index.	G
NAME	VARCHAR(128) NOT NULL	Name of the index.	G
FIRSTKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the first key column. The value is -1 if statistics have not been gathered.	S
FULLKEYCARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	For the index partition, number of distinct values of the key. The value is -1 if statistics have not been gathered.	S
KEYCOUNTF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of RIDs in the index partition. The value is -1 if statistics have not been gathered.Total number of rows in the partition. The value is -1 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	S
CLUSTERRATIOF	FLOAT(8) NOT NULL	For the index partition, the value, when multiplied by 100, is the percentage of rows that are in clustering order. For example, a value of '0.9125' indicates 91.25%. The value is 0 if statistics have not been gathered. For a sparse index, the statistic is based on the actual contents of the index.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DATAREPEATFACTORF	FLOAT NOT NULL WITH DEFAULT -1	The anticipated number of data pages that will be touched following an index key order. This number is -1 if statistics have not been collected. This is an updatable column. For a sparse index, the statistic is based on the actual contents of the index.	G

SYSJARCLASS_SOURCE catalog table

The SYSJARCLASS_SOURCE catalog table is an auxiliary table for SYSIBM.SYSJARCONTENTS. The schema is SYSIBM.

Column name	Data type	Description	Use
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G

SYSJARCONTENTS catalog table

The SYSJARCONTENTS table contains Java class source for an installed JAR file. The schema is SYSIBM.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
CLASS	VARCHAR(384) NOT NULL	The class name contained in the JAR file.	G
CLASS_SOURCE_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support CLOB data type.	G
CLASS_SOURCE	CLOB(10M) NOT NULL	The contents of the class in the JAR file.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSJARDATA catalog table

The SYSJARDATA table is an auxiliary table for SYSIBM.SYSJAROBJECTS. The schema is SYSIBM.

Column name	Data type	Description	Use
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file.	G

SYSJAROBJECTS catalog table

The SYSJAROBJECTS table contains binary large object representing the installed JAR file. The schema is SYSIBM.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
JAR_DATA_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID used to support BLOB data type.	G
JAR_DATA	BLOB(100M) NOT NULL	The contents of the JAR file. This is an updatable column.	G
PATH	VARCHAR(2048) NOT NULL	The class resolution path of the JAR file. This is an updatable column.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the JAR object was created.	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the JAR object was altered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSJAVAOPTS catalog table

The SYSJAVAOPTS table contains build options used during INSTALL_JAR. The schema is SYSIBM.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G
BUILDSCHEMA	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
DBRMLIB	VARCHAR(256) NOT NULL	PDS name where DBRM is located.	G
HPJCOMPILE_OPTS	VARCHAR(512) NOT NULL	HPJ compile options used to install the routine.	G
BIND_OPTS	VARCHAR(2048) NOT NULL	Bind options used to install the routine.	G
POBJECT_LIB	VARCHAR(256) NOT NULL	PDSE name where program object is located.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSJAVAPATHS catalog table

The SYSJAVAPATHS table contains the complete class resolution path of a JAR file, and records the dependencies that one JAR file has on the JAR files in its Java path. The schema is SYSIBM.

Column name	Data type	Description	Use
JARSCHEMA	VARCHAR(128) NOT NULL	The schema of the JAR file.	G
JAR_ID	VARCHAR(128) NOT NULL	The name of the JAR file.	G

Column name	Data type	Description	Use
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the owner of the JAR object.	G
ORDINAL	SMALLINT NOT NULL	The ordinal number of the path element within the JAR file's Java path.	G
PE_CLASS_PATTERN	VARCHAR(2048) NOT NULL	The pattern for the names of the classes that are to be searched for in this path element's JAR file.	G
PE_JARSCHEMA	VARCHAR(128) NOT NULL	The schema of this path element's JAR file.	G
PE_JAR_ID	VARCHAR(128) NOT NULL	The name of this path element's JAR file.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSKEYCOLUSE catalog table

The SYSKEYCOLUSE table contains a row for every column in a unique constraint (primary key or unique key) from the SYSIBM.SYSTABCONST table. The schema is SYSIBM.

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key (the first position in the key is 1).	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table on which the constraint is defined.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: **B** The column is the start of the period BUSINESS_TIME. **C** Column is the end of period BUSINESS_TIME. **blank** Column is not used as either the start or the end of a BUSINESS_TIME period.	G

SYSKEYS catalog table

The SYSKEYS table contains one row for each column of an index key. The schema is SYSIBM.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXCREATOR	VARCHAR(128) NOT NULL	Schema or qualifier of the index.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column of the key.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table. For example, 4 (out of 10).	G
COLSEQ	SMALLINT NOT NULL	Numeric position of the column in the key for an index on columns. For example, 4 (out of 4). The value is meaningless for an expression-based index.	G
ORDERING	CHAR(1) NOT NULL	Order of the column in the key: **blank** Index is an expression-based index or the column is specified for the index using the INCLUDE clause **A** Ascending order **D** Descending order **R** Random order	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PERIOD	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the column is the start or end column for the BUSINESS_TIME period: **B** The column is the start of the period BUSINESS_TIME. **C** Column is the end of period BUSINESS_TIME. **blank** Column is not used as either the start or the end of a BUSINESS_TIME period.	G

SYSKEYTARGETS catalog table

The SYSKEYTARGETS table contains one row for each key-target that is participating in an extended index definition. The schema is SYSIBM.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
COLNO	SMALLINT NOT NULL	Numeric position of the column in the table if the expression is a single column. Otherwise the value is 0. For XML indexes, this field is also 0.	G
ORDERING	CHAR(1) NOT NULL	Order of the key: **A** Ascending	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type.	G

Column name	Data type	Description	Use
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this column contains 0. For a distinct type, this column contains the internal ID of the built-in type on which the distinct type is based.	G
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. **data type** **value of the LENGTH column** **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** The length of the string **VARCHAR** The maximum length of the string **DECIMAL** The precision of the number **GRAPHIC** The number of DBCS characters **VARGRAPHIC** The maximum number of DBCS characters **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((*p*+1)/2) + 7 where *p* is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((*p*+1)/2) + 9 where *p* is the precision of the timestamp **BIGINT** 8 **BINARY** The length of the string **VARBINARY** The maximum length of the string **DECFLOAT** 8 or 16	G

Column name	Data type	Description	Use
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: **0** Not a ROWID column **40** For a ROWID column, the length of the value that is returned	G
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: **N** No **Y** Yes. Y also indicates that the index is an XML index.	G
CCSID	INTEGER NOT NULL	The CCSID of the key. CCSID contains 0 if the key is a non-character type key.	G
SUBTYPE	CHAR(1) NOT NULL	SUBTYPE applies to character keys only and indicated the subtype of the data: **B** BIT data **M** MIXED data **S** SBCS data **blank** non-character data	G
—	VARCHAR(512) NOT NULL FOR BIT DATA	Internal use only.	I
CREATEDTS	TIMESTAMP NOT NULL	The timestamp for when the key-target is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 in which the key-target is created. SeeRelease dependency indicators for values.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
DERIVED_FROM	VARCHAR(4000) NOT NULL	For an index on a scalar expression, DERIVED_FROM contains the text of the scalar expression that is used to generated the key-target value. For an XML index, this is the XML pattern that is used to generate the key-target value. Otherwise DERIVED_FROM contains an empty string.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	S
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value. HIGH2KEY is an updatable column.	S
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value. LOW2KEY is an updatable column.	S
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded STATS_FORMAT is an updatable column.	G

SYSKEYTARGETSTATS catalog table

The SYSKEYTARGETSTATS table contains partition statistics for selected key-targets. For each key-target, a row exists for each partition in the table.

Rows are inserted when RUNSTATS collects indexed key statistics or non-indexed key statistics for a partitioned table space. No row is inserted if the table space is nonpartitioned. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
HIGHKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The highest key value.	S
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	S
LOWKEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The lowest key value.	S
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	S
PARTITION	SMALLINT NOT NULL	The partition number of the table space.	G
—	VARCHAR(1000) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of distinct values for the key target.	S

SYSKEYTARGETS_HIST catalog table

The SYSKEYTARGETS_HIST table contains rows from the SYSKEYTARGETS table. The schema is SYSIBM.

Whenever rows are added or changed in SYSKEYTARGETS, the rows are also written to this table. Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
IXNAME	VARCHAR(128) NOT NULL	Name of the index.	G
IXSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type.	G
DATATYPEID	INTEGER NOT NULL	The internal ID of the data type.	G
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, this field contains 0. For a distinct type, this field contains the internal ID of the built-in type on which the distinct type is based.	G

Column name	Data type	Description	Use
LENGTH	SMALLINT NOT NULL	The length attribute of the key-target or its precision for a decimal key-target. The number does not include the internal prefixes that are used to record the actual length and null states, when applicable. **data type** **value of the LENGTH column** **INTEGER** 4 **SMALLINT** 2 **FLOAT** 4 or 8 **CHAR** The length of the string **VARCHAR** The maximum length of the string **DECIMAL** The precision of the number **GRAPHIC** The number of DBCS characters **VARGRAPHIC** The maximum number of DBCS characters **DATE** 4 **TIME** 3 **TIMESTAMP WITHOUT TIME ZONE** The integral part of ((*p*+1)/2) + 7 where *p* is the precision of the timestamp **TIMESTAMP WITH TIME ZONE** The integral part of ((*p*+1)/2) + 9 where *p* is the precision of the timestamp **BIGINT** 8 **BINARY** The length of the string **VARBINARY** The maximum length of the string **DECFLOAT** 8 or 16	G
LENGTH2	INTEGER NOT NULL	The maximum length of the data that is retrieved from the column. Possible values include the following values: **0** Not a ROWID column **40** For a ROWID column, the length of the value that is returned	G

Column name	Data type	Description	Use
SCALE	SMALLINT NOT NULL	The scale of decimal data or number of fractional second digits of timestamp or timestamp with time zone data. Otherwise the value is 0. If the column is a timestamp type, the LENGTH is 10 and the SCALE is 0, the number of fractional second digits is 6.	G
NULLS	CHAR(1) NOT NULL	Whether the key can contain null values: **N** No **Y** Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	The estimated number of distinct values for the key-target. The value is -2 if the index is a node ID index. For an XML value index, the statistic is collected for the second key target (the DOCID column). For all other key targets of the XML value index, a value of -2 is set.	G
HIGH2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second highest key-value.	G
LOW2KEY	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	The second lowest key-value.	G
STATS_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The type of statistics that are gathered: **N** VARCHAR column statistical values are not padded **blank** Statistics have not been collects or VARCHAR column statistical values are padded	G

SYSKEYTGTDIST catalog table

The SYSKEYTGTDIST table contains one or more rows for the first key-target of an extended index key. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G

Column name	Data type	Description	Use
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	S
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	S
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains a value that indicates the percentage of entries in the index that have the value that is contained in the KEYVALUE column. When TYPE='H', FREQUENCYF contains a value that indicates the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in the QUALTILENO column. To determine the percentage from the value of FREQUENCYF, multiply the value by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates '15.3' percent.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSKEYTGTDISTSTATS catalog table

The SYSKEYTGTDISTSTATS table contains zero or more rows per partition for the first key-target of a data-partitioned secondary index.

Rows are inserted when RUNSTATS scans a data-partitioned secondary index. No row is inserted if the index is a secondary index. Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PARTITION	SMALLINT NOT NULL	The partition number of the table space that contains the index in which the key is defined.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	Numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	S
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G

Column name	Data type	Description	Use
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in the quantile that is in QUANTILENO.	S
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT	Identifies the set of keys that are associated with the statistics. If the statistics are only associated with a single key, KEYGROUPKEYNO contains a zero length value. Otherwise, KEYGROUPKEYNO contains an array of SMALLINT key numbers that have a dimension that is equal to the value in NUMKEYS.	S
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT	Identifies the number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUALTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE is the lower bound for the quantile that is indicated in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE is the upper bound for the quantile that is indicated in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G
—	VARCHAR(1000)	Internal use only.	I

SYSKEYTGTDIST_HIST catalog table

The SYSKEYTGTDIST_HIST table contains rows from the SYSKEYTGTDIST table. Whenever rows are added or changed in SYSKEYTGTDIST, the rows are also written to this table.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.	G
IXNAME	VARCHAR(128) NOT NULL	The name of the index.	G
KEYSEQ	SMALLINT NOT NULL	The numeric position of the key-target in the index.	G
KEYVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	KEYVALUE contains the data of a frequently occurring value. If the value has a non-character data type, the data might not be printable.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT 'F'	The type of statistics that are gathered: **C** Cardinality **F** Frequent value **N** Non-padded frequent value **H** Histogram statistics	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='C', CARDF contains the number of distinct values for the key group. When TYPE='H', CARDF contains the number of distinct values for the key group in a quantile indicated by QUANTILENO.	G
KEYGROUPKEYNO	VARCHAR(254) NOT NULL WITH DEFAULT FOR BIT DATA	KEYGROUPKEYNO contains a value that identifies the set of keys that are associated with the statistics. KEYGROUPKEYNO contains 0 if the statistics are only associated with a single key. If the statistics are associated with more than a single key, KEYGROUPKEYNO contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS.	G

Column name	Data type	Description	Use
NUMKEYS	SMALLINT NOT NULL WITH DEFAULT -1	The number of keys that are associated with the statistics.	G
FREQUENCYF	FLOAT NOT NULL WITH DEFAULT -1	When TYPE='F' or 'N', FREQUENCYF contains the percentage of entries in the index that have the value that is specified in KEYVALUE when the number of entries is multiplied by 100. For example, a value of '1' indicates 100 percent. A value of '.153' indicates 15.3 percent. When TYPE='H', FREQUENCYF contains the percentage of entries in the index that have a value that is in the range of the quantile that is indicated in QUALTILENO.	G
QUANTILENO	SMALLINT NOT NULL WITH DEFAULT -1	QUANTILENO contains an ordinary sequence number of a quantile in the whole consecutive value range, from low to high.	G
LOWVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', LOWVALUE contains the lower bound for the quantile that is in QUANTILENO. LOWVALUE is not used if TYPE does not equal 'H'.	G
HIGHVALUE	VARCHAR(2000) NOT NULL WITH DEFAULT FOR BIT DATA	When TYPE='H', HIGHVALUE contains the upper bound for the quantile that is in QUANTILENO. HIGHVALUE is not used if TYPE does not equal 'H'.	G

SYSLOBSTATS catalog table

The SYSLOBSTATS table contains one row for each LOB table space. The schema is SYSIBM.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
AVGSIZE	INTEGER NOT NULL	Average size of a LOB, measured in bytes, in the LOB table space.	S
FREESPACE	INTEGER NOT NULL	Number of kilobytes of available space in the LOB table space.	S

Column name	Data type	Description	Use
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSLOBSTATS_HIST catalog table

The SYSLOBSTATS_HIST table contains rows from SYSIBM.SYSLOBSTATS. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
FREESPACE	INTEGER NOT NULL	Number of pages of free space in the LOB table space.	S
ORGRATIO	DECIMAL(5,2) NOT NULL	The percentage of organization in the LOB table space. A value of '100' indicates perfect organization of the LOB table space. A value of '1' indicates that the LOB table space is disorganized. A value of '0' indicates that the LOB table space is totally disorganized.	S
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the LOB table space named in NAME.	G
NAME	VARCHAR(24) NOT NULL	Name of the LOB table space.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSOBJROLEDEP catalog table

The SYSOBJROLEDEP table lists the dependent objects for each role. The schema is SYSIBM.

Column name	Data type	Description	Use
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that created the object.	G
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: **L** Role **blank** Authorization ID	G
ROLENAME	VARCHAR(128) NOT NULL	Name of the role on which there is a dependency.	G
DSCHEMA	VARCHAR(128) NOT NULL	Name of the schema of the dependent object.	G
DNAME	VARCHAR(762) NOT NULL	Name of the dependent object.	G

Column name	Data type	Description	Use
DTYPE	CHAR(1) NOT NULL	The type of the dependent object in DNAME: **B** Trigger **D** Database **E** Distinct type **F** User-defined function **H** Global variable **I** Index **J** JAR file **L** Role **M** Materialized query table **N** Trusted context **O** Stored procedure **Q** Sequence **R** Table space **S** Storage group **T** Table **V** View **X** Row permission **Y** Column mask **0 (zero)** Alias	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPACKAGE catalog table

The SYSPACKAGE table contains a row for every package. The schema is SYSIBM.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. For a package derived from a Db2 DBRM, this is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the package. The creator is the authorization ID under which the package was bound or rebound. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G

[43] Packages are divided into *sections*. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

[44] The value is not updated instantly. There might be a delay of several days before the value is updated.

Column name	Data type	Description	Use
PKSIZE	INTEGER NOT NULL	Size of the base section[43] of the package, in bytes.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[43] of the plan that contain SQL statements processed at bind time.	G
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G
VALID	CHAR(1) NOT NULL	Whether the package is valid: **A** An ALTER statement changed the description of the table or base table of a view referred to by the package. The changes do not invalidate the package. However, a rebind might be required for the package to pick up the changes from the ALTER statement. **H** An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of Db2 prior to Version 5, the change invalidates the package. **N** No **Y** Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: **N** No; an explicit BIND or REBIND is required before the package can be allocated. **Y** Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed at bind time. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G

Column name	Data type	Description	Use
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not specified, and therefore at the level specified for the plan executing the package	G
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: **C** Value used was COMMIT. **D** Value used was DEALLOCATE. **I** The local package is inheriting the value from the plan **blank** Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: **N** No **Y** Yes	G
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: **N** Period **Y** Comma	G

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	Host language, or a value set by the program preparation process: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **J** Java **P** PL/I **R** REST **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++ **blank** For remotely bound packages, trigger packages (TYPE='T'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **K** Yes **A** No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 99): **N** No **Y** Yes	G

Column name	Data type	Description	Use
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 232): **N** No **Y** Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: **A** Data currency is required for all cursors. Inhibit blocking for all cursors. **B** Data currency is not required for ambiguous cursors. **C** Data currency is required for ambiguous cursors. **blank** The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: **C** CONTINUE **N** NOPACKAGE	G
REMOTE	CHAR(1) NOT NULL	Source of the package: **C** Package was created by BIND COPY. **D** Package was created by BIND COPY with the OPTIONS(COMMAND) option. **K** The package was copied from a package that was originally bound on behalf of a remote requester. **L** The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. **N** Package was locally bound from a DBRM. **Y** Package was bound on behalf of a remote requester.	G

Column name	Data type	Description	Use
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-Db2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is blank for a trigger package (TYPE='T') and when the package is created using the BIND PACKAGE command the initial version of the package (TYPE='blank').	G
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: • For Db2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, "<LUSQLDS>"). • For non-Db2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G

Column name	Data type	Description	Use
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **D** DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **E** DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **H** INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior.	G

Column name	Data type	Description	Use
DYNAMICRULES (continued)		**I** INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **R** RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. **blank** DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see “Authorization IDs and dynamic SQL” on page 91.	
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G

Column name	Data type	Description	Use
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: **N** Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. **Y** Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. **I** The local package is inheriting the value from the plan **blank** Bind option not specified for the package. It is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at each commit point. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past each commit point.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses the default SQL path.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: **F** A CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a compiled SQL scalar function package. **N** A CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. **T** A CREATE TRIGGER or ALTER TRIGGER statement for a trigger created the package. **blank** BIND PACKAGE command created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'D'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: **D** DRDA **C** DRDA access with package-based continuous block fetch enabled.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to Db2. Refer to the ACCESSPATH column in the “SYSPACKSTMT catalog table” on page 2306 for information about which statements are using the specified hints.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G

Column name	Data type	Description	Use
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **I** The local package is inheriting the value from the plan **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCODE	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The package created in a Db2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if Db2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): **A** Db2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. **L** Db2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the package is used. The LASTUSED value is set to '0001-01-01' in response to any BIND command for the package, and the value is updated whenever the package is used.[44] The REBIND command has no effect on the value of LASTUSED.	G

Column name	Data type	Description	Use
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G
EXTENDEDINDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option: **blank** Not specified **N** EXTENDEDINDICATOR NO **Y** EXTENDEDINDICATOR YES	G
COPYID	INTEGER NOT NULL	Not used.	N
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option: **E** PLANMGMT EXTENDED **B** PLANMGMT BASIC **blank** PLANMGMT OFF	G
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option: **S** PLANMGMTSCOPE STATIC	G
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option at the conclusion of a successful bind operation. **N** NO or NONE: Access paths were not reused. **W** WARN: Db2 attempted to reuse access paths. If an access path could not be reused, Db2 generated a new access path. **E** ERROR: Access paths were successfully reused. No error condition prevented Db2 from reusing access paths.	G

Column name	Data type	Description	Use
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option: **Y** APRETAINDUP YES specified. All copies were retained. **0** APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences. **1** APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy. **2** APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	G
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option: **Y** References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register. **N** References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	G
RECORDTEMPORALHIST	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.	N
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option: **Y** References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register. **N** References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	G
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT	The application compatibility level of the package: **V11R1** Specifies Db2 11 application compatibility behavior. This value is supported only in Db2 11 new-function mode. **V10R1** Specifies Db2 10 compatibility behavior.	G

Column name	Data type	Description	Use
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the ARCHIVESENSITIVE bind option. **Y** References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value. **N** References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	G
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	Internal use only.	I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option. **Y** The Db2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution. **N** The Db2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements.	G

SYSPACKCOPY catalog table

The SYSPACKCOPY table contains one row for the previous version of each package and one row for the original version of each package. The schema is SYSIBM.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection. For a trigger package, it is the schema name of the trigger.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G

[45] Packages are divided into *sections*. The base section of the package must be in the EDM pool during the entire time the package is executing. Other sections of the package, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Column name	Data type	Description	Use
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	Consistency token for the package. For a package derived from a Db2 DBRM, this is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner. For a trigger package, the value is the authorization ID of the owner of the trigger, which is set to the current authorization ID (the plan or package owner for static CREATE TRIGGER statement; the CURRENT SQLID for a dynamic CREATE TRIGGER statement).	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the creator of the package. The creator is the authorization ID under which the package was bound or rebound. For a trigger package, the value is determined differently. For dynamic SQL, it is the primary authorization ID of the user who issued the CREATE TRIGGER statement. For static SQL, it is the authorization ID of the plan or package owner.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
QUALIFIER	VARCHAR(128) NOT NULL	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the package.	G
PKSIZE	INTEGER NOT NULL	Size of the base section[45] of the package, in bytes.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[45] of the plan that contain SQL statements processed at bind time.	G
SYSENTRIES	SMALLINT NOT NULL	Number of enabled or disabled entries for this package in SYSIBM.SYSPKSYSTEM. A value of 0 if all types of connections are enabled.	G

Column name	Data type	Description	Use
VALID	CHAR(1) NOT NULL	Whether the package is valid: **A** An ALTER statement changed the description of the table or base table of a view referred to by the package. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". The changes do not invalidate the package. **H** An ALTER TABLE statement changed the description of the table or base table of a view referred to by the package. For releases of Db2 prior to Version 5, the change invalidates the package. **N** No **Y** Yes	G
OPERATIVE	CHAR(1) NOT NULL	Whether the package can be allocated: **N** No; an explicit BIND or REBIND is required before the package can be allocated. **Y** Yes	G
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed at bind time. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level when the package was last bound or rebound **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not specified, and therefore at the level specified for the plan executing the package	G

Column name	Data type	Description	Use
RELEASE	CHAR(1) NOT NULL	The value used for RELEASE when the package was last bound or rebound: **C** Value used was COMMIT. **D** Value used was DEALLOCATE. **blank** Not specified, and therefore the value specified for the plan executing the package.	G
EXPLAIN	CHAR(1) NOT NULL	EXPLAIN option specified for the package; that is, whether information on the package's statements was added to the owner of the PLAN_TABLE table: **N** No **Y** Yes	G
QUOTE	CHAR(1) NOT NULL	SQL string delimiter for SQL statements in the package: **N** Apostrophe **Y** Quotation mark	G
COMMA	CHAR(1) NOT NULL	Decimal point representation for SQL statements in package: **N** Period **Y** Comma	G

Column name	Data type	Description	Use
HOSTLANG	CHAR(1) NOT NULL	Host language, or a value set by the program preparation process: **B** Assembler language **C** OS/VS COBOL **D** C **F** Fortran **J** Java **P** PL/I **R** REST **2** VS COBOL II or IBM COBOL Release 1 (formerly called COBOL/370) **3** IBM COBOL (Release 2 or subsequent releases) **4** C++ **blank** For remotely bound packages, trigger packages (TYPE='T'), SQL procedure packages (TYPE='N'), or non-inline SQL scalar function packages (TYPE='F').	G
CHARSET	CHAR(1) NOT NULL	Indicates whether the system CCSID for SBCS data was 290 (Katakana) when the program was precompiled: **K** Yes **A** No	G
MIXED	CHAR(1) NOT NULL	Indicates if mixed data was in effect when the package's program was precompiled (for more on when mixed data is in effect, see “Character strings” on page 99): **N** No **Y** Yes	G

Column name	Data type	Description	Use
DEC31	CHAR(1) NOT NULL	Indicates whether DEC31 was in effect when the package's program was precompiled (for more on when DEC31 is in effect, see “Arithmetic with two decimal operands” on page 232): **N** No **Y** Yes	G
DEFERPREP	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the package was bound or rebound: **A** Data currency is required for all cursors. Inhibit blocking for all cursors. **B** Data currency is not required for ambiguous cursors. **C** Data currency is required for ambiguous cursors. **blank** The package was created before the CURRENTDATA option was available.	G
SQLERROR	CHAR(1) NOT NULL	Indicates the SQLERROR option on the most recent subcommand that bound or rebound the package: **C** CONTINUE **N** NOPACKAGE	G

Column name	Data type	Description	Use
REMOTE	CHAR(1) NOT NULL	Source of the package: **C** Package was created by BIND COPY. **D** Package was created by BIND COPY with the OPTIONS(COMMAND) option. **K** The package was copied from a package that was originally bound on behalf of a remote requester. **L** The package was copied with the OPTIONS(COMMAND) option from a package that was originally bound on behalf of a remote requester. **N** Package was locally bound from a DBRM. **Y** Package was bound on behalf of a remote requester.	G
PCTIMESTAMP	TIMESTAMP NOT NULL	Date and time the application program was precompiled, or '0001-01-01-00.00.00.000000' if the LEVEL precompiler option was used, or if the package came from a non-Db2 location.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package. The value is blank for a trigger package (TYPE='T').	G
PDSNAME	VARCHAR(132) NOT NULL	For a locally bound package, the name of the PDS (library) in which the package's DBRM is a member. For a locally copied package, the value in SYSPACKAGE.PDSNAME for the source package. Otherwise, the product signature of the bind requester followed by one of the following: • For Db2 for z/OS remote requesters, the requester's location name, or IP address, or LU name enclosed in angle brackets (for example, "<LUSQLDS>"). • For non-Db2 for z/OS remote requesters, the requester's IP address or LU name enclosed in angle brackets.	G

Column name	Data type	Description	Use
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the package was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the package was migrated.	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the package was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **D** DEFINEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior. **E** DEFINERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES define behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **H** INVOKEBIND. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES bind behavior.	G

Column name	Data type	Description	Use
DYNAMICRULES (cont.)		**I** INVOKERUN. When the package is run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES invoke behavior. When the package is not run under an active stored procedure or user-defined function, dynamic SQL statements in the package are executed with DYNAMICRULES run behavior. **R** RUN. Dynamic SQL statements are executed with DYNAMICRULES run behavior. **blank** DYNAMICRULES is not specified for the package. The package uses the DYNAMICRULES value of the plan to which the package is appended at execution time. For a description of the DYNAMICRULES behaviors, see "Authorization IDs and dynamic SQL" on page 91.	
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G

Column name	Data type	Description	Use
DEFERPREPARE	CHAR(1) NOT NULL WITH DEFAULT	Whether PREPARE processing is deferred until OPEN is executed: **N** Bind option NODEFER(PREPARE) indicates that PREPARE processing is not deferred until OPEN is executed. **Y** Bind option DEFER(PREPARE) indicates that PREPARE processing is deferred until OPEN is executed. **blank** Bind option not specified for the package. It is inherited from the plan.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at each commit point. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past each commit point.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the package. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses the default SQL path.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package. Identifies how the package is created: **F** CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. **N** CREATE PROCEDURE or ALTER PROCEDURE statement, or BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. **R** CREATE TRIGGER or ALTER TRIGGER statement created the package, and the package is a trigger package that has been created or regenerated in Db2 11 new-function mode or later. **T** CREATE TRIGGER statement prior to Db2 11 new-function mode has created the package, and the package is a trigger package. CREATE TRIGGER statement created the package, and the package is a trigger package. **blank** BIND PACKAGE command created the package.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL is implemented with DRDA access or DRDA access with the capability for package-based continuous block fetch: **D** DRDA **C** DRDA access with the capability for package-based continuous block fetch.	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in owner.PLAN_TABLE that are to be used as input to Db2. Refer to the ACCESSPATH column in the “SYSPACKSTMT catalog table” on page 2306 for information about which statements are using the specified hints.	G

Column name	Data type	Description	Use
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the package was bound prior to Version 7.	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCODE	CHAR(1)	Not used.	N
REMARKS	VARCHAR(550) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the package was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The package created in a Db2 release prior to Version 9.	G
DISTRIBUTE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Determines if Db2 should gather location names from SQL statements, and create remote packages for the user (This only has effect during local bind): **A** Db2 will collect remote location names from SQL statements during local bind, and automatically create remote packages at those sites. The site names are gathered from object names in static SQL statements and literals on CONNECT statements. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package. **L** Db2 will automatically create remote packages at the sites specified in the list of location-names. The sites at which the package is remotely bound can be determined by the location (BTYPE='X') records in SYSIBM.SYSPACKDEP for this package.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	The last date that the corresponding objects are used.	G

Column name	Data type	Description	Use
CONCUR_ACC_RES	CHAR(1) NOT NULL'	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G
EXTENDEDINDICATOR	CHAR(1) NOT NULL WITH DEFAULT	The value of the EXTENDEDINDICATOR bind option: **N** EXTENDEDINDICATOR NO **Y** EXTENDEDINDICATOR YES	G
COPYID	INTEGER NOT NULL	The version of the copy of the package that this row explains: **1** The previous copy of the package **2** The original copy of the package	G
PLANMGMT	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMT bind option: **E** PLANMGMT EXTENDED **B** PLANMGMT BASIC **F** PLANMGMT OFF	G
PLANMGMTSCOPE	CHAR(1) NOT NULL WITH DEFAULT	The value of the PLANMGMTSCOPE bind option: **S** PLANMGMTSCOPE STATIC	G
APREUSE	CHAR(1) NOT NULL WITH DEFAULT	The value of the APREUSE bind option: **N** NO or NONE: Access paths are not reused. **E** ERROR: Db2 tries to reuse access paths. Processing ends when an access path cannot be reused.	I

Column name	Data type	Description	Use
APRETAINDUP	CHAR(1) NOT NULL WITH DEFAULT	The value of the APRETAINDUP bind option: **Y** APRETAINDUP YES specified. All copies were retained. **0** APRETAINDUP NO specified; however, the previous or original package copy is still retained due to access path differences. **1** APRETAINDUP NO specified, and the previous package copy is not retained as the access paths are identical to the current copy. **2** APRETAINDUP NO specified, and the previous and original package copies are not retained as the access paths are identical to the current copy.	G
SYSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the SYSTIMESENSITIVE bind option: **Y** References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register. **N** References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.	G
RECORDTEMPORALHIST	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Not used.	N
BUSTIMESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the BUSTIMESENSITIVE bind option: **Y** References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register. **N** References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.	G
APPLCOMPAT	VARCHAR(10) NOT NULL WITH DEFAULT 'Y'	The value of the APPLCOMPAT bind option: **V10R1** SQL statements in the package have V10R1 compatibility behavior. **V11R1** SQL statements in the package have V11R1 compatibility behavior.	G

Column name	Data type	Description	Use
ARCHIVESENSITIVE	CHAR(1) NOT NULL WITH DEFAULT 'N'	The value of the ARCHIVESENSITIVE bind option. **Y** References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable. Y is the default value. **N** References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.	G
EXTSEQNO	INTEGER NOT NULL WITH DEFAULT 0	Internal use only.	I
DESCSTAT	CHAR(1) NOT NULL WITH DEFAULT	The value of the DESCSTAT bind option. **Y** The Db2 database manager generates a DESCRIBE SQLDA at bind time so that DESCRIBE requests for static SQL can be satisfied during execution. **N** The Db2 database manager does not generate a DESCRIBE SQLDA at bind time for static SQL statements.	G

SYSPACKAUTH catalog table

The SYSPACKAUTH table records the privileges that are held by users over packages. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege. Could also be PUBLIC.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges, the name of a plan that uses the privileges or PUBLIC for a grant to PUBLIC.	G
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Collection name for the package or packages on which the privilege was granted.	G
NAME	VARCHAR(128) NOT NULL	Name of the package on which the privileges are held. An asterisk (*) if the privileges are held on all packages in a collection.	G

Column name	Data type	Description	Use
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Not used.	N
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the privilege was granted.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **A** PACKADM (on collection *) **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **P** PACKADM (on a specific collection) **S** SYSADM **T** DATAACCESS	G

Column name	Data type	Description	Use
BINDAUTH	CHAR(1) NOT NULL	Whether GRANTEE can use the BIND and REBIND subcommands on the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
COPYAUTH	CHAR(1) NOT NULL	Whether GRANTEE can COPY the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the package: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSPACKDEP catalog table

The SYSPACKDEP table records the dependencies of packages on local tables, views, synonyms, table spaces, indexes, aliases, functions, and stored procedures. The schema is SYSIBM.

Access paths for SQL statements might depend on objects that Db2 does not actually use when it processes the selected access paths. Such dependencies are recorded in the SYSPACKDEP catalog table, but they are not be shown in EXPLAIN output.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object that a package depends on. If BTYPE is W or Z, the value is the name of the table on which the period is defined.	G

Column name	Data type	Description	Use
BQUALIFIER	VARCHAR(128) NOT NULL	The value of the column depends on the type of object: • If BNAME identifies a table space (BTYPE is R), the value is the name of its database. • If BNAME identifies a table on which a period is defined (BTYPE is W or Z), the value is the qualifier of that table. • If BNAME identifies user-defined function, a cast function, a stored procedure, or a sequence (BTYPE is F, O, or Q), the value is the schema name. • If BNAME identifies a role, the value is blank. • Otherwise, the value is the schema of BNAME.	G

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME and BQUALIFIER: **A** Alias **E** INSTEAD OF trigger **F** User-defined function or cast function **H** Global variable **G** Global temporary table **I** Index **M** Materialized query table **O** Stored procedure **P** Partitioned table space if it is defined as LARGE or with the DSSIZE parm **Q** Sequence object **R** Table space **S** Synonym **T** Table **U** Distinct type **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period **0 (zero)** Sequence alias	G
DLOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
DCOLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
DNAME	VARCHAR(128) NOT NULL	Name of the package.	G

Column name	Data type	Description	Use
DCONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Owner of the package:	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of package: **F** Compiled SQL scalar function **N** Native SQL routine package **O** Original copy of a package **P** Previous copy of a package **R** Reserved for IBM use **T** Trigger package **blank** Not a trigger package or a native SQL routine package	G
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner of the package: **blank** Authorization ID **L** Role	G

SYSPACKLIST catalog table

The SYSPACKLIST table contains one or more rows for every local application plan bound with a package list. Each row represents a unique entry in the plan's package list. The schema is SYSIBM.

Column name	Data type	Description	Use
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
SEQNO	SMALLINT NOT NULL	Sequence number of the entry in the package list.	G

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Location of the package. Blank if this is local. An asterisk (*) indicates location to be determined at run time.	G
COLLID	VARCHAR(128) NOT NULL	Collection name for the package. An asterisk (*) indicates that the collection name is determined at run time.	G
NAME	VARCHAR(128) NOT NULL	Name of the package. An asterisk (*) indicates an entire collection.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the row was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPACKSTMT catalog table

The SYSPACKSTMT table contains one or more rows for each statement in a package. The schema is SYSIBM.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format	S
SEQNO	INTEGER NOT NULL	Not used.	G

[46] Rows in which the value of SEQNO, STMTNO, and SECTNO are zero are for internal use.
[47] To convert a negative STMTNO to a meaningful statement number that corresponds to your precompile output, add 65536 to it. For example, -26472 is equivalent to +39064 (-26472 + 65536).

Column name	Data type	Description	Use
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero[46] or as a negative number[47]. If the value is zero, see STMTNOI for the statement number.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement.[47] For generated packages for SQL routines, such as procedures and user-defined functions, a value of 1 indicates the control statement for the routine. For trigger packages, a value of 1 indicates the WHEN clause for activating the trigger.	G
BINDERROR	CHAR(1) NOT NULL	Whether an SQL error was detected at bind time: **N** No **Y** Yes	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package.	G
—	VARCHAR(3500) NOT NULL WITH DEFAULT FOR BIT DATA	Internal use only.	I
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read) **L** RS isolation, with a *lock-clause* **X** RR isolation, with a *lock-clause* **blank** The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: **A** Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. **B** Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. **C** Compiled - statement was bound successfully using defaults for input variables during access path selection. **D** Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. **E** Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. **F** Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. **G** Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. **H** Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. **I** Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Column name	Data type	Description	Use
STATUS (cont.)		**J** Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. **K** Control - CALL statement. **L** Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. **M** Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. **O** Compiled for acceleration. The static query was bound successfully for acceleration and will be routed to an accelerator when executed. **blank** The statement is non-executable, or was bound in a Db2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints: **H** Optimization hints were used. **A** The access path was reused because of the APREUSE bind option. **blank** One of the following situations: • The access path was determined without the use of hints, and a previous access path was not reused. • No access path is associated with the statement. • The statement is a dynamic SQL statement	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	If the value of STMTNO is zero, the column contains the statement number of the statement in the source program. If both STMTNO and STMTNOI are zero, the statement number is greater than 32767.	G
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. For generated packages for SQL routines, such as procedures and user-defined functions, a value of 1 indicates the control statement for the routine. For trigger packages, a value of 1 indicates the WHEN clause for activating the trigger.	G

Column name	Data type	Description	Use
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: **Y** Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. **N** Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. **blank** Indicates that the SQL statement was bound prior to Version 7.	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT –1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of –1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, DECLARE CURSOR, or REFRESH TABLE statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
STMT_ID	BIGINT NOT NULL	A unique statement identifier.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G
—	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, Db2 implicitly adds certain syntax to the statement. This column indicates whether this implicit query transformation occurred when the package was bound and why. For dynamic statements, this column is blank. For static statements, this column can have one of the following values: **A** The statement was bound with implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The statement was bound with implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** One of the following events occurred: • The statement did not bind successfully and the VALIDATE(RUN) bind option was used. • The statement was bound without implicit query transformation. If this column is not blank, you can see the resulting access path for the transformed statement by using EXPLAIN. **Related information:** "Built-in global variables" on page 305 "CURRENT TEMPORAL BUSINESS_TIME" on page 194 "CURRENT TEMPORAL SYSTEM_TIME" on page 195 BIND and REBIND options for packages, plans, and services (Db2 Commands)	G

SYSPACKSTMT_STMB catalog table

The SYSPACKSTMT_STMB table is an auxiliary table for the STMTBLOB column of the SYSPACKSTMT table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
—	BLOB(2M) NOT NULL WITH DEFAULT	Internal use only.	I

SYSPACKSTMT_STMT catalog table

The SYSPACKSTMT_STMT table is an auxiliary table for the STATEMENT column of the SYSPACKSTMT table and contains the LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the SQL statement that the row represents.	G

SYSPARMS catalog table

The SYSPARMS table contains a row for each parameter of a routine or multiple rows for table parameters (one for each column of the table). The schema is SYSIBM.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: **N** Not a cast function **Y** A cast function The only way to get a value of Y is if a user creates a distinct type when Db2 implicitly generates cast functions for the distinct type.	G

Column name	Data type	Description	Use
PARMNAME	VARCHAR(128) NOT NULL	Name of the parameter. For a table parameter, the parameter name in the row corresponding to the first column of the table is the parameter name specified on CREATE; an empty string or blanks are stored for the parameter name for the rows corresponding to the remaining columns.	G
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S

Column name	Data type	Description	Use
ROWTYPE	CHAR(1) NOT NULL	The following values indicate the type of parameter described by this row: **P** Input parameter. **O** Output parameter; not applicable for functions **B** Both an input and an output parameter; not applicable for functions **R** Result before casting; not applicable for stored procedures **C** Result after casting; not applicable for stored procedures **S** Input parameter of the underlying built-in source function. For a sourced function and a given ORDINAL value: • The row with ROWTYPE = P describes the input parameter of the user-defined function (identified by ROUTINEID). • The row with ROWTYPE = S describes the corresponding input parameter of the built-in function that is the underlying source function (identified by the SOURCESCHEMA and SOURCESPECIFIC values). A value of 'X' indicates that the row is not used to describe a particular parameter of the routine. Instead, for a routine that was created prior to Version 9, the row is used to record a CCSID for the encoding scheme specified in a PARAMETER CCSID clause, or a DATATYPEID for the representation of the variable length character string parameters of a LANGUAGE C routine, as specified in a PARAMETER VARCHAR clause. For routines created with Version 8 (new function mode) or later releases, the CCSID is recorded in the PARAMETER_CCSID column of SYSROUTINES. For routines created with Version 9 or later releases, the DATATYPEID information to support PARAMETER VARCHAR is recorded in the PARAMETER_VARCHARFORM column of SYSIBM.SYSROUTINES.	G

Column name	Data type	Description	Use
ORDINAL	SMALLINT NOT NULL	If ROWTYPE is B, O, P, or S, the value is the ordinal number of the parameter within the routine signature. If ROWTYPE is C or R, the value depends on the type of function: • For a scalar function, the value is 0. • For a table function, the value is the ordinal number of the column of the output table. If ROWTYPE is X, the value is 0.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	Schema of the data type of the parameter.	G
TYPENAME	VARCHAR(128) NOT NULL	Name of the data type of the parameter.	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. When ROWTYPE is X and ORDINAL is 0, a non-zero DATATYPEID indicates that actual representation, for a LANGUAGE C routine, of any varying length string parameters that appear in the routine's parameter list ot in the RETURNS clause.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based.	S
LOCATOR	CHAR(1) NOT NULL	Indicates whether a locator to a value, instead of the actual value, is to be passed or returned when the routine is called: **N** The actual value is to be passed. **Y** A locator to a value is to be passed	G
TABLE	CHAR(1) NOT NULL	The data type of a column for a table parameter: **N** This is not a table parameter. **Y** This is a table parameter.	G
TABLE_COLNO	SMALLINT NOT NULL	For table parameters, the column number of the table. Otherwise, the value is 0.	G
LENGTH	INTEGER NOT NULL	Length attribute of the parameter or result; If the parameter or result length is determined during function resolution, the length attribute can also be 0. In the case of a decimal parameter or result this is the precision. If the parameter is an array, the value is 0.	G

Column name	Data type	Description	Use
SCALE	SMALLINT NOT NULL	Scale of the data type of the parameter or number of fractional second digits of timestamp or timestamp with time zone parameter. If it is TIMESTAMP parameter where LENGTH is 10 and SCALE is 0, the number of fractional second digits is 6.	G
SUBTYPE	CHAR(1) NOT NULL	If the data type is a distinct type, the subtype of the distinct type, which is based on the subtype of its source type: **B** The subtype is FOR BIT DATA. **S** The subtype is FOR SBCS DATA. **M** The subtype is FOR MIXED DATA. **blank** The source type is not a character type. If the parameter is an array type, the value is blank.	G
CCSID	INTEGER NOT NULL	CCSID of the data type for a character, date, time, timestamp or graphic data type. If the parameter is a datetime array, the value is 0. (not null) When ROWTYPE is X and ORDINAL is 0, the CCSID column is the CCSID for all character and graphic string parameters.	G
CAST_FUNCTION_ID	INTEGER NOT NULL	Internal function ID of the function used to cast the argument, if this function is sourced on another function, or result. Otherwise, the value is 0. Not applicable for stored procedures.	S
ENCODING_SCHEME	CHAR(1) NOT NULL	Encoding scheme of the parameter: **A** ASCII **E** EBCDIC **U** UNICODE **blank** The source type is not a character, graphic, or datetime type. If the parameter is an array type, the value is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the routine. The column is a zero-length string if the value of ORIGIN is not 'I' or if the rows were created prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSPENDINGDDL catalog table

The SYSPENDINGDDL table contains information about which objects have pending definition changes. The entries only exist during the window between when the pending option is executed and when the utility applies these pending changes to the object. The schema is SYSIBM.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database for the pending option.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space for the pending option.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object that contains the pending option.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object that contains the pending option.	G
OBJOBID	SMALLINT NOT NULL	Internal identifier of the object.	S
OBJTYPE	CHAR(1) NOT NULL	Type of object that is identified by OBJSCHEMA and OBJNAME. **I** The object is an index **S** The object is a table space **T** The object is a table	G

Column name	Data type	Description	Use
STATEMENT_TYPE	CHAR(1) NOT NULL	The type of the statement for the pending option. **A** An ALTER statement **R** A RECOVER statement	G
OPTION_ENVID	INTEGER NOT NULL	Internal identifier of the environment for the pending option.	G
OPTION_KEYWORD	VARCHAR(128) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the name of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the name of the RECOVER option.	G
OPTION_VALUE	VARCHAR(4000) NOT NULL	If the row is inserted into this table during execution of a data definition statement, this value is the value of the pending option. If the row is inserted into this table during recovery to a prior point in time, this value is the value of the RECOVER option.	G
OPTION_SEQNO	SMALLINT NOT NULL	The sequence of the pending option within the statement.	G
CREATEDTS	TIMESTAMP(12) NOT NULL	Timestamp when the pending option was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine- readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
ROWID	ROWID	ID to support LOB columns for source text	G
STATEMENT_TEXT	CLOB(2M) NOT NULL	The source text of the original statement for the pending option.	G
COLNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the column with a pending definition change.	G
PARTITION	SMALLINT NOT NULL	The partition number for the partition with a pending definition change. The value is 0 if the pending definition change is for the entire table space or index space.	G

Column name	Data type	Description	Use
PARTITION_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column is populated if the PARTITION column has a non-zero value. The keyword that is associated with the PARTITION clause of the ALTER TABLE statement. For example, suppose that you issued the following statement: `ALTER TABLE ALTER PARTITION` In that case, this column contains ALTER.	G
COLUMN_ KEYWORD	VARCHAR(18) NOT NULL WITH DEFAULT	This column contains the keyword that corresponds to the column that is listed in COLNAME.	G

SYSPENDINGOBJECTS catalog table

The SYSPENDINGOBJECTS table contains the name of and OBID information about objects that are the pending creation. The data sets for these objects are created but the object definition have not been materialized to the catalog. The entries in this table only exist during the time between when the names of the new objects are generated and when the catalog definition of the new objects are materialized. The schema is SYSIBM.

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the base table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database.	S
PSID	SMALLINT NOT NULL	Internal identifier of the base table space page set descriptor.	S
PARTITION	SMALLINT NOT NULL	Partition number with which the object is associated.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the column contained in the base table space with which the object is associated.	G
OBJSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the object.	G
OBJNAME	VARCHAR(128) NOT NULL	Name of the object.	G

Column name	Data type	Description	Use
OBJTYPE	CHAR(1) NOT NULL	Type of object identified by OBJSCHEMA and OBJNAME. **I** The object is an index **S** The object is a table space **T** The object is a table	G
INDEXSPACE	VARCHAR(24) NOT NULL	Name of the index space. An empty string if the object is not an index.	G
OBJOBID	SMALLINT NOT NULL	Internal identifier of the object.	S
OBJPSID	SMALLINT NOT NULL	Internal identifier of the object page set descriptor, or 0 if the object does not have a page set descriptor.	S

SYSPKSYSTEM catalog table

The SYSPKSYSTEM table contains zero or more rows for each package. Each row for a given package represents one or more connections to an environment where the package can be executed. The schema is SYSIBM.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks	S
COLLID	VARCHAR(128) NOT NULL	Name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	Name of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package. This is either: • The "level" as specified by the LEVEL option when the package's program was precompiled • The timestamp indicating when the package's program was precompiled, in an internal format.	S

Column name	Data type	Description	Use
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: **BATCH** TSO batch **CICS** Customer Information Control System **DB2CALL** Db2 call attachment facility **DLIBATCH** DLI batch support facility **IMSBMP** IMS BMP region **IMSMPP** IMS MPP and IFP region **REMOTE** remote server	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: **N** Disabled **Y** Enabled	G
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: • Blank if SYSTEM=BATCH or SYSTEM=DB2CALL • The LU name for a database server if SYSTEM=REMOTE • Either the requester's location (if the product is Db2) or the requester's LU name enclosed in angle brackets if SYSTEM=REMOTE. • The name of a single connection if SYSTEM has any other value. CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all servers or connections for the indicated environment.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPLAN catalog table

The SYSPLAN table contains one row for each application plan. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
BINDDATE	CHAR(6) NOT NULL	Not used.	N
VALIDATE	CHAR(1) NOT NULL	Whether validity checking can be deferred until run time: **B** All checking must be performed during BIND. **R** Validation is done at run time for tables, views, and privileges that do not exist at bind time.	G
ISOLATION	CHAR(1) NOT NULL	Isolation level for the plan: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read)	G
VALID	CHAR(1) NOT NULL	Whether the application plan is valid: **A** An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. For a CREATE INDEX statement involving data sharing, VALID is also marked as "A". **H** An ALTER TABLE statement changed the description of the table or base table of a view that is referred to by the application plan. **N** No **Y** Yes	G

[48] Plans are divided into *sections*. The base section of the plan must be in the EDM pool during the entire time the application program is executing. Other sections of the plan, corresponding roughly to sets of related SQL statements, are brought into the pool as needed.

Column name	Data type	Description	Use
OPERATIVE	CHAR(1) NOT NULL	Whether the application plan can be allocated: **N** No; an explicit BIND or REBIND is required before the plan can be allocated **Y** Yes	G
BINDTIME	CHAR(8) NOT NULL	Not used.	N
PLSIZE	INTEGER NOT NULL	Size of the base section [48] of the plan, in bytes.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
AVGSIZE	INTEGER NOT NULL	Average size, in bytes, of those sections[48] of the plan that contain SQL statements processed at bind time.	G
ACQUIRE	CHAR(1) NOT NULL	When resources are acquired: **A** At allocation **U** At first use	G
RELEASE	CHAR(1) NOT NULL	When resources are released: **C** At commit **D** At deallocation	G
EXREFERENCE	CHAR(1) NOT NULL	Not used.	N
EXSTRUCTURE	CHAR(1) NOT NULL	Not used.	N
EXCOST	CHAR(1) NOT NULL	Not used.	N

Column name	Data type	Description	Use
EXPLAN	CHAR(1) NOT NULL	EXPLAIN option specified for the plan; that is, whether information on the plan's statements was added to the owner's PLAN_TABLE table: **N** No **Y** Yes	G
EXPREDICATE	CHAR(1) NOT NULL	Indicates the CURRENTDATA option when the plan was bound or rebound: **B** Data currency is not required for ambiguous cursors. Allow blocking for ambiguous cursors. **C** Data currency is required for ambiguous cursors. Inhibit blocking for ambiguous cursors. **N** Blocking is inhibited for ambiguous cursors, but the plan was created before the CURRENTDATA option was available.	G
BOUNDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the binder of the plan.	G
QUALIFIER	VARCHAR(128) NOT NULL WITH DEFAULT	Implicit qualifier for the unqualified table, view, index, and alias names in the static SQL statements of the plan.	G
CACHESIZE	SMALLINT NOT NULL WITH DEFAULT	Size, in bytes, of the cache to be acquired for the plan. A value of zero indicates that no cache is used.	G
PLENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of package list entries for the plan. The negative of that number if there are rows for the plan in SYSIBM.SYSPACKLIST but the plan was bound in a prior release after fall back.	G
DEFERPREP	CHAR(1) NOT NULL WITH DEFAULT	Whether the package was last bound with the DEFER(PREPARE) option: **N** No **Y** Yes	G
CURRENTSERVER	VARCHAR(128) NOT NULL WITH DEFAULT	Location name specified with the CURRENTSERVER option when the plan was last bound. Blank if none was specified, implying that the first server is the local Db2 subsystem.	G

Column name	Data type	Description	Use
SYSENTRIES	SMALLINT NOT NULL WITH DEFAULT	Number of rows associated with the plan in SYSIBM.SYSPLSYSTEM. The negative of that number if such rows exist but the plan was bound in a prior release after fall back. A negative value or zero means that all connections are enabled.	G
DEGREE	CHAR(3) NOT NULL WITH DEFAULT	The DEGREE option used when the plan was last bound: **ANY** DEGREE(ANY) **1 or blank** DEGREE(1). Blank if the plan was migrated.	G
SQLRULES	CHAR(1) NOT NULL WITH DEFAULT	The SQLRULES option used when the plan was last bound: **D or blank** SQLRULES(Db2) **S** SQLRULES(STD) **blank** A migrated plan	G
DISCONNECT	CHAR(1) NOT NULL WITH DEFAULT	The DISCONNECT option used when the plan was last bound: **E or blank** DISCONNECT(EXPLICIT) **A** DISCONNECT(AUTOMATIC) **C** DISCONNECT(CONDITIONAL) **blank** A migrated plan	G
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The Db2 data sharing member name of the Db2 subsystem that performed the most recent bind. This column is blank if the Db2 subsystem was not in a Db2 data sharing environment when the bind was performed.	G
DYNAMICRULES	CHAR(1) NOT NULL WITH DEFAULT	The DYNAMICRULES option used when the plan was last bound: **B** BIND. Dynamic SQL statements are executed with DYNAMICRULES bind behavior. **blank** RUN. Dynamic SQL statements in the plan are executed with DYNAMICRULES run behavior.	G
BOUNDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the plan was bound.	G

Column name	Data type	Description	Use
REOPTVAR	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether the access path is determined again at execution time using input variable values: **A** Bind option REOPT(AUTO) indicates that the access path is determined multiple times at execution time depending on the parameter value. **N** Bind option REOPT(NONE) indicates that the access path is determined at bind time. **Y** Bind option REOPT(ALWAYS) indicates that the access path is determined at execution time for SQL statements with variable values. **1** Bind option REOPT(ONCE) indicates that the access path is determined only once at execution time, using the first set of input variable values, regardless of how many times the same statement is executed.	G
KEEPDYNAMIC	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether prepared dynamic statements are to be purged at each commit point: **N** The bind option is KEEPDYNAMIC(NO). Prepared dynamic SQL statements are destroyed at commit or rollback. **Y** The bind option is KEEPDYNAMIC(YES). Prepared dynamic SQL statements are kept past commit or rollback.	G
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path specified on the BIND or REBIND command that bound the plan. The path is used to resolve unqualified data type, function, and stored procedure names used in certain contexts. If the PATH bind option was not specified, the value in the column is a zero length string; however, Db2 uses a default SQL path of: SYSIBM, SYSFUN, SYSPROC, *plan qualifier*.	G
DBPROTOCOL	CHAR(1) NOT NULL WITH DEFAULT 'P'	Whether remote access for SQL with three-part names is implemented with DRDA or Db2 private protocol access: **D** DRDA **P** Db2 private protocol	G
FUNCTIONTS	TIMESTAMP NOT NULL WITH DEFAULT	Timestamp when the function was resolved. This value is set by the BIND and REBIND commands, but not by automatic rebinds (autobind).	G

Column name	Data type	Description	Use
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	Value of the OPTHINT bind option. Identifies rows in the *owner*.PLAN_TABLE to be used as input to Db2. Contains blanks if no rows in the *owner*.PLAN_TABLE are to be used as input.	G
ENCODING_CCSID	INTEGER NOT NULL WITH DEFAULT	The CCSID corresponding to the encoding scheme or CCSID as specified for the bind option ENCODING. The Encoding Scheme specified on the bind command: **ccsid** The specified or derived CCSID. **0** The default CCSID as specified on panel DSNTIPF at installation time. Used when the plan was bound prior to Version 7	G
IMMEDWRITE	CHAR(1) NOT NULL WITH DEFAULT	Indicates when writes of updated group buffer pool dependent pages are to be done. This option is only applicable for data sharing environments. **N** Bind option IMMEDWRITE(NO) indicates normal write activity is done. **Y** Bind option IMMEDWRITE(YES) indicates that immediate writes are done for updated group buffer pool dependent pages. **1** Bind option IMMEDWRITE(PH1) indicates that updated group buffer pool dependent pages are written at or before phase 1 commit. **blank** A migrated package.	G
RELBOUND	CHAR(1) NOT NULL WITH DEFAULT	The release when the package was bound or rebound. **blank** Bound prior to Version 7 For all other values, see Release dependency indicators	G
CATENCODE	CHAR(1)	Not used.	N
REMARKS	VARCHAR(762) NOT NULL WITH DEFAULT	A character string provided by the user with the COMMENT statement.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
ROUNDING	CHAR(1) NOT NULL WITH DEFAULT	The ROUNDING option used when the plan was last bound: **C** ROUND_CEILING **D** ROUND_DOWN **F** ROUND_FLOOR **G** ROUND_HALF_DOWN **E** ROUND_HALF_EVEN **H** ROUND_HALF_UP **U** ROUND_UP **blank** The plan was created in a Db2 release prior to Version 9.	G
LASTUSED	DATE NOT NULL WITH DEFAULT	Not used.	N
CONCUR_ACC_RES	CHAR(1) NOT NULL	Indicates the CONCURRENTACCESSRESOLUTION option when the package was bound or rebound: **blank** Not specified **U** USECURRENTLYCOMMITTED **W** WAITFOROUTCOME	G
PROGAUTH	CHAR(1) NOT NULL WITH DEFAULT 'D'	Indicates whether Db2 checks if a program is authorized to run a plan: **D** DISABLE **E** ENABLE	G

SYSPLANAUTH catalog table

The SYSPLANAUTH table records the privileges that are held by users over application plans. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G

Column name	Data type	Description	Use
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privileges. Could also be PUBLIC for a grant to PUBLIC.	G
NAME	VARCHAR(24) NOT NULL	Name of the application plan on which the privileges are held.	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL	Not used.	N
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **S** SYSADM	G
BINDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND, REBIND, or FREE subcommands against the plan: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
EXECUTEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can run application programs that use the application plan: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSPLANDEP catalog table

The SYSPLANDEP table records the dependencies of plans on tables, views, aliases, synonyms, table spaces, indexes, functions, and stored procedures. The schema is SYSIBM.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	The name of an object the plan depends on.	G
BCREATOR	VARCHAR(128) NOT NULL	If BNAME is a table space, its database. Otherwise, the schema of BNAME. If BNAME is a role, the value is blank.	G

Column name	Data type	Description	Use
BTYPE	CHAR(1) NOT NULL	Type of object identified by BNAME: **A** Alias **E** INSTEAD OF trigger **F** User-defined function or cast function **H** Global variable **G** Global temporary table **I** Index **M** Materialized query table **O** Stored procedure **P** Partitioned table space if it is defined as LARGE or with the DSSIZE parm **Q** Sequence object **R** Table space **S** Synonym **T** Table **V** View	G
DNAME	VARCHAR(24) NOT NULL	Name of the plan.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSPLSYSTEM catalog table

The SYSPLSYSTEM table contains zero or more rows for every plan. Each row for a given plan represents one or more connections to an environment in which the plan could be used. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the plan.	G

Column name	Data type	Description	Use
SYSTEM	VARCHAR(24) NOT NULL	Environment. Values can be: **BATCH** TSO batch **DB2CALL** Db2 call attachment facility **CICS** Customer Information Control System **DLIBATCH** DLI batch support facility **IMSBMP** IMS BMP region **IMSMPP** IMS MPP or IFP region	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the connections represented by the row are enabled or disabled: **N** Disabled **Y** Enabled	G
CNAME	VARCHAR(60) NOT NULL	Identifies the connection or connections to which the row applies. Interpretation depends on the environment specified by SYSTEM. Values can be: • Blank if SYSTEM=BATCH or SYSTEM=DB2CALL • The name of a single connection if SYSTEM has any other value CNAME can also be blank when SYSTEM is not equal to BATCH or DB2CALL. When this is so, the row applies to all connections for the indicated environment.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSQUERY catalog table

Each SYSIBM.SYSQUERY table row identifies a SQL statement. The information is used to influence access path selection when matching statements are optimized. The schema is SYSIBM.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL GENERATED BY DEFAULT AS IDENTITY	Unique identifier for the query.	G

Column name	Data type	Description	Use
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by statement text.	G
SCHEMA	VARCHAR(128) NOT NULL	The default schema name for unqualified objects in the query or blank. If the query contains unqualified objects and access path hints exist for the query, the access path hints are applied only if the default schema matches the schema in the access path hint.	G
QUERY_SEC_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the modified statement text.	G
QUERY_HASH_ VERSION	INTEGER NOT NULL	The version of the query hash.	G
SOURCE	SMALLINT NOT NULL	The source of the row: **0** Statement-level optimization hints.	G
USERFILTER	CHAR(8) NOT NULL	Filter name that is used to group a set of queries or blank.	G
—	CHAR(128) NOT NULL	Internal use only.	I
PLAN_VALID	CHAR(1) NOT NULL	Whether plan hints are valid: **blank** No access path i specified for the statement, but optimization parameters exist in SYSQUERYOPTS **Y** An access path is specified in SYSQUERYPLAN for the statement. The access path is also valid if the statement has already been executed and the access path was used. **N** A an access path is specified in SYSQUERYPLAN, but the access path is invalid and not used.	G
INVALID_REASON	INTEGER NOT NULL	When PLAN_VALID is N, this column contains the reason that the access path is invalid. If PLAN_VALID is Y or blank, this column contains -1. For descriptions of the reason code values, see: +395 (Db2 Codes).	S
LOCATION	VARCHAR(128) NOT NULL	Not used.	N
COLLECTION	VARCHAR(128) NOT NULL	Name of the collection of the originating query or blank.	G

Column name	Data type	Description	Use
PACKAGE	VARCHAR(128) NOT NULL	Name of the package of the originating query or blank.	G
VERSION	VARCHAR(128) NOT NULL	Version of the package or blank.	G
AUTHID	VARCHAR(128) NOT NULL	Authorization ID this was in effect when the query was captured or blank.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp when the package was bound or when BIND QUERY was run	G
RELBOUND	CHAR(1) NOT NULL	The release of Db2 in which the package was bound, or blank. See Release dependency indicators for values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELBOUND should be used instead.	G
STMTNO	INTEGER NOT NULL	The statement number in the package. -1 when not applicable.	G
SECTNO	INTEGER NOT NULL	The section number in the package. -1 when not applicable.	G
STMTTEXT	CLOB(2M) INLINE LENGTH 2048	The text of the matching SQL statement. The value is populated from the value of the QUERY_TEXT column of the DSN_USERQUERY_TABLE table, with the following items removed: • Blanks including leading and trailing blanks, and embedded blanks that are not within literal strings between pairs of quotation mark symbols • White space, including leading and trailing white space, and white space that is not within a literal string between a pair of quotation mark symbols • SQL comments • EXPLAIN clauses	G
QUERYNO	INTEGER NOT NULL WITH DEFAULT '-1'	The query number.	G
CLIENT_USERID	VARCHAR(255)	User ID of the client.	G
CLIENT_ WRKSTNNAME	VARCHAR(255)	Name of the client workstation.	G

Column name	Data type	Description	Use
CLIENT_APPLNAME	VARCHAR(255)	Name of the client application.	G
SELECTVTY_OVERRIDE	CHAR(1) NOT NULL	Whether selectivity overrides are in effect for the query: **'Y'** Selectivtiy overrides are in effect **'N'** Selectivity overrides are not in effect.	G
ACCESSPATH_HINT	CHAR(1) NOT NULL	Whether access paths are specified for the matching statements: **'Y'** An access paths is specified and in effect **'N'** An access path hints is specified and in effect **blank** An access path might be specified. When the value is blank you must query the SYSIBM.SYSQUERYPLAN catalog table to determine whether an access path is specified	G
OPTION_OVERRIDE	CHAR(1) NOT NULL	Whether statement-level optimization parameters are in effect for matching statements: **'Y'** Optimization parameters are in effect. **'N'** Optimization parameters are not in effect. **blank** Optimization parameters might be in effect. When the value is blank you must query the SYSIBM.SYSQUERYOPTS catalog table to determine whether option overrides are in effect.	G
SELECTIVITY_VALID	CHAR(1) NOT NULL	Whether selectivity overrides are valid: **blank** No selectivity overrides exist for the statement. **'Y'** Selectivity overrides exist for the query. The overrides are valid if the statement has already been executed and the overrides were used. **'N'** Selectivity overrides exist but the overrides are invalid and not used.	G

SYSQUERY_AUX catalog table

The SYSQUERY_AUX table is an auxiliary table for the STMTTEXT column of the SYSQUERY table. The schema is SYSIBM.

Column name	Data type	Description	Use
STMTTEXT	CLOB(2M)	The full text of the query.	G

SYSQUERYOPTS catalog table

The SYSQUERYOPTS table contains optimization parameters for the queries that are in the SYSQUERY table. The schema is SYSIBM.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. This column corresponds to the QUERYID column in the SYSIBM.SYSQUERY table.	G
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. **0** Current version of the plan hints. **1** Previous version of the plan hints used by PLAN STABILITY **2** Original version of the plan hints used by PLAN STABILITY	G
REOPT	CHAR(1) NOT NULL	The value of the REOPT bind option that is in effect for the plan: **1** REOPT(ONCE) **A** REOPT(AUTO) **N** REOPT(NONE) **Y** REOPT(ALWAYS) **blank** REOPT is not specified	G
STARJOIN	CHAR(1) NOT NULL	Whether star join is enabled: **Y** Star join is enabled **N** Star join is disabled **blank** Star join is not specified	G
MAX_PAR_DEGREE	INTEGER NOT NULL	The maximum parallel degree. This column will contain a value between 0 and 254. If the value of the column is -1, the maximum parallel degree is not specified.	G

Column name	Data type	Description	Use
DEF_CURR_DEGREE	CHAR(3) NOT NULL	Whether query parallelism is enabled: **ONE** Query parallelism is disabled **ANY** Query parallelism is enabled **blank** Query parallelism is disabled	G
SJTABLES	INTEGER NOT NULL	The number of tables specified in a query to qualify for star join processing. If this column contains -1, star join processing is not specified.	G
—	VARCHAR(128) NOT NULL	Internal use only.	I
GROUP_MEMBER	VARCHAR(24) NOT NULL	The group member name to which the parameters are to be applied. This column contains blank if the group member name is not specified.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

DSN_USERQUERY_TABLE (Db2 Performance)

SYSQUERYPLAN catalog table

The SYSQUERYPLAN table contains the plan hint information for the queries in the SYSIBM.SYSQUERY table. It correlates to the SYSQUERY table by the QUERYID column. For a query, there can be up to 3 copies of plan hints stored in the SYSQUERYPLAN table, distinguished by the value of the COPYID column. The schema is SYSIBM.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL ON DELETE CASCADE	Unique identifier for the query. The value of QUERYID corresponds to the value of the QUERYID column in the SYSIBM.SYSQUERY column.	G

Column name	Data type	Description	Use
COPYID	SMALLINT NOT NULL	The version of the plan hints for the query in this row. **0** Current version of the plan hints. **1** Previous version of the plan hints used by PLAN STABILITY **2** Original version of the plan hints used by PLAN STABILITY	G
PLAN_VALID	CHAR(1) NOT NULL	Whether the plan hints are valid: **N** The plan hints are invalid **Y** The plan hints are valid	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	G
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.	G

Column name	Data type	Description	Use
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: **0** The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. **1** A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. **2** A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. **3** Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. **4** A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.	G
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.	G
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Materialized query table • Created or declared temporary table • Materialized view • materialized table expression The value is blank if METHOD is 3. The column can also contain the name of a table in the form DSNWFQB(*qblockno*). DSNWFQB(*qblockno*) is used to represent the intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. DSN_DIM_TBLX(*qblockno*) is used to the represent the work file of a star join dimension table.	G
—	SMALLINT NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
ACCESSTYPE	CHAR(2) NOT NULL	The method of accessing the new table: **A** Accelerated query table access. **DI** By an intersection of multiple DOCID lists to return the final DOCID list **DU** By a union of multiple DOCID lists to return the final DOCID list **DX** By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list **E** By direct row access using a row change timestamp column. **H** By hash overflow index (identified in ACCESSCREATOR and ACCESSNAME) **I** By an index (identified in ACCESSCREATOR and ACCESSNAME) **IN** By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table. **I1** By a one-fetch index scan **M** By a multiple index scan (followed by MX, MI, MU, or MH) **MH** By the hash overflow index named in ACCESSNAME **MI** By an intersection of multiple indexes **MU** By a union of multiple indexes **MX** By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. **N** • By an index scan when the matching predicate contains the IN keyword • By an index scan when Db2 rewrites a query using the IN keyword • By hash access with the IN keyword • By hash access when Db2 rewrites a query using the IN keyword **NR** Range list access. **P**	G

Column name	Data type	Description	Use
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.	G
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.	G
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(*mixopseqno*) is the starting pair-wise join leg in MIXOPSEQNO; otherwise, blank.	G
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. **Y** Yes **N** No	G
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. **Y** Yes **N** No	G
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. **Y** Yes **N** No	G
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. **Y** Yes **N** No	G
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. **Y** Yes **N** No	G

Column name	Data type	Description	Use
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. **Y** Yes **N** No	G
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. **Y** Yes **N** No	G
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. **Y** Yes **N** No	G
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. **Y** Yes **N** No	G

Column name	Data type	Description	Use
TSLOCKMOD	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: **IS** Intent share lock **IX** Intent exclusive lock **S** Share lock **U** Update lock **X** Exclusive lock **SIX** Share with intent exclusive lock **N** UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. **NS** For UR isolation, no lock; for CS, RS, or RR, an S lock. **NIS** For UR isolation, no lock; for CS, RS, or RR, an IS lock. **NSS** For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. **SS** For UR, CS, or RS isolation, an IS lock; for RR, an S lock. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESSTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.	G

Column name	Data type	Description	Use
PREFETCH	CHAR(1) NOT NULL	Indication of whether data pages are to be read in advance by prefetch: **D** Optimizer expects dynamic prefetch **S** Pure sequential prefetch **L** Prefetch through a page list **blank** Unknown or no prefetch	G
COLUMN_FN_EVAL	CHAR(1) NOT NULL	When an SQL aggregate function is evaluated: **R** While the data is being read from the table or index **S** While performing a sort to satisfy a GROUP BY clause **blank** After data retrieval and after any sorts	G
MIXOPSEQ	SMALLINT NOT NULL	The sequence number of a step in a multiple index operation. **1, 2, ... *n*** For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), or the sequence number of range list access (ACCESSTYPE is 'NR'). **0** For any other rows.	G
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
ACCESS_PGROUP_ID	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time.This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G

Column name	Data type	Description	Use
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
JOIN_PGROUP_ID	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTC_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
SORTN_PGROUP_ID	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
PARALLELISM_ MODE	CHAR(1)	The kind of parallelism, if any, that is used at bind time: **I** Query I/O parallelism **C** Query CP parallelism This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
MERGE_ JOIN_ COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G
CORRELATION_ NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.	G

Column name	Data type	Description	Use
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. **Y** Yes **blank** No	G
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: **F** FULL OUTER JOIN **L** LEFT OUTER JOIN **P** Pair-wise join **S** Star join **blank** INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.	G

Column name	Data type	Description	Use
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type. Possible values include: **SELECT** SELECT **INSERT** INSERT **UPDATE** UPDATE **MERGE** MERGE **DELETE** DELETE **SELUPD** SELECT with FOR UPDATE OF **DELCUR** DELETE WHERE CURRENT OF CURSOR **UPDCUR** UPDATE WHERE CURRENT OF CURSOR **CORSUB** Correlated subselect or fullselect **TRUNCA** TRUNCATE **NCOSUB** Noncorrelated subselect or fullselect **TABLEX** Table expression **TRIGGR** WHEN clause on CREATE TRIGGER **UNION** UNION **UNIONA** UNION ALL **INTERS** INTERSECT **INTERA** INTERSECT ALL **EXCEPT** EXCEPT **EXCEPTA** EXCEPT ALL	G

Column name	Data type	Description	Use
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates Indication of whether direct row access is attempted first: **D** Db2 tries to use direct row access with a rowid column. If Db2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE. **T** The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed. **blank** Db2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.	G
PARENT_QBLOCKNO	SMALLINT NOT NULL	A number that indicates the QBLOCKNO of the parent query block.	G

Column name	Data type	Description	Use
TABLE_TYPE	CHAR(1)	The type of new table: **B** Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement. **C** Common table expression **F** Table function **I** The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table. **M** Materialized query table **Q** Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed. **R** Recursive common table expression **S** Subquery (correlated or non-correlated) **T** Table **W** Work file The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.	G
TABLE_ENCODE	CHAR(1)	The encoding scheme of the table. The possible values are: **A** ASCII **E** EBCDIC **U** Unicode **M** The table contains multiple CCSID sets	G
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.	G

Column name	Data type	Description	Use
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the DSNHDECP module, the value is -2.	G
	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.	I
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.	G
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.	G

Column name	Data type	Description	Use
EXPANSION_REASON	CHAR(2) NOT NULL	This column applies to only static statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. If one of these special registers or the global variable is set to Y and the corresponding bind option is set to YES, Db2 implicitly adds certain syntax to the statement. This column indicates whether the query contains this implicit query transformation and why. This column can have one of the following values: **A** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **B** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **S** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **SB** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation. **Related information:** "Built-in global variables" on page 305 "CURRENT TEMPORAL BUSINESS_TIME" on page 194 "CURRENT TEMPORAL SYSTEM_TIME" on page 195 BIND and REBIND options for packages, plans, and services (Db2 Commands)	G

PLAN_TABLE (Db2 Performance)

SYSQUERYPREDICATE catalog table

The SYSQUERYPREDICATE table contains information about predicates for queries in the SYSQUERY table that have been identified for extended optimization. It correlates to the SYSQUERY table by the QUERYID column. The schema is SYSIBM.

Column name	Data type	Description	Use
QUERYID	BIGINT	Identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.	S

Column name	Data type	Description	Use
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'OR' • 'EQUAL' • 'RANGE' • 'BETWEEN' • 'IN' • 'LIKE' • 'NOT LIKE' • 'EXISTS • 'NOTEXIST' • 'SUBQUERY' • 'HAVING' • 'OTHERS'	S
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LEFT_HAND_PNO	INTEGER NOT NULL	If the LHS of the predicate is a table column (LHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
LHS_TABNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S

Column name	Data type	Description	Use
LHS_QBNO	SMALLINT NOT NULL	If the LHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	If the RHS of the predicate is a table column (RHS_TABNO > 0), then this column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks	S
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.	S
RHS_TABNO	SMALLINT NOT NULL	If the RHS of the predicate is a table column, then this column indicates a number which uniquely identifies the corresponding table reference within a query.	S
RHS_QBNO	SMALLINT NOT NULL	If the RHS of the predicate is a subquery, then this column indicates a number which uniquely identifies the corresponding query block within a query.	S
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.	S
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.	S
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.	S
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.	S
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: **'A'** After join **'D'** During join **blank** Not applicable	S

Column name	Data type	Description	Use
ADDED_PRED	CHAR(1) NOT NULL	Whether it is generated by transitive closure, which means Db2 can generate additional predicates to provide more information for access path selection, when the set of predicates that belong to a query logically imply other predicates.	S
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.	S
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.	S
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by Db2.	S
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
CATEGORY	SMALLINT NOT NULL,	IBM internal use only.	S
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.	S
TEXT	VARCHAR(2000) NOT NULL	The transformed predicate text; truncated if exceeds 2000 characters.	S
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.	S
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.	S
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.	S
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.	S
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.	S

Column name	Data type	Description	Use
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: **'HAVING '** The HAVING clause **'ON '** The ON clause **'WHERE '** The WHERE clause **SELECT** The SELECT clause	S
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.	S
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. **Blank** Generated by Db2 **C** Column mask **R** Row permission **U** Specified by the user	S
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.	S
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements.	S
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.	S
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable.	S

DSN_PREDICAT_TABLE (Db2 Performance)

SYSQUERYSEL catalog table

The SYSQUERYSEL table contains information about the selectivity of predicates for queries in the SYSQUERY table that have been identified for extended optimization. It correlates to the SYSQUERY table by the QUERYID column. The schema is SYSIBM.

Column name	Data type	Description	Use
QUERYID	BIGINT NOT NULL	The identifier of the query.	S
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique.	S
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.	S
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable.	S
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable.	S
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements.	S

Column name	Data type	Description	Use
COLLID	VARCHAR(128) NOT NULL	The collection ID: **DSNDYNAMICSQLCACHE** The row originates from the dynamic statement cache **DSNEXPLAINMODEYES** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **DSNEXPLAINMODEEXPLAIN** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.	S
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a non-inline SQL function or native SQL procedure, this column is not used and is blank.	S
PREDNO	INTEGER NOT NULL	Identifies the predicate	S
INSTANCE	SMALLINT NOT NULL	The selectivity instance, which is used to group related selectivities.	S
SELECTIVITY	FLOAT NOT NULL	The selectivity of the predicate.	S
WEIGHT	FLOAT (4) NOT NULL	The weight of the selectivity instance. For example, a value of .25 means that 25% of the time when a query is executed the predicate will have this selectivity.	S
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or will be used: One of the following values: **'NORMAL'** Estimated using the normal selectivity assumptions. **'OVERRIDE'** To be used as input to the Optimizer and override it's selectivity estimation.	S
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS AS ROW CHANGE TIMESTAMP	The time when the row was inserted.	S

Column name	Data type	Description	Use
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.	S
REMARKS	VARCHAR(762)	Internal use only.	S

SYSRELS catalog table

The SYSRELS table contains one row for every referential constraint. The schema is SYSIBM.

Column name	Data type	Description	Use
CREATOR	VARCHAR(128) NOT NULL	The schema of the dependent table of the referential constraint.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the dependent table of the referential constraint.	G
RELNAME	VARCHAR(128) NOT NULL	Constraint name.	G
REFTBNAME	VARCHAR(128) NOT NULL	Name of the parent table of the referential constraint.	G
REFTBCREATOR	VARCHAR(128) NOT NULL	The schema of the parent table.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the foreign key.	G

Column name	Data type	Description	Use
DELETERULE	CHAR(1) NOT NULL	Type of delete rule for the referential constraint: **A** NO ACTION **C** CASCADE **N** SET NULL **R** RESTRICT	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELOBID1	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the parent table.	S
RELOBID2	SMALLINT NOT NULL WITH DEFAULT	Internal identifier of the constraint with respect to the database that contains the dependent table.	S
TIMESTAMP	TIMESTAMP NOT NULL WITH DEFAULT	Date and time the constraint was defined. If the constraint is between catalog tables prior to Version 2 Release 3, the value is '1985-04-01-00.00.00.000000.'.	G
IXOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Schema for a unique non-primary index used to enforce the parent key of a referential constraint. Blank or empty string for a primary key used to enforce the parent key of a referential constraint which is a primary key.	G
IXNAME	VARCHAR(128) NOT NULL WITH DEFAULT	Name of a unique non-primary index used to enforce the parent key of a referential constraint. Empty string for a primary index used to enforce the parent key of a referential constraint which is a primary key.	G
ENFORCED	CHAR(1) NOT NULL WITH DEFAULT 'Y"	Enforced by the system or not: **Y** Enforced by the system **N** Not enforced by the system (trusted)	G

Column name	Data type	Description	Use
CHECKEXISTINGDATA	CHAR(1) NOT NULL WITH DEFAULT	Option for checking existing data: **I** Immediately check existing data. If ENFORCED = 'Y', this column will have a value of 'I'. **N** Never check existing data. If ENFORCED = 'N', this column will have a value of 'N'.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSRESAUTH catalog table

The SYSRESAUTH table records CREATE IN and PACKADM ON privileges for collections; USAGE privileges for distinct types; and USE privileges for buffer pools, storage groups, and table spaces. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
QUALIFIER	VARCHAR(128) NOT NULL	Qualifier of the table space (the database name) if the privilege is for a table space (OBTYPE='R'). The schema name of the user-defined data type if the privilege is for a distinct type (OBTYPE='D'). The schema name of the JAR file if the privilege is for a JAR file (OBTYPE='J'). The value is PACKADM if the privilege is for a collection (OBTYPE='C') and the authority held is PACKADM. Otherwise, the value is blank.	G
NAME	VARCHAR(128) NOT NULL	Name of the buffer pool, collection, Db2 storage group, distinct type, or table space. Could also be ALL when USE OF ALL BUFFERPOOLS is granted.	G
—	CHAR(1) NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **A** PACKADM (on collection *) **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **M** DBMAINT **P** PACKADM (on a specific collection) **S** SYSADM **T** DATAACCESS	G
OBTYPE	CHAR(1) NOT NULL	Type of object: **B** Buffer pool **C** Collection **D** Distinct type **R** Table space **S** Storage group **J** JAR file (Java archive file)	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N

Column name	Data type	Description	Use
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
USEAUTH	CHAR(1) NOT NULL	Whether the privilege is held with the GRANT option: **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option The authority held is PACKADM when the OBTYPE is C (a collection) and QUALIFIER is PACKADM. The authority held is CREATE IN when the OBTYPE is C and QUALIFIER is blank.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSROLES catalog table

The SYSROLES table contains one row for each role. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the role.	G
DEFINER	VARCHAR(128) NOT NULL	The authorization ID or role that defined this role listed in the NAME column.	G

Column name	Data type	Description	Use
DEFINERTYPE	CHAR(1) NOT NULL	The type of definer: **L** Role **blank** Authorization ID	G
CREATEDTS	TIMESTAMP NOT NULL	The time when the role is created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the role. See Release dependency indicators for the values.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

SYSROUTINEAUTH catalog table

The SYSROUTINEAUTH table records the privileges that are held by users on routines. (A routine can be a user-defined function, cast function, or stored procedure.) The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user who holds the privilege or the name of a plan or package that uses the privilege. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine. An asterisk (*) if the privilege is held on all routines in the schema.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or package. The grantee is a package if COLLID is not blank. **R** Internal use only	G
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. **blank** Not applicable **1** Grantor had privilege on schema.* at time of grant **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM **T** DATAACCESS	G
EXECUTEAUTH	CHAR(1) NOT NULL	Whether GRANTEE can execute the routine: **Y** Privilege is held without GRANT option. **G** Privilege is held with GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSROUTINES catalog table

The SYSROUTINES table contains a row for every routine. (A routine can be a user-defined function, cast function, or stored procedure.) The schema is SYSIBM.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the routine.	G
NAME	VARCHAR(128) NOT NULL	Name of the routine.	G
ROUTINETYPE	CHAR(1) NOT NULL	Type of routine: **F** User-defined function or cast function **P** Stored procedure	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the routine.	G
SPECIFICNAME	VARCHAR(128) NOT NULL	Specific name of the routine.	G
ROUTINEID	INTEGER NOT NULL	Internal identifier of the routine.	S
RETURN_TYPE	INTEGER NOT NULL	Internal identifier of the result data type of the function. The column contains a -2 if the function is a table function.	S

Column name	Data type	Description	Use
ORIGIN	CHAR(1) NOT NULL	Origin of the routine: **E** External routine or external SQL procedure **N** Native SQL procedure **Q** SQL function **S** System-generated function **U** Sourced on user-defined function or built-in function	G
FUNCTION_TYPE	CHAR(1) NOT NULL	Type of function: **C** Aggregate function **S** Scalar function **T** Table function **blank** For a stored procedure (ROUTINETYPE = 'P')	G
PARM_COUNT	SMALLINT NOT NULL	Number of parameters for the routine.	G
LANGUAGE	VARCHAR(24) NOT NULL	Implementation language of the routine: • ASSEMBLE • C • COBOL • COMPJAVA • JAVA • PLI • REXX • SQL The value is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G
COLLID	VARCHAR(128) NOT NULL	Name of the package collection to be used when the routine is executed. A blank value indicates the package collection is the same as the package collection of the program that invoked the routine.	G
SOURCESCHEMA	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the schema of the source user-defined function ('SYSIBM' for a source built-in function). Otherwise, the value is blank.	G
SOURCESPECIFIC	VARCHAR(128) NOT NULL	If ORIGIN is 'U' and ROUTINETYPE is 'F', the specific name of the source user-defined function or source built-in function name. Otherwise, the value is blank.	G

Column name	Data type	Description	Use
DETERMINISTIC	CHAR(1) NOT NULL	The deterministic option of an external function or a stored procedure: **N** Indeterminate (results might differ with a given set of input values). **Y** Deterministic (results are consistent). **blank** ROUTINETYPE='F' and ORIGIN is not 'E' or not 'Q' (the routine is a function, but not an external function or an SQL function).	G
EXTERNAL_ACTION	CHAR(1) NOT NULL	The external action option of an external function or SQL function: **N** Function has no side effects. **E** Function has external side effects so that the number of invocations is important. **blank** ORIGIN is not 'E' or 'Q' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
NULL_CALL	CHAR(1) NOT NULL	The CALLED ON NOT NULL INPUT option of an external function or stored procedure: **N** The routine is not called if any parameter has a NULL value. **Y** The routine is called if any parameter has a NULL value. **blank** ROUTINETYPE='F' and ORIGIN is not 'E' (the routine is a function, but not an external function).	G
CAST_FUNCTION	CHAR(1) NOT NULL	Whether the routine is a cast function: **N** The routine is not a cast function. **Y** The routine is a cast function. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P'). A cast function is generated by Db2 for a CREATE TYPE statement.	G

Column name	Data type	Description	Use
SCRATCHPAD	CHAR(1) NOT NULL	The SCRATCHPAD option of an external function: **N** This function does not have a SCRATCHPAD. **Y** This function has a SCRATCHPAD. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
SCRATCHPAD_LENGTH	INTEGER NOT NULL	Length of the scratchpad if the ORIGIN is 'E' for the function (ROUTINETYPE='F') and NO SCRATCHPAD is not specified. Otherwise, the value is 0.	G
FINAL_CALL	CHAR(1) NOT NULL	The FINAL CALL option of an external function: **N** A final call will not be made to the function. **Y** A final call will be made to the function. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G
PARALLEL	CHAR(1) NOT NULL	The PARALLEL option of an external function: **A** This function can be invoked by parallel tasks. **D** This function cannot be invoked by parallel tasks. **blank** ORIGIN is not 'E' for the function (ROUTINETYPE='F'), or it is a stored procedure (ROUTINETYPE='P').	G

Column name	Data type	Description	Use
PARAMETER_STYLE	CHAR(1) NOT NULL	The PARAMETER STYLE option of an external function or stored procedure: **D** DB2SQL. All parameters are passed to the external function or stored procedure according to the DB2SQL standard convention. **G** GENERAL. All parameters are passed to the stored procedure according to the GENERAL standard convention. **N** GENERAL CALL WITH NULLS. All parameters are passed to the stored procedure according to the GENERAL WITH NULLS convention. **J** JAVA. All parameters are passed to the function or procedure according to the conventions for JAVA and SQLJ specifications. **blank** The column is blank if the ORIGIN is not 'E' or if LANGUAGE is SQL.	G
FENCED	CHAR(1) NOT NULL	**Y** Indicates that this routine runs separately from the Db2 address space in a WLM managed Db2 address space. All user-defined routines that are not marked with Y in this column run in the Db2 address space. **blank** ORIGIN is 'Q' or ORIGIN is 'N'.	G
SQL_DATA_ACCESS	CHAR(1) NOT NULL	The SQL statements that are allowed in an external function, SQL function, or stored procedure: **C** CONTAINS SQL - Only SQL that does not read or modify data is allowed. **M** MODIFIES SQL DATA - All SQL is allowed, including SQL that reads or modifies data. **N** NO SQL - SQL is not allowed. **R** READS SQL DATA - Only SQL that reads data is allowed. **blank** Not applicable.	G

Column name	Data type	Description	Use
DBINFO	CHAR(1) NOT NULL	The DBINFO option of an external function or stored procedure: **N** No, the DBINFO parameter will not be passed to the external function or stored procedure. **Y** Yes, the DBINFO parameter will be passed to the external function or stored procedure. **blank** ORIGIN is not 'E'.	G
STAYRESIDENT	CHAR(1) NOT NULL	The STAYRESIDENT option of the routine, which determines whether the routine is to be deleted from memory when the routine ends. **N** The load module is to be deleted from memory after the routine terminates. **Y** The load module is to remain resident in memory after the routine terminates. **blank** ORIGIN is not 'E'.	G
ASUTIME	INTEGER NOT NULL	Number of CPU service units permitted for any single invocation of this routine. If ASUTIME is zero, the number of CPU service units is unlimited. The value is 0 if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If a routine consumes more CPU service units than the ASUTIME value allows, Db2 cancels the routine.	G
WLM_ENVIRONMENT	VARCHAR(96) NOT NULL	Name of the WLM environment to be used to run this routine. When ORIGIN = 'N', this is the name of the WLM ENVIRONMENT FOR DEBUG MODE that is to be used when debugging a native SQL procedure. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'. If the ROUTINETYPE = 'P', the value might be blank. If this value is blank the stored procedure cannot be run.	G

Column name	Data type	Description	Use
WLM_ENV_FOR_ NESTED	CHAR(1) NOT NULL	For nested routine calls, indicates whether the address space of the calling stored procedure or user-defined function is used to run the nested stored procedure or user-defined function: **N** The nested stored procedure or user-defined function runs in an address space other than the specified WLM environment if the calling stored procedure or user-defined function is not running in the specified WLM environment. 'WLM ENVIRONMENT name' was specified. **Y** The nested stored procedure or user-defined function runs in the environment used by the calling stored procedure or user-defined function. 'WLM ENVIRONMENT(name,*)' was specified. **blank** WLM_ENVIRONMENT is blank. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
PROGRAM_TYPE	CHAR(1) NOT NULL	Indicates whether the routine runs as a Language Environment main routine or a subroutine: **M** The routine runs as a main routine. **S** The routine runs as a subroutine. **blank** ORIGIN is not 'E'.	G
EXTERNAL_SECURITY	CHAR(1) NOT NULL	Specifies the authorization ID to be used if the routine accesses resources protected by an external security product: **D** Db2 - The authorization ID associated with the WLM-established stored procedure address space. **U** SESSION_USER - The authorization ID of the SQL user that invoked the routine. **C** DEFINER - The authorization ID of the owner of the routine. **blank** ORIGIN is not 'E'.	G

Column name	Data type	Description	Use
COMMIT_ON_RETURN	CHAR(1) NOT NULL	If ROUTINETYPE = 'P', whether the transaction is always to be committed immediately on successful return (non-negative SQLCODE) from this stored procedure: **N** The unit of work is to continue. **Y** The unit of work is to be committed immediately. **A** The unit of work of the autonomous procedure is committed immediately, but other work of the calling application is not committed. If ROUTINETYPE = 'F', the value is blank.	G
RESULT_SETS	SMALLINT NOT NULL	If ROUTINETYPE = 'P', the maximum number of ad hoc result sets that this stored procedure can return. If no ad hoc result sets exist or ROUTINETYPE = 'F', the value is zero.	G
LOBCOLUMNS	SMALLINT NOT NULL	If ORIGIN = 'E' or 'Q', the number of LOB columns found in the parameter list for this user-defined function. If no LOB columns are found in the parameter list or ORIGIN is not 'E' or not 'Q', the value is 0.	S
CREATEDTS	TIMESTAMP NOT NULL	Time when the routine was created.	G
ALTEREDTS	TIMESTAMP NOT NULL	Time when the last ALTER statement was executed for this routine.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
PARM1	SMALLINT NOT NULL	Internal use only.	I
PARM2	SMALLINT NOT NULL	Internal use only.	I
PARM3	SMALLINT NOT NULL	Internal use only.	I
PARM4	SMALLINT NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
PARM5	SMALLINT NOT NULL	Internal use only.	I
PARM6	SMALLINT NOT NULL	Internal use only.	I
PARM7	SMALLINT NOT NULL	Internal use only.	I
PARM8	SMALLINT NOT NULL	Internal use only.	I
PARM9	SMALLINT NOT NULL	Internal use only.	I
PARM10	SMALLINT NOT NULL	Internal use only.	I
PARM11	SMALLINT NOT NULL	Internal use only.	I
PARM12	SMALLINT NOT NULL	Internal use only.	I
PARM13	SMALLINT NOT NULL	Internal use only.	I
PARM14	SMALLINT NOT NULL	Internal use only.	I
PARM15	SMALLINT NOT NULL	Internal use only.	I
PARM16	SMALLINT NOT NULL	Internal use only.	I
PARM17	SMALLINT NOT NULL	Internal use only.	I
PARM18	SMALLINT NOT NULL	Internal use only.	I
PARM19	SMALLINT NOT NULL	Internal use only.	I
PARM20	SMALLINT NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
PARM21	SMALLINT NOT NULL	Internal use only.	I
PARM22	SMALLINT NOT NULL	Internal use only.	I
PARM23	SMALLINT NOT NULL	Internal use only.	I
PARM24	SMALLINT NOT NULL	Internal use only.	I
PARM25	SMALLINT NOT NULL	Internal use only.	I
PARM26	SMALLINT NOT NULL	Internal use only.	I
PARM27	SMALLINT NOT NULL	Internal use only.	I
PARM28	SMALLINT NOT NULL	Internal use only.	I
PARM29	SMALLINT NOT NULL	Internal use only.	I
PARM30	SMALLINT NOT NULL	Internal use only.	I
IOS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/Os that required to execute the routine. The value is -1 if the estimated number is not known.	S
INSTS_PER_INVOC	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that required to execute the routine. The value is -1 if the estimated number is not known.	S
INITIAL_IOS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of I/O's that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S
INITIAL_INSTS	FLOAT NOT NULL WITH DEFAULT -1	Estimated number of machine instructions that are performed the first time or the last time the routine is invoked. The value is -1 if the estimated number is not known.	S
CARDINALITY	FLOAT NOT NULL WITH DEFAULT -1	The predicted cardinality of the routine, -1 to trigger the use of the default value (10,000).	S

Column name	Data type	Description	Use
RESULT_COLS	SMALLINT NOT NULL DEFAULT 1	For a table function, the number of columns in the result table. Otherwise, the value is 1.	S
EXTERNAL_NAME	VARCHAR(762) NOT NULL	The path/module/function that Db2 should load to execute the routine. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
—	VARCHAR(150) NOT NULL FOR BIT DATA	Internal use only.	I
RUNOPTS	VARCHAR(762) NOT NULL	The Language Environment run time options to be used for this routine. An empty string indicates that the installation default Language Environment run time options are to be used. The column is blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
JAVA_SIGNATURE	VARCHAR(3072) NOT NULL WITH DEFAULT	The signature of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
CLASS	VARCHAR(384) NOT NULL WITH DEFAULT	The class name contained in the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JARSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
JAR_ID	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the JAR file. **blank** When PARAMETER STYLE is not JAVA. The column is also blank if ROUTINETYPE = 'F' and ORIGIN is not 'E'.	G
SPECIAL_REGS	CHAR(1) NOT NULL WITH DEFAULT 'I'	The SPECIAL REGISTER option for a routine. **I** INHERIT SPECIAL REGISTERS **D** DEFAULT SPECIAL REGISTERS **blank** ROUTINETYPE = 'F' and ORIGIN is not 'E' or not 'Q'.	G

Column name	Data type	Description	Use
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is 0 if the row does not describe a user-defined table function, or if no materialized query tables are defined on the table function.	G
MAX_FAILURE	SMALLINT NOT NULL WITH DEFAULT -1	Allowable failures for this routine (0-32767). If zero is specified, the routine will never be stopped. If no value is specified for this routine, the default will be -1 to indicate that the Db2 installation parameter (STORMXAB) will be used.	G
PARAMETER_CCSID	INTEGER NOT NULL WITH DEFAULT	A CCSID that specifies how character, graphic, date, time, and timestamp data types for system generated parameters to the routine such as message tokens and DBINFO should be passed. The value is dependent on the encoding scheme specified implicitly or explicitly for the PARAMETER CCSID clause defined at the system for that encoding scheme. The following list describes the CCSID for each encoding scheme: **ASCII** If mixed data is allowed, this CCSID is for mixed ASCII data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this CCSID is for SBCS ASCII data. **EBCDIC** If mixed data is allowed, this CCSID is for mixed EBCDIC data, SBCS data uses the corresponding SBCS CCSID, and graphic data uses the corresponding DBCS CCSID. Otherwise, this is the CCSID for SBCS EBCDIC data. **UNICODE** This CCSID is for mixed data (1208). A value of zero means that the CCSIDs used are those CCSIDs for the encoding scheme of other string or datetime parameters in the parameter list or RETURNS clause CCSID clauses, or the value in the DEF ENCODING SCHEME on installation panel DSNTIPF.	G
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for a native SQL procedure (indicated by the value 'N' in the column ORIGIN) or a non-inline SQL scalar function (indicated by the value 'Q' in the column ORIGIN and 'N' in the column INLINE). A zero length string for the rows that are created prior to Version 9 and for the rows that correspond to neither native SQL procedures or non-inline SQL scalar functions.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	The consistency token for the routine. The column is set to X'20' if the value of ORIGIN is not 'N'	G

Column name	Data type	Description	Use
ACTIVE	CHAR(1) NOT NULL WITH DEFAULT	Identifies the active version of the routine: **Y** This version is active. **N** This version is not active. **blank** The value of ORIGIN is not 'N' or the row was created prior to Version 9.	G
DEBUG_MODE	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether or not this routine is enabled for debugging: **1** This routine is enabled for debugging and can be debugged in a client debug session using the Db2 Unified Debugger. **0** This routine is not enabled for debugging. **N** This routine can never be enabled for debugging. **blank** The LANGUAGE is not specified as JAVA, the value of ORIGIN is not 'N', or the row was created prior to Version 9.	G
TEXT_ENVID	INTEGER NOT NULL WITH DEFAULT	Internal identifier of the environment. The column is 0 if the value of ORIGIN is not 'N' or if the row was created prior to Version 9.	G
TEXT_ROWID	ROWID NOT NULL GENERATED ALWAYS	ID to support LOB columns for source text.	G
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the statement that created the SQL routine, including the body of the routine. In some cases, this column might instead contain the text of a statement that altered the SQL routine. In many cases, changes to routines or to objects on which routines are dependent do not update this value. The value is a zero-length string if the value of ORIGIN is not 'N' or if the row was created prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
PARAMETER_ VARCHARFORM	INTEGER NOT NULL WITH DEFAULT	A non-zero value that indicates the actual representation, to a LANGUAGE C routine, of any varying length string parameter that appears in the parameter list or RETURNS clause for that routine.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
PACKAGEPATH	VARCHAR(4096)	The value of the PACKAGE PATH option of the CREATE FUNCTION, CREATE PROCEDURE, ALTER FUNCTION, or ALTER PROCEDURE statement that created or last changed the routine. PACKAGE PATH identifies the package path to use when the routine is executed. A blank value indicates the package path is the same as the package path of the program that invoked the routine.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the routine is secured: **N** The routine is not secured **Y** The routine is secured	G
INLINE	CHAR(1) NOT NULL WITH DEFAULT	Specifies if the SQL function is inline: **Y** The SQL function is inline when referenced. No package is associated with this type of routine. **N** The SQL function has an associated package. **blank** Not an SQL function (the ORIGIN column has a value other than 'Q')	G
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I
SYSTEM_DEFINED	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether this routine is system defined: **blank** This routine is not system defined **S** This routine is system defined	G

SYSROUTINESTEXT catalog table

The SYSROUTINESTEXT is an auxiliary table for the TEXT column of SYSIBM.SYSROUTINES and is required to hold the LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
TEXT	CLOB(2M) NOT NULL WITH DEFAULT	See the description of the TEXT column in "SYSROUTINES catalog table" on page 2366.	G

SYSROUTINES_OPTS catalog table (deprecated)

The SYSROUTINES_OPTS table Contains a row for each generated routine, such as one created by Db2 for z/OS Procedure Processor DSNTPSMP, that records the build options for the routine. The schema is SYSIBM.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see Creating native SQL procedures (Db2 Application programming and SQL) and Migrating an external SQL procedure to a native SQL procedure (Db2 Application programming and SQL).

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's options is the current version.	G
BUILDSCHEMA	VARCHAR(128) NOT NULL	Schema name for BUILDNAME.	G
BUILDNAME	VARCHAR(128) NOT NULL	Procedure used to create the routine.	G
BUILDOWNER	VARCHAR(128) NOT NULL	Authorization ID used to create the routine.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
PRECOMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	SQL processing (precompiler or coprocessor) options used to build the routine.	G
COMPILE_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Compiler options used to build the routine.	G

Column name	Data type	Description	Use
PRELINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Prelink-edit options used to build the routine.	G
LINK_OPTS	VARCHAR(765) NOT NULL WITH DEFAULT	Link-edit options used to build the routine.	G
BIND_OPTS	VARCHAR(3072) NOT NULL WITH DEFAULT	Bind options used to build the routine.	G
SOURCEDSN	VARCHAR(765) NOT NULL WITH DEFAULT	Name of the source data set.	G
DEBUG_MODE	CHAR(1) NOT NULL	Debugging is on or off for this object. **0** Debugging is off. Default and value on migration are both 0. **1** Debugging is on.	G

SYSROUTINES_TREE catalog table

The SYSROUTINES_TREE table is an auxiliary table for the PTREE column of the SYSROUTINES table. The schema is SYSIBM.

Column name	Data type	Description	Use
PTREE	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSROUTINES_SRC catalog table (deprecated)

The SYSROUTINES_SRC table contains source for generated routines, such as those created by Db2 for z/OS Procedure Processor DSNTPSMP. The schema is SYSIBM.

Deprecated function: External SQL procedures are deprecated and not as fully supported as native SQL procedures. For best results, create native SQL procedures instead. For more information, see Creating native SQL procedures (Db2 Application programming and SQL) and Migrating an external SQL procedure to a native SQL procedure (Db2 Application programming and SQL).

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the routine.	G
ROUTINENAME	VARCHAR(128) NOT NULL	Name of the routine.	G

Column name	Data type	Description	Use
BUILDDATE	DATE NOT NULL WITH DEFAULT	Date the routine was built.	G
BUILDTIME	TIME NOT NULL WITH DEFAULT	Time the routine was built.	G
BUILDSTATUS	CHAR(1) NOT NULL WITH DEFAULT 'C'	Whether this version of the routine's source is the current version.	G
SEQNO	INTEGER NOT NULL	Number of the source statement piece in CREATESTMT.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
CREATESTMT	VARCHAR(7500) NOT NULL	Routine source statement.	G

SYSSCHEMAAUTH catalog table

The SYSSCHEMAAUTH table contains one or more rows for each user that is granted a privilege on a particular schema in the database. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges or SYSADM.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group who holds the privileges. Can also be PUBLIC for a grant to PUBLIC.	G
SCHEMANAME	VARCHAR(128) NOT NULL	Name of the schema or '*' for all schemas.	G

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. This field is also used to indicate that the privilege was held on all schemas by the grantor. **1** Grantor had privilege on all schemas at time of grant **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM	G
CREATEINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds CREATEIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
ALTERINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTERIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DROPINAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds DROPIN privilege on the schema: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSSEQUENCEAUTH catalog table

The SYSSEQUENCEAUTH table records the privileges that are held by users over sequences. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user or group that holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the sequence.	G
NAME	VARCHAR(128) NOT NULL	Name of the sequence.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID. **L** Role **P** An application plan or package. The grantee is a package if COLLID is not blank. **R** Internal use only.	G

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor: **blank** Not applicable **E** SECADM **G** ACCESSCTRL **L** SYSCTRL **S** SYSADM **T** DATAACCESS	G
ALTERAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds ALTER privilege on the sequence: **blank** Privilege is not held. **G** Privilege is held with the GRANT option. **Y** Privilege is held without the GRANT option.	G
USEAUTH	CHAR(1) NOT NULL	Indicates whether grantee holds USAGE privilege on the sequence: **blank** Privilege is not held. **G** Privilege is held with the GRANT option. **Y** Privilege is held without the GRANT option.	G
COLLID	VARCHAR(128) NOT NULL	If the GRANTEE is a package, its collection name. Otherwise, a string of length zero.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, blank.	G
GRANTEDTS	TIMESTAMP NOT NULL	Time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

Column name	Data type	Description	Use
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSSEQUENCES catalog table

The SYSSEQUENCES table contains one row for each identity column or user-defined sequence. The schema is SYSIBM.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	Schema of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the alias or sequence. For an identity column, the value of TBCREATOR from the SYSCOLUMNS entry for the column.	G
NAME	VARCHAR(128) NOT NULL	Name of the alias, identity column, or sequence. The name for an identity column is generated by Db2.	G
SEQTYPE	CHAR(1) NOT NULL	Type of sequence object: **A** Alias for a sequence **I** An identity column **S** A user-defined sequence **X** An implicitly created DOCID column for a base table that contains XML data.	G
SEQUENCEID	INTEGER NOT NULL	Internal identifier of the alias, identity column, or sequence.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the alias, identity column, or sequence.	G
INCREMENT	DECIMAL(31,0) NOT NULL	Increment value (positive or negative, within INTEGER scope). The value is 0 if the row describes an alias.	G
START	DECIMAL(31,0) NOT NULL	Start value. The value is 0 if the row describes an alias.	G
MAXVALUE	DECIMAL(31,0) NOT NULL	Maximum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G

Column name	Data type	Description	Use
MINVALUE	DECIMAL(31,0) NOT NULL	Minimum value allowed for the identity column or sequence. The value is 0 if the row describes an alias.	G
CYCLE	CHAR(1) NOT NULL	Whether cycling will occur when a boundary is reached: **N** No **Y** Yes, cycling will occur **blank** The row describes an alias	G
CACHE	INTEGER NOT NULL	Number of sequence values to preallocate in memory for faster access. A value of 0 indicates that values are not to be preallocated. The value is 0 if the row describes an alias.	G
ORDER	CHAR(1) NOT NULL	Whether the values must be generated in order: **Y** Yes **N** No **R** The values must be generated in pseudo-random order for an XML document ID column that was created when subsystem parameter XML_RANDOMIZE_DOCID was set to YES. **blank** The row describes an alias	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type. The value is 0 if the row describes an alias.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type upon which the distinct type is based. The value is 0 if the row describes an alias.	S
CREATEDTS	TIMESTAMP NOT NULL	Timestamp of the creation of the alias, identity column, or sequence.	G
ALTEREDTS	TIMESTAMP NOT NULL	Timestamp when the last ALTER statement was executed for this alias, identity column, or sequence.	G

Column name	Data type	Description	Use
MAXASSIGNEDVAL	DECIMAL(31,0)	Last possible assigned value. MAXASSIGNEDVAL is updated each time that the next chunk of *n* values is cached. *n* is the CACHE column value. MAXASSIGNEDVAL is initialized to null when the object is created or when it is altered to restart the sequence. The value is also null when the object is an alias. The value is 0 if the row describes an alias.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	Character string provided by user with the COMMENT statement. The value is blank for an identity column.	G
PRECISION	SMALLINT NOT NULL WITH DEFAULT	The precision defined for a sequence with a decimal or numeric type. The value is 5 for SMALLINT, 10 for INTEGER, 19 for BIGINT, or the actual precision specified by the user for the decimal data type. The value is 0 for rows created prior to Version 8. The value is 0 if the row describes an alias.	G
RESTARTWITH	DECIMAL(31,0) NULLABLE WITH DEFAULT	The sequence RESTART value for an ALTER SEQUENCE statement. The value is NULL for the following: • There have been no ALTER statements with the RESTART option. • The row describes an alias	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
SEQSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema of the target sequence.	G
SEQNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the target sequence.	G

SYSSEQUENCESDEP catalog table

The SYSSEQUENCESDEP table records the dependencies of identity columns and sequences. The schema is SYSIBM.

Column name	Data type	Description	Use
BSEQUENCEID	INTEGER NOT NULL	Internal identifier of the identity column or sequence.	G
DCREATOR	VARCHAR(128) NOT NULL	The owner of the object that is dependent on this identity column or sequence.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DNAME	VARCHAR(128) NOT NULL	Name of the object that is dependent on this identity column or sequence.	G
DCOLNAME	VARCHAR(128) NOT NULL	Name of the identity column. Blank for SQL function rows.	G
DTYPE	CHAR(1) NOT NULL WITH DEFAULT 'I'	The type of object that is dependent on this sequence: **F** SQL function **I** Identity column **X** Implicit DOCID column that is created on a base table with XML **blank** Represents an identity column created prior to Version 8	G
BSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the sequence, will be a string of length zero for an object created prior to Version 8.	G
BNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The sequence name (generated by Db2 for an identity column), will be a string of length zero for an object created prior to Version 8.	G
DSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	The qualifier of the object that is dependent on this sequence, will be a string of length zero for an object created prior to Version 8.	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	The owner of the object that is dependent on this sequence. This will be a string of length zero for an object that was created prior to Version 9.	G

Column name	Data type	Description	Use
DOWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of owner: **Blank** An authorization ID **L** A role	G

SYSSTATFEEDBACK catalog table

The SYSTATFEEDBACK table contains information about missing or conflicting catalog statistics for SQL statements. The schema is SYSIBM.

The following values control the collection of statistics feedback data in the SYSSTATFEEDBACK catalog table:

- The STATFDBK_SCOPE subsystem parameter controls whether the data is collected, and whether it is collected only for static SQL statements, only for dynamic SQL statements, or for both.
- The STATSINT subsystem parameter controls when and how frequently the data is externalized.
- The STATS_FEEDBACK column of the SYSTABLES catalog table controls whether the data is collected for a particular table.

The RUNSTATS utility removes data from the SYSSTATFEEDBACK catalog table when the recommended statistics are collected.

Tip: The SYSSTATFEEDBACK table might contain rows that recommend collection of statistics for DEFINE NO objects, or empty table space partitions. However, statistics cannot be collected for such objects until after data is inserted and the underlying data sets are created. For more information, see Effect of utilities on objects that have the DEFINE NO attribute (Db2 Utilities).

Column name	Data type	Description	Use
TBCREATOR	VARCHAR(128)	The creator of the table.	S
TBNAME	VARCHAR(128)	The name of the table.	S
IXCREATOR	VARCHAR(128)	The creator of the index.	S
IXNAME	VARCHAR(128)	The name of the index.	S
COLNAME	VARCHAR(128)	The name of the column.	S
NUMCOLUMNS	SMALLINT	The number of columns in the column group.	S
COLGROUPCOLNO	VARCHAR(254) FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.	S

Column name	Data type	Description	Use
TYPE	CHAR(1)	The type of statistic to collect: **'C'** Cardinality. **'F'** Frequency. **'H'** Histogram. **'I'** Index. **'T'** Table.	I
DBNAME	VARCHAR(24)	The name of the database.	S
TSNAME	VARCHAR(24)	The name of the table space.	S
REASON	CHAR(8)	The reason for the statistics collection recommendation: **'BASIC'** A basic statistical value for a column table or index is missing. **'CONFLICT'** Another statistic conflicts with this statistic. **'COMPFFIX'** Multi-column cardinality statistics are needed for an index compound filter factor. **'DEFAULT'** A predicate references a value that is probably a default value. **'KEYCARD'** The cardinalities of index key columns are missing. **'LOWCARD'** The cardinality of the column is a low value, which indicates that data skew is likely. **'NULLABLE'** Distribution statistics are not available for a nullable column. **'RANGEPRD'** Histogram statistics are not available for a range predicate. **'PARALLEL'** Parallelism could be improved by uniform partitioning of key ranges.	S
BLOCK_RUNSTATS	CHAR(1)	Whether the row is used when optimization tools collect statistics based on the recommendations. Db2 inserts a blank value in this column for all new rows. Db2 does not refer to or change the value of this column. This is an updatable column.	S
REMARKS	VARCHAR(254)	Free form text for extensibility.	S

Column name	Data type	Description	Use
LASTDATE	DATE	The last date that this statistics recommendation was updated by Db2.	S

SYSTABLES catalog table

The SYSTABLES table contains one row for each table, view, or alias. The schema is SYSIBM. Each SYSTABLES table row indicates whether the object that it describes is a table, view, or alias, its name, who created it, the database that it belongs to, the table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

RUNSTATS (Db2 Utilities)

SYSSTMT catalog table

The SYSSTMT table contains one or more rows for each SQL statement of each DBRM. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the DBRM.	G
PLNAME	VARCHAR(24) NOT NULL	Name of the application plan.	G
PLCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the application plan.	G
SEQNO	INTEGER NOT NULL	Sequence number of this row with respect to a statement of the plan.Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use. The numbering starts with zero.	G
STMTNO	SMALLINT NOT NULL	The statement number of the statement in the source program. A statement number greater than 32767 is stored as zero. If the value is zero, see STMTNOI for the statement number. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G
SECTNO	SMALLINT NOT NULL	The section number of the statement. Rows in which the values of SEQNO, STMTNO, and SECTNO are zero are for internal use.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
TEXT	VARCHAR(3800) NOT NULL FOR BIT DATA	Text or portion of the text of the SQL statement.	S
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level for the SQL statement: **R** RR (repeatable read) **T** RS (read stability) **S** CS (cursor stability) **U** UR (uncommitted read) **L** RS isolation, with a *lock-clause* **X** RR isolation, with a *lock-clause* **blank** The WITH clause was not specified on this statement. The isolation level is recorded in SYSPACKAGE.ISOLATION and in SYSPLAN.ISOLATION.	G

Column name	Data type	Description	Use
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Status of binding the statement: **A** Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using defaults for input variables during access path selection. **B** Distributed - statement uses Db2 private protocol access. The statement will be parsed and executed at the server using values for input variables during access path selection. **C** Compiled - statement was bound successfully using defaults for input variables during access path selection. **D** Distributed - statement references a remote object using a three-part name. Db2 will implicitly use DRDA access either because the DBPROTOCOL bind option was not specified (defaults to DRDA), or the bind option DBPROTOCOL(DRDA) was explicitly specified. This option allows the use of three-part names with DRDA access but it requires that the package be bound at the target remote site. **E** Explain - statement is an SQL EXPLAIN statement. The explain is done at bind time using defaults for input variables during access path selection. **F** Parsed - statement did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using values for input variables during access path selection. **G** Compiled - statement bound successfully, but REOPT is specified. The statement will be rebound at execution time using values for input variables during access path selection. **H** Parsed - statement is either a data definition statement or a statement that did not bind successfully and VALIDATE(RUN) was used. The statement will be rebound at execution time using defaults for input variables during access path selection. Data manipulation statements use defaults for input variables during access path selection. **I** Indefinite - statement is dynamic. The statement will be bound at execution time using defaults for input variables during access path selection.	S

Column name	Data type	Description	Use
STATUS		**J** Indefinite - statement is dynamic. The statement will be bound at execution time using values for input variables during access path selection. **K** Control - CALL statement. **L** Bad - the statement has some allowable error. The bind continues but the statement cannot be executed. **M** Parsed - statement references a table that is qualified with SESSION and was not bound because the table reference could be for a declared temporary table that will not be defined until the package or plan is run. The SQL statement will be rebound at execution time using values for input variables during access path selection. **blank** The statement is non-executable, or was bound in a Db2 release prior to Version 5.	
ACCESSPATH	CHAR(1) NOT NULL WITH DEFAULT	For static statements, indicates if the access path for the statement is based on user-specified optimization hints. A value of 'H' indicates that optimization hints were used. A blank value indicates that the access path was determined without the use of optimization hints, or that there is no access path associated with the statement. For dynamic statements, the value is blank.	G
STMTNOI	INTEGER NOT NULL WITH DEFAULT	If the value of STMTNOI is not zero, the column contains the statement number of the statement in the source program.	G
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement.	G
EXPLAINABLE	CHAR(1) NOT NULL WITH DEFAULT	Contains one of the following values: **Y** Indicates that the SQL statement can be used with the EXPLAIN function and might have rows describing its access path in the owner.PLAN_TABLE. **N** Indicates that the SQL statement does not have any rows describing its access path in the owner.PLAN_TABLE. **blank** Indicates that the SQL statement was bound prior to Version 7.	G

Column name	Data type	Description	Use
QUERYNO	INTEGER NOT NULL WITH DEFAULT –1	The query number of the SQL statement in the source program. SQL statements bound prior to Version 7 have a default value of –1. Statements bound in Version 7 or later use the value specified on the QUERYNO clause on SELECT, UPDATE, INSERT, DELETE, EXPLAIN, and DECLARE CURSOR statements. If the QUERYNO clause is not specified, the query number is set to the statement number.	G
PLCREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G

SYSSTOGROUP catalog table

The SYSSTOGROUP table contains one row for each storage group. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of the integrated catalog facility catalog.	G
VPASSWORD	VARCHAR(24) NOT NULL	Not used.	N
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the storage group as determined by the last execution of the STOSPACE utility.	G
SPCDATE	CHAR(5) NOT NULL	Not used.	N
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the storage group.	G

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If the STOSPACE utility was executed for the storage group, date and time when STOSPACE was last executed.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the storage group.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER STOGROUP statement was executed for the storage group. If no ALTER STOGROUP statement has been applied, ALTEREDTS has the value of CREATEDTS.	G
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G
DATACLAS	VARCHAR(24) NOT NULL	Name of the SMS data class. Blank if data class is not used.	G
MGMTCLAS	VARCHAR(24) NOT NULL	Name of the SMS management class. Blank if management class is not used.	G
STORCLAS	VARCHAR(24) NOT NULL	Name of the SMS storage class. Blank if storage class is not used.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSSTRINGS catalog table

The SYSSTRINGS table contains information about character conversion. Each row describes a conversion from one coded character set to another. The schema is SYSIBM.

Also refer to z/OS C/C++ Programming Guide for information on the additional conversions that are supported.

Each row in the table must have a unique combination of values for its INCCSID, OUTCCSID, and IBMREQD columns. Rows for which the value of IBMREQD is N can be deleted, inserted, and updated subject to this uniqueness constraint and to the constraints imposed by a VALIDPROC defined on the table. An inserted row could have values for the INCCSID and OUTCCSID columns that match those of a row for which the value of IBMREQD is Y. Db2 then uses the information in the inserted row instead of the information in the IBM-supplied row. Rows for which the value of IBMREQD is Y cannot be deleted, inserted, or updated. For information about the use of inserted rows for character conversion, see *Db2 Installation Guide*.

Db2 has two methods for character conversions and applies them in the following order:

1. Conversions specified by the various combinations of the INCCSID and OUTCCSID columns in the SYSIBM.SYSSTRINGS catalog table.
2. Conversions provided by z/OS support for Unicode. For more information, see z/OS Support for Unicode: Using Conversion Services.

If neither of these methods can be used for a particular character conversion, Db2 returns an error.

Column name	Data type	Description	Use
INCCSID	INTEGER NOT NULL	The source CCSID for the character conversion represented by this row. The value of the source CCSID must be in the range of 1 to 65533 and must not be the same as the value for the OUTCCSID column.	G
OUTCCSID	INTEGER NOT NULL	The target CCSID for the character conversion represented by this row. The value of the target CCSID must be in the range of 1 to 65533 and must not be the same as the value for the INCCSID column.	G
TRANSTYPE	CHAR(2) NOT NULL	Indicates the nature of the conversion. Values can be: **GG** GRAPHIC to GRAPHIC **MM** EBCDIC MIXED to EBCDIC MIXED **MS** EBCDIC MIXED to SBCS **PM** ASCII MIXED to EBCDIC MIXED **PS** ASCII MIXED to SBCS **SM** SBCS to EBCDIC MIXED **SS** SBCS to SBCS **MP** EBCDIC MIXED to ASCII MIXED **PP** ASCII MIXED to ASCII MIXED **SP** SBCS to ASCII MIXED	G
ERRORBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as an error byte. Any non-null value that is specified for the ERRORBYTE column must not be the same as the value that is specified for the SUBBYTE column. Null indicates the absence of an error byte.	S
SUBBYTE	CHAR(1) FOR BIT DATA (Nulls are allowed)	The byte used in the conversion table as a substitution character. Any non-null value that is specified for the SUBBYTE column must not be the same as the value that is specified for the ERRORBYTE column. Null indicates the absence of a substitution character.	S

Column name	Data type	Description	Use
TRANSPROC	VARCHAR(24) NOT NULL WITH DEFAULT	The name of a module or blanks. A nonblank value must conform to the rules for z/OS program names. If IBMREQD is 'N', a nonblank value is the name of a conversion procedure provided by the user. The first five characters of the name of a user-provided conversion procedure must not be 'DSNXV'; these characters are used to distinguish user-provided conversion procedures from Db2 modules that contain DBCS conversion tables. If IBMREQD is 'Y', a nonblank value is the name of a Db2 module that contains DBCS conversion tables.	G

Column name	Data type	Description	Use
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. **Value** **Meaning** **B** Version 1R3 dependency indicator, not from the machine-readable material (MRM) tape **C** Version 2R1 dependency indicator, not from MRM tape **D** Version 2R2 dependency indicator, not from MRM tape **E** Version 2R3 dependency indicator, not from MRM tape **F** Version 3R1 dependency indicator, not from MRM tape **G** Version 4 dependency indicator, not from MRM tape **H** Version 5 dependency indicator, not from MRM tape **I** Version 6 dependency indicator, not from MRM tape **J** Version 6 dependency indicator, not from MRM tape **K** DB2 Version 7 dependency indicator, not from MRM tape **L** DB2 Version 8 dependency indicator, not from MRM tape **M** DB2 9 dependency indicator, not from MRM tape **O** DB2 10 dependency indicator, not from MRM tape **P** Db2 11 dependency indicator, not from MRM tape **N** Not from MRM tape, no dependency The value in this field is not a reliable indicator of release dependencies.	G
TRANSTAB	VARCHAR(256) FOR BIT DATA NOT NULL WITH DEFAULT	Either a 256-byte conversion table or an empty (0 length) string.	S

SYSSYNONYMS catalog table

The SYSSYNONYMS table contains one row for each synonym of a table or view. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Synonym for the table or view.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the synonym.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the synonym.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the synonym. The value is '0001-01.01.00.00.00.000000' for synonyms created in a Db2 release prior to Version 5.	G
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSTABAUTH catalog table

The SYSTABAUTH table records the privileges that users hold on tables and views. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID or role of the user who granted the privileges. Could also be PUBLIC.	G

Column name	Data type	Description	Use
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID or role of the user who holds the privileges or the name of an application plan or package that uses the privileges. PUBLIC for a grant to PUBLIC.	G
GRANTEETYPE	CHAR(1) NOT NULL	Type of grantee: **blank** An authorization ID **L** Role **P** An application plan or a package. The grantee is a package if COLLID is not blank.	G
DBNAME	VARCHAR(24) NOT NULL	If the privileges were received from a user with DBADM, DBCTRL, or DBMAINT authority, DBNAME is the name of the database on which the GRANTOR has that authority. Otherwise, DBNAME is blank.	G
SCREATOR	VARCHAR(128) NOT NULL	If the row of SYSIBM.SYSTABAUTH was created as a result of a CREATE VIEW statement, SCREATOR is the schema of a table or view referred to in the CREATE VIEW statement. Otherwise, SCREATOR is the same as TCREATOR.	G
STNAME	VARCHAR(128) NOT NULL	If the row of SYSIBM.SYSTABAUTH was created as a result of a CREATE TABLE statement or a materialized query table, STNAME is the name of a table or view referred to in the fullselect of the CREATE TABLE statement.	G
TCREATOR	VARCHAR(128) NOT NULL	The schema of the table or view.	G
TTNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable **B** System DBADM **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **L** SYSCTRL **M** DBMAINT **S** SYSADM **T** DATAACCESS	G
—	CHAR(12) NOT NULL	Internal use only.	I
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
UPDATECOLS	CHAR(1) NOT NULL	The value of this column is blank if the value of UPDATEAUTH applies uniformly to all columns of the table or view. The value is an asterisk (*) if the value of UPDATEAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with matching timestamps and PRIVILEGE = blank. These rows list the columns on which update privileges have been granted.	G

Column name	Data type	Description	Use
ALTERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can alter the table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DELETEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can delete rows from the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
INDEXAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create indexes on the table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
INSERTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can insert rows into the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SELECTAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can select rows from the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
UPDATEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can update rows of the table or view: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
GRANTEELOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Not used.	N
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	If the GRANTEE is a package, its collection name. Otherwise, the value is blank.	G
CONTOKEN	CHAR(8) NOT NULL WITH DEFAULT FOR BIT DATA	If the GRANTEE is a package, the consistency token of the DBRM from which the package was derived. Otherwise, the value is blank.	S
CAPTUREAUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
REFERENCESAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create or drop referential constraints in which the table is a parent. **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege held without the GRANT option	G

Column name	Data type	Description	Use
REFCOLS	CHAR(1) NOT NULL WITH DEFAULT	The value of this column is blank if the value of REFERENCESAUTH applies uniformly to all columns of the table. The value is an asterisk(*) if the value of REFERENCESAUTH applies to some columns but not to others. In this case, rows will exist in SYSIBM.SYSCOLAUTH with PRIVILEGE = R and matching timestamps that list the columns on which reference privileges have been granted.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed.	G
TRIGGERAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create triggers in which the table is named as the subject table: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G

SYSTABCONST catalog table

The SYSTABCONST table contains one row for each unique constraint (primary key or unique key) created in DB2 Version 7 or later. The schema is SYSIBM.

Column name	Data type	Description	Use
CONSTNAME	VARCHAR(128) NOT NULL	Name of the constraint.	G
TBCREATOR	VARCHAR(128) NOT NULL	The schema of the table on which the constraint is defined.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table on which the constraint is defined.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID under which the constraint was created.	G
TYPE	CHAR(1) NOT NULL	Type of constraint: **P** Primary key **U** Unique key	G

Column name	Data type	Description	Use
IXOWNER	VARCHAR(128) NOT NULL	The schema of the index enforcing the constraint or blank if index has not been created yet.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the index enforcing the constraint or blank if index has not been created yet.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the statement to create the constraint was executed.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the constraint.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to DB2 9. See Release dependency indicators for all other values.	G

SYSTABLEPART catalog table

The SYSTABLEPART table contains one row for each nonpartitioned table space and one row for each partition of a partitioned table space. The schema is SYSIBM.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number; 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
IXNAME	VARCHAR(128) NOT NULL	Name of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.	G
IXCREATOR	VARCHAR(128) NOT NULL	The schema of the partitioning index. This column is blank unless this is a table that uses index-controlled partitioning.	G

Column name	Data type	Description	Use
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement.	G
SQTY	SMALLINT NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If the value does not fit into the column, the value of the column is 32767. See the description of column SECQTYI.	G
STORTYPE	CHAR(1) NOT NULL	Type of storage allocation: **E** Explicit (storage group not used) **I** Implicit (storage group used)	G
STORNAME	VARCHAR(128) NOT NULL	Name of storage group used for space allocation. Blank if storage group not used or for the catalog table spaces.	G
VCATNAME	VARCHAR(24) NOT NULL	Name of integrated catalog facility catalog used for space allocation.	G
CARD	INTEGER NOT NULL	Number of rows in the table space or partition or, if the table space is a LOB table space, the number of LOBs in the table space. The value is '2147483647' if the number of rows is greater than or equal to '2147483647'. The value is -1 if statistics have not been gathered.	G

Column name	Data type	Description	Use
FARINDREF	INTEGER NOT NULL	Number of rows that have been relocated far from their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
NEARINDREF	INTEGER NOT NULL	Number of rows that have been relocated near their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
PERCACTIVE	SMALLINT NOT NULL	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics have not been gathered. The value is -2 if the table space is a LOB table space. This value is not applicable for understanding data distribution in tables that are organized for hash access.	S
PERCDROP	SMALLINT NOT NULL	Percentage of space occupied by rows of dropped tables. The value is -1 if statistics have not been gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
LIMITKEY	VARCHAR(765) NOT NULL	The high value of the partition in external format. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If the table is not in a partition-by-range table space, the value is an empty string. This column can contain a mixture of values with differing formats: • Date and time values are delimited by single quotation marks (for example, '2001-01-01'). However, values that were added in releases prior to Db2 11 do not contain these delimiters. • When comma decimal point indicators are used, a space follows any comma delimiter in the value. The comma decimal point indicator is used when the DECIMAL POINT IS field setting is `,(comma)` or a COBOL program that executes the ALTER statement uses the COMMA processing option. No spaces follow comma delimiters when period decimal point indicators are used, or for values added prior to Db2 11.	S
FREEPAGE	SMALLINT NOT NULL	Number of pages loaded before a page is left as free space.	G

Column name	Data type	Description	Use
PCTFREE	SMALLINT NOT NULL	Percentage of each page left as free space.	G
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	**blank** The table space is not a partition, or does not contain rows that might violate referential constraints, check constraints, or both. **C** The table space partition is in a check pending status and there are rows in the table that can violate referential constraints, check constraints, or both. **D** The inline length of the LOB column that is associated with this LOB table space was decremented when the inline length was altered. **I** The inline length of the LOB column that is associated with this LOB table space was incremented when the inline length was altered.	G
CHECKRID	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	Not used.	N
SPACE	INTEGER NOT NULL WITH DEFAULT	Number of kilobytes of DASD storage allocated to the table space partition, as determined by the last execution of the STOSPACE utility or RUNSTATS utility. **0** The STOSPACE or RUNSTATS utility has not been run. **-1** The table space was defined with the DEFINE NO clause, which defers the physical creation of the data sets until data is first inserted into one of the partitions, and data has yet to be inserted. **non-zero or non-negative value** An auxiliary table in the LOB table space. The STOSPACE utility updates this value if the table space is related to a storage group. The RUNSTATS utility updates this value when RUNSTATS TABLESPACE is run with UPDATE(ALL) or UPDATE(SPACE).	G

Column name	Data type	Description	Use
COMPRESS	CHAR(1) NOT NULL WITH DEFAULT	Indicates the following: • For a table space partition, whether the COMPRESS attribute for the partition is YES. • For a nonpartitioned table space, whether the COMPRESS attribute is YES for the table space. Values for the column can be: **Y** Compression is defined for the table space **blank** No compression	G
PAGESAVE	SMALLINT NOT NULL WITH DEFAULT	Percentage of pages saved in the table space or partition as a result of defining the table space with COMPRESS YES. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics have not been gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
GBPCACHE	CHAR(1) NOT NULL WITH DEFAULT	Group buffer pool cache option specified for this table space or table space partition. **A** Changed and unchanged pages are cached in the group buffer pool. **N** No data is cached in the group buffer pool. **S** Only changed system pages, such as space map pages that do not contain actual data values, are cached in the group buffer pool. **blank** Only changed pages are cached in the group buffer pool.	G

Column name	Data type	Description	Use
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	Blank if the table or partition is not in a check pending status (CHECKFLAG is blank), or if the table space is not partitioned. Otherwise, the RID of the first row of the table space partition that can violate referential constraints, check constraints, or both; or the value is X'0000000000', indicating that any row can violate referential constraints.	S
TRACKMOD	CHAR(1) NOT NULL WITH DEFAULT	Whether to track the page modifications in the space map pages: **N** No **blank** Yes	G
EPOCH	INTEGER NOT NULL WITH DEFAULT	A number that increments whenever a utility operation that changes the location of rows in a table occurs.	G
SECQTYI	INTEGER NOT NULL WITH DEFAULT	Secondary space allocation in units of 4KB storage. For user-managed data sets, the value is the secondary space allocation in units of 4KB blocks.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBs in the table space. The value is -1 if statistics have not been gathered.	G
IPREFIX	CHAR(1) NOT NULL WITH DEFAULT 'I'	The first character of the instance qualifier for the data set name for the table space or partition. 'I' or 'J' are the only valid characters for this field. The default is 'I'.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space or partition. If no ALTER TABLESPACE statement has been applied, the value is '0001-01-01.00.00.00.000000'.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This is an updatable column.	G
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Number of data sets. The value is -1 if statistics have not been gathered. This is an updatable column.	G
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is -1 if statistics have not been gathered. This is an updatable column. This value is only for the last DSNUM for the object.	G

Column name	Data type	Description	Use
LOGICAL_PART	SMALLINT NOT NULL WITH DEFAULT	The logical partition number (logical ascending or descending order) for partitioned table spaces. The physical partition number is kept in column PARTITION. LOGICAL_PART is 0 for nonpartitioned table spaces. For partitioned table spaces that were created prior to Version 8, LOGICAL_PART is originally 0, but might be changed later to a non-zero value by processes such as conversion to table-controlled partitioning.	G
LIMITKEY_INTERNAL	VARCHAR(512) NOT NULL WITH DEFAULT FOR BIT DATA	The highest value of the limit key of the partition in an internal format. If the table uses index-controlled partitioning instead of table-controlled partitioning or the table is not partitioned, the value is an empty string. If the table space was converted from index-controlled partitioning to table-controlled partitioning, the value is the highest possible value for an ascending key, or the lowest possible value for a descending key. If any column of the key has a field procedure, the internal format is the encoded form of the value.	S
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table part and any image copies at the part level.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the partition was created.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
FORMAT	CHAR(1) NOT NULL WITH DEFAULT	Indicates the format of the rows in the table space or partition: **R** Indicates reordered row format **blank** Indicates basic row format or a LOB table space	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
REORG_LR_TS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the REORG or LOAD REPLACE utility last occurred. The default value is '0001-01-01.00.00.00.000000'.	G

Column name	Data type	Description	Use
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	For partition-by-growth table spaces this is zero. For partition-by-range (UTS) table spaces, this is the amount of space, in KB, specified at the partition level to override the space specification at the table level. If no override is provided it will be the same as the value of HASHSPACE in the SYSIBM.SYSTABLEPSACE catalog table.	G
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	For partition-by-growth table spaces, the value is zero. For partition-by-range table spaces, this is the number of hash data pages that correspond to the value of the HASHSPACE column for each partition. The value is 0 for table spaces which have been changed to use hash access but have not been reorganized.	G
RBA_FORMAT	CHAR(1) NOT NULL WITH DEFAULT	The RBA and LRSN format for the page sets of the table partition: **B** The page sets are still in the basic 6-byte format. **E** The page sets are converted to the extended 10-byte format. **U** The format is undefined because DEFINE NO was specified when the table space was created. **blank** The page sets are still in the basic 6-byte format, the table partition was created before Db2 11 new-function mode (NFM), and no utility that sets the RBA_FORMAT value has run for the table partition in Db2 11 NFM or higher.	G
PCTFREE_UPD	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, as defined when the object as created or altered.	G
PCTFREE_UPD_CALC	SMALLINT NOT NULL WITH DEFAULT	The percentage of free space that is reserved for updates to variable length records, calculated by Db2 or utilities.	G

SYSTABLEPART_HIST catalog table

The SYSTABLEPART_HIST table contains rows from the SYSTABLEPART table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
PARTITION	SMALLINT NOT NULL	Partition number. 0 if table space is not partitioned.	G
TSNAME	VARCHAR(24) NOT NULL	Name of the table space.	G

Column name	Data type	Description	Use
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
PQTY	INTEGER NOT NULL	For user-managed data sets, the value is the primary space allocation in units of 4 KB storage blocks or -1. For user-specified values of PRIQTY other than -1, the value is set to the primary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. PQTY is based on a value of PRIQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike PQTY, however, PRIQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • PRIQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for PRIQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G
SECQTYI	INTEGER NOT NULL	For user-managed data sets, the value is the secondary space allocation in units of 4 KB storage blocks or -1. For user-specified values of SECQTY other than -1, the value is set to the secondary space allocation only if RUNSTATS TABLESPACE with UPDATE(ALL) or UPDATE(SPACE) is executed; otherwise, the value is zero. SQTY is based on a value of SECQTY in the appropriate CREATE or ALTER TABLESPACE statement. Unlike SQTY, however, SECQTY asks for space in 1 KB units. A value of -1 indicates that either of the following cases is true: • SECQTY was not specified for a CREATE TABLESPACE statement or for any subsequent ALTER TABLESPACE statements. • -1 was the most recently specified value for SECQTY, either on the CREATE TABLESPACE statement or a subsequent ALTER TABLESPACE statement. If a storage group is not used, the value is 0.	G
FARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated far from their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S

Column name	Data type	Description	Use
NEARINDREF	INTEGER NOT NULL WITH DEFAULT -1	Number of rows that have been relocated near their original page. The value is -1 if statistics have not been gathered. Not applicable if the table space is a LOB table space.	S
PERCACTIVE	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of data from active tables. The value is -1 if statistics have not been gathered. The value is -2 if the table space is a LOB table space.	S
PERCDROP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of space occupied by rows of dropped tables. The value is -1 if statistics have not been gathered. The value is 0 for segmented table spaces. Not applicable if the table is an auxiliary table.	S
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of kilobytes of DASD storage allocated to the table space partition. The value is -1 if statistics have not been gathered.	G
PAGESAVE	SMALLINT NOT NULL	Percentage of pages saved in the table space or partition as a result of defining the table space with COMPRESS YES. For example, a value of 25 indicates a savings of 25 percent, so that the pages required are only 75 percent of what would be required without data compression. The calculation includes overhead bytes for each row, the bytes required for dictionary, and the bytes required for the current FREEPAGE and PCTFREE specification for the table space or partition. This calculation is based on an average row length, and the result varies depending on the actual lengths of the rows. The value is 0 if there are no savings from using data compression, or if statistics have not been gathered. The value can be negative, if for example, data compression causes an increase in the number of pages in the data set.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of rows in the table space or partition, or if the table space is a LOB table space, the number of LOBS in the table space. The value is '-1' if statistics have not been gathered.	S
EXTENTS	INTEGER NOT NULL WITH DEFAULT -1	Number of data set extents. The value is '-1' if statistics have not been gathered. This value is only for the last DSNUM for the object.	G

Column name	Data type	Description	Use
DSNUM	INTEGER NOT NULL WITH DEFAULT -1	Data set number within the table space. For partitioned table spaces, this value corresponds to the partition number for a single partition copy, or 0 for a copy of an entire partitioned table space or index space. The value is '-1' if statistics have not been gathered.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is '-1' if statistics have not been gathered.	G

SYSTABLES catalog table

The SYSTABLES table contains one row for each table, view, or alias. The schema is SYSIBM. Each SYSTABLES table row indicates whether the object that it describes is a table, view, or alias, its name, who created it, the database that it belongs to, the table space it belongs to, and other information. The SYSTABLES table also has a REMARKS column in which you can store your own information about the table in question.

For an example query for the SYSTABLES catalog table, see Retrieving catalog information about a table (Db2 Administration Guide).

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	Type of object: **A** Alias **C** Clone table **D** Accelerator-only table **G** Created global temporary table **H** History table **M** Materialized query table **P** Table that was implicitly created for XML columns **R** Archive table **T** Table **V** View **X** Auxiliary table	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space that is named in TSNAME. For a created temporary table, an alias, or a view of a view, the value is DSNDB06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a created temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database; 0 if the row describes a view, alias, or created temporary table. Non-zero if the view has an INSTEAD OF trigger defined.	S
OBID	SMALLINT NOT NULL	Internal identifier of the table; 0 if the row describes a view, an alias, or a created temporary table. Non-zero if the view has an INSTEAD OF trigger defined.	S
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
EDPROC	VARCHAR(24) NOT NULL	Name of the edit procedure; blank if the row describes a view or alias or a table without an edit procedure.	G
VALPROC	VARCHAR(24) NOT NULL	Name of the validation procedure; blank if the row describes a view or alias or a table without a validation procedure.	G

Column name	Data type	Description	Use
CLUSTERTYPE	CHAR(1) NOT NULL	Whether RESTRICT ON DROP applies: **blank** No **Y** Yes. You cannot drop the table or any table space or database that contains the table.	G
CLUSTERRID	INTEGER NOT NULL	**1** The table is a system-period temporal table with versioning, and the table is defined with the ON DELETE ADD EXTRA ROW clause. **0** All other tables.	N
CARD	INTEGER NOT NULL	Not used	N
NPAGES	INTEGER NOT NULL	Total number of pages that include rows of the table. The value is -1 if statistics have not been gathered, or the row describes a view, an alias, a created temporary table, an accelerator-only table, or an auxiliary table. This column can be updated.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments that are assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, an accelerator-only table, or auxiliary table. This column can be updated.	S
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
REMARKS	VARCHAR(762) NOT NULL	A character string that is provided by the user with the COMMENT statement.	G
PARENTS	SMALLINT NOT NULL	Number of relationships in which the table is a dependent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G
CHILDREN	SMALLINT NOT NULL	Number of relationships in which the table is a parent. The value is 0 if the row describes a view, an alias, a created temporary table, or a materialized query table.	G

Column name	Data type	Description	Use
KEYCOLUMNS	SMALLINT NOT NULL	Number of columns in the primary key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G
RECLENGTH	SMALLINT NOT NULL	For user tables, the maximum length of any record in the table. Length is 8+*N*+*L*, where: • The number 8 accounts for the header (6 bytes) and the ID map entry (2 bytes). • *N* is 10 if the table has an edit procedure, or 0 otherwise. • *L* is the sum of the maximum column lengths. In determining the maximum length of a column, take into account whether the column allows nulls and the data type of the column. If the column can contain nulls and is not a LOB or ROWID column, add 1 byte for a null indicator. Use 4 bytes for the length of a LOB column and 19 bytes for the length of a ROWID column. If the column has a varying-length data type (for example, VARCHAR, CLOB, or BLOB), add 2 bytes for a length indicator. For more information about column lengths, see "Data types" on page 95. The value is 0 if the row describes a view, alias, or auxiliary table. For maximum row and record sizes, see the note on the maximum record size in "CREATE TABLE" on page 1509.	G
STATUS	CHAR(1) NOT NULL	Indicates the status of the table definition: **I** The definition of the table is incomplete. The TABLESTATUS column indicates the reason why the table definition is incomplete. **R** An error occurred when an attempt was made to regenerate the internal representation of the view. **X** The table has a unique constraint (primary key or unique key) and the table definition is complete. **blank** The table has no unique constraint (primary key or unique key), the table is a catalog table, or the row describes a view or alias. The definition of the table, view, or alias is complete.	G
KEYOBID	SMALLINT NOT NULL	Internal Db2 identifier of the index that enforces uniqueness of the primary key of the table; 0 if not applicable.	S
LABEL	VARCHAR(90) NOT NULL	The label as given by a LABEL statement; otherwise, the value is an empty string.	G

Column name	Data type	Description	Use
CHECKFLAG	CHAR(1) NOT NULL WITH DEFAULT	**C** The table space that contains the table is in CHECK-pending status. One of the following conditions is true: • There are rows in the table that violate referential constraints, check constraints, or both • The table is a materialized query table that might contain inconsistent data **blank** Indicates one of the following conditions: • The table contains no rows that violate referential constraints, check constraints, or both • The table is a materialized query table that contains consistent data • The row describes a view, an alias, or a temporary table	G
CHECKRID	CHAR(4) NOT NULL WITH DEFAULT FOR BIT DATA	A value of 'FFFFFF00' in this column indicates that the edit procedure on this table is defined without row attribute sensitivity. Any other value indicates that the edit procedure is defined with row attribute sensitivity.	G
AUDITING	CHAR(1) NOT NULL WITH DEFAULT	Value of the audit option: **A** AUDIT ALL **C** AUDIT CHANGE **blank** AUDIT NONE, or the row describes a view, an alias, or a created temporary table.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table, view, or alias.	G
LOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	Location name of the object of an alias. The value is blank for a table, a view, an alias that was not defined with a three-part object name, or a materialized query table.	G
TBCREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	• For an alias, the schema of the referenced table or view • For a base table that is involved in a clone relationship, the name of the creator of the clone table • For a clone table that is involved in a clone relationship, the name of the creator of the base table • Otherwise, TBCREATOR is blank	G

Column name	Data type	Description	Use
TBNAME	VARCHAR(128) NOT NULL WITH DEFAULT	• For an alias, the name for the referenced table or view • For a base table that is involved in a clone relationship, the name of the clone table • For a clone table that is involved in a clone relationship, the name of the base table • Otherwise, TBNAME is blank	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table, view, or alias	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	For a table, the time when the latest ALTER TABLE statement was applied. If no ALTER TABLE statement was applied, or if the row is for an alias, ALTEREDTS has the value of CREATEDTS. For a view, the time when the last ALTER VIEW REGENERATE statement was applied.	G
DATACAPTURE	CHAR(1) NOT NULL WITH DEFAULT	Records the value of the DATA CAPTURE option for a table: **blank** No **Y** Yes For a created temporary table, DATACAPTURE is always blank.	G
RBA1	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was created. Otherwise, RBA1 is X'00000000000000000000', indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. In a data sharing environment, RBA1 is the LRSN (Log Record Sequence Number) value.	S
RBA2	CHAR(10) NOT NULL WITH DEFAULT FOR BIT DATA	The log RBA when the table was last altered. Otherwise, RBA2 is X'00000000000000000000' indicating that the log RBA is not known, or that the object is a view, an alias, or a created temporary table. RBA1 equals RBA2 if the table has not been altered. In a data sharing environment, RBA2 is the LRSN (Log Record Sequence Number) value.	S
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT	Percentage of rows that are compressed within the total number of active rows in the table. This number includes any row in a table space that is defined with COMPRESS YES. The value is -1 if statistics have not been gathered, or the row describes a view, alias, created temporary table, an accelerator-only table, or auxiliary table. This column can be updated.	S

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. For a created temporary table, the value of STATSTIME is always the default value.	G
CHECKS	SMALLINT NOT NULL WITH DEFAULT	Number of check constraints that are defined on the table. The value is 0 if either of the following conditions are true: • The row describes a view, an alias, a created temporary table, or a materialized query table. • No constraints are defined on the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, accelerator-only table, or created temporary table. This column can be updated.	S
CHECKRID5B	CHAR(5) NOT NULL WITH DEFAULT FOR BIT DATA	RID of the first row of the table space partition that can violate referential constraints, check constraints, or both. The value of X'0000000000' indicates that any row can violate referential constraints. The value is blank if any of the following conditions are true: • The table or partition is not in CHECK-pending status (CHECKFLAG is blank) • The table space is not partitioned • The table is a created temporary table	S

Column name	Data type	Description	Use
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Encoding scheme for a table, view, or the table or view that is referred to by a local alias: **E** EBCDIC. This value is 'E' even if the table contains a Unicode column. **A** ASCII **M** Multiple CCSID set or multiple encoding schemes **U** Unicode **blank** For remote aliases The value is 'E' for tables in non-work file databases. The value is blank for tables in work file databases that were created before Version 5 or in the default database, DSNDB04. This column is not applicable for objects that were created before Db2 for z/OS Version 5. This field contains the default encoding scheme for table columns for which a CCSID is not explicitly defined. The ENCODING_SCHEME column in SYSIBM.SYSCOLUMNS table contains the encoding schemes for columns for which a CCSID is explicitly defined.	G
TABLESTATUS	VARCHAR(30) NOT NULL WITH DEFAULT	Indicates the reason for an incomplete table definition: **L** An auxiliary table or auxiliary index has not been defined for a LOB column. **P** The table lacks a primary index. **R** The table lacks a required index on a row ID. **U** The table lacks a required index on a unique key. **V** An error occurred when an attempt was made to regenerate the internal representation of the view. **blank** Definition is complete.	G
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Number of pages that are used by the table. The value is -1 if statistics have not been gathered or the table is an auxiliary table or accelerator-only table. This column can be updated.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. The value might be non-zero for an auxiliary table in the LOB table space. This column can be updated.	G

Column name	Data type	Description	Use
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space. If the table space is compressed, the value is the compressed row length. If the table space is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
NUM_DEP_MQTS	SMALLINT NOT NULL WITH DEFAULT	Number of dependent materialized query tables. The value is zero if the row describes an alias or a created temporary table, or if no materialized query tables are defined on the table.	G
VERSION	SMALLINT NOT NULL WITH DEFAULT	The version of the data row format for this table. • A value of zero indicates that an alter operation that creates a new version has never occurred for this table. • A value of -1 indicates that the view has been regenerated because a column of the base table has been altered. • A value of 800 indicates that a successful CREATE VIEW or ALTER VIEW statement has occurred against this view in Version 8 or later. • A value of 900 indicates that a successful ALTER TABLE statement with a DROP COLUMN clause has occurred against this view.	G
PARTKEYCOLNUM	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the partitioning key. This value is zero for tables that do not have partitioning or use index-controlled partitioning. The value is non-zero for tables that use table-controlled partitioning.	G
SPLIT_ROWS	CHAR(1) NOT NULL WITH DEFAULT	This column is blank except for volatile tables. For volatile table, this column contains 'Y' to indicate to Db2 to use index access on this table whenever possible.	G
SECURITY_LABEL	CHAR(1) NOT NULL	This column is only meaningful if the TYPE column is a T (for table) or M (for materialized query table). The value indicates whether the table has multilevel security: **Blank** The table does not have multilevel security. **R** The table has multilevel security with row granularity.	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the table, view, or alias. This column is blank for tables, views, or aliases that were created before Db2 for z/OSDB2 9.	G

Column name	Data type	Description	Use
APPEND	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the APPEND option is specified for the table. **Y** The APPEND option is specified. **N** The APPEND option is not specified.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
CONTROL	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether access to the table is enforced by using row or column access control: **blank** No access control enforcement **B** The table is enforced by using both row and column access control **C** The table is enforced by using column access control **R** The table is enforced by using row access control	G
VERSIONING_SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the schema name of the history table if the table is a system-period temporal table with versioning. Indicates the schema name of the system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
VERSIONING_TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Indicates the table name of the history table if the table is a system-period temporal table with versioning. Indicates the table name of system-period temporal table if the table is a history table. Otherwise, the value is blank.	G
HASHKEYCOLUMNS	SMALLINT NOT NULL WITH DEFAULT	The number of columns in the hash key of the table. The value is 0 if the row describes a view, an alias, or a created temporary table.	G
ARCHIVING_SCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a schema name as follows: • If the table is an archive-enabled table, this column contains the schema name of the archive table. • If the table is an archive table, this column contains the schema name of the archive-enabled table. • If the table is not an archive-enabled table or an archive table, the value is blank.	G

Column name	Data type	Description	Use
ARCHIVING_TABLE	VARCHAR(128) NOT NULL WITH DEFAULT	Contains a table name as follows: • If the table is an archive-enabled table, this column contains the table name of the archive table. • If the table is an archive table, this column contains the table name of the archive-enabled table. • If the table is not an archive-enabled table or an archive table, the value is blank.	G
STATS_FEEDBACK	CHAR (1) NOT NULL WITH DEFAULT	When a query qualifies for statistics collection based on DSNZPARM STATFDBK_SCOPE, this column controls whether statistics recommendations for this table are placed in SYSIBM.SYSSTATFEEDBACK. You can update this flag to 'Y' or 'N' to enable or disable collection for the table. The default value is 'Y'.	G

SYSTABLESPACE catalog table

The SYSTABLESPACE table contains one row for each table space. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(24) NOT NULL	Name of the table space.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the table space.	G
DBNAME	VARCHAR(24) NOT NULL	Name of the database that contains the table space.	G
DBID	SMALLINT NOT NULL	Internal identifier of the database which contains the table space.	S
OBID	SMALLINT NOT NULL	Internal identifier of the table space file descriptor.	S
PSID	SMALLINT NOT NULL	Internal identifier of the table space page set descriptor.	S
BPOOL	CHAR(8) NOT NULL	Name of the buffer pool used for the table space.	G
PARTITIONS	SMALLINT NOT NULL	Number of partitions of the table space; 0 if the table space is not partitioned.	G

Column name	Data type	Description	Use
LOCKRULE	CHAR(1) NOT NULL	Lock size of the table space: **A** Any **L** Large object (LOB) **P** Page **R** Row **S** Table space **T** Table **X** implicitly created XML table space	G
PGSIZE	SMALLINT NOT NULL	Size of pages in the table space in kilobytes.	G
ERASERULE	CHAR(1) NOT NULL	Whether the data sets are to be erased when dropped. The value is meaningless if the table space is a partition-by-range table space. **N** No erase **Y** Erase	G
STATUS	CHAR(1) NOT NULL	Availability status of the table space: **A** Available **C** Definition is incomplete because the table space does not use table-controlled partitioning and a partitioning index has not been created. **P** Table space is in a check pending status. **S** Table space is in a check pending status with the scope less than the entire table space. **T** Definition is incomplete because no table has been created.	G
IMPLICIT	CHAR(1) NOT NULL	Whether the table space was created implicitly: **N** No **Y** Yes	G

Column name	Data type	Description	Use
NTABLES	SMALLINT NOT NULL	Number of tables defined in the table space.	G
NACTIVE	INTEGER NOT NULL	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is 0 if statistics have not been gathered. This is an updatable column.	S
	VARCHAR(24) NOT NULL	Not used	N
CLOSERULE	CHAR(1) NOT NULL	Whether the data sets are candidates for closure when the limit on the number of open data sets is reached. **N** No **Y** Yes	G
SPACE	INTEGER NOT NULL	Number of kilobytes of DASD storage allocated to the table space, as determined by the last execution of the STOSPACE utility. The value is 0 if the table space is not related to a storage group, or if STOSPACE has not been run. If the table space is partitioned, the value is the total kilobytes of DASD storage allocated to all partitions that are storage group defined.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. If ALTER TABLESPACE changes the DSSIZE value to 128G or 256G, this column value is changed to O, which is the release dependency indicator for Version 10. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
—	VARCHAR(54) NOT NULL	Internal use only.	I
—	VARCHAR(24) NOT NULL	Internal use only.	I
SEGSIZE	SMALLINT NOT NULL WITH DEFAULT	Number of pages in each segment of a segmented table space. The value is 0 if the table space is not segmented.	G
CREATEDBY	VARCHAR(128) NOT NULL WITH DEFAULT	Primary authorization ID of the user who created the table space.	G

Column name	Data type	Description	Use
STATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
LOCKMAX	INTEGER	The maximum number of locks per user to acquire for the table or table space before escalating to the next locking level. **0** Lock escalation does not occur. ***n*** *n*, where *n* > 0, is the maximum number of locks (row, page, or LOB locks for the table or table space) an application process can acquire before lock escalation occurs. **-1** Represents LOCKMAX SYSTEM. The value of field LOCKS PER TABLE(SPACE) on installation panel DSNTIPJ determines lock escalation. If the value of the field is 0, lock escalation does not occur. If the value is *n*, where *n* > 0, lock escalation occurs as it does for LOCKMAX n.	G
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of table space: **blank** The table space was created without the LOB or MEMBER CLUSTER options. If the DSSIZE column is zero, the table space is not greater than 64 gigabytes. **G** Partition-by-growth table space. **L** The table space can be greater than 64 gigabytes. **O** The table space was defined with the LOB option (the table space is a LOB table space). **P** Implicit table space created for XML columns. **R** Partition-by-range table space.	G
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the CREATE statement was executed for the table space. If the table space was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G

Column name	Data type	Description	Use
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the most recent ALTER TABLESPACE statement was executed for the table space. If no ALTER TABLESPACE statement has been applied, ALTEREDTS has the value of CREATEDTS. If the index was created in a Db2 release prior to Version 5, the value is '0001-01-01.00.00.00.000000'.	G
ENCODING_SCHEME	CHAR(1) NOT NULL WITH DEFAULT 'E'	Default encoding scheme for the table space: **E** EBCDIC **A** ASCII **U** UNICODE **blank** For table spaces in a work file database or a TEMP database (a database that was created AS TEMP, which is for declared temporary tables.) The value is 'E' for tables in non work file databases and blank for tables in work file databases created prior to Version 5 or the default database, DSNDB04.	G
SBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default SBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
DBCS_CCSID	INTEGER NOT NULL WITH DEFAULT	Default DBCS CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MIXED_CCSID	INTEGER NOT NULL WITH DEFAULT	Default mixed CCSID for the table space. For a table space in a work file database, a TEMP database, or a database created in a Db2 release prior to Version 5, the value is 0.	G
MAXROWS	SMALLINT NOT NULL DEFAULT 255	The maximum number of rows that Db2 will place on a data page. The default value is 255. For a LOB table space, the value is 0 to indicate that the column is not applicable.	G
LOCKPART	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N

Column name	Data type	Description	Use
LOG	CHAR(1) NOT NULL WITH DEFAULT 'Y'	Whether the changes to a table space are to be logged. **N** This table space has the NOT LOGGED attribute. Undo and redo logging for the table space and all indexes for tables in the table space is suppressed. Logging is also suppressed for the auxiliary indexes for all auxiliary tables associated with tables in the table space. **Y** This table space has the LOGGED attribute. Normal logging is associated with modifications to this table space, all indexes for tables in this table space, and all auxiliary indexes for all auxiliary tables associated with tables in the table space. **X** This LOB or XML table space has the NOT LOGGED attribute. Undo and redo logging for the table space is suppressed. Also, the logging attribute for this LOB or XML table space is linked to the logging attribute of the associated base table space and might not be able to be altered independently. If the logging attribute of the base table space is altered to LOGGED, the logging attribute of the LOB or XML table space will also be altered to LOGGED.	G
NACTIVEF	FLOAT NOT NULL WITH DEFAULT -1	Number of active pages in the table space. A page is termed active if it is formatted for rows, even if it currently contains none. The value is -1 if statistics have not been gathered. This is an updatable column.	S
DSSIZE	INTEGER NOT NULL WITH DEFAULT	Maximum size of a data set in kilobytes. The value might be 0 if the table space was created prior to DB2 10, but will contain the actual value after the table space is converted to a partitioned by growth table space.	G
OLDEST_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number of the oldest format of data in the table space and any image copies.	G
CURRENT_VERSION	SMALLINT NOT NULL WITH DEFAULT	The version number describing the newest format of data in the table space. A zero indicates that the table space has never had versioning. After the version number reaches the maximum value, the number wraps back to one.	G
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average length of rows for the tables in the table space or part. If the table space or part is compressed, the value is the compressed row length. If the table space or part is not compressed, the value is the uncompressed row length. The value is -1 if statistics have not been gathered.	G
SPACEF	FLOAT NOT NULL WITH DEFAULT	Kilobytes of DASD storage for the storage group. The value is -1 if statistics have not been gathered. This is an updatable column.	G

Column name	Data type	Description	Use
CREATORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to DB2 9. See Release dependency indicators for all other values.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT	INSTANCE indicates the data set instance number of the current base object (table and index).	G
CLONE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the table space contains any objects that are involved in a clone relationship: **Y** Table space contains objects that are involved in a clone relationship **N** Table space does not contain any objects that are involved in a clone relationship	G
MAXPARTITIONS	SMALLINT NOT NULL WITH DEFAULT	Identifies the maximum number of partitions to which the table space can grow. 0 if the table space is not a partition-by-growth table space.	G
MEMBER_CLUSTER	CHAR(1) NOT NULL WITH DEFAULT	Whether MEMBER CLUSTER is specified for the table space: **Y** MEMBER CLUSTER is specified for the table space **blank** MEMBER CLUSTER is not specified for the table space	G
ORGANIZATIONTYPE	CHAR(1) NOT NULL WITH DEFAULT	Type of table space organization: **blank** Not known. Blank is the default. **H** Hash organization	G
HASHSPACE	BIGINT NOT NULL WITH DEFAULT	The amount of space, in KB, that is to be allocated to the table space or partition as hash space. For partition-by-growth table spaces, the space applies to the whole table space. For partition-by-range table spaces, the space is applicable for each partition.	G

Column name	Data type	Description	Use
HASHDATAPAGES	BIGINT NOT NULL WITH DEFAULT	The total number of hash data pages to preallocate for hash space. For partition-by-growth table spaces, this includes all pages in the fixed part of the table space. For partition-by-range table spaces, this is the number of pages in the fixed hash space in each partition unless it is overridden by providing hash space at the partition level. This is calculated by Db2 from the value specified with the HASH SPACE option or when the REORG utility is run with automatic estimation of space. The calculated value is used in the hash algorithm. The value is 0 for non-hash table spaces. The value is also 0 for table spaces which have been changed to use hash access but have not been reorganized.	G

SYSTABLESPACESTATS catalog table

The SYSTABLESPACESTATS table contains real time statistics for table spaces. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

In data sharing environments, the values in SYSIBM.SYSTABLESPACESTATS can be negative for short periods of time for certain situations.

Column name	Data type	Description	Use
UPDATESTATSTIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp that the row in the SYSTABLESPACESTATS table is inserted or updated.	G
NACTIVE	INTEGER	The number of active pages in the table space or partition.	G
NPAGES	INTEGER	The number of distinct pages with active rows in the partition or table space. This is an updatable column. This column can be used to calculate an estimate of the size of LOB data in a table space. To produce an estimate, use the following formula: *value of NPAGES * page size =* *approximate size of LOB data*	G
EXTENTS	SMALLINT	The number of extents in the table space. For multi-piece table spaces, this value is the number of extents for the last data set. For a data set that is striped across multiple volumes, the value is the number of logical extents. A null value indicates the number of extents is unknown.	G

Column name	Data type	Description	Use
LOADRLASTTIME	TIMESTAMP	The timestamp that the LOAD REPLACE utility was last run on the table space or partition. A null value indicates that the LOAD REPLACE utility has never been run on the table space or partition or that the timestamp is unknown.	G
REORGLASTTIME	TIMESTAMP	The timestamp the REORG utility was last run on the table space or partition, or when the REORG utility has not been run, the time when the table space or partition was created. A null value indicates that the timestamp is unknown.	G
REORGINSERTS	INTEGER	The number of rows or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of inserted rows or LOBs is unknown.	G
REORGDELETES	INTEGER	The number of rows or LOBs that have been deleted from the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of deleted rows or LOBs is unknown.	G
REORGUPDATES	INTEGER	The number of rows that have been updated in the table space or partition since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of updated rows is unknown.	G
REORGUNCLUSTINS	INTEGER	The number of rows that were inserted that are not well-clustered with respect to the clustering index since the last REORG or LOAD REPLACE, or since the object was created. A record is well-clustered if the record is inserted into a page that is within 16 pages of the ideal candidate page. The clustering index determines the ideal candidate page. A null value indicates that the number of pages that are not well clustered is unknown. For a table space that has the MEMBER CLUSTER attribute, the clustering index is not used to identify the ideal candidate page. Therefore, this value is not updated.	G

Column name	Data type	Description	Use
REORGDISORGLOB	INTEGER	The number of LOBs that were inserted that are not perfectly chunked since the last REORG or LOAD REPLACE, or since the object was created. A LOB is perfectly chunked if the allocated pages are in the minimum number of chunks. A null value indicates that the number of not perfectly chunked LOBs is unknown.	G
REORGMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of dropped tables from a segmented table space since the last time the REORG or LOAD REPLACE utilities were run, or since the object was created. A null value indicates that the number of mass deletes is unknown.	G
REORGNEARINDREF	INTEGER	The number of overflow rows that are created and relocated near the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is near the present page if the two page numbers differ by 16 or less. For segmented table spaces, a page is near the present page if the two page numbers differ by SEGSIZE*2 or less. A null value indicates that the number of overflow rows that are near the pointer record is unknown.	G
REORGFARINDREF	INTEGER	The number of overflow rows that are created and relocated far from the pointer record since the last time the REORG and LOAD REPLACE utilities were run, or since the object was created. For non-segmented table spaces, a page is far from the present page if the two page numbers differ by more than 16. For segmented table spaces, a page is far from the present page if the two page numbers differ by at least (SEGSIZE*2)+1. A null value indicates that the number of overflow rows that are near the pointer record is unknown.	G
STATSLASTTIME	TIMESTAMP	The timestamp of the last time that the RUNSTATS utility is run on the table space or partition.	G

Column name	Data type	Description	Use
STATSINSERTS	INTEGER	The number of rows or LOBs that have been inserted into the table space or partition or loaded into the table space or partition using the LOAD utility specified without the REPLACE option since the last time that the RUNSTATS utility was run. A null value indicates that the number of inserted rows or LOBs is unknown.	G
STATSDELETES	INTEGER	The number of rows or LOBs that have been deleted from the table space or partition since the last time that the RUNSTATS utility was run, or since the object was created. A null value indicates that the number of deleted rows or LOBs is unknown.	G
STATSUPDATES	INTEGER	The number of rows that have been updated in the table space or partition since the last time that the RUNSTATS utility was run. A null value indicates that the number of updated rows is unknown.	G
STATSMASSDELETE	INTEGER	The number of mass deletes from a segmented or LOB table space, or the number of tables that are dropped from a segmented table space, since the last time the RUNSTATS utility was run. A null value indicates that the number of mass deletes is unknown.	G
COPYLASTTIME	TIMESTAMP	The timestamp of the last full or incremental image copy of the table space or partition. A null value indicates that the COPY utility has never been run on the table space or partition. A null value can also indicate that the timestamp of the last image copy is unknown.	G
COPYUPGETDATEDPAGES	INTEGER	The number of distinct pages that have been updated since the last time that the COPY utility was run. A null value indicates that the number of updated pages is unknown.	G

Column name	Data type	Description	Use
COPYCHANGES	INTEGER	The number of insert, update, and delete operations, or the number of rows loaded, since the last time that the COPY utility was run. This value does not include operations that result in no change to the data, such as an update that sets the value of a column to its existing value. A null value indicates that the number of insert, update, and delete operations or the number of rows loaded is unknown.	G
COPYUPDATELRSN	CHAR(10) FOR BIT DATA	The LRSN or RBA of the first update that occurs after the last time the COPY utility was run. A null value indicates that the LRSN or RBA is unknown.	G
COPYUPDATETIME	TIMESTAMP	The timestamp of the first update that occurs after the last time that the COPY utility was run. A null value indicates that the timestamp is unknown. The value is 6 bytes of X'FF' if the RBA/LRSN exceeds the 6-byte limit.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBID	SMALLINT NOT NULL	The internal identifier of the database. This column is used to map a DBID to its statistics.	G
PSID	SMALLINT NOT NULL	The internal identifier of the table space page set descriptor. This column is used to map a PSID to its statistics.	G
PARTITION	SMALLINT NOT NULL	The data set number within the table space. This column is used to map a data set number in a table space to its statistics. For partitioned table spaces, this value corresponds to the partition number for a single partition. For non-partitioned table spaces, this value is 0.	G
INSTANCE	SMALLINT NOT NULL WITH DEFAULT 1	Indicates if the object is associated with data set instance 1 or 2. This is an updatable column.	G
SPACE	BIGINT	The amount of space, in KB, that is allocated to the table space or partition. For multi-piece, linear page sets, this value is the amount of space in all data sets. A null value indicates the amount of space is unknown.	G

Column name	Data type	Description	Use
TOTALROWS	BIGINT	The number of rows or LOBs that are in the table space or partition, calculated from the in-memory counters for inserts and deletes. For XML, this column contains the number of physical rows in the table space or partition. Each XML document might have more than one physical record in a table space or partition.	G
DATASIZE	BIGINT	The total number of bytes that row data occupy. For LOB table spaces this column is always 0. This is an updatable column.	G
UNCOMPRESSEDDATASIZE	BIGINT	This column is not used. The value is always set to 0.	G
DBNAME	VARCHAR(24) NOT NULL	The name of the database. This column is used to map a database to its statistics.	G
NAME	VARCHAR(24) NOT NULL	The name of the table space. This column is used to map a table space to its statistics.	G
REORGSCANACCESS	BIGINT	The number of times data is accessed for SELECT, FETCH, searched UPDATE, or searched DELETE since the last CREATE, LOAD REPLACE or REORG, or since the object was created.A null value indicates that the number of times data is accessed is unknown.	G
REORGHASHACCESS	BIGINT	The number of times data is accessed using hash access for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints since the last CREATE, LOAD REPLACE or REORG, or since the object was created. A null value indicates that the number of times data is accessed is unknown.	G
HASHLASTUSED	DATE	The date when hash access was last used for SELECT, FETCH, searched UPDATE, searched DELETE, or used to enforce referential integrity constraints.	G
REORGCLUSTERSENS	BIGINT	The number of times that data has been read by SQL statements that are sensitive to the clustering sequence of the data since the last REORG or LOAD REPLACE, or since the object was created. For a table space that has the MEMBER CLUSTER attribute, when records are inserted, the clustering index is not used. Therefore, this value is not updated.	G

Column name	Data type	Description	Use
DRIVETYPE	CHAR(3) NOT NULL WITH DEFAULT	The drive type on which the table space or table space partition data set is defined. **HDD** Hard Disk Drive **SSD** Solid State Drive For multi-volume data sets, the drive type is set to SSD if any volume is SSD. For multi-piece linear page sets, the drive type of the first data set is used. This is an updatable column.	G
LPFACILITY	CHAR(1)	Whether the disk control unit has the high performance list prefetch facility. **N** No **Y** Yes A NULL value indicates that it is unknown whether the disk control unit has the high performance list prefetch facility. This is an updatable column.	G
	BIGINT	Reserved for future IBM use.	R
UPDATESIZE	BIGINT	The net number of bytes that were added or removed by UPDATE operations since the object was created, or since the last REORG or LOAD REPLACE operation. Valid values can be positive or negative.	G
LASTDATACHANGE	TIMESTAMP	The last time that this row was updated because data was modified in the table space or partition. The timestamp reflects the time at which the real-time statistics table was updated, and not the time at which the data in the table space or partition was modified. Physical data changes such as reorganization of data are not reflected in this column.	G

SYSTABLES_HIST catalog table

The SYSTABLES_HIST table contains rows from the SYSTABLES table. The schema is SYSIBM.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the table, view, or alias.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table, view, or alias.	G
DBNAME	VARCHAR(24) NOT NULL	For a table, or a view of tables, the name of the database that contains the table space named in TSNAME. For a temporary table, an alias, or a view of a view, the value is DSNDB06.	G
TSNAME	VARCHAR(24) NOT NULL	For a table, or a view of one table, the name of the table space that contains the table. For a view of more than one table, the name of a table space that contains one of the tables. For a temporary table, a view of a view, or an alias, it is SYSTSTAB.	G
COLCOUNT	SMALLINT NOT NULL	Number of columns in the table or view. The value is 0 if the row describes an alias.	G
PCTPAGES	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of active table space pages that contain rows of the table. A page is termed active if it is formatted for rows, regardless of whether it contains any. If the table space is segmented, the percentage is based on the number of active pages in the set of segments assigned to the table. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.	S
PCTROWCOMP	SMALLINT NOT NULL WITH DEFAULT -1	Percentage of rows compressed within the total number of active rows in the table. This includes any row in a table space that is defined with COMPRESS YES. The value is -1 if statistics have not been gathered, or the row describes a view, alias, temporary table, accelerator-only table, or auxiliary table.	G
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column. For a temporary table, the value of STATSTIME is always the default value.	G
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the table or total number of LOBs in an auxiliary table. The value is -1 if statistics have not been gathered or the row describes a view, alias, accelerator-only table, or temporary table.	S
NPAGESF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of pages on which rows of the partition appear. The value is -1 if statistics have not been gathered.	S

Column name	Data type	Description	Use
AVGROWLEN	INTEGER NOT NULL WITH DEFAULT -1	Average row length of the table specified in the table space. The value is -1 if statistics have not been gathered.	G
SPACEF	FLOAT(8) NOT NULL WITH DEFAULT -1	Kilobytes of DASD storage. The value is -1 if statistics have not been gathered. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSTABLES_PROFILES catalog table

The SYSTABLES_PROFILES table contains one row for each profile that is associated with a table in SYSIBM.SYSTABLES. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
SCHEMA	VARCHAR(128) NOT NULL	The schema (qualifier) for the table.	G
TBNAME	VARCHAR(128) NOT NULL	The table name.	G
PROFILE_TYPE	VARCHAR(32) NOT NULL	The type of profile. Allowed values are 'RUNSTATS'.	G
—	VARCHAR(32)	Internal use only.	I
PROFILE_TEXT	CLOB(1M)	The text of the profile.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the LOB column of this table.	G
PROFILE_UPDATE	TIMESTAMP NOT NULL	The last time the profile was updated, or the timestamp for when the profile was inserted into the table.	G
—	TIMESTAMP	Internal use only.	I

SYSTABLES_PROFILE_TEXT catalog table

The SYSTABLES_PROFILE_TEXT table is an auxiliary table for the PROFILE_TEXT column of the SYSIBM.SYSTABLES_PROFILES table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
PROFILE_TEXT	CLOB(2M) NOT NULL WITH DEFAULT	The complete text for the profile that the row represents.	G

SYSTABSTATS catalog table

The SYSTABSTATS table contains one row for each partition of a partitioned table space. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Important: Use care when issuing SQL statements or using tools to update statistics values in catalog tables. If such updates introduce invalid data, unpredictable results can occur, including abends for RUNSTATS and other utilities. If such problems occur, you can run the RUNSTATS utility and collect statistics at the table space level to resolve the problems, in most cases.

Column name	Data type	Description	Use
CARD	INTEGER NOT NULL	Total number of rows in the partition.	S
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
PCTPAGES	SMALLINT NOT NULL	Percentage of total active pages in the partition that contain rows of the table.	S
NACTIVE	INTEGER NOT NULL	Number of active pages in the partition.	S
PCTROWCOMP	SMALLINT NOT NULL	Percentage of rows compressed within the total number of active rows in the partition. This includes any row in a table space that is defined with COMPRESS YES.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G

Column name	Data type	Description	Use
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G
CARDF	FLOAT NOT NULL WITH DEFAULT -1	Total number of rows in the partition.	S

SYSTABSTATS_HIST catalog table

The SYSTABSTATS_HIST table contains rows from the SYSTABSTATS table.

Rows are added or changed in this table when RUNSTATS collects history statistics. Rows in this table can also be inserted, updated, and deleted.

Column name	Data type	Description	Use
NPAGES	INTEGER NOT NULL	Total number of pages on which rows of the partition appear.	S
STATSTIME	TIMESTAMP NOT NULL	If RUNSTATS or another utility with inline statistics updated the statistics, the date and time when the last utility invocation updated the statistics. The default value is '0001-01-01-00.00.00.000000'. The default value indicates that statistics were not collected. This is an updatable column.	G
DBNAME	VARCHAR(24) NOT NULL	Database that contains the table space named in TSNAME.	G
TSNAME	VARCHAR(24) NOT NULL	Table space that contains the table.	G
PARTITION	SMALLINT NOT NULL	Partition number of the table space that contains the table.	G
OWNER	VARCHAR(128) NOT NULL	The schema of the table.	G
NAME	VARCHAR(128) NOT NULL	Name of the table.	G

Column name	Data type	Description	Use
CARDF	FLOAT(8) NOT NULL WITH DEFAULT -1	Total number of rows in the partition. The value is -1 if statistics have not been gathered.	S
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSTRIGGERS catalog table

The SYSTRIGGERS table contains one row for each trigger. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the trigger and trigger package.	G
SCHEMA	VARCHAR(128) NOT NULL	Schema of the trigger. This implicit or explicit qualifier for the trigger name is also used for the collection ID of the trigger package.	G
SEQNO	SMALLINT NOT NULL	Not used.	N
DBID	SMALLINT NOT NULL	Internal identifier of the database for the trigger.	G
OBID	SMALLINT NOT NULL	Internal identifier of the trigger.	G
OWNER	VARCHAR(128) NOT NULL	Owner of the trigger.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the trigger.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the table or view.	G
TBOWNER	VARCHAR(128) NOT NULL	Qualifier of the name of the table or view to which this trigger applies.	G

Column name	Data type	Description	Use
TRIGTIME	CHAR(1) NOT NULL	Time when triggered actions are applied to the base table, relative to the event that activated the trigger: **A** Trigger is applied after the event. **B** Trigger is applied before the event. **I** Trigger is applied instead of the event	G
TRIGEVENT	CHAR(1) NOT NULL	Operation that activates the trigger: **I** Insert **D** Delete **U** Update	G
GRANULARITY	CHAR(1) NOT NULL	Trigger is executed once per: **S** Statement **R** Row	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the trigger was created.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
TEXT	VARCHAR(6000) NOT NULL	Not used.	N
REMARKS	VARCHAR(762) NOT NULL	A character string provided by the user with the COMMENT statement.	G
TRIGNAME	VARCHAR(128) NOT NULL	Not used.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of creator: **blank** Authorization ID **L** Role	G

Column name	Data type	Description	Use
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G
SECURE	CHAR(1) NOT NULL WITH DEFAULT 'N'	Indicates if the trigger is secured: **N** The trigger is not secured **Y** The trigger is secured	G
ALTEREDTS	TIMESTAMP NOT NULL	Indicates when the trigger was last changed.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table.	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G

SYSTRIGGERS_STMT catalog table

The SYSTRIGGERS_STMT table is an auxiliary table for the STATEMENT column of the SYSTRIGGERS table and contains LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the entire CREATE TRIGGER statement that was used to create the object.	G

SYSUSERAUTH catalog table

The SYSUSERAUTH table records the system privileges that are held by users. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privileges.	G
GRANTEE	VARCHAR(128) NOT NULL	Authorization ID of the user that holds the privilege. Could also be PUBLIC for a grant to PUBLIC.	G
—	CHAR(12) NOT NULL	Internal use only.	I

Column name	Data type	Description	Use
DATEGRANTED	CHAR(6) NOT NULL	Not used.	N
TIMEGRANTED	CHAR(8) NOT NULL	Not used.	N
GRANTEETYPE	CHAR(1) NOT NULL	Not used.	N
AUTHHOWGOT	CHAR(1) NOT NULL WITH DEFAULT	Authorization level of the user from whom the privileges were received. This authorization level is not necessarily the highest authorization level of the grantor. **blank** Not applicable. AUTHHOWGOT is also blank when the privilege that is held is BINDAGENT. **C** DBCTRL **D** DBADM **E** SECADM **G** ACCESSCTRL **K** SQLADM **L** SYSCTRL **M** DBMAINT **O** SYSOPR **S** SYSADM	G
ALTERBPAUTH	CHAR(1) NOT NULL	Not used.	N
BINDADDAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the BIND subcommand with the ADD option: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
BSDSAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the RECOVER BSDS command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATEDBAAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can create databases and automatically receive DBADM authority over the new databases: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATEDBCAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE DATABASE statement to create new databases and automatically receive DBCTRL authority over the new databases: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATESGAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can execute the CREATE STOGROUP statement to create new storage groups: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
DISPLAYAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the DISPLAY commands: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
RECOVERAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the RECOVER INDOUBT command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOPALLAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOP command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
STOSPACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can use the STOSPACE utility: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SYSADMAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system administration authority: **blank** Privilege is not held **G** Privilege was granted with the GRANT option **Y** Privilege was granted without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
SYSOPRAUTH	CHAR(1) NOT NULL	Whether the GRANTEE has system operator authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
TRACEAUTH	CHAR(1) NOT NULL	Whether the GRANTEE can issue the START TRACE and STOP TRACE commands: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
MON1AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC serviceability data: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
MON2AUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can obtain IFC data: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CREATEALIASAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can execute the CREATE ALIAS statement: **blank** Privilege is not held **G** Privilege held with the GRANT option **Y** Privilege held without the GRANT option	G

Column name	Data type	Description	Use
SYSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SYSCTRL authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option GRANTEE has the privilege with the GRANT option for a value of either Y or G.	G
BINDAGENTAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has BINDAGENT privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
ARCHIVEAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE is privileged to use the ARCHIVE LOG command: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
CAPTURE1AUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
CAPTURE2AUTH	CHAR(1) NOT NULL WITH DEFAULT	Not used.	N
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	Time when the GRANT statement was executed. The value is '1985-04-01.00.00.00.000000' for the one installation row.	G
CREATETMTABAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has CREATETMTABAUTH privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantee: **blank** Authorization ID **L** Role	G
GRANTORTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of grantor: **blank** Authorization ID **L** Role	G
DEBUGSESSIONAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DEBUGSESSION privilege: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
EXPLAINAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can explain and prepare statements: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SQLADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has SQLADM authority: **blank** Privilege is not held **G** Privilege is held with the GRANT option **Y** Privilege is held without the GRANT option	G
SDBADMAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has system DBADM authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G

Column name	Data type	Description	Use
DATAACCESSAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has DATAACCESS authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G
ACCESSCTRLAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE has ACCESSCTRL authority: **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G
CREATESECUREAUTH	CHAR(1) NOT NULL WITH DEFAULT	Whether the GRANTEE can create secured objects (triggers and user-defined functions): **blank** Privilege is not held **Y** Privilege is held without the GRANT option	G

SYSVARIABLES catalog table

The SYSVARIABLES table contains one row for each global variable that is created. The schema is SYSIBM.

Column name	Data type	Description	Use
VARID	BIGINT NOT NULL GENERATED ALWAYS AS IDENTITY	The identifier of the global variable.	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
OWNER	VARCHAR(128) NOT NULL	The authorization ID of the owner of the global variable.	G
OWNERTYPE	CHAR(1) NOT NULL	The type of owner of the global variable: **L** The owner is a role **blank** The owner is an authorization ID	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for all other values.	G

Column name	Data type	Description	Use
CREATEDTS	TIMESTAMP NOT NULL	Time at which the global variable was created.	G
TYPESCHEMA	VARCHAR(128) NOT NULL	The schema name of the data type. For built-in data types, this value is SYSIBM.	G
TYPENAME	VARCHAR(128) NOT NULL	The unqualified name of the data type.	G
DATATYPEID	INTEGER NOT NULL	For a built-in data type, the internal ID of the built-in type. For a distinct type, the internal ID of the distinct type.	S
SOURCETYPEID	INTEGER NOT NULL	For a built-in data type, 0. For a distinct type, the internal ID of the built-in data type on which the distinct type is based.	S
LENGTH	INTEGER NOT NULL	The maximum length of the global variable.	G
SCALE	SMALLINT NOT NULL	The scale of the global variable.	G
CCSID	INTEGER NOT NULL	The CCSID of the global variable.	G

Column name	Data type	Description	Use
DEFAULT	CHAR(3) NOT NULL	The default value of the global variable. This column can contain one of the following values: **N** The global variable does not have a default value. **S** The default value is the value of the SQL authorization ID of the process at the time that a default value is used. **1** The default value is a string constant. **2** The default value is a floating-point constant. **3** The default value is a decimal constant. **4** The default value is an integer constant. **5** The default value is a hexadecimal character string. **6** The default value is a UX string. **7** The global variable has a graphic data type and has a default value that is a character string constant. **8** The global variable has a character data type and has a default value that is a character string constant. **9** The default value is a DECFLOAT constant If this column contains one of the following values, the default value of the global variable is the value of the indicated special register at the time that a default value is used: **AES** CURRENT APPLICATION ENCODING SCHEME **ACT** CURRENT CLIENT_ACCTNG **APN** CURRENT CLIENT_APPLNAME **CID** CURRENT CLIENT_USERID **WSN** CURRENT CLIENT_WRKSTNNAME **DAT** CURRENT DATE **DBG** CURRENT DEBUG MODE **DEC** CURRENT DECFLOAT ROUNDING MODE **DEG**	G

Column name	Data type	Description	Use
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID value for the lob columns in this table.	G
DEFAULTTEXT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the default value of the global variable.	G
—	BLOB(2M) NOT NULL	Reserved for future IBM use.	I
ENVID	INTEGER NOT NULL	Internal environment identifier.	G
REMARKS	VARCHAR(762) NOT NULL	A character string about this global variable that is provided by using the COMMENT statement.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

SYSVARIABLEAUTH catalog table

The SYSVARIABLEAUTH table contains one row for each privilege of each authorization ID that has privileges on a global variable. The schema is SYSIBM.

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	The grantor of the privilege.	G
GRANTORTYPE	CHAR(1) NOT NULL	The type of grantor: **blank** Grantor is an authorization ID **L** Grantor is a role	G
GRANTEE	VARCHAR(128) NOT NULL	The holder of the privilege.	G

Column name	Data type	Description	Use
GRANTEETYPE	CHAR(1) NOT NULL	The type of grantee: **blank** Grantee is an authorization ID **L** Grantee is a role **P** Grantee is a package. The grantee is a package if COLLID is a value other than blank.	G
SCHEMA	VARCHAR(128) NOT NULL	The schema name of the global variable.	G
NAME	VARCHAR(128) NOT NULL	The unqualified name of the global variable.	G
COLLID	VARCHAR(128) NOT NULL	If the grantee is a package, this value is the COLLID of the package.	G
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	If the grantee is a package, this value is the consistency token of the DBRM from which the package is derived. Otherwise, this value is blank.	G
READAUTH	CHAR(1) NOT NULL	The privilege to read the global variable: **blank** The READ privilege is not held **G** The READ privilege is held with the GRANT option **Y** The READ privilege is held without the GRANT option	G
WRITEAUTH	CHAR(1) NOT NULL	The privilege to write to the global variable: **blank** The WRITE privilege is not held **G** The WRITE privilege is held with the GRANT option **Y** The WRITE privilege is held without the GRANT option	G

Column name	Data type	Description	Use
AUTHHOWGOT	CHAR(1) NOT NULL	The authorization level of the user who granted the privileges: **blank** Not applicable **E** SECADM **G** ACCESSCTRL **S** SYSADM **T** DATAACCESS This authorization level is not necessarily the highest authority level of the grantor.	G
GRANTEDTS	TIMESTAMP NOT NULL	The time when the GRANT statement was executed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSVARIABLES_DESC catalog table

The SYSVARIABLES_DESC table is an auxiliary table for the SYSIBM.SYSVARIABLES table. The schema is SYSIBM.

Column name	Data type	Description	Use
—	BLOB(2M)	Internal use only.	I

SYSVARIABLES_TEXT catalog table

The SYSVARIABLES_TEXT table is an auxiliary table for the DEFAULTTEXT column of the SYSVARIABLES table. The schema is SYSIBM.

Column name	Data type	Description	Use
DEFAULTTEXT	CLOB(2M)	The text of the default value of the global variable.	G

SYSVIEWDEP catalog table

The SYSVIEWDEP table records the dependencies of views on tables, functions, and other views. The schema is SYSIBM.

Column name	Data type	Description	Use
BNAME	VARCHAR(128) NOT NULL	Name of the object on which the view is dependent. If the object type is a function (BTYPE='F'), the name is the specific name of the function.	G

Column name	Data type	Description	Use
BCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of BNAME.	G
BTYPE	CHAR(1) NOT NULL	Type of object: **F** Function **G** Created global temporary table **M** Materialized query table **T** Table **V** View **W** SYSTEM_TIME period **Z** BUSINESS_TIME period	G
DNAME	VARCHAR(128) NOT NULL	Name of the view.	G
DCREATOR	VARCHAR(128) NOT NULL	The schema of the view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G
BSCHEMA	VARCHAR(128) NOT NULL WITH DEFAULT	Schema of BNAME.	G
DTYPE	CHAR(1) NOT NULL	Type of table: **F** SQL function **M** Materialized query table **V** View	G
DOWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the view, blank for views that were created in a Db2 release prior to Version 9.	G

Column name	Data type	Description	Use
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G

SYSVIEWS catalog table

The SYSVIEWS table contains one or more rows for each view, materialized query table, or user-defined SQL function. The schema is SYSIBM.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	Name of the object.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the object.	G
SEQNO	SMALLINT NOT NULL	Not used.	N
CHECK	CHAR(1) NOT NULL	Whether the WITH CHECK OPTION clause was specified in the CREATE VIEW statement: **N** No **C** Yes with the *cascaded* semantic **Y** Yes with the *local* semantic The value is N if the view has no WHERE clause, or the object is not a view.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
TEXT	VARCHAR(1500) NOT NULL	Not used.	N
PATHSCHEMAS	VARCHAR(2048) NOT NULL WITH DEFAULT	SQL path at the time the object was defined. The path is used to resolve unqualified data type and function names used in the object definition.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	Type of table: **F** SQL function **M** Materialized query table **V** View	G
REFRESH	CHAR(1) NOT NULL WITH DEFAULT	Refresh mode: **D** A materialized query table with a deferred refresh mode **blank** Not a materialized query table	G
ENABLE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether query optimization is enabled: **Y** Enabled **N** Disabled **blank** Not a materialized query table	G
MAINTENANCE	CHAR(1) NOT NULL WITH DEFAULT	Maintenance mode: **S** For a REFRESH = 'D', a materialized query table that is maintained by the system. **U** For a REFRESH = 'D', a materialized query table that is maintained by the user. **blank** Not a materialized query table.	G
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	For REFRESH = 'D' and MAINTENANCE = 'S', the timestamp of the REFRESH TABLE statement that last refreshed the data. Otherwise, this is the default timestamp ('0001-01-01.00.00.00.000000').	G
ISOLATION	CHAR(1) NOT NULL WITH DEFAULT	Isolation level when the materialized query table is created or altered from a base table: **R** RR (repeatable read) **S** CS (cursor stability) **T** RS (read stability) **U** UR (uncommitted read) **blank** Not a materialized query table	G

Column name	Data type	Description	Use
SIGNATURE	VARCHAR(1024) NOT NULL WITH DEFAULT FOR BIT DATA	Contains an internal description. Used for materialized query tables.	G
APP_ENCODING_ CCSID	INTEGER NOT NULL WITH DEFAULT	CCSID of the current application encoding scheme at the time the object was created. For objects created prior to Version 8 of Db2, the value is 0.	G
OWNER	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the view, blank for views that were created in a Db2 release prior to Version 9.	G
OWNERTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates the type of owner: **blank** Authorization ID **L** Role	G
ENVID	INTEGER NOT NULL WITH DEFAULT	Internal environment identifier.	G
ROWID	ROWID NULL GENERATED ALWAYS	ROWID column, created for the lob columns in this table	G
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	The text of the statement that created the view. In some cases, this column might instead contain the text of a statement that altered the view. In many cases, changes to views or to objects on which views are dependent do not update this value.	G
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSVIEWS_STMT catalog table

The SYSVIEWS_STMT table is an auxiliary table for the STATEMENT column of the SYSIBM.SYSVIEWS table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
STATEMENT	CLOB(2M) NOT NULL WITH DEFAULT	See the description of the STATEMENT column in “SYSVIEWS catalog table” on page 2461	G

SYSVIEWS_TREE catalog table

The SYSVIEWS_TREE table is an auxiliary table for the PARSETREE column of the SYSVIEWS table and is required to hold LOB data. The schema is SYSIBM.

Column name	Data type	Description	Use
—	BLOB(1G) NOT NULL WITH DEFAULT	Internal use only.	I

SYSVOLUMES catalog table

The SYSVOLUMES table contains one row for each volume of each storage group. The schema is SYSIBM.

Column name	Data type	Description	Use
SGNAME	VARCHAR(128) NOT NULL	Name of the storage group.	G
SGCREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the storage group.	G
VOLID	VARCHAR(18) NOT NULL	Serial number of the volume or * if SMS-managed.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. Blank if created prior to Version 9. See Release dependency indicators for all other values.	G

SYSXMLRELS catalog table

The SYSXMLRELS table contains one row for each XML table that is created for an XML column. The schema is SYSIBM.

Column name	Data type	Description	Use
TBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the base table.	G
TBNAME	VARCHAR(128) NOT NULL	Name of the base table.	G
COLNAME	VARCHAR(128) NOT NULL	Name of the XML column in the base table.	G
XMLTBOWNER	VARCHAR(128) NOT NULL	Schema or qualifier of the XML table.	G

Column name	Data type	Description	Use
XMLTBNAME	VARCHAR(128) NOT NULL	Name of the XML table.	G
XMLRELOBID	INTEGER NOT NULL	Internal identifier of the relationship between the base table and the XML table.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDTS	TIMESTAMP NOT NULL	Time when the XML table was created.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

SYSXMLSTRINGS catalog table

Each row of the SYSXMLSTRINGS table contains a single string and its unique ID that are used to condense XML data. The string can be an element name, attribute name, name space prefix, or a namespace URI. The schema is SYSIBM.

Column name	Data type	Description	Use
STRINGID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	Unique ID for the string.	G
STRING	VARCHAR(1000) NOT NULL	The string data.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

USERNAMES table

Each row in the USERNAMES table is used to carry out one outbound ID translation or inbound ID translation and "come from" checking. The schema is SYSIBM.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
TYPE	CHAR(1) NOT NULL	How the row is to be used: **I** For inbound translation and "come from" checking. **O** For outbound translation. **S** For outbound system AUTHID to establish a trusted connection.	G
AUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID to be translated. Applies to any authorization ID if blank.	G
LINKNAME	VARCHAR(24) NOT NULL	Identifies the VTAM or TCP/IP network locations associated with this row. A blank value in this column indicates this name translation rule applies to any TCP/IP or SNA partner. If a non-blank LINKNAME is specified, one or both of the following statements must be true: • A row exists in SYSIBM.LUNAMES whose LUNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the VTAM site associated with this name translation rule. • A row exists in SYSIBM.IPNAMES whose LINKNAME matches the value specified in the SYSIBM.USERNAMES LINKNAME column. This row specifies the TCP/IP host associated with this name translation rule. Inbound name translation and "come from" checking are not performed for TCP/IP clients.	G
NEWAUTHID	VARCHAR(128) NOT NULL WITH DEFAULT	Translated value of AUTHID. Blank specifies no translation.NEWAUTHID can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of AUTHID across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.	G
PASSWORD	VARCHAR(255) NOT NULL WITH DEFAULT	Password to accompany an outbound request, if passwords are not encrypted by RACF. If passwords are encrypted, or the row is for inbound requests, the column is not used.PASSWORD can be stored as encrypted data by calling the DSNLEUSR stored procedure. To send the encrypted value of PASSWORD across a network, one of the encryption security options in the SYSIBM.IPNAMES table should be specified.	G
IBMREQD	CHAR(1) NOT NULL WITH DEFAULT 'N'	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies.	G

SYSXMLTYPMOD catalog table

The SYSXMLTYPMOD table contains rows about the XML type modifiers of XML columns. Rows in this table can be inserted, updated and deleted. The schema is SYSIBM.

Column name	Data type	Description	Use
XML_TYPEMOD _ID	INTEGER NOT NULL GENERATED ALWAYS AS IDENTITY	An id generated for the XML type modifier, it is an identity column and primary key.	G
TYPE_ ANNOTATION	CHAR(1) NOT NULL	Indicate whether there is type annotation. **Y** WITH type annotation **N** with no type annotation.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G
CREATEDBY	VARCHAR(128) NOT NULL	Primary authorization ID of the user who created the database.	G

SYSXMLTYPMSCHEMA catalog table

The SYSXMLTYPMSCHEMA table contains the XML schema information for an XML type modifier. It contains one row per XML schema for an XML type modifier. The schema is SYSIBM.

Column name	Data type	Description	Use
XML_TYPEMOD _ID	INTEGER NOT NULL	The id for the XML type modifier.	G
XSROBJECTID	INTEGER NOT NULL	The id for an XML schema registered in XSR.	G
ELEMENT_ NAMESPACE	INTEGER NOT NULL	String id for the namespace name of the root element node. By default, it is the TARGETNAMESPACE of the XML schema. It would be 0 if it is NO NAMESPACE.	G

Column name	Data type	Description	Use
ELEMENT_ NAME	INTEGER NOT NULL	String id for the local name of the root element node. It would be 0 if it is not specified.	G
CREATEDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is created.	G
ALTEREDTS	TIMESTAMP NOT NULL	The timestamp when this type modifier is altered	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
IBMREQD	CHAR(1) NOT NULL	A value of Y indicates that the row came from the basic machine-readable material (MRM) tape. For all other values, see Release dependency indicators. The value in this field is not a reliable indicator of release dependencies. RELCREATED should be used instead.	G

Reorganizing the catalog

The REORG TABLESPACE utility can be run on all the table spaces in the catalog database (DSNDB06) to reclaim unused or wasted space, which can affect performance.

The utility observes the PCTFREE and FREEPAGE values specified in the ALTER INDEX statement for all the catalog indexes and the following table spaces:

- DSNDB06.SYSDDF
- DSNDB06.SYSGPAUT
- DSNDB06.SYSGRTNS
- DSNDB06.SYSHIST
- DSNDB06.SYSJAVA
- DSNDB06.SYSJAUXA
- DSNDB06.SYSJAUXB
- DSNDB06.SYSSEQ
- DSNDB06.SYSSEQ2
- DSNDB06.SYSSTATS
- DSNDB06.SYSTSCHX
- DSNDB06.SYSTSCKD
- DSNDB06.SYSTSCKS
- DSNDB06.SYSTSCPY
- DSNDB06.SYSTSSRG
- DSNDB06.SYSUSER
- DSNDB01.SCT02
- DSNDB01.SPT01

ALTER INDEX
The ALTER INDEX statement changes the description of an index at the current server.

SQL statements allowed on the catalog

Certain SQL statements can be used to change the value of certain options for existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables.

Table 249. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables

SQL statement	Index	Allowable clauses and usage notes
ALTER INDEX	IBM-defined	Only these clauses are allowed: CLOSE COPY FREEPAGE GBPCACHE NOT PADDED PADDED PCTFREE PIECESIZE You cannot alter the GBPCACHE value for indexes DSNDXX01, DSNDXX02, and DSNDXX03, which are on catalog table SYSIBM.SYSINDEXES.
ALTER INDEX	User-created	All clauses are allowed, except for the following: BUFFERPOOL REGENERATE COMPRESS YES Any partitioning clause
ALTER SEQUENCE		The only clause allowed is MAXVALUE. You can only change the MAXVALUE value of the catalog sequence DSNSEQ_IMPLICITDB. The only value specific must be an integer between 1 and 60000, inclusive.
ALTER TABLE		Only these clauses are allowed: DATA CAPTURE CHANGES

Table 249. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes
ALTER TABLESPACE		Only these clauses are allowed: CLOSE FREEPAGE GBPCACHE LOCKMAX MAXROWS PCTFREE TRACKMOD You cannot alter the GBPCACHE or MAXROWS value of some catalog table spaces. Do not specify GBPCACHE for the following table spaces: • DSNDB06.SYSTSCOL • DSNDB06.SYSTSDBA • DSNDB06.SYSTSDBR • DSNDB06.SYSTSDBU • DSNDB06.SYSTSFAU • DSNDB06.SYSTSFLD • DSNDB06.SYSTSFOR • DSNDB06.SYSTSIPT • DSNDB06.SYSTSIXR • DSNDB06.SYSTSIXS • DSNDB06.SYSTSIXT • DSNDB06.SYSTSKEY • DSNDB06.SYSTSPKA • DSNDB06.SYSTSPKD • DSNDB06.SYSTSPKG • DSNDB06.SYSTSPKL • DSNDB06.SYSTSPKS • DSNDB06.SYSTSPKX • DSNDB06.SYSTSPKY • DSNDB06.SYSTSPLA • DSNDB06.SYSTSPLD • DSNDB06.SYSTSPLN • DSNDB06.SYSTSPLY • DSNDB06.SYSTSPVR • DSNDB06.SYSTSREL • DSNDB06.SYSTSSTM • DSNDB06.SYSTSSYN • DSNDB06.SYSTSTAB • DSNDB06.SYSTSTAU • DSNDB06.SYSTSTPT • DSNDB06.SYSTSTSP For DSNDB06.SYSSEQ, MAXROW can be specified only with a value of 1. You can specify the LOCKSIZE keyword on the ALTER

Table 249. SQL statements that can be used to change existing catalog indexes, sequences, and table spaces, or to add indexes to any of the catalog tables (continued)

SQL statement	Index	Allowable clauses and usage notes
CREATE INDEX	User-created	All clauses are allowed, except for: CLOSE YES CLUSTER UNIQUE DEFER YES (only on tables SYSINDEXES, SYSINDEXPART, and SYSKEYS) COMPRESS YES Any partitioning clause The USING clause is ignored. Indexes that are created with *key-expressions* are not allowed on the catalog. The only value allowed for BUFFERPOOL is BP0. You can create up to 500 indexes on the catalog.
DROP INDEX	User-created	The statement has no clauses.

Catalog indexes

Indexes are defined on most catalog tables to improve catalog access.

The following table identifies the Db2 catalog tables on which indexes are defined, the columns that are in each of the indexes, and the data types of those columns.

Table 250. Indexes on Db2 catalog tables

Table	Index (type "1" on page 2493)	Columns (data type)
IPLIST	DSNDUX01 (U)	LINKNAME (CHAR(8)) IPADDR (VARCHAR(254))
IPNAMES	DSNFPX01 (UC)	LINKNAME (CHAR(8))
LOCATIONS	DSNFCX01 (UC)	LOCATION (VARCHAR(128))
LULIST	DSNFLX01 (UC)	LINKNAME (CHAR(8)) LUNAME (VARCHAR(24))
	DSNFLX02 (U)	LINKNAME (CHAR(8))
LUNAMES	DSNFNX01 (UC)	LUNAME (VARCHAR(24))
LUMODES	DSNFMX01 (UC)	LUNAME (VARCHAR(24)) MODENAME (VARCHAR(24))
MODESELECT	DSNFDX01 (UC)	LUNAME (VARCHAR(24)) AUTHID (VARCHAR(128)) PLANNAME (CHAR(8))

Table 250. Indexes on Db2 catalog tables (continued)

Table	Index (type "1" on page 2493)	Columns (data type)
SYSAUDITPOLICIES	DSNAPX03 (UC)	AUDITPOLICYNAME (VARCHAR(128))
SYSAUTOALERTS	DSNALX01 (UC)	ALERT_ID (BIGINT)
	DSNALX02 (N)	HISTORY_ENTRY_ID (BIGINT)
	DSNALX03 (N)	RETURN_CODE (INTEGER) ACTION (VARCHAR(32))
	DSNALX04 (N)	TARGET_QUALIFIER (VARCHAR(128)) TARGET_OBJECT (VARCHAR(128)) TARGET_PARTITION (SMALLINT)
	DSNALX05 (N)	CREATEDTS (TIMESTAMP)
	DSNALX06 (N)	STARTTS (TIMESTAMP) RETURN_CODE (INTEGER) ACTION (VARCHAR(32))
SYSAUTOALERTS_OUT	DSNALX07 (A)	OUTPUT (CLOB(2M))
SYSAUTORUNS_HIST	DSNPHX01 (UC)	HISTORY_ENTRY_ID (BIGINT)
	DSNPHX03	STARTTS (TIMESTAMP)
SYSAUTORUNS_HISTOU	DSNPHX04 (A)	OUTPUT (CLOB(2M))
SYSAUTOTIMEWINDOWS	DSNTWX01 (UC)	WINDOW_ID (BIGINT)
SYSAUXRELS	DSNOXX01 (NC)	TBOWNER (VARCHAR(128)) TBNAME (VARCHAR(128))
	DSNOXXO2 (N)	AUXTBOWNER (VARCHAR(128)) AUXTBNAME (VARCHAR(128))
SYSCHECKDEP	DSNSDX01 (UC)	TBOWNER (VARCHAR(128)) TBNAME (VARCHAR(128)) CHECKNAME (VARCHAR(128)) COLNAME (VARCHAR(128))
SYSCHECKS	DSNSCX01 (UC)	TBOWNER (VARCHAR(128)) TBNAME (VARCHAR(128)) CHECKNAME (VARCHAR(128))

Table 250. Indexes on Db2 catalog tables (continued)

Table	Index (type "1" on page 2493)	Columns (data type)

Db2 directory tables

Db2 for z/OS maintains a set of tables (in database DSNDB01) called the Db2 directory. Authorized users can query the directory; however, it is primarily intended for use by Db2 and is therefore subject to change.

About these topics

These topics describe the directory tables that allow SELECT operations by describing the columns of those tables.

Users must have one of the following privileges to execute SELECT statements on the directory tables:

- Installation SYSADM
- SYSADM
- SYSCTRL
- ACCESSCTRL
- DATAACCESS
- SECADM
- SQLADM
- System DBADM
- DBADM on DSNDB01
- The SELECT privilege on a specific table

All directory tables are qualified by SYSIBM. Do not use this qualifier for user-defined tables.

The directory tables are not, in most cases, updated as part of Db2 operations.

The following table lists restrictions on SQL statements that reference directory tables:

SQL statement	Restriction
ALTER TABLE	*table-name* cannot specify a directory table.
ALTER TABLESPACE	The table space cannot be altered if it is associated with a directory table.
CREATE INDEX	ON *table-name* or *aux-table-name* cannot specify a directory table.
CREATE TRIGGER	ON *table-name* cannot specify a directory table.
DELETE	FROM *table-name* cannot specify a directory table.
DROP	*table-name* cannot specify a directory table.
INSERT	INTO *table-name* cannot specify a directory table.
MERGE	INTO *table-name* cannot specify a directory table.
RENAME	*source-table-name* cannot specify a directory table.
UPDATE	*table-name* cannot specify a directory table.

Programming interface information

None of the directory table columns are part of the general-use programming interface. The column labeled "Use" in the table that describes the column indicates whether the column is part of the product-sensitive interface or is for internal, IBM use, only. The values that "Use" can assume are as follows:

Value
Meaning

S
Column is part of the product-sensitive interface

I
Column is for internal use only

For columns for which "Use" is I, the name of the column and its description do not appear in the explanation of the column.

Directory table spaces and indexes

Db2 directory tables are contained in certain table spaces and have indexes.

The following table lists the table space and indexes for each directory table and lists the index fields for each index. The indexes are in ascending order.

The directory table space, tables, and indexes are primarily intended for use by Db2 and are therefore subject to change.

Table 251. Table spaces and indexes for the directory tables

TABLE SPACE DSNDB01. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DBD01	DBDR	DSNDB01X	DBID.SECTION
SYSDBDXA	SYSDBD_DATA	DSNDB1XA	DBD_DATA
SCT02	SCTR	DSNSCT02	SCTNAME.SCTSEC. SPTSEQ

Table 251. Table spaces and indexes for the directory tables (continued)

TABLE SPACE DSNDB01. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
SPT01	SPTR	DSNSPT01	SPTPID.SPTSEC. SPTSEQ
		DSNSPT02	version.SPTID. SPTSEC.SPTSEQ
SYSSPUXA	SYSSPTSEC_DATA	DSNSPDXA	SPTSEC_DATA
SYSSPUXB	SYSSPTSEC_EXPL	DSNSPEXA	SPTSEC_EXPL
SYSLGRNX	SYSLGRNX	DSNLLX01	LGRDBID.LGRPSID. LGRPART.LGRMEMB. LGRSLRSN
		DSNLLX02	LGRDBID.LGRPSID. LGRSLRSN
SYSUTILX	SYSUTIL	DSNLUX01	USUUID
	SYSUTILX	DSNLUX02	UTILID.SEQNO

DBDR table

The DBDR table stores one row for each DBD section. The schema is SYSIBM.

Column name	Data type	Description	Use
	INTEGER	Not used	S
DBID	SMALLINT	DBID of the database	S
SECTION	SMALLINT	DBD section number	S
DBD_ROWID	ROWID	ID that is used to support the DBD_DATA column	S
DBD_DATA	BLOB(2G)	DBD data for the section	I

SYSDBD_DATA table

The SYSDBD_DATA table is an auxiliary table for the SYSIBM.DBDR table. The schema is SYSIBM.

Column name	Data type	Description	Use
DBD_DATA	BLOB(2G)	Contents of the DBD section.	I

SYSIBM.SCTR table

The SCTR table stores Skeleton Cursor Tables (SKCT) information. The schema is SYSIBM.

Column name	Data type	Description	Use
SCTLL	CHAR (4) FOR BIT DATA	The length of the record.	S

Column name	Data type	Description	Use
SCTNAME	CHAR (14) FOR BIT DATA	The plan name, section number, and sequence number.	S
SCTDAT	VARCHAR(4028)	SKCT data.	I

SYSIBM.SPTR table

The SPTR table stores skeleton package table (SKPT) information. The schema is SYSIBM.

Column name	Data type	Description	Use
SPTLL	INTEGER	The length of the record.	S
SPTLOCID	VARCHAR(128)	Package location.	S
SPTCOLID	VARCHAR(128)	Package collection ID.	S
SPTNAME	VARCHAR(128)	Package name.	S
SPTCONID	CHAR(8) FOR BIT DATA	Package consistency token.	S
SPTRESV	CHAR(2) FOR BIT DATA	Internal use only.	I
SPTSEC	CHAR(4) FOR BIT DATA	Section number.	S
SPTSEQ	CHAR(2) FOR BIT DATA	Sequence number within the section.	S
SPTBODY	VARCHAR(1)	Reserved for future IBM use.	I
SPTVER	VARCHAR(64)	Package version.	S
SPT_ROWID	ROWID	ROWID that Db2 creates for the LOB columns in this table.	S
SPT_DATA	BLOB(2G)	Internal use only.	I
SPT_EXPLAIN	BLOB(2G)	Internal use only.	I

SYSSPTSEC_DATA table

The SYSSPTSEC_DATA table is an auxiliary table that contains package data for the SPTR table. The schema is SYSIBM.

Column name	Data type	Description	Use
SPT_DATA	BLOB(2G)	Contents of the SKPT section	I

SYSSPTSEC_EXPL table

The SYSSPTSEC_EXPL table is an auxiliary table that contains static package explain data for the SPTR table. The schema is SYSIBM.

Column name	Data type	Description	Use
SPT_EXPLAIN	BLOB(2G)	Contents of the SKPT section explain block	I

SYSLGRNX table

The SYSLGRNX table stores recovery log ranges that record the time an index space defined with COPY YES or a table space was open for updates. This provides an efficient way for Db2 to access the appropriate log records for recovery, rather than having to scan every record in the recovery log for a particular table. The schema is SYSIBM.

Column name	Data type	Description	Use
LGRDBID	CHAR(2) FOR BIT DATA	DBID of the modified object	S
LGRPSID	CHAR(2) FOR BIT DATA	OBID of the modified object	S
LGRUCDT	CHAR(6)	Modification date in the form *mmddyy*	S
LGRUCTM	CHAR(8)	Modification time in the form *hhmmssth*	S
LGRSRBA[1]	CHAR(10) FOR BIT DATA	Starting RBA	S
LGRSPBA[1]	CHAR(10) FOR BIT DATA	Stopping RBA	S
LGRPART	SMALLINT	Partition number in the table space or index space	S
LGRSLRSN[1]	CHAR(10) FOR BIT DATA	Starting LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the first update log record.	S
LGRELRSN[1]	CHAR(10) FOR BIT DATA	Ending LRSN of update log records for data sharing. Otherwise, the system clock value that corresponds to the last update log record.	S
LGRMEMB	CHAR(2)	Data sharing member ID of the modifying Db2 subsystem. X'0000' for a non-data-sharing environment.	S

Note:

1. A SELECT from SYSIBM.SYSLGRNX displays this column in either 6-byte or 10-byte format. Before CATENFM of SYSLGRNX the data and the display are in 6-byte format. After CATENFM of SYSLGRNX the data and the display are in 10-byte format.

SYSUTIL table

The SYSUTIL table stores status information about Db2 utilities that are active or stopped. Each record is uniquely identified by the utility identifier. Each row of the table contains the information for one utility execution step. When the utility completes, the corresponding entries in the SYSUTIL table are deleted. The schema is SYSIBM.

Name	Data type	Description	Use
USUUID	CHAR(16)	UTILID value that was passed in a JOB statement parameter	S
USUJOBNM	CHAR(8)	Job name from the JOB statement	S
USUAUID	CHAR(8)	Authorization ID of the invoker	S

Name	Data type	Description	Use
USURDATE	CHAR(4) FOR BIT DATA	Date of the utility	S
USUREL	CHAR(3)	Utility release level at restart time	S
USUIRQD	CHAR(1)	IBM required field	S
USULSIZE	CHAR(4) FOR BIT DATA	List size	S
USULCUR	CHAR(4) FOR BIT DATA	The object that is currently being processed or was last processed	S
USUUTNAM	CHAR(8)	Name of the currently executing utility	S
USUPHASE	CHAR(8)	Current phase of the currently executing utility	S
USUDSNU	CHAR(2) FOR BIT DATA	Data set or piece number	S
USUDSNU2	CHAR(2) FOR BIT DATA	Ending number of the partition range	S
USUSTATU	CHAR(1)	Reserved	I
USUTREQ	CHAR(1)	Termination requested (Y or N)	S
USUFORCE	CHAR(1)	Element of USO forced (Y or N)	S
USURLOK	CHAR(1)	Reload was successful (Y or N)	S
USUCMPOK	CHAR(1)	Compatibility check passed (Y or N)	S
USURSFLG	BIT(8)	Utility restriction flags	S
USURTFLG	BIT(8)	Term settings	S
USURSFLG2	BIT(8)	Utility flags	S
USUPOS	CHAR(4) FOR BIT DATA	Relative USM position in the SYSIN DD statement	S
USUDONE	CHAR(8) FOR BIT DATA	Number of objects processed	S
USUCKSUM	CHAR(4) FOR BIT DATA	USU checksum	S
USUDBOB	CHAR(2) FOR BIT DATA	DBID for the table space	S
USUPSID	CHAR(2) FOR BIT DATA	PSID for the table space or index space	S

Name	Data type	Description	Use
USUPSDD	CHAR(2) FOR BIT DATA	Secondary PSID for RECOVER INDEX data page set	S
USUCATMGFRM	CHAR(1) FOR BIT DATA	Saved catalog level for the release from which migration is done, from the DBD01 header page	S
USUOFLAG	CHAR(1) FOR BIT DATA	Flags for object properties	S
USUDBNAM	CHAR(8)	Database name	S
USUSPNAM	CHAR(8)	Table space or index space name	S
USUMEMBR	CHAR(8)	Member name	S
USUOCATR	CHAR(1) FOR BIT DATA	Saved catalog release level, from the DBD01 header page	S
USUOCATV	CHAR(1) FOR BIT DATA	Saved catalog version level, from the DBD01 header page	S
USUOCATCV	CHAR(1) FOR BIT DATA	Saved migration mode, from the DBD01 header page	S
USUOCATH	CHAR(1) FOR BIT DATA	Saved highest version of the catalog	S
USUUDA	CHAR(150) FOR BIT DATA	Utility-dependent data	S
USURTIME	CHAR(4) FOR BIT DATA	Latest utility start time	S
USURLSN	CHAR(6) FOR BIT DATA	Latest utility start LRSN	S
USURDATO	CHAR(4) FOR BIT DATA	Original utility start date	S
USURTIMO	CHAR(4) FOR BIT DATA	Original utility start time	S
USURLSNO	CHAR(4) FOR BIT DATA	Original utility start LRSN	S
USUR5	CHAR(10) FOR BIT DATA	Reserved	I
USURCNTR	CHAR(31) FOR BIT DATA	Generic counter or value holder	S

Name	Data type	Description	Use
USURLSNX	CHAR(10) FOR BIT DATA	Latest utility start LRSN value	S
USURLSOX	CHAR(10) FOR BIT DATA	Original utility start LRSN value	S
USUR6	CHAR(72) FOR BIT DATA	Reserved	I
USUUSTRN	CHAR(27000) FOR BIT DATA	Utility-dependent restart information	S

SYSUTILX table

The SYSUTILX table is a dependent of the SYSUTIL table. A record is created in the SYSUTILX table when the amount of information in the parent record exceeds the record size of SYSUTIL. The rows in SYSUTILX are uniquely identified by the utility identifier and sequence number.

Column name	Data type	Description	Use
UTILID	CHAR(16)	The utility ID that identifies the parent record in SYSIBM.SYSUTIL	S
SEQNO	SMALLINT	The sequence number of this row	S
	CHAR(12)	Reserved	I
CHECKPOINT	VARCHAR(32000)	The overflow checkpoint/restart information	S

Performance information for SQL application programming

Efficient applications are an important first step to good system and application performance. As you code applications that access data in Db2, consider performance objectives in your application design.

The following topics can help you understand how application programmers can consider performance as they write applications that access data in Db2 for z/OS.

Concurrency and programming

The goal is to program and prepare applications in a way that:

- Protects the integrity of the data that is being read or updated from being changed by other applications.
- Minimizes the length of time that other access to the data is prevented.

For more information about data concurrency in Db2 and recommendations for improving concurrency in your application programs, see the following topics:

- Designing databases for concurrency (Db2 Performance)
- Concurrency and locks (Db2 Performance)
- Improving concurrency (Db2 Performance)
- Improving concurrency in data sharing environments (Db2 Data Sharing Planning and Administration)

Writing efficient queries

The predicates, subqueries, and other structures in SQL statements affect the access paths that Db2 uses to access the data.

For information about how to write SQL statements that access data efficiently, see the following topics:

- Ways to improve query performance (Introduction to Db2 for z/OS)
- Writing efficient SQL queries (Db2 Performance)

Analyzing access paths

By analyzing the access path that Db2 uses to access the data for an SQL statement, you can discover potential problems. You can use this information to modify your statement to perform better.

Tip: You can use tools such as IBM Data Server Manager and related Db2 Tools for z/OS solutions to simplify this task.

- IBM Data Server Manager (Introduction to Db2 for z/OS)
- Db2 Tools for z/OS

For information about how you can use EXPLAIN tables to analyze the access paths for your SQL statements, see the following topics:

- Investigating access path problems (Db2 Performance)
- 00C200A4 (Db2 Codes)
- Investigating SQL performance by using EXPLAIN (Db2 Performance)
- Interpreting data access by using EXPLAIN (Db2 Performance)
- EXPLAIN tables (Db2 Performance)
- “EXPLAIN” on page 1732

Distributed data access performance

The goal is to reduce the amount of network traffic that is required to access the distributed data, and to manage the use of system resources such as distributed database access threads and connections.

For information about improving the performance of applications that access distributed data, see the following topics:

- Ways to reduce network traffic (Introduction to Db2 for z/OS)
- Managing Db2 threads (Db2 Performance)
- Improving performance for applications that access distributed data (Db2 Performance)
- Improving performance for SQL statements in distributed applications (Db2 Performance)

Stored procedures performance

For information about stored procedures and Db2 performance, see the following topics:

- Implementing Db2 stored procedures ()
- Improving the performance of stored procedures and user-defined functions (Db2 Performance)

Db2 XML schema repository tables

The Db2 for z/OS XML schema repository (XSR) is a set of Db2 tables where you can store XML schemas.

Db2 creates the XSR tables during installation or migration. After you add XML schemas to the Db2 XSR, you can use them to validate XML documents before you store them in XML columns.

An XML schema consists of a set of XML schema documents. To add an XML schema to the Db2 XSR, you register XML schema documents to Db2. The XML schema documents must be in the Unicode encoding scheme.

Programming interface information

Not all XSR table columns are part of the general-use programming interface. Whether a column is part of this interface is indicated in a column labeled "Use" in the row that describes the table column. The meaning of the values for the "Use" column is indicated in the following table.

Table 252. Meaning of values in the "Use" column if table descriptions

Value	Meaning
G	Column is part of the general-use programming interface
S	Column is part of the product-sensitive interface
I	Column is for IBM use only
N	Column is not used

For columns for which "Use" is N or I, the name of the column and its description do not appear in the explanation of the column.

XML schema repository (XSR) table spaces and indexes

Db2 XSR tables are contained in certain table spaces and have indexes.

The following tables list the table space and indexes for each XRS table and lists the index fields for each index. The indexes are in ascending order, except where noted.

Table 253. Table spaces and indexes for the DSNXSR database tables

Table space DSNXSR. ...	Table SYSIBM. ...	Index SYSIBM. ...	Index fields
SYSXSR	XSROBJECTS	XSROBJ01	XSROBJECTID
		XSROBJ02	XSROBJECTSCHEMA.XSROBJECTNAME
		XSROBJ03	TARGETNAMESPACE.SCHEMALOCATION
		XSROBJ04	SCHEMALOCATION

Table 253. Table spaces and indexes for the DSNXSR database tables (continued)

Table space DSNXSR. ...	Table SYSIBM. ...	Index SYSIBM. ...	Index fields
	XSROBJECT-COMPONENTS	XSRCOMP01	XSRCOMPONENTID
		XSRCOMP02	TARGETNAMESPACE.SCHEMALOCATION
	XSROBJECT-HIERARCHIES	XSRHIER01	XSROBJECTID.TARGETNAMESPACE. SCHEMALOCATION
		XSRHIER02	XSROBJECTID.TARGETNAMESPACE
SYSXSRA1	XSROBJECTGRAMMAR	XSRXOG01	GRAMMAR
SYSXSRA2	XSROBJECTPROPERTY	XSRXOP01	PROPERTIES
SYSXSRA3	XSRCOMPONENT	XSRXCC01	COMPONENT
SYSXSRA4	XSRPROPERTY	XSRXCP01	PROPERTIES

Note: Index field is in descending order

XSRCOMPONENT table

The SYSIBM.XSRCOMPONENT table is an auxiliary table for the BLOB column COMPONENT in the SYSXSROBJECTCOMPONENTS table. It is in LOB table space SYSXSRA3. The schema is SYSIBM.

Column name	Data type	Description	Use
COMPONENT	BLOB(30M)	Contents of the XML schema document	G

XSROBJECTS table

The SYSIBM.XSROBJECTS table contains one row for each registered XML schema. The schema is SYSIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSROBJECTID	INTEGER NOT NULL	Internal identifier of the XML schema. XSROBJECTID is generated as an identity column.	G
XSROBJECTSCHEMA	VARCHAR(128) NOT NULL	Qualifier of the XML schema name. This is always set to 'SYSXSR'.	G
XSROBJECTNAME	VARCHAR(128) NOT NULL	Name of the XML schema.	G

Column name	Data type	Description	Use
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
GRAMMAR	BLOB(250M)	The internal binary representation of the XML schema.	G
PROPERTIES	BLOB(5M)	Additional property information of the entire XML schema.	G
CREATEDBY	VARCHAR(128) NOT NULL	Authorization ID under which the XML schema was created.	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the Db2-supplied stored procedure XSR_REGISTER was executed for the XML schema.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: **C** Complete **I** Incomplete **T** Temporary	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G
	CHAR(1)	Not used.	N
	VARCHAR(128)	Not used.	N
REMARKS	VARCHAR(762)	Character string that contains comments about this XML schema.	G

XSROBJECTCOMPONENTS table

The XSROBJECTCOMPONENTS table contains one row for each component (document) in an XML schema. The schema is SYIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSRCOMPONENTID	INTEGER NOT NULL	Internal identifier of the XML schema document. XSRCOMPONENTID is generated as an identity column.	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
ROWID	ROWID NOT NULL GENERATED ALWAYS	The ID that is used to support BLOB data type values.	G
COMPONENT	BLOB(30M) NOT NULL	Contents of the XML schema document.	G
PROPERTIES	BLOB(5M)	If available, additional property information of the XML schema document	G
CREATEDTS	TIMESTAMP NOT NULL	The time that the XML schema document was registered.	G
STATUS	CHAR(1) NOT NULL WITH DEFAULT	Registration status of the XML schema: **C** Complete **I** Incomplete	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

XSROBJECTGRAMMAR table

SYSIBM.XSROBJECTGRAMMAR is an auxiliary table for the BLOB column GRAMMAR in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA1. The schema is SYSIBM.

Column name	Data type	Description	Use
GRAMMAR	BLOB(250M)	Internal binary representation of the XML schema	G

XSROBJECTHIERARCHIES table

The XSROBJECTHIERARCHIES table contains one row for each component (document) in an XML schema to record the XML schema document hierarchy relationship. The schema is SYSIBM.

Rows in this table can only be changed using static SQL statements issued by the Db2-supplied XSR stored procedures.

Column name	Data type	Description	Use
XSROBJECTID	INTEGER	Internal identifier of the XML schema.	G
XSRCOMPONENTID	INTEGER	Internal identifier of the XML schema document.	G
HTYPE	CHAR(1)	Hierarchy type: **D** Document **P** Primary document	G
TARGETNAMESPACE	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the target namespace URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
SCHEMALOCATION	INTEGER	The value of the STRINGID column in SYSIBM.SYSXMLSTRINGS when the schema location URI of the primary XML schema document is stored in SYSIBM.SYSXMLSTRINGS.	G
RELCREATED	CHAR(1) NOT NULL	The release of Db2 that is used to create the object. See Release dependency indicators for the values.	G

XSROBJECTPROPERTY table

The XSROBJECTPROPERTY table is an auxiliary table for the BLOB column PROPERTIES in SYSIBM.SYSXSROBJECTS. It is in LOB table space SYSXSRA2. The schema is SYSIBM.

Column name	Data type	Description	Use
PROPERTIES	BLOB(5M)	Contents of the additional property information of the entire XML schema.	G

XSRPROPERTY table

The XSRPROPERTY table is an auxiliary table for the BLOB column COMPONENT in XSROBJECTCOMPONENTS. It is in LOB table space SYSXSRA3. The schema is SYSIBM.

Column name	Data type	Description	Use
COMPONENT	BLOB(5M)	Contents of the additional property information of the XML schema document.	G

EXPLAIN tables

EXPLAIN tables contain information about SQL statements and functions that run on Db2 for z/OS.

You can create and maintain a set of *EXPLAIN tables* to capture and analyze information about the performance of SQL statements and functions that run on Db2 for z/OS. Each row in an EXPLAIN table describes some aspect of a step in the execution of a query or subquery in an explainable statement. The column values for the row identify, among other things, the query or subquery, the tables and other objects involved, the methods used to carry out each step, and cost information about those methods. Db2 creates EXPLAIN output and populates EXPLAIN tables in the following situations:

- When an EXPLAIN statement is executed.

- At BIND or REBIND with the EXPLAIN(YES) or (ONLY) bind options. Rows are added for every explainable statement in the plan or package being bound. For a plan, these do not include statements in the packages that can be used with the plan. For either a package or plan, they do not include explainable statements within EXPLAIN statements nor do they include explainable statements that refer to declared temporary tables, which are incrementally bound at run time.
- When an explainable dynamic statement is executed and the value of the CURRENT EXPLAIN MODE special register is set to YES or EXPLAIN.

Important: It is best to convert EXPLAIN tables to Db2 11 format during migration, or soon after migration. In Db2 11, the EXPLAIN function supports tables in Db2 11 or Db2 10 formats only. However, Db2 10 format EXPLAIN tables are deprecated. If you invoke EXPLAIN and Db2 10 tables are used, Db2 issues SQL code +20520. If tables of an unsupported format are found, Db2 issues SQL code -20008 and the EXPLAIN operation fails. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Related tasks

Migration step 24: Convert EXPLAIN tables to the current format (Db2 Installation and Migration)

Related reference

BIND and REBIND options for packages, plans, and services (Db2 Commands)

EXPLAIN

The EXPLAIN statement obtains information about access path selection for an *explainable statement*. A statement is explainable if it is a SELECT, MERGE, or INSERT statement, or the searched form of an UPDATE or DELETE statement. The information that is obtained is placed in a set of supplied user tables that are called *EXPLAIN tables*.

Investigating SQL performance by using EXPLAIN (Db2 Performance)

“ADMIN_EXPLAIN_MAINT stored procedure” on page 666

You can use the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade the tables tothe format for the current Db2 version, and complete other administrative tasks.

PLAN_TABLE

The plan table, PLAN_TABLE, contains information about access paths that is collected from the results of EXPLAIN statements.

Tip: You can use tools such as IBM Data Server Manager and related Db2 Tools for z/OS solutions to simplify this task.

- IBM Data Server Manager (Introduction to Db2 for z/OS)
- Db2 Tools for z/OS

Tip: You can use the *visual explain* feature of tools such as IBM Data Server Manager to create visual diagrams of the access paths for your SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a

user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Optional PLAN_TABLE formats

A PLAN_TABLE instance can have a format with fewer columns than those shown in the sample CREATE TABLE statement. However instances of PLAN_TABLE must have one of the following formats:

Db2 11 format
All columns shown in the sample CREATE TABLE statement, up to and including the EXPANSION_REASON column (COLCOUNT=66).

DB2 10 format
All columns shown in the sample CREATE TABLE statement, up to and including the MERGN column (COLCOUNT=64). This format is deprecated in Db2 11.

Important: If the EXPLAIN tables have any format older than the Db2 10 format, Db2 returns an error for any operation that tries to insert rows in the EXPLAIN tables. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in PLAN_TABLE.

Table 254. Descriptions of columns in PLAN_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PLANNO	SMALLINT NOT NULL	The number of the step in which the query that is indicated in QBLOCKNO was processed. This column indicates the order in which the steps were executed.
METHOD	SMALLINT NOT NULL	A number that indicates the join method that is used for the step: **0** The table in this step is the first table that is accessed, a continuation of a previous table that was accessed, or a table that is not used. **1** A nested loop join is used. For each row of the current composite table, matching rows of a new table are found and joined. **2** A merge scan join is used. The current composite table and the new table are scanned in the order of the join columns, and matching rows are joined. **3** Sorts are needed by ORDER BY, GROUP BY, SELECT DISTINCT, UNION, INTERSECT, EXCEPT, a quantified predicate, or an IN predicate. This step does not access a new table. **4** A hybrid join was used. The current composite table is scanned in the order of the join-column rows of the new table. The new table is accessed using list prefetch.
CREATOR	VARCHAR(128) NOT NULL	The creator of the new table that is accessed in this step, blank if METHOD is 3.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TNAME	VARCHAR(128) NOT NULL	The name of one of the following objects: • Table • Materialized query table • Created or declared temporary table • Materialized view • Materialized table expression • Any of the following object names that identify intermediate results: **'DSNWFQB(*qblockno*)'** The intermediate result of a UNION ALL, INTERSECT ALL, EXCEPT ALL, or an outer join that is materialized. If a view is merged, the name of the view does not appear. **'DSN_DIM_TBLX(*qblockno*)'** The work file of a star join dimension table. The value is blank if METHOD is 3.
TABNO	SMALLINT NOT NULL	Values are for IBM use only.
ACCESSTYPE"1" on page 2525	CHAR(2) NOT NULL	The method of accessing the new table."4" on page 2525
MATCHCOLS	SMALLINT NOT NULL	For ACCESSTYPE I, IN, I1, N, NR, MX, or DX, the number of index keys that are used in an index scan; otherwise, 0.
ACCESSCREATOR	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, N, NR, MX, or DX, the creator of the index; otherwise, blank.
ACCESSNAME	VARCHAR(128) NOT NULL	For ACCESSTYPE I, I1, H, MH, N, NR, MX, or DX, the name of the index; for ACCESSTYPE P, DSNPJW(*mixopseqno*) is the starting pair-wise join leg in MIXOPSEQ; otherwise, blank.
INDEXONLY	CHAR(1) NOT NULL	Indication of whether access to an index alone is enough to perform the step, or Indication of whether data too must be accessed. **Y** Yes **N** No
SORTN_UNIQ	CHAR(1) NOT NULL	Indication of whether the new table is sorted to remove duplicate rows. **Y** Yes **N** No

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
SORTN_JOIN	CHAR(1) NOT NULL	Indication of whether the new table is sorted for join method 2 or 4. **Y** Yes **N** No
SORTN_ORDERBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for ORDER BY. **Y** Yes **N** No
SORTN_GROUPBY	CHAR(1) NOT NULL	Indication of whether the new table is sorted for GROUP BY. **Y** Yes **N** No
SORTC_UNIQ	CHAR(1) NOT NULL	Indication of whether the composite table is sorted to remove duplicate rows. **Y** Yes **N** No
SORTC_JOIN	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for join method 1, 2 or 4. **Y** Yes **N** No
SORTC_ORDERBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for an ORDER BY clause or a quantified predicate. **Y** Yes **N** No
SORTC_GROUPBY	CHAR(1) NOT NULL	Indication of whether the composite table is sorted for a GROUP BY clause. **Y** Yes **N** No

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TSLOCKMODE	CHAR(3) NOT NULL	An indication of the mode of lock that is acquired on either the new table, or its table space or table space partitions. If the isolation can be determined at bind time, the values are: **IS** Intent share lock **IX** Intent exclusive lock **S** Share lock **U** Update lock **X** Exclusive lock **SIX** Share with intent exclusive lock **N** UR isolation; no lock If the isolation level cannot be determined at bind time, the lock mode is determined by the isolation level at run time is shown by the following values. **NS** For UR isolation, no lock; for CS, RS, or RR, an S lock. **NIS** For UR isolation, no lock; for CS, RS, or RR, an IS lock. **NSS** For UR isolation, no lock; for CS or RS, an IS lock; for RR, an S lock. **SS** For UR, CS, or RS isolation, an IS lock; for RR, an S lock. The data in this column is right justified. For example, IX appears as a blank, followed by I, followed by X. If the column contains a blank, then no lock is acquired. If the access method in the ACCESSTYPE column is DX, DI, or DU, no latches are acquired on the XML index page and no lock is acquired on the new base table data page or row, nor on the XML table and the corresponding table spaces. The value of TSLOCKMODE is a blank in this case.
TIMESTAMP	CHAR(16) NOT NULL	This column is deprecated. Use EXPLAIN_TIME instead.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
REMARKS	VARCHAR(762) NOT NULL	A field into which you can insert any character string of 762 or fewer characters. Db2 inserts a value into this column in certain situations. "6" on page 2527 , "7" on page 2527
PREFETCH	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether data pages are to be read in advance by prefetch: **'D'** Optimizer expects dynamic prefetch **'S'** Pure sequential prefetch **'L'** Prefetch through a page list **'U'** List prefetch with an unsorted RID list **blank** Unknown or no prefetch
COLUMN_FN_EVAL	CHAR(1) NOT NULL WITH DEFAULT	When an SQL aggregate function is evaluated: **'R'** While the data is being read from the table or index **'S'** While performing a sort to satisfy a GROUP BY clause **blank** After data retrieval and after any sorts
MIXOPSEQ	SMALLINT NOT NULL WITH DEFAULT	The sequence number of a step in a multiple index operation. **1, 2, ... *n*** For the steps of the multiple index procedure (ACCESSTYPE is MX, MI, MU, DX, DI, or DU), the sequence number of the OR predicate in the SQL statement. (ACCESSTYPE is 'NR'). **0** For any other rows.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNDYNAMICSQLCACHE'** The row originates from the dynamic statement cache. **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
ACCESS_DEGREE	SMALLINT	The number of parallel tasks or operations that are activated by a query. This value is determined at bind time; the actual number of parallel operations that are used at execution time could be different. This column contains 0 if a host variable is used. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
ACCESS_PGROUP_ID"2" on page 2525	SMALLINT	The identifier of the parallel group for accessing the new table. A parallel group is a set of consecutive operations, executed in parallel, that have the same number of parallel tasks. This value is determined at bind time; it could change at execution time.This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
JOIN_DEGREE	SMALLINT	The number of parallel operations or tasks that are used in joining the composite table with the new table. This value is determined at bind time and can be 0 if a host variable is used. The actual number of parallel operations or tasks used at execution time could be different. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
JOIN_PGROUP_ID"2" on page 2525	SMALLINT	The identifier of the parallel group for joining the composite table with the new table. This value is determined at bind time; it could change at execution time. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTC_PGROUP_ID"3" on page 2525	SMALLINT	The parallel group identifier for the parallel sort of the composite table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
SORTN_PGROUP_ID"3" on page 2525	SMALLINT	The parallel group identifier for the parallel sort of the new table. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
PARALLELISM_MODE"2" on page 2525	CHAR(1)	The kind of parallelism, if any, that is used at bind time: **C** Query CP parallelism. **I** Query I/O parallelism. Query I/O parallelism is deprecated and is likely to be removed in a future release. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns, if the method that it refers to does not apply, or if the plan or package was bound prior to DB2 10.
MERGE_JOIN_COLS	SMALLINT	The number of columns that are joined during a merge scan join (Method=2). This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.
CORRELATION_NAME	VARCHAR(128)	The correlation name of a table or view that is specified in the statement. If no correlation name exists, then the column is null. This column contains the null value if the plan or package was bound using a plan table with fewer than 43 columns. Otherwise, it can contain null if the method that it refers to does not apply.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PAGE_RANGE	CHAR(1) NOT NULL WITH DEFAULT	Indication of whether the table qualifies for page range screening, so that plans scan only the partitions that are needed. **Y** Yes **blank** No
JOIN_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of join: **F** FULL OUTER JOIN **L** LEFT OUTER JOIN **P** Pair-wise join **S** Star join **blank** INNER JOIN or no join RIGHT OUTER JOIN converts to a LEFT OUTER JOIN when you use it, so that JOIN_TYPE contains L.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
IBM_ SERVICE_ DATA	VARCHAR(254) FOR BIT DATA	This column contains values that are for IBM use only.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
WHEN_OPTIMIZE	CHAR(1) NOT NULL WITH DEFAULT	When the access path was determined: **blank** At bind time, using a default filter factor for any host variables, parameter markers, or special registers. **B** At bind time, using a default filter factor for any host variables, parameter markers, or special registers; however, the statement is re-optimized at run time using input variable values for input host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for reoptimization to occur. **R** At run time, using input variables for any host variables, parameter markers, or special registers. The bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE) must be specified for this to occur.
QBLOCK_TYPE"1" on page 2525	CHAR(6) NOT NULL WITH DEFAULT	For each query block, an indication of the type of SQL operation that is performed. For the outermost query, this column identifies the statement type."5" on page 2526
BIND_TIME	TIMESTAMP NOT NULL WITH DEFAULT	This column is deprecated. Use EXPLAIN_TIME instead.
OPTHINT	VARCHAR(128) NOT NULL WITH DEFAULT	A string that you use to identify this row as an optimization hint for Db2. Db2 uses this row as input when choosing an access path.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
HINT_USED	VARCHAR(128) NOT NULL WITH DEFAULT	One of the following values: **'APREUSE'** When an access path was successfully reused because the APREUSE option was specified at bind or rebind. **'*opthint-value*'** When PLAN_TABLE access path hints are used. *opthint-value* is the value of the OPTHINT column for the hint that was used. **'SYSQUERYPLAN *query-id*'** When statement-level access path hints are used. *query-id* is the value of the QUERYID column in the SYSQUERYPLAN catalog table for the hint. **'SYSQUERYSEL *query-id*'** When a predicate selectivity override is used. *query-id* is the value of the QUERYID column of the SYSQUERYSEL catalog table row for the hint. **'EXPLAIN PACKAGE: COPY *copy-id*'** When the row is the result of an EXPLAIN PACKAGE statement. *copy-id* is one of the following values: **0** The current copy. **1** The previous copy. **2** The original copy.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
PRIMARY_ ACCESSTYPE	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether direct row access is attempted first: **'D'** Db2 tries to use direct row access with a rowid column. If Db2 cannot use direct row access with a rowid column at run time, it uses the access path that is described in the ACCESSTYPE column of PLAN_TABLE. **'P'** Db2 used data partitioned secondary index and a part-level operation to access the data. **'T'** The base table or result file is materialized into a work file, and the work file is accessed via sparse index access. If a base table is involved, then ACCESSTYPE indicates how the base table is accessed. **blank** Db2 does not try to use direct row access by using a rowid column or sparse index access for a work file. The value of the ACCESSTYPE column of PLAN_TABLE provides information on the method of accessing the table.
PARENT_QBLOCKNO	SMALLINT NOT NULL WITH DEFAULT	A number that indicates the QBLOCKNO of the parent query block.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TABLE_TYPE	CHAR(1)	The type of new table: **'B'** Buffers for SELECT from INSERT, SELECT from UPDATE, SELECT from MERGE, or SELECT from DELETE statement. **'C'** Common table expression **'F'** Table function **'I'** The new table is generated from an IN-LIST predicate. If the IN-LIST predicate is selected as the matching predicate, it will be accessed as an in-memory table. **'M'** Materialized query table **'Q'** Temporary intermediate result table (not materialized). For the name of a view or nested table expression, a value of Q indicates that the materialization was virtual and not actual. Materialization can be virtual when the view or nested table expression definition contains a UNION ALL that is not distributed. **'R'** Recursive common table expression **'S'** Subquery (correlated or non-correlated) **'T'** Table **'W'** Work file The value of the column is null if the query uses GROUP BY, ORDER BY, or DISTINCT, which requires an implicit sort.
TABLE_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	The encoding scheme of the table. The possible values are: **'A'** ASCII **'E'** EBCDIC **'U'** Unicode **'M'** The table contains multiple CCSID sets

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
TABLE_SCCSID	SMALLINT NOT NULL WITH DEFAULT	The SBCS CCSID value of the table. If column TABLE_ENCODE is M, the value is 0.
TABLE_MCCSID	SMALLINT NOT NULL WITH DEFAULT	The mixed CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.
TABLE_DCCSID	SMALLINT NOT NULL WITH DEFAULT	The DBCS CCSID value of the table. If the value of the TABLE_ENCODE column is M, the value is 0. If MIXED=NO in the application defaults module, the value is -2.
ROUTINE_ID	INTEGER NOT NULL WITH DEFAULT	The values in this column are for IBM use only.
CTEREF	SMALLINT NOT NULL WITH DEFAULT	If the referenced table is a common table expression, the value is the top-level query block number.
STMTTOKEN	VARCHAR(240)	User-specified statement token.
PARENT_PLANNO	SMALLINT NOT NULL	Corresponds to the plan number in the parent query block where a correlated subquery is invoked. Or, for non-correlated subqueries, corresponds to the plan number in the parent query block that represents the work file for the subquery.
BIND_EXPLAIN_ONLY	CHAR(1) NOT NULL WITH DEFAULT	Identifies whether the row was inserted because a command specified the EXPLAIN(ONLY) option.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MERGC	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the composite table is consolidated before the join. **'Y'** Yes **'N'** No
MERGN	CHAR(1) NOT NULL WITH DEFAULT	Indicates whether the new table is consolidated before the join, or whether access that used a data partitioned secondary index (DPSI) involved a merge operation. **'Y'** Yes, the new table is consolidated before the join. **'N'** No, the new table is not consolidated before the join **'D'** Access through a DPSI involved a merge operation. **'U'** Access through a DPSI that did not involve a merge operation.
SCAN_DIRECTION	CHAR(1)	For index access, the direction of the index scan: **'F'** Forward **'R'** Reverse **blank** Index scan is not used

Table 254. Descriptions of columns in PLAN_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. For PLAN_TABLE rows in which ACCESSTYPE='A' and QBLOCK_TYPE='SELECT', the values of all other columns except QUERYNO, APPLNAME, and PROGNAME are the default values for those columns.
2. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallelism:
   - PARALLELISM_MODE
   - ACCESS_PGROUP_ID
   - JOIN_PGROUP_ID
3. In rows that are used for optimization hints, NULL values in the following columns indicate a hint for no parallel sort:
   - SORTN_PGROUP_ID
   - SORTC_PGROUP_ID
4. The ACCESSTYPE column contains the following values:

   'A'
   The query is sent to an accelerator server.

   'DI'
   By an intersection of multiple DOCID lists to return the final DOCID list

   'DU'
   By a union of multiple DOCID lists to return the final DOCID list

   'DX'
   By an XML index scan on the index that is named in ACCESSNAME to return a DOCID list

   'E'
   By direct row access using a row change timestamp column.

   'H'
   By hash access. IF an overflow condition occurs, the hash overflow index that is identified by ACCESSCREATOR and ACCESSNAME is used.

   'HN'
   By hash access using an IN predicate, or an IN predicate that Db2 generates. If a hash overflow condition occurs, the hash overflow index that is identified in ACCESSCREATOR and ACCESSNAME is used.

   'I'
   By an index (identified in ACCESSCREATOR and ACCESSNAME)

   'IN'
   By an index scan when the matching predicate contains an IN predicate and the IN-list is accessed through an in-memory table.

   'I1'
   By a one-fetch index scan

   'M'
   By a multiple index scan. A row that contains this value might be followed by a row that contains one of the following values:
   - 'DI'
   - 'DU'
   - 'MH'
   - 'MI'
   - 'MU'
   - 'MX'

   'MH'
   By the hash overflow index named in ACCESSNAME. A row that contains this value always follows a row that contains M.

'MI'
By an intersection of multiple indexes. A row that contains this value always follows a row that contains M.

'MU'
By a union of multiple indexes. A row that contains this value always follows a row that contains M.

'MX'
By an index scan on the index named in ACCESSNAME. When the access method MX follows the access method DX, DI, or DU, the table is accessed by the DOCID index by using the DOCID list that is returned by DX, DI, or DU. A row that contains this value always follows a row that contains M.

'N'
One of the following types:

- By an index scan when the matching predicate contains the IN keyword
- By an index scan when Db2 rewrites a query using the IN keyword

'O'
By a work file scan, as a result of a correlated subquery.

'NR'
Range list access.

'P'
By a dynamic pair-wise index scan

'R'
By a table space scan

'RW'
By a work file scan of the result of a materialized user-defined table function

'V'
By buffers for an INSERT statement within a SELECT

blank
Not applicable to the current row

5. The QBLOCK_TYPE column contains the following values:

'SELECT'
SELECT

'INSERT'
INSERT

'UPDATE'
UPDATE

'MERGE'
MERGE

'DELETE'
DELETE

'SELUPD'
SELECT with FOR UPDATE OF

'DELCUR'
DELETE WHERE CURRENT OF CURSOR

'UPDCUR'
UPDATE WHERE CURRENT OF CURSOR

'CORSUB'
Correlated subselect or fullselect

'TRUNCA'
TRUNCATE

'NCOSUB'
Noncorrelated subselect or fullselect

'TABLEX'
Table expression

'TRIGGR'
WHEN clause on CREATE TRIGGER

'UNION'
UNION

'UNIONA'
UNION ALL

'INTERS'
INTERSECT

'INTERA'
INTERSECT ALL

'EXCEPT'
EXCEPT

'EXCPTA'
EXCEPT ALL

'PRUNED'
Db2 does not generate an access path for the query because the query is guaranteed to qualify zero rows, such as the case of an always-false WHERE clause. For example:`WHERE 0=1`

6. Db2 inserts a value into the REMARKS column at bind or rebind when the EXPLAIN(ONLY) option is specified and reuse or comparison fails for an access path. The value might include the following information:
   - A reason code that corresponds to the reason codes in SQLCODE +395 when reuse fails
   - The name of the unmatched PLAN_TABLE column for which comparison failed
   - The string 'UNMATCHED ROW(S)', which indicates that there are extra rows in addition to the rows in the original access path, or there are fewer rows than in the original access path.

   The values that are in the REMARKS column as a result of a reuse or comparison failure do not describe all the access path differences. The REMARKS values are not sufficient to determine if an access path change is acceptable. They are an indication that further analysis might be necessary to determine how the access path has changed, and whether the changes warrant any further action.
7. Db2 inserts a value into the REMARKS column when selectivity overrides cannot be used for a statement . The value contains a reason code that indicates why the selectivity override was not used. The value might also contain additional diagnostic information.

   The reason code values correspond to SQLCODE +395 reason codes:

   '1'-'41'
   Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

   '42'
   Indicates that the structure of the selectivity override is not valid. Generate the selectivity override again.

   '43'
   The selectivity override cannot be applied because of an unexpected error. If the problem persists, you might need to contact IBM Support.

   '44'-'99'
   Indicate that an optimization hint that was generated as part of the extended optimization process cannot be applied. Use only a single selectivity instance.

The PLAN_TABLE_HINT_IX index

The PLAN_TABLE_HINT_IX index improves prepare performance when access path hints are used. This index is required for statement-level access paths and optimization parameters. The PLAN_TABLE_HINT_IX index is optional, although strongly recommended, for PLAN_TABLE access path hints.

The statement that creates the PLAN_TABLE_HINT_IX index is included as part of the DSNTESC member of the SDSNSAMP library. PSPI

EXPLAIN

The EXPLAIN statement obtains information about access path selection for an *explainable statement*. A statement is explainable if it is a SELECT, MERGE, or INSERT statement, or the searched form of an UPDATE or DELETE statement. The information that is obtained is placed in a set of supplied user tables that are called *EXPLAIN tables*.

EXPLAIN table changes in Db2 11 (Db2 for z/OS What's New?)

Related information

IBM Db2 Analytics Accelerator for z/OS documentation

DSN_COLDIST_TABLE

The column distribution table contains non-uniform column group statistics that are obtained dynamically by Db2 from non-index leaf pages.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

PSPI

The following table shows the descriptions of the columns in the DSN_COLDIST_TABLE table.

Table 255. Descriptions of columns in DSN_COLDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.

Table 255. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 255. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SCHEMA	VARCHAR(128) NOT NULL	The schema of the table that contains the column.
TBNAME	VARCHAR(128) NOT NULL	The name of the table that contains the column.
NAME	VARCHAR(128) NOT NULL	Name of the column. If the value of NUMCOLUMNS is greater than 1, this name identifies the first column name of the set of columns associated with the statistics.
COLVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value in the column. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. This column might contain values that depend on the value of the type column: **TYPE='T'** One of the following values: • 'E3C2C1C3C1D9C4C6' for TBACARDF • 'E3C2C1D5C1C3E3C6' for TBANPAGF • 'E3C2C1D5D7C1C7C6' for TBANACTF **TYPE='L'** 'C3C1E3C6D3C4C3C6' for CATFLDCF **TYPE='P'** One of the following values: • 'D7C3C1D7D5D9E6C6' for PCAPNRWF • 'D7C3C1D7D5D7C7C6' for PCAPNPGF

Table 255. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
TYPE	CHAR(1) NOT NULL	The type of statistics: **C** Cardinality **F** Frequent value **H** Histogram **T** Real-time table cardinality **L** Real-time column cardinality (unique index only) **P** real-time partition cardinality
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='T', a value related to real-time statistics table values that are determined by the COLVALUE column. For TYPE= 'L', a value related to a real-time statistics column value that is determined by the COLVALUE column. The QUANTILENO column contains the column number. The NAME column contains the column name. For TYPE='P' a value related to real-time statistics partition value that is determined by the COLVALUE column. The QUANTILENO column contains the partition number.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	The identity of the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in the NUMCOLUMNS column. This is an updatable column.
NUMCOLUMNS	SMALLINT NOT NULL	Identifies the number of columns associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.

Table 255. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable. For TYPE= 'L', this column contains the column number. For TYPE='P', the column contains the partition number.
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.

Table 255. Descriptions of columns in DSN_COLDIST_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Column descriptions

The following table describes the columns of DSN_DETCOST_TABLE.

Table 256. DSN_DETCOST_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each mini-plan with a query block.
OPENIO	FLOAT(4) NOT NULL	The Do-at-open IO cost for non-correlated subquery.
OPENCPU	FLOAT(4) NOT NULL	The Do-at-open CPU cost for non-correlated subquery.
OPENCOST	FLOAT(4) NOT NULL	The Do-at-open total cost for non-correlated subquery.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
DMIO	FLOAT(4) NOT NULL	IBM internal use only.
DMCPU	FLOAT(4) NOT NULL	IBM internal use only.
DMTOT	FLOAT(4) NOT NULL	IBM internal use only.
SUBQIO	FLOAT(4) NOT NULL	IBM internal use only.
SUBQCOST	FLOAT(4) NOT NULL	IBM internal use only.
BASEIO	FLOAT(4) NOT NULL	IBM internal use only.
BASECPU	FLOAT(4) NOT NULL	IBM internal use only.
BASETOT	FLOAT(4) NOT NULL	IBM internal use only.
ONECOMPROWS	FLOAT(4) NOT NULL	The number of rows qualified after applying local predicates.
IMLEAF	FLOAT(4) NOT NULL	The number of index leaf pages scanned by Data Manager.
IMIO	FLOAT(4) NOT NULL	IBM internal use only.
IMPREFH	CHAR(2) NOT NULL	IBM internal use only.
IMMPRED	INTEGER NOT NULL	IBM internal use only.
IMFF	FLOAT(4) NOT NULL	The filter factor of matching predicates only.
IMSRPRED	INTEGER NOT NULL	IBM internal use only.
IMFFADJ	FLOAT(4) NOT NULL	The filter factor of matching and screening predicates.
IMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
IMROWCST	FLOAT(4) NOT NULL	IBM internal use only.
IMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
IMRIDSORT	FLOAT(4) NOT NULL	IBM internal use only.
IMMERGCST	FLOAT(4) NOT NULL	IBM internal use only.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
IMCPU	FLOAT(4) NOT NULL	IBM internal use only.
IMTOT	FLOAT(4) NOT NULL	IBM internal use only.
IMSEQNO	SMALLINT NOT NULL	IBM internal use only.
DMPEREFH	FLOAT(4) NOT NULL	IBM internal use only.
DMCLUDIO	FLOAT(4) NOT NULL	IBM internal use only.
DMPREDS	INTEGER NOT NULL	IBM internal use only.
DMSROWS	FLOAT(4) NOT NULL	IBM internal use only.
DMSCANCST	FLOAT(4) NOT NULL	IBM internal use only.
DMCOLS	FLOAT(4) NOT NULL	The number of data manager columns.
DMROWS	FLOAT(4) NOT NULL	The number of data manager rows returned (after all stage 1 predicates are applied).
RDSROWCST	FLOAT(4) NOT NULL	IBM internal use only.
DMPAGECST	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATAIO	FLOAT(4) NOT NULL	IBM internal use only.
DMDATACPU	FLOAT(4) NOT NULL	IBM internal use only.
DMDATACPU	FLOAT(4) NOT NULL	IBM internal use only.
RDSROW	FLOAT(4) NOT NULL	The number of RDS rows returned (after all stage 1 and stage 2 predicates are applied).
SNCOLS	SMALLINT NOT NULL	The number of columns as sort input for new table.
SNROWS	FLOAT(4) NOT NULL	The number of rows as sort input for new table.
SNRECSZ	INTEGER NOT NULL	The record size for new table.
SNPAGES	FLOAT(4) NOT NULL	The page size for new table.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
SNRUNS	FLOAT(4) NOT NULL	The number of runs generated for sort of new table.
SNMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort.
SNIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCOST	FLOAT(4) NOT NULL	IBM internal use only.
SNCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SNSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SNCCOLS	FLOAT(4) NOT NULL	The number of columns as sort input for Composite table.
SCROWS	FLOAT(4) NOT NULL	The number of rows as sort input for Composite Table.
SCRECSZ	FLOAT(4) NOT NULL	The record size for Composite table.
SCPAGES	FLOAT(4) NOT NULL	The page size for Composite table.
SCRUNS	FLOAT(4) NOT NULL	The number of runs generated during sort of composite.
SCMERGES	FLOAT(4) NOT NULL	The number of merges needed during sort of composite.
SCIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCCOST	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANIO	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCPU	FLOAT(4) NOT NULL	IBM internal use only.
SCSCANCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCARD	FLOAT(4) NOT NULL	The total composite cardinality.
COMPIOCOST	FLOAT(4) NOT NULL	IBM internal use only.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
COMPCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
COMPCOST	FLOAT(4) NOT NULL	The total cost.
JOINCOLS	SMALLINT NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
COSTBLK	INTEGER NOT NULL	IBM internal use only.
COSTSTOR	INTEGER NOT NULL	IBM internal use only.
MPBLK	INTEGER NOT NULL	IBM internal use only.
MPSTOR	INTEGER NOT NULL	IBM internal use only.
COMPOSITES	INTEGER NOT NULL	IBM internal use only.
CLIPPED	INTEGER NOT NULL	IBM internal use only.
TABREF	VARCHAR(64) NOT NULL FOR BIT DATA	IBM internal use only.
MAX_COMPOSITES	INTEGER NOT NULL	IBM internal use only.
MAX_STOR	INTEGER NOT NULL	IBM internal use only.
MAX_CPU	INTEGER NOT NULL	IBM internal use only.
MAX_ELAP	INTEGER NOT NULL	IBM internal use only.
TBL_JOINED_THRESH	INTEGER NOT NULL	IBM internal use only.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
STOR_USED	INTEGER NOT NULL	IBM internal use only.
CPU_USED	INTEGER NOT NULL	IBM internal use only.
ELAPSED	INTEGER NOT NULL	IBM internal use only.
MIN_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_KEEP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MIN_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_CARD_CLIP	FLOAT(4) NOT NULL	IBM internal use only.
MAX_VALUE_COST_CLIP	FLOAT(4) NOT NULL	IBM internal use only.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PSEQCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJIOCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCPUCOST	FLOAT(4) NOT NULL	IBM internal use only.
PADJCOST	FLOAT(4) NOT NULL	IBM internal use only.
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of inner table index access. It is aggregated from uncertainty of inner table probing predicates. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
UNCERTAINTY_1T	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of ONECOMPROWS column of the table. It is aggregated from all local predicates on the table. A larger value indicates a higher uncertainty. 0 indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(128) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
IMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
DMNP	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJBC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
IMJFC	FLOAT(4) NOT NULL WITH DEFAULT	IBM internal use only.
CRED	INTEGER NOT NULL WITH DEFAULT	IBM internal use only.
IXSCAN_SKIP_DUPS	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether duplicate index key values are skipped during an index scan. **'Y'** Duplicate key values are skipped. **'N'** Duplicate key values are not skipped.
IXSCAN_SKIP_SCREEN	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether key ranges that are disqualified by index screening predicates are skipped during an index scan. **'Y'** Disqualified key ranges are skipped. **'N'** Key ranges are not skipped.

Table 256. DSN_DETCOST_TABLE description (continued)

Column name	Data type	Description
EARLY_OUT	CHAR(1) NOT NULL WITH DEFAULT ' '	Whether fetching from the table stops after the first qualified row. **'Y'** Internal fetching stops after the first qualified row **'N'** Internal fetching continues after the first qualified row. **blank** The EXPLAIN information was captured in a previous release, or the EXPLAIN information was captured for a package that was bound in a previous release.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

IBM Db2 Analytics Accelerator for z/OS documentation

DSN_FILTER_TABLE

The filter table, DSN_FILTER_TABLE, contains information about how predicates are used during query processing.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_FILTER_TABLE.

Table 257. DSN_FILTER_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.

Table 257. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
ORDERNO	INTEGER NOT NULL	The sequence number of evaluation. Indicates the order in which the predicate is applied within each stage
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.
STAGE	CHAR(9) NOT NULL	The processing stage in which the predicate is evaluated: **MATCHING** During the index matching stage. **SCREENING** During the index screening stage. **PAGERANGE** Db2 used page range screening to limit the number of partitions that were accessed to evaluate the predicate in a join context. **STAGE1** During stage 1 processing, after data page access. **STAGE2** During stage 2 processing on the returned data rows.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
MIXOPSEQNO	SMALLINT NOT NULL	IBM internal use only.
REEVAL	CHAR(1) NOT NULL	IBM internal use only.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 257. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
PUSHDOWN	CHAR(1) NOT NULL WITH DEFAULT	Whether the predicate is pushed down the Index Manager or Data Manager subcomponents for evaluation: **'I'** The Index Manager subcomponent evaluates the predicate. **'D'** The Data Manager subcomponent evaluates the predicate. **blank** The predicate is not pushed down for evaluation.

Table 257. DSN_FILTER_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

DSN_FUNCTION_TABLE

The function table, DSN_FUNCTION_TABLE, contains descriptions of functions that are used in specified SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

PSPI

The following table describes the columns of DSN_FUNCTION_TABLE.

Table 258. Descriptions of columns in DSN_FUNCTION_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.

Table 258. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNDYNAMICSQLCACHE'** The row originates from the dynamic statement cache. **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
SCHEMA_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The schema name of the function invoked in the explained statement.
FUNCTION_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the function invoked in the explained statement.
SPEC_FUNC_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	The specific name of the function invoked in the explained statement.

Table 258. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
FUNCTION_TYPE	CHAR(2) NOT NULL WITH DEFAULT	The type of function invoked in the explained statement. Possible values are: **CU** Column function **SU** Scalar function **TU** Table function
VIEW_CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the creator of the view. Otherwise, blank.
VIEW_NAME	VARCHAR(128) NOT NULL WITH DEFAULT	If the function specified in the FUNCTION_NAME column is referenced in a view definition, the name of the view. Otherwise, blank.
PATH	VARCHAR(2048) NOT NULL WITH DEFAULT	The value of the SQL path that was used to resolve the schema name of the function.
FUNCTION_TEXT	VARCHAR(1500) NOT NULL WITH DEFAULT	The text of the function reference (the function name and parameters). If the function reference is over 100 bytes, this column contains the first 100 bytes. For functions specified in infix notation, FUNCTION_TEXT contains only the function name. For example, for a function named /, which overloads the SQL divide operator, if the function reference is A/B, FUNCTION_TEXT contains only /.
FUNC_VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	For a version of a non-inline SQL scalar function, this column contains the version identifier. For all other cases, this column contains a zero length string. A version of a non-inline SQL scalar function is defined in the SYSIBM.SYSROUTINES table with ORIGIN='Q', FUNCTION_TYPE='S', INLINE='N', and VERSION column containing the version identifier.
SECURE	CHAR(1) NOT NULL WITH DEFAULT	Whether the user-defined function is secure.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 258. Descriptions of columns in DSN_FUNCTION_TABLE (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

COLUMN descriptions

The following table shows the descriptions of the columns in the DSN_KEYTGTDIST_TABLE table.

Table 259. Descriptions of columns in DSN_KEYTGTDIST_TABLE

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.

Table 259. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
APPLNAME	VARCHAR(128) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(128) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 259. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
IXSCHEMA	VARCHAR(128) NOT NULL	The qualifier of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
KEYSEQ	VARCHAR(128) NOT NULL	The numeric position of the key-target in the index.
KEYVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	Contains the data of a frequently occurring value. Statistics are not collected for an index on a ROWID column. If the value has a non-character data type, the data might not be printable. When the value of the TYPE column contains 'I', this column contains one of the following values: • 'C9C4E7C6E4D3D2C6' for IDXFULKF • 'C9C4E7D3C5C1C6C6' for IDXLEAFF • 'C9C4E7D5D3E5D3C6' for IDXNLVLF

Table 259. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
TYPE	CHAR(1) NOT NULL	The type of statistics: **C** Cardinality **F** Frequent value **H** Histogram **I** Real-time index statistics
CARDF	FLOAT NOT NULL	For TYPE='C', the number of distinct values for the column group. For TYPE='H', the number of distinct values for the column group in a quantile indicated by the value of the QUANTILENO column. For TYPE='I', a value related to real-time index statistics values determined by the KEYVALUE column.
KEYGROUPKEYNO	VARCHAR(254) NOT NULL FOR BIT DATA	Contains a value that identifies the set of keys that are associated with the statistics. If the statistics are associated with more than a single key, it contains an array of SMALLINT key numbers with a dimension that is equal to the value in NUMKEYS. If the statistics are only associated with a single key, it contains 0.
NUMKEYS	SMALLINT NOT NULL	The number of keys that are associated with the statistics.
FREQUENCYF	FLOAT NOT NULL	The percentage of rows in the table with the value that is specified in the COLVALUE column when the number is multiplied by 100. For example, a value of '1' indicates 100%. A value of '.153' indicates 15.3%.
QUANTILENO	SMALLINT NOT NULL	The ordinary sequence number of a quantile in the whole consecutive value range, from low to high. This column is not updatable
LOWVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the lower bound for the quantile indicated by the value of the QUANTILENO column. Not used if the value of the TYPE column is not 'H'. This column is not updatable.
HIGHVALUE	VARCHAR(2000) NOT NULL FOR BIT DATA	For TYPE='H', this is the higher bound for the quantile indicated by the value of the QUANTILENO column. This column is not used if the value of the TYPE column is not 'H'. This column is not updatable.

Table 259. Descriptions of columns in DSN_KEYTGTDIST_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Column descriptions

The following table describes the columns of DSN_PGRANGE_TABLE.

Table 260. DSN_PGRANGE_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
RANGE	SMALLINT NOT NULL	The sequence number of the current page range.
FIRSTPART	SMALLINT NOT NULL	The starting partition in the current page range.
LASTPART	SMALLINT NOT NULL	The ending partition in the current page range.
NUMPARTS	SMALLINT NOT NULL	The number of partitions in the current page range.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.

Table 260. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 260. DSN_PGRANGE_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_PGROUP_TABLE

The parallel group table, DSN_PGROUP_TABLE, contains information about the parallel groups in a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2

EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_PGROUP_TABLE

Table 261. DSN_PGROUP_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNAME	VARCHAR(24) NOT NULL	The application plan name.

Table 261. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
GROUPID	SMALLINT NOT NULL	The parallel group identifier within the current query block.
FIRSTPLAN	SMALLINT NOT NULL	The plan number of the first contributing mini-plan associated within this parallel group.
LASTPLAN	SMALLINT NOT NULL	The plan number of the last mini-plan associated within this parallel group.

Table 261. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
CPUCOST	REAL NOT NULL	The estimated total CPU cost of this parallel group in milliseconds.
IOCOST	REAL NOT NULL	The estimated total I/O cost of this parallel group in milliseconds.
BESTTIME	REAL NOT NULL	The estimated elapsed time for each parallel task for this parallel group.
DEGREE	SMALLINT NOT NULL	The degree of parallelism for this parallel group determined at bind time. Max parallelism degree if the Table space is large is 255, otherwise 64.
MODE	CHAR(1) NOT NULL	The parallel mode: **'I'** I/O parallelism **'C'** CPU parallelism **'N'** No parallelism
REASON	SMALLINT NOT NULL	The reason code for downgrading parallelism mode.
LOCALCPU	SMALLINT NOT NULL	The number of CPUs currently online when preparing the query.
TOTALCPU	SMALLINT NOT NULL	The total number of CPUs in Sysplex. LOCALCPU and TOTALCPU are different only for the Db2 coordinator in a Sysplex.
FIRSTBASE	SMALLINT	The table number of the table that partitioning is performed on.
LARGETS	CHAR(1)	'Y' if the TableSpace is large in this group.
PARTKIND	CHAR(1)	The partitioning type: **'L'** Logical partitioning **'P'** Physical partitioning
GROUPTYPE	CHAR(3)	Determines what operations this parallel group contains: table Access, Join, or Sort 'A' 'AJ' 'AJS'
ORDER	CHAR(1)	The ordering requirement of this parallel group : **'N'** No order. Results need no ordering. **'T'** Natural Order. Ordering is required but results already ordered if accessed via index. **'K'** Key Order. Ordering achieved by sort. Results ordered by sort key. This value applies only to parallel sort.

Table 261. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
STYLE	CHAR(4)	The Input/Output format style of this parallel group. Blank for IO Parallelism. For other modes: **'RIRO'** Records IN, Records OUT **'WIRO'** Work file IN, Records OUT **'WIWO'** Work file IN, Work file OUT
RANGEKIND	CHAR(1)	The range type: **'K'** Key range **'L'** IN-list elements partitioning **'P'** Page range **'R'** Record range partitioning
NKEYCOLS	SMALLINT	The number of interesting key columns, that is, the number of columns that will participate in the key operation for this parallel group.
LOWBOUND	VARCHAR(40) FOR BIT DATA	The low bound of parallel group.
HIGHBOUND	VARCHAR(40) FOR BIT DATA	The high bound of parallel group.
LOWKEY	VARCHAR(40) FOR BIT DATA	The low key of range if partitioned by key range.
HIGHKEY	VARCHAR(40) FOR BIT DATA	The high key of range if partitioned by key range.
FIRSTPAGE	CHAR(4) FOR BIT DATA	The first page in range if partitioned by page range.
LASTPAGE	CHAR(4) FOR BIT DATA	The last page in range if partitioned by page range.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HOST_REASON	SMALLINT	IBM internal use only.
PARA_TYPE	CHAR(4)	IBM internal use only.
PART_INNER	CHAR(1)	IBM internal use only.
GRNU_KEYRNG	CHAR(1)	IBM internal use only.
OPEN_KEYRNG	CHAR(1)	IBM internal use only.

Table 261. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
STRAW_MODEL	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.

Table 261. DSN_PGROUP_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_PREDICAT_TABLE

The predicate table, DSN_PREDICAT_TABLE, contains information about all of the predicates in a query. It is also used as input when you issue a BIND QUERY command to override predicate selectivities for matching SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of the DSN_PREDICAT_TABLE

Table 262. DSN_PREDICAT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a predicate within a query.
TYPE	CHAR(8) NOT NULL	A string used to indicate the type or the operation of the predicate. The possible values are: • 'AND' • 'BETWEEN' • 'EQUAL' • 'EXISTS • 'COMPOUND' • 'HAVING' • 'IN' • 'LIKE' • 'NOT LIKE' • 'NOTEXIST' • 'OTHERS' • 'OR' • 'RANGE' • 'SUBQUERY' • 'XEXISTS' • 'NXEXISTS'

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
LEFT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the left side of the predicate. If the left side of the predicate is a table column, this value indicates the name of that column. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks
LEFT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the first child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.
LHS_TABNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
LHS_QBNO	SMALLINT NOT NULL	If the left side of the predicate is a table column or a column expression in expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.
RIGHT_HAND_SIDE	VARCHAR(128) NOT NULL	Describes the right side of the predicate. If the right side of the predicate is a table column, this value column indicates the column name. Other possible values are: • 'VALUE' • 'COLEXP' • 'NONCOLEXP' • 'CORSUB' • 'NONCORSUB' • 'SUBQUERY' • 'EXPRESSION' • Blanks
RIGHT_HAND_PNO	INTEGER NOT NULL	If the predicate is a compound predicate (AND/OR), then this column indicates the second child predicate. However, this column is not reliable when the predicate tree consolidation happens. Use PARENT_PNO instead to reconstruct the predicate tree.

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
RHS_TABNO	CHAR(1) NOT NULL	If the right side of the predicate is a table column or a column expression in an index on expression, then this column indicates a number which uniquely identifies the corresponding table reference within a query.
RHS_QBNO	CHAR(1) NOT NULL	If the right side of the predicate is a subquery or a column expression in an expression-based index, then this column indicates a number which uniquely identifies the corresponding query block within a query.
FILTER_FACTOR	FLOAT NOT NULL	The estimated filter factor.
BOOLEAN_TERM	CHAR(1) NOT NULL	Whether this predicate can be used to determine the truth value of the whole WHERE clause.
SEARCHARG	CHAR(1) NOT NULL	Whether this predicate can be processed by data manager (DM). If it is not, then the relational data service (RDS) needs to be used to take care of it, which is more costly.
JOIN	CHAR(1) NOT NULL	Whether the predicate can be used as a simple join predicate between two tables.
AFTER_JOIN	CHAR(1) NOT NULL	Indicates the predicate evaluation phase: **'A'** After join **'D'** During join **blank** Not applicable
ADDED_PRED	CHAR(1) NOT NULL	Whether the predicate is generated by Db2, and the reason why the predicate is added: **blank** Db2 did not add the predicate. **'B'** For bubble up. **'C'** For correlation. **'J'** For join. **'K'** For LIKE for expression-based index. **'L'** For localization. **'P'** For push down. **'R'** For page range. **'S'** For simplification. **'T'** For transitive closure.

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
REDUNDANT_PRED	CHAR(1) NOT NULL	Whether it is a redundant predicate, which means evaluation of other predicates in the query already determines the result that the predicate provides.
DIRECT_ACCESS	CHAR(1) NOT NULL	Whether the predicate is direct access, which means one can navigate directly to the row through ROWID.
KEYFIELD	CHAR(1) NOT NULL	Whether the predicate includes the index key column of the involved table for all applicable indexes considered by Db2.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
CATEGORY	SMALLINT NOT NULL	IBM internal use only.
CATEGORY_B	SMALLINT NOT NULL	IBM internal use only.
TEXT	VARCHAR(2000) NOT NULL	The text of the transformed predicate text. If the text of the predicate contains more than 2000 characters, it is truncated.
PRED_ENCODE	CHAR(1) NOT NULL WITH DEFAULT	IBM internal use only.
PRED_CCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.
PRED_MCCSID	SMALLINT NOT NULL WITH DEFAULT	IBM internal use only.
MARKER	CHAR(1) NOT NULL WITH DEFAULT	Whether this predicate includes host variables, parameter markers, or special registers.
PARENT_PNO	INTEGER NOT NULL	The parent predicate number. If this predicate is a root predicate within a query block, then this column is 0.
NEGATION	CHAR(1) NOT NULL	Whether this predicate is negated via NOT.
LITERALS	VARCHAR(128) NOT NULL	This column indicates the literal value or literal values separated by colon symbols.

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
CLAUSE	CHAR(8) NOT NULL	The clause where the predicate exists: **'HAVING '** The HAVING clause **'ON '** The ON clause **'WHERE '** The WHERE clause **SELECT** The SELECT clause
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the predicate. **Blank** Generated by Db2 **C** Column mask **R** Row permission **U** Specified by the user
UNCERTAINTY	FLOAT(4) NOT NULL WITH DEFAULT	Describes the uncertainty factor of a predicate's estimated filter factor. A bigger value indicates a higher degree of uncertainty. Value zero indicates no uncertainty or uncertainty not considered.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.

Table 262. DSN_PREDICAT_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

Related concepts

Predicates

A *predicate* specifies a condition that is true, false, or unknown about a given value, row, or group.

Predicates and access path selection (Db2 Performance)

Related tasks

Overriding predicate selectivities at the statement level (Db2 Performance)

Related reference

Tables for influencing access path selection (Db2 Performance)
BIND QUERY (DSN) (Db2 Commands)

DSN_PREDICATE_SELECTIVITY table

The predicate selectivity table contains information about the selectivity of predicates that are used for access path selection. It is used as an input table for the BIND QUERY command when selectivity overrides are specified.

PSPI

When selectivity overrides are not specified, or specified selectivity overrides cannot not be used by Db2, the DSN_PREDICATE_SELECTIVITY table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values. DSN_PREDICATE_SELECTIVITY does not contain rows from DSN_PREDICAT_TABLE for predicates that are not used for access path selection.

When selectivity overrides are specified and used by Db2, this table also contains one row for each selectivity override that was used. These rows contain ASSUMPTION='OVERRIDE' values.

Additionally, if the sum of the weights for all specified selectivity override instances is less than one, this table contains one row for each predicate in DSN_PREDICAT_TABLE that is used for access path selection. These rows contain ASSUMPTION='NORMAL' values and WEIGHT values equal to one minus the sum of the specified override weight values.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

Your subsystem or data sharing group can contain more than one of these tables, including a table with the qualifier SYSIBM, a table with the qualifier DB2OSCA, and additional tables that are qualified by user IDs.

The following table shows the descriptions of the columns in the DSN_PREDICATE_SELECTIVITY table.

Table 263. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table

Column name	Data Type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.

Table 263. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
PREDNO	INTEGER NOT NULL	The predicate number, a number used to identify a specific predicate within a query.
INSTANCE	SMALLINT NOT NULL	The selectivity instance. Used to group related selectivities.
SELECTIVITY	FLOAT NOT NULL	The selectivity estimate.
WEIGHT	FLOAT(4) NOT NULL	The percentage of executions that have the specified selectivity. For example, a value of 0.25 means that 25% of the time when query is executed it has this selectivity.

Table 263. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
ASSUMPTION	VARCHAR(128) NOT NULL	Indicates how the selectivity was estimated, or is used. One of the following values: **'NORMAL'** Selectivity is estimated by using the normal selectivity assumptions. **'OVERRIDE'** Selectivity is based on an override.
INSERT_TIME	TIMESTAMP NOT NULL GENERATED ALWAYS FOR EACH ROW ON UPDATE AS ROW CHANGE TIMESTAMP	The time when the row was inserted or updated.
EXPLAIN_TIME	TIMESTAMP	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
REMARKS	VARCHAR(762)	IBM internal use only.

Table 263. Descriptions of columns in the DSN_PREDICATE_SELECTIVITY table (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_PTASK_TABLE.

Table 264. DSN_PTASK_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PGDNO	SMALLINT NOT NULL	The parallel group identifier within the current query block. This value corresponds to the value of the GROUPID column in DSN_PGROUP_TABLE table rows.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
LPTNO	SMALLINT NOT NULL	The parallel task number.
KEYCOLID	SMALLINT	The key column ID (KEY range only).
DPSI	CHAR(1) NOT NULL	Indicates if a data partition secondary index (DPSI) is used.
LPTLOKEY	VARCHAR(40) FOR BIT DATA	The low key value for this key column for this parallel task (KEY range only).

Table 264. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
LPTHIKEY	VARCHAR(40) FOR BIT DATA	The high key value for this key column for this parallel task (KEY range only).
LPTLOPAG	CHAR(4) FOR BIT DATA	The low page information if partitioned by page range.
LPTLHIPAG	CHAR(4) FOR BIT DATA	The high page information if partitioned by page range.
LPTLOPG"1" on page 2585	CHAR(4) FOR BIT DATA	The lower bound page number for this parallel task (Page range or DPSI enabled only).
LPTHIPG"1" on page 2585	CHAR(4) FOR BIT DATA	The upper bound page number for this parallel task (Page range or DPSI enabled only).
LPTLOPT"1" on page 2585	SMALLINT	The lower bound partition number for this parallel task (Page range or DPSI enabled only).
LPTHIPT"1" on page 2585	SMALLINT	The upper bound partition number for this parallel task (Page range or DPSI enabled only).
KEYCOLDT	SMALLINT	The data type for this key column (KEY range only).
KEYCOLPREC	SMALLINT	The precision/length for this key column (KEY range only).
KEYCOLSCAL	SMALLINT	The scale for this key column (KEY range with Decimal datatype only).
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 264. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 264. DSN_PTASK_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. The name of these columns originally contained the # symbol as the last character in the names. However, the names that contain these characters are obsolete and are no longer supported.

PSPI

DSN_QUERYINFO_TABLE

The query information table, DSN_QUERYINFO_TABLE, contains information about the eligibility of query blocks for automatic query rewrite, information about the materialized query tables that are considered for eligible query blocks, reasons why ineligible query blocks are not eligible, and information about acceleration of query blocks.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2

EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain more than one of these tables:

userID
You can create additional instances of EXPLAIN tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind, or rebind, a plan or package with the EXPLAIN(YES) option. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

Table 265. Descriptions of columns in DSN_QUERYINFO_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.

Table 265. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
QINAME1	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A': • When REASON_CODE=0, this value is the name of the accelerator server to which the statement is sent. • When REASON_CODE<>0, the statement was not sent to an accelerator server. The REASON_CODE value indicates why the statement was not sent to the accelerator server. When TYPE='ACCELMDL', this statement used accelerator modeling. For static queries, the value in this field might be the name of the accelerator server that is available at execution time.
QINAME2	VARCHAR(128) NOT NULL WITH DEFAULT	When TYPE='A' and REASON_CODE=0, this value is the name of the location name of the accelerator server to which the statement is sent. For static queries, the value in this field might be the name of the accelerator server that is available at execution time.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 265. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
SEQNO	INTEGER NOT NULL WITH DEFAULT	The sequence number for this row if QI_DATA exceeds the size of its column.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
TYPE	CHAR(8) NOT NULL WITH DEFAULT	The type of the output for this row: **A** This row is for a statement that Db2 attempts to run on an accelerator server. The value in column REASON_CODE indicates the outcome.
QI_DATA	CLOB(2M) NOT NULL WITH DEFAULT	When TYPE='A': • For REASON_CODE values other than 0, this value is the description of the REASON_CODE value. • For a REASON_CODE value of 0, this value is the statement text, after it is converted for processing by the accelerator.

Table 265. Descriptions of columns in DSN_QUERYINFO_TABLE (continued)

Column name	Data type	Description
SERVICE_INFO	BLOB(2M) NOT NULL WITH DEFAULT	IBM internal use only.
QB_INFO_ROWID	ROWID NOT NULL GENERATED ALWAYS	IBM internal use only.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Notes:

1. The REASON_CODE column has the following values:

   0
   The query block qualifies for routing to an accelerator server. The values of QINAME1 and QINAME2 identify the accelerator server.

For example, for version 1 of the IBM Db2 Analytics Accelerator for z/OS, the associated data mart name is recorded in the QINAME2 column, with the following naming convention: *data-mart-name*@*accelerator-name*@*digits*.

1
No active accelerator server was found or the table was not enabled for query offloading when the statement was executed.

2
The CURRENT QUERY ACCELERATION special register is set to NONE.

3
Db2 classified the query as a short-running query, or Db2 determined that sending the query to an accelerator server provided no performance advantage.

4
The query is not read-only.

6
The cursor is defined as a scrollable cursor or is a row set-positioned cursor.

7
The query references objects with multiple encoding schemes.

8
The FROM clause of the query specifies a *data-change-table-reference*.

9
The query contains a table expression with one or more correlated references to other tables in the same FROM clause.

10
The query contains a reference to a recursive common table expression.

11
The query contains an unsupported expression. The text of the expression is in QI_DATA.

12
The query references a table that has any of the following characteristics:

- The table is not defined in the accelerator server.
- The table is defined in a different accelerator server from another table in the query.
- The table is defined in the accelerator server, but is not enabled for processing by an accelerator.

13
The accelerator server that contains the tables that are referenced in the query is not started.

14
A column that is referenced in the query was altered by Db2 after the data was loaded in the accelerator server.

15
The query uses functionality that is available only in Db2 for z/OS Version 10 new-function mode or later, and the functionality is not supported by the accelerator server.

17
The query is an INSERT statement, but the Db2 subsystem parameter DSN6SPRM.QUERY_ACCEL_OPTIONS does not specify option 2 to enable its acceleration.

18
The query uses functionality that is available only in Db2 11 or later, and the functionality is not supported by the accelerator server.

19
The accelerator server is not at the correct level and does not support a function in the SQL statement. The QI_DATA column contains the function text or expression text that is using the unsupported function for the accelerator server.

20

The query is a rowset cursor that is declared WITH RETURN, runs remotely, or runs under an SQL PL routine.

21

The query contains a correlated subquery that is not supported for acceleration.

22

The statement references an accelerator-only table, but the statement is not offloadable. For example:

- MERGE statement references an accelerator-only table.
- UPDATE or DELETE statement references an accelerator-only table, but the target table of the UPDATE, DELETE is a normal Db2 table: UPDATE DB2_TABLE SET .. (SELECT .. FROM ACCEL_ONLY_TABLE).
- INSERT, UPDATE or DELETE of a row expression with subselect. UPDATE ACCEL_ONLY_TABLE SET (C1, C2) = (SELECT C3, C4 FROM TABLE2);

23

The SELECT INTO statement is bound for acceleration but is run as a remote SELECT INTO statement, which is not supported for acceleration.

24

The DDL or DML statement cannot be offloaded because the connection to the accelerator server does not allow updates. This problem can occur when a two-phase commit requester (for example, a Db2 for z/OS requester) connects to a Db2 for z/OS server to offload a DDL or DML statement.

25

The statement contains a reference to a column with an unsupported data type.

26

The CREATE TABLE statement clause IN ACCELERATOR specifies an accelerator alias that resolves to more than one accelerator.

27

The DROP TABLE statement specifies a referencing accelerator-only table, which cannot be removed by using the DROP TABLE statement.

To drop a referencing accelerator-only table, invoke the IBM Db2 Analytics Accelerator for z/OS ACCEL_REMOVE_REFERENCE_TABLES stored procedure.

30

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The Db2 change might or might not be related to the Db2 accelerated table that is referenced in the query.

31

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query that specifies both an accelerator-only table (AOT) and a Db2 accelerated table. The query will not be accelerated and cannot be run in Db2. The same Db2 unit of work includes a previous uncommitted Db2 change that will not be available to the query when it is run on the accelerator. The change might or might not be related to the Db2 accelerated table that is referenced in the query.

32

Accelerator WAITFORDATA behavior is requested but cannot be achieved for this query. The query will not be accelerated. The query specifies a Db2 accelerated table, but the same Db2 unit of work includes a previous uncommitted accelerator-only table (AOT) change. This uncommitted change resulted in the creation of an accelerator database *snapshot isolation* (SI) for this unit of work before the query was run. This accelerator database SI can prevent committed and replicated Db2 changes, made either by this transaction or by a different transaction, from being

available to the accelerated query, even if the Db2 changes are replicated to the accelerator before the query is run there.

33
The query could not be offloaded to the accelerator due to different reasons on different versions of the accelerator.

36
The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES; however, either an active V7 or later accelerator was not found or the table was not enabled for query offloading in the V7 or later accelerator when the statement was executed.

37
The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator that contains the tables of the query is not started.

38
The USE ONLY NEW ACCELERATOR_TYPE subsystem parameter is set to YES, but the V7 or later accelerator is not at the correct level.

900-999
For IBM internal use only.

PSPI

Related information

IBM Db2 Analytics Accelerator for z/OS documentation

DSN_QUERY_TABLE

The query table, DSN_QUERY_TABLE, contains information about a SQL statement, and displays the statement before and after query transformation.

PSPI

Unlike other EXPLAIN tables, rows in DSN_QUERY_TABLE are not populated for static SQL statements at BIND or REBIND with the EXPLAIN(YES) option.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_QUERY_TABLE.

Table 266. DSN_QUERY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
TYPE	CHAR(8) NOT NULL	The type of the data in the NODE_DATA column.
QUERY STAGE	CHAR(8) NOT NULL WITH DEFAULT	The stage during query transformation when this row is populated.
SEQNO	NOT NULL	The sequence number for this row if NODE_DATA exceeds the size of its column.
NODE_DATA	CLOB(2M)	The XML data containing the SQL statement and its query block, table, and column information.
EXPLAIN_TIME	TIMESTAMP	The EXPLAIN timestamp.
QUERY_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
GROUP MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 subsystem that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
HASHKEY	INTEGER NOT NULL	The hash value of the contents in NODE_DATA
HAS_PRED	CHAR(1) NOT NULL	When NODE_DATA contains an SQL statement, this column indicates if the statement contains a parameter marker literal, non-parameter marker literal, or no predicates.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 266. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 266. DSN_QUERY_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_SORTKEY_TABLE

The sort key table, DSN_SORTKEY_TABLE, contains information about sort keys for all of the sorts required by a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_SORTKEY_TABLE.

Table 267. DSN_SORTKEY_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.

Table 267. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort
ORDERNO	SMALLINT NOT NULL	The sequence number of the sort key
EXPTYPE	CHAR(3) NOT NULL	The type of the sort key. The possible values are: • 'COL' • 'EXP' • 'QRY'
TEXT	VARCHAR(128) NOT NULL	The sort key text, can be a column name, an expression, or a scalar subquery, or 'Record ID'.
TABNO	SMALLINT NOT NULL	The table number, a number which uniquely identifies the corresponding table reference within a query.
COLNO	SMALLINT NOT NULL	The column number, a number which uniquely identifies the corresponding column within a query. Only applicable when the sort key is a column.

Table 267. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
DATATYPE	CHAR(18)	The data type of sort key. The possible values are • 'HEXADECIMAL' • 'CHARACTER' • 'PACKED FIELD ' • 'FIXED(31)' • 'FIXED(15)' • 'DATE' • 'TIME' • 'VARCHAR' • 'PACKED FLD' • 'FLOAT' • 'TIMESTAMP' • 'UNKNOWN DATA TYPE'
LENGTH	INTEGER NOT NULL	The length of sort key.
CCSID	INTEGER NOT NULL	IBM internal use only.
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 267. DSN_SORTKEY_TABLE description (continued)

Column name	Data type	Description
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_SORT_TABLE

The sort table, DSN_SORT_TABLE, contains information about the sort operations required by a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_SORT_TABLE.

Table 268. DSN_SORT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.
PLANNO	SMALLINT NOT NULL	The plan number, a number used to identify each miniplan with a query block.

Table 268. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
SORTC	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the composite table. The reasons are shown as a series of bytes: • Byte 1 is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • Byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTN	CHAR(5) NOT NULL WITH DEFAULT	Indicates the reasons for sort of the new table. The reasons are shown as a series of bytes: • The first byte is 'G' if the reason is GROUP BY, or otherwise blank. • The second byte is 'J' if the reason is JOIN, or otherwise blank. • The third byte is 'O' if the reason is ORDER BY, or otherwise blank. • The fourth by is 'U' if the reason is uniqueness, or otherwise blank.
SORTNO	SMALLINT NOT NULL	The sequence number of the sort.
KEYSIZE	SMALLINT NOT NULL	The sum of the lengths of the sort keys.

Table 268. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
ORDERCLASS	INTEGER NOT NULL	IBM internal use only.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 268. DSN_SORT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_STATEMENT_CACHE_TABLE

The statement cache table, DSN_STATEMENT_CACHE_TABLE, contains information about the SQL statements in the statement cache, information captured as the results of an EXPLAIN STATEMENT CACHE ALL statement.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table shows the descriptions of the columns in DSN_STATEMENT_CACHE_TABLE.

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE

Column name	Data Type	Description
STMT_ID	INTEGER NOT NULL	The statement ID; this value is the EDM unique token for the statement.
STMT_TOKEN	VARCHAR(240)	The statement token; you provide this value as an identification string.
COLLID	VARCHAR(128) NOT NULL	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register.
PROGRAM_NAME	VARCHAR(128) NOT NULL	The name of the package that performed the initial PREPARE for the statement.
INV_DROPALT	CHAR(1) NOT NULL	This column is not used.
INV_REVOKE	CHAR(1) NOT NULL	This column is not used.
INV_LRU	CHAR(1) NOT NULL	This column is not used.
INV_RUNSTATS	CHAR(1) NOT NULL	This column is not used.
CACHED_TS	TIMESTAMP NOT NULL	The timestamp when the statement was stored in the dynamic statement cache."3" on page 2612
USERS	INTEGER NOT NULL	The number of current users of the statement. This number indicates the users that have prepared or run the statement during their current unit of work. "1" on page 2612,"3" on page 2612
COPIES	INTEGER NOT NULL	The number of copies of the statement that are owned by all threads in the system. "1" on page 2612,"3" on page 2612

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
LINES	INTEGER NOT NULL	The precompiler line number from the initial PREPARE of the statement. “1” on page 2612
PRIMAUTH	VARCHAR(128) NOT NULL	The primary authorization ID that did the initial PREPARE of the statement.
CURSQLID	VARCHAR(128) NOT NULL	The CURRENT SQLID that did the initial PREPARE of the statement.
BIND_QUALIFIER	VARCHAR(128) NOT NULL	The BIND qualifier. For unqualified table names, this is the object qualifier.
BIND_ISO	CHAR(2) NOT NULL	The value of the ISOLATION BIND option that is in effect for this statement. The value will be one of the following values: **'UR'** Uncommitted read **'CS'** Cursor stability **'RS'** Read stability **'RR'** Repeatable read
BIND_CDATA	CHAR(1) NOT NULL	The value of the CURRENTDATA BIND option that is in effect for this statement. The value will be one of the following values: **'Y'** CURRENTDATA(YES) **'N'** CURRENTDATA(NO)
BIND_DYNRL	CHAR(1) NOT NULL	The value of the DYNAMICRULES BIND option that is in effect for this statement. The value will be one of the following values: **'B'** DYNAMICRULE(BIND) **'R'** DYNAMICRULES(RUN)
BIND_DEGRE	CHAR(1) NOT NULL	The value of the CURRENT DEGREE special register that is in effect for this statement. The value will be one of the following values: **'A'** CURRENT DEGREE = ANY **'1'** CURRENT DEGREE = 1

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
BIND_SQLRL	CHAR(1) NOT NULL	The value of the CURRENT RULES special register that is in effect for this statement. The value will be one of the following values: **'D'** CURRENT RULES = Db2 **'S'** CURRENT RULES = SQL
BIND_CHOLD	CHAR(1) NOT NULL	The value of the WITH HOLD attribute of the PREPARE for this statement. The value will be one of the following values: **'Y'** Initial PREPARE specified WITH HOLD **'N'** Initial PREPARE specified WITHOUT HOLD
STAT_TS	TIMESTAMP NOT NULL	Timestamp of the statistics. This is the timestamp when IFCID 318 is started. “2” on page 2612
STAT_EXEC	INTEGER NOT NULL	This column is deprecated. Use STAT_EXECB instead.
STAT_GPAG	INTEGER NOT NULL	This column is deprecated. Use STAT_GPAGB instead. “1” on page 2612
STAT_SYNR	INTEGER NOT NULL	This column is deprecated. Use STAT_SYNRB instead. “1” on page 2612
STAT_WRIT	INTEGER NOT NULL	This column is deprecated. Use STAT_WRITB instead. “1” on page 2612
STAT_EROW	INTEGER NOT NULL	This column is deprecated. Use STAT_EROWB instead. “1” on page 2612
STAT_PROW	INTEGER NOT NULL	This column is deprecated. Use STAT_PROWB instead. “1” on page 2612
STAT_SORT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead. “1” on page 2612
STAT_INDX	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_RSCN	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_PGRP	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_ELAP	FLOAT NOT NULL	The accumulated elapsed time that is used for the statement. “2” on page 2612
STAT_CPU	FLOAT NOT NULL	The accumulated CPU time that is used for the statement. “2” on page 2612
STAT_SUS_SYNIO	FLOAT NOT NULL	The accumulated wait time for synchronous I/O operations for the statement. “2” on page 2612
STAT_SUS_LOCK	FLOAT NOT NULL	The accumulated wait time for lock requests for the statement. “2” on page 2612
STAT_SUS_SWIT	FLOAT NOT NULL	The accumulated wait time for synchronous execution unit switch for the statement. “2” on page 2612

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_SUS_GLCK	FLOAT NOT NULL	The accumulated wait time for global parent L-locks for this statement. “2” on page 2612
STAT_SUS_OTHR	FLOAT NOT NULL	The accumulated wait time for read activity that is done by another thread. “2” on page 2612
STAT_SUS_OTHW	FLOAT NOT NULL	The accumulated wait time for write activity done by another thread. “2” on page 2612
STAT_RIDLIMT	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
STAT_RIDSTOR	INTEGER NOT NULL	This column is deprecated. Use STAT_SORTB instead.
EXPLAIN_TS	TIMESTAMP NOT NULL	The timestamp for when the statement cache table is populated.
SCHEMA	VARCHAR(128) NOT NULL	The value of the CURRENT SCHEMA special register.
STMT_TEXT	CLOB(2M) NOT NULL	The statement that is being explained.
STMT_ROWID	ROWID NOT NULL GENERATED ALWAYS	The ROWID of the statement.
BIND_RO_TYPE	CHAR(1) NOT NULL WITH DEFAULT	The current specification of the REOPT option for the statement“3” on page 2612: **'N'** REOPT(NONE) or its equivalent **'1'** REOPT(ONCE) or its equivalent **'A'** REOPT(AUTO) or its equivalent **'O'** The current plan is deemed optimal and there is no need for REOPT(AUTO)
BIND_RA_TOT	INTEGER NOT NULL WITH DEFAULT	The total number of REBIND commands that have been issued for the dynamic statement because of the REOPT(AUTO) option.“1” on page 2612,“3” on page 2612
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
STAT_EXECB	BIGINT NOT NULL WITH DEFAULT	The number of times this statement has been run. For a statement with a cursor, this is the number of OPENs.“2” on page 2612
STAT_GPAGB	BIGINT NOT NULL WITH DEFAULT	The number of getpage operations that are performed for the statement. “2” on page 2612
STAT_SYNRB	BIGINT NOT NULL WITH DEFAULT	The number of synchronous buffer reads that are performed for the statement. “2” on page 2612

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
STAT_WRITB	BIGINT NOT NULL WITH DEFAULT	The number of buffer write operations that are performed for the statement. “2” on page 2612
STAT_EROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are examined for the statement. “2” on page 2612
STAT_PROWB	BIGINT NOT NULL WITH DEFAULT	The number of rows that are processed for the statement. “2” on page 2612
STAT_SORTB	BIGINT NOT NULL WITH DEFAULT	The number of sorts that are performed for the statement.“2” on page 2612
STAT_INDXB	BIGINT NOT NULL WITH DEFAULT	The number of index scans that are performed for the statement.“2” on page 2612
STAT_RSCNB	BIGINT NOT NULL WITH DEFAULT	The number of table space scans that are performed for the statement.“2” on page 2612
STAT_PGRPB	BIGINT NOT NULL WITH DEFAULT	The number of parallel groups that are created for the statement.“2” on page 2612
STAT_RIDLIMTB	BIGINT NOT NULL WITH DEFAULT	The number of times a RID list was not used because the number of RIDs would have exceeded Db2 limits.“2” on page 2612
STAT_RIDSTORB	BIGINT NOT NULL WITH DEFAULT	The number of times a RID list was not used because there is not enough storage available to hold the list of RIDs.“2” on page 2612
LITERAL_REPL	CHAR(1) NOT NULL WITH DEFAULT	Identifies cached statements where the literal values are replaced by the '&' symbol:“3” on page 2612 **'R'** The statement is prepared with CONCENTRATE STATEMENTS WITH LITERALS behavior and the literal constants in the statement have been replaced with '&' . **'D'** This statement is a duplicate statement instance with different literal reusability criteria. **blank** Literal values are not replaced.
STAT_SUS_LATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for latch requests for the statement.
STAT_SUS_PLATCH	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for page latch requests for the statement.
STAT_SUS_DRAIN	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for drain lock requests for the statement.
STAT_SUS_CLAIM	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for claim count requests for the statement.
STAT_SUS_LOG	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for log writer requests for the statement.

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
ACCELERATED	CHAR(10)	Identifies whether a cached dynamic statement was prepared for acceleration to an accelerator server. Possible values are: **'NO'** The cached statement was not prepared for acceleration. This is the default value. This value also applies to cached statements under the following conditions: • The query acceleration behavior was not specified or was explicitly set to NONE when the dynamic statement was prepared. • A query acceleration behavior other than ALL was specified when the dynamic statement was prepared. Db2 did not prepare the statement for acceleration because it did not qualify for acceleration based on the query acceleration behavior that was specified. **'YES'** The cached statement was prepared for acceleration to an accelerator server based on the query acceleration behavior that was specified. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation. **'NEVER'** The cached statement was not prepared for acceleration to an accelerated server, because the statement can never be accelerated. • If the query acceleration behavior is set to ENABLE, ENABLE WITH FAILBACK, or ELIGIBLE for the prepare of the statement, Db2 considers this cache entry first as a possible cache match during the prepare operation. This action verifies whether the statement was cached previously as one that can never be accelerated. • If the query acceleration behavior is set to ALL for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation. • If the query acceleration behavior is not specified, or is explicitly set to NONE for the prepare of the statement, Db2 does not consider this cache entry as a possible cache match during the prepare operation.

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
ACCELERATED (continued)		**'ACCEL-ONLY'** The cached statement was prepared for acceleration to an accelerator. The statement references at least one accelerator-only table and can only be prepared to execute in the accelerator server. If query acceleration behavior is specified when a dynamic statement is prepared, Db2 can consider this cache entry for a possible cache match during the prepare operation of the dynamic statement. If query acceleration behavior is not specified, or is explicitly set to NONE when the statement is prepared, Db2 does not consider this cache entry for a cache match during the prepare operation. Query acceleration behavior is specified by either the QUERY_ACCELERATION subsystem parameter, the QUERYACCELERATION bind option, or the CURRENT QUERY ACCELERATION special register, and depends on their order of precedence. The order of precedence (lowest to highest) is: • The QUERY_ACCELERATION subsystem parameter • The QUERYACCELERATION bind option, if specified • An explicit SET CURRENT QUERY ACCELERATION statement
STAT_ACC_ELAP	BIGINT	The accumulated elapsed time for the accelerator.
STAT_ACC_CPU	BIGINT	The accumulated CPU time for the accelerator.
STAT_ACC_ROW	BIGINT	The accumulated number of rows that are returned from the accelerator.
STAT_ACC_BYTE	BIGINT	The accumulated number of bytes that are returned from the accelerator.
STAT_ACC_1ROW	BIGINT	The time waited for the first row of the query result to be available from the accelerator.
STAT_ACC_DB2	BIGINT	The total time the accelerator waited for Db2 to request query results.
STAT_ACC_EXEC	BIGINT	The accumulated execution time for the accelerator.
STAT_ACC_WAIT	BIGINT	The accumulated queue wait time for the accelerator.
ACCEL_OFFLOAD_ELIGIBLE	CHAR(1)	**'NO'** The statement is not eligible for acceleration. This is the default value. **'YES'** The statement is a candidate for acceleration when an accelerator server is available to the Db2 subsystem.
ACCELERATOR_NAME	VARCHAR(128)	The concatenated name of the accelerator server that processed the query.

Table 269. Descriptions of columns in DSN_STATEMENT_CACHE_TABLE (continued)

Column name	Data Type	Description
PER_STMT_ID	BIGINT NOT NULL	The statement identifier of the stabilized dynamic SQL statement. This value is set if this entry was stabilized to or loaded from the SYSIBM.SYSDNQRY catalog table
STBLGRP	VARCHAR(128) NOT NULL	The stabilization group name specified in a START DYNQRY command. This value is set if this entry was stabilized to or loaded from the SYSIBM.SYSDNQRY catalog table.
QUERY_HASH	CHAR(16) NOT NULL FOR BIT DATA	The hash key generated by the statement text.
QUERY_HASH_VERSION	INTEGER NOT NULL	The version of QUERY_HASH.
STABILIZED	CHAR(1) NOT NULL	Indicates whether the statement was stabilized.
APPLCOMPAT	CHAR(10) NOT NULL	The application compatibility level of a dynamic SQL statement.
CNO	BIGINT NOT NULL	The command number for the dynamic query capture monitor if applicable. Otherwise 0.
STAT_SUS_CHILDLLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for child L-locks for the statement.
STAT_SUS_OTHERLLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for other L-locks for the statement.
STAT_SUS_PAGESETPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for global pageset or partition L-locks for the statement.
STAT_SUS_PAGEPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for page P-locks for the statement.
STAT_SUS_OTHERPLOCK	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for other P-locks for the statement.
STAT_SUS_PIPE	FLOAT NOT NULL WITH DEFAULT	The accumulated wait time for pipe requests for the statement.
STAT_SUS_PQSYNC	FLOAT NOT NULL WITH DEFAULT	The accumulated waittime for parallel query waits for the statement.
STAT_ACC_TWDP	BIGINT	The accumulated wait time for the accelerator delay protocol.
STAT_ACC_NWDP	BIGINT	The accumulated number of statements for which the wait time for the accelerator delay protocol has expired.

Notes:

1. If the specified value exceeds 2147483647, the column contains the value 2147483647.
2. Statistics are cumulative, across executions of the same statement, and across threads, if the value of COLLID is DSNDYNAMICSQLCACHE. If the value of COLLID is DSNEXPLAINMODEYES, the values are for a single run of the statement only. If the value of COLLID is DSNEXPLAINMODE EXPLAIN, the values of all statistics columns are 0.
3. The column is not applicable when the value of the COLLID column is 'DSNEXPLAINMODEYES' or 'DSNEXPLAINMODEEXPLAIN'

PSPI

DSN_STATEMNT_TABLE

The statement table, DSN_STATEMNT_TABLE, contains information about the estimated cost of specified SQL statements.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the content of each column in STATEMNT_TABLE.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNDYNAMICSQLCACHE'** The row originates from the dynamic statement cache. **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(24) NOT NULL WITH DEFAULT	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
STMT_TYPE	CHAR(6) NOT NULL WITH DEFAULT	The type of statement being explained. Possible values are: **SELECT** SELECT **INSERT** INSERT **UPDATE** UPDATE **MERGE** MERGE **DELETE** DELETE **TRUNCA** TRUNCATE **SELUPD** SELECT with FOR UPDATE OF **DELCUR** DELETE WHERE CURRENT OF CURSOR **UPDCUR** UPDATE WHERE CURRENT OF CURSOR **PRUNED** A query that always returns 0 rows.
COST_CATEGORY	CHAR(1) NOT NULL WITH DEFAULT	Indicates if Db2 was forced to use default values when making its estimates. Possible values: **A** Indicates that Db2 had enough information to make a cost estimate without using default values. **B** Indicates that some condition exists for which Db2 was forced to use default values. See the values in REASON to determine why Db2 was unable to put this estimate in cost category A.
PROCMS	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in milliseconds, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 milliseconds, which is equivalent to approximately 24.8 days. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, the difference is reflected in this value.
PROCSU	INTEGER NOT NULL WITH DEFAULT	The estimated processor cost, in service units, for the SQL statement. The estimate is rounded up to the next integer value. The maximum value for this cost is 2147483647 service units. If the estimated value exceeds this maximum, the maximum value is reported. If an accelerator is used, this value represents the estimated cost including any impact of acceleration.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
REASON	VARCHAR(254) WITH DEFAULT	A string that indicates the reasons for putting an estimate into cost category B. **ACCELMODEL ELIGIBLE** The query is eligible for acceleration. **ACCELMODEL NOT ELIGIBLE** The query is not eligible for acceleration. **HAVING CLAUSE** A subselect in the SQL statement contains a HAVING clause. **HOST VARIABLES** The statement uses host variables, parameter markers, or special registers. **OPTIMIZATION HINTS** An statement-level access path, or PLAN_TABLE access path hint is applied to the statement, or APREUSE(ERROR/WARN) is applied for the package. **PROFILEID *value*** When profile monitoring is used for the statement, the value of the PROFILEID column in SYSIBM.DSN_PROFILE_TABLE. **REFERENTIAL CONSTRAINTS** Referential constraints of the type CASCADE or SET NULL exist on the target table of a DELETE statement. **TABLE CARDINALITY** The cardinality statistics are missing for one or more of the tables that are used in the statement, or the statement used materialized views or table expressions. **TRIGGERS** Triggers are defined on the target table of an insert, update, or delete operation. **UDF** The statement uses user-defined functions.
STMT_ENCODE	CHAR(1) WITH DEFAULT	Encoding scheme of the statement. If the statement represents a single CCSID set, the possible values are: **A** ASCII **E** EBCDIC **U** Unicode If the statement has multiple CCSID sets, the value is M.
TOTAL_COST	FLOAT NOT NULL WITH DEFAULT	The overall estimated cost of the statement. If an accelerator is used, the benefit is reflected in this value. . Use this value for reference purposes only. Db2 does not always choose the access path that has the lowest TOTAL_COST value. Db2 also uses other factors during access path selection, such as the reliability of the filter factor estimates.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 270. Descriptions of columns in DSN_STATEMNT_TABLE (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

IBM Db2 Analytics Accelerator for z/OS documentation

DSN_STAT_FEEDBACK

The DSN_STAT_FEEDBACK table contains recommendations for capturing missing or conflicting statistics that are defined during EXPLAIN. Collecting these statistics by the RUNSTATS utility might improve the performance of the query.

PSPI The values in this table are updated only at EXPLAIN time, and are not modified by the RUNSTATS utility.

Information is captured in this table only for EXPLAIN operations that use the access path selection process. The access path selection process is not used when you issue an EXPLAIN statement with the STMTCACHE or PACKAGE options.

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See “ADMIN_EXPLAIN_MAINT stored procedure” on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table contains descriptions of the columns in the DSN_STAT_FEEDBACK table.

Table 271. Descriptions of columns in the DSN_STAT_FEEDBACK table

Column name	Data Type	Descriptions
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.

Table 271. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.

Table 271. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
SECTNOI	INTEGER NOT NULL WITH DEFAULT WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
TBCREATOR	VARCHAR(128) NOT NULL	The creator of the table.
TBNAME	VARCHAR(128) NOT NULL	The name of the table.
IXCREATOR	VARCHAR(128) NOT NULL	The creator of the index.
IXNAME	VARCHAR(128) NOT NULL	The name of the index.
COLNAME	VARCHAR(128) NOT NULL	The name of the column.
NUMCOLUMNS	SMALLINT NOT NULL	The number of columns in the column group.
COLGROUPCOLNO	VARCHAR(254) NOT NULL FOR BIT DATA	A hex representation that identifies the set of columns associated with the statistics. If the statistics are only associated with a single column, the field contains a zero length. Otherwise, the field is an array of SMALLINT column numbers with a dimension equal to the value in NUMCOLUMNS.
TYPE	CHAR(1) NOT NULL	The type of statistic to collect: **'C'** Cardinality. **'F'** Frequency. **'H'** Histogram. **'I'** Index. **'T'** Table.
DBNAME	VARCHAR(24) NOT NULL	The name of the database.
TSNAME	VARCHAR(24) NOT NULL	The name of the table space.

Table 271. Descriptions of columns in the DSN_STAT_FEEDBACK table (continued)

Column name	Data Type	Descriptions
REASON	CHAR(8) NOT NULL	The reason for the statistics collection recommendation: **'BASIC'** A basic statistic value for a column, table, or index is missing. No statistics were collected for the identified object. **'CONFLICT'** Another statistic contains a value that conflicts with the value of this statistic. Such conflicts usually occur because statistics were collected for related objects at different times. **'COMPFFIX'** Multi-column cardinality statistics are needed for an index compound filter factor. **'DEFAULT'** A predicate references a value that is probably a default value, which indicates that data might be skewed. **'KEYCARD'** The cardinalities of index key columns are missing. **'LOWCARD'** The cardinality of the column is a low value, which indicates that data might be skewed. **'NULLABLE'** Distribution statistics are not available for a nullable column, which indicates that data might be skewed. **'RANGEPRD'** Histogram statistics are not available for a range predicate. **'PARALLEL'** Parallelism might be improved by uniform partitioning of key ranges.
REMARKS	VARCHAR(254) NOT NULL	Free form text for extensibility.

Column descriptions

The following table describes the columns of DSN_STRUCT_TABLE

Table 272. DSN_STRUCT_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
QBLOCKNO	SMALLINT NOT NULL	A number that identifies each query block within a query. The value of the numbers are not in any particular order, nor are they necessarily consecutive.

Table 272. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
APPLNAME	VARCHAR(24) NOT NULL	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.
PROGNAME	VARCHAR(128) NOT NULL	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
PARENT	SMALLINT NOT NULL	The parent query block number of the current query block in the structure of SQL text; this is the same as the PARENT_QBLOCKNO in PLAN_TABLE.
TIMES	FLOAT NOT NULL	The estimated number of rows returned by Data Manager; also the estimated number of times this query block is executed.
ROWCOUNT	INTEGER NOT NULL	The estimated number of rows returned by RDS (Query Cardinality).
ATOPEN	CHAR(1) NOT NULL	Whether the query block is moved up for do-at-open processing; 'Y' if done-at-open; 'N': otherwise.
CONTEXT	CHAR(10) NOT NULL	This column indicates what the context of the current query block is. The possible values are: • 'TOP LEVEL' • 'UNION' • 'UNION ALL' • 'PREDICATE' • 'TABLE EXP' • 'UNKNOWN'
ORDERNO	SMALLINT NOT NULL	Not currently used.
DOATOPEN_PARENT	SMALLINT NOT NULL	The parent query block number of the current query block; Do-at-open parent if the query block is done-at-open, this may be different from the PARENT_QBLOCKNO in PLAN_TABLE.

Table 272. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
QBLOCK_TYPE	CHAR(6) NOT NULL WITH DEFAULT	This column indicates the type of the current query block. The possible values are • 'SELECT' • 'INSERT' • 'UPDATE' • 'DELETE' • 'SELUPD' • 'DELCUR' • ''UPDCUR' • 'CORSUB' • 'NCOSUB' • 'TABLEX' • 'TRIGGR' • 'UNION' • 'UNIONA' • 'CTE' It is equivalent to QBLOCK_TYPE column in PLAN_TABLE, except for CTE.
EXPLAIN_TIME	TIMESTAMP NOT NULL	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
QUERY_STAGE	CHAR(8) NOT NULL	IBM internal use only.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
ORIGIN	CHAR(1) NOT NULL WITH DEFAULT	Indicates the origin of the query block: **Blank** Generated by Db2 **C** Column mask **R** Row permission **U** Specified by the user

Table 272. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.

Table 272. DSN_STRUCT_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

DSN_VIEWREF_TABLE

The view reference table, DSN_VIEWREF_TABLE, contains information about all of the views and materialized query tables that are used to process a query.

PSPI

Recommendation: Do not manually insert data into system-maintained EXPLAIN tables, and use care when deleting obsolete EXPLAIN table data. The data is intended to be manipulated only by the Db2 EXPLAIN function and optimization tools. Certain optimization tools depend on instances of the various EXPLAIN tables. Be careful not to delete data from or drop instances EXPLAIN tables that are created for these tools.

Qualifiers

Your subsystem or data sharing group can contain multiple instances of these tables that are qualified by user ID. These tables are populated with statement cost information when you issue the EXPLAIN statement or bind. They are also populated when you specify EXPLAIN(YES) or EXPLAIN(ONLY) in a BIND or REBIND command. SQL optimization tools might also create EXPLAIN tables that are qualified by a user ID. You can find the SQL statement for creating an instance of these tables in member DSNTESC of the SDSNSAMP library.

Sample CREATE TABLE statement

You can find a sample CREATE TABLE statement for each EXPLAIN table in member DSNTESC of the *prefix*.SDSNSAMP library. You can call the ADMIN_EXPLAIN_MAINT stored procedure to create EXPLAIN tables, upgrade them to the format for the current Db2 release, or complete other maintenance tasks. See "ADMIN_EXPLAIN_MAINT stored procedure" on page 666 for information about using the *action* input parameter to request each of these tasks.

Column descriptions

The following table describes the columns of DSN_VIEWREF_TABLE.

Table 273. DSN_VIEWREF_TABLE description

Column name	Data type	Description
QUERYNO	INTEGER NOT NULL WITH DEFAULT	A number that identifies the statement that is being explained. The origin of the value depends on the context of the row: **For rows produced by EXPLAIN statements** The number specified in the QUERYNO clause, which is an optional part of the SELECT, INSERT, UPDATE, MERGE, and DELETE statement syntax. **For rows not produced by EXPLAIN statements** Db2 assigns a number that is based on the line number of the SQL statement in the source program. When the values of QUERYNO are based on the statement number in the source program, values that exceed 32767 are reported as 0. However, in certain rare cases, the value is not guaranteed to be unique. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, if the QUERYNO clause is specified, its value is used by Db2. Otherwise Db2 assigns a number based on the line number of the SQL statement in the compiled SQL function or native SQL procedure.
APPLNAME	VARCHAR(24) NOT NULL WITH DEFAULT	The name of the application plan for the row. Applies only to embedded EXPLAIN statements that are executed from a plan or to statements that are explained when binding a plan. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column is not used, and is blank.

Table 273. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
PROGNAME	VARCHAR(128) NOT NULL WITH DEFAULT	The name of the program or package containing the statement being explained. Applies only to embedded EXPLAIN statements and to statements explained as the result of binding a plan or package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the specific name of the compiled SQL function or native SQL procedure.
VERSION	VARCHAR(122) NOT NULL WITH DEFAULT	The version identifier for the package. Applies only to an embedded EXPLAIN statement executed from a package or to a statement that is explained when binding a package. A blank indicates that the column is not applicable. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the version identifier of the compiled SQL function or native SQL procedure.
COLLID	VARCHAR(128) NOT NULL WITH DEFAULT	The collection ID: **'DSNEXPLAINMODEYES'** The row originates from an application that specifies YES for the value of the CURRENT EXPLAIN MODE special register. **'DSNEXPLAINMODEEXPLAIN'** The row originates from an application that specifies EXPLAIN for the value of the CURRENT EXPLAIN MODE special register. When the SQL statement is embedded in a compiled SQL function or native SQL procedure, this column indicates the schema name of the compiled SQL function or native SQL procedure.
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT	Authorization ID of the owner of the object.
NAME	VARCHAR(128)	Name of the object.
TYPE	CHAR(1) NOT NULL WITH DEFAULT	The type of the object: **'V'** View **'R'** MQT that has been used to replace the base table for rewrite **'M'** MQT
MQTUSE	SMALLINT WITH DEFAULT	IBM internal use only.

Table 273. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
EXPLAIN_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The time when the EXPLAIN information was captured: **All cached statements** When the statement entered the cache, in the form of a full-precision timestamp value. **Non-cached static statements** When the statement was bound, in the form of a full precision timestamp value. **Non-cached dynamic statements** When EXPLAIN was executed, in the form of a value equivalent to a CHAR(16) representation of the time appended by 4 zeros.
GROUP_MEMBER	VARCHAR(24) NOT NULL	The member name of the Db2 that executed EXPLAIN. The column is blank if the Db2 subsystem was not in a data sharing environment when EXPLAIN was executed.
SECTNOI	INTEGER NOT NULL WITH DEFAULT	The section number of the statement. The value is taken from the same column in SYSPACKSTMT or SYSSTMT tables and can be used to join tables to reconstruct the access path for the statement. This column is applicable only for static statements. The default value of -1 indicates EXPLAIN information that was captured in DB2 9 or earlier.

Table 273. DSN_VIEWREF_TABLE description (continued)

Column name	Data type	Description
EXPANSION_REASON	CHAR(2) NOT NULL WITH DEFAULT	This column applies only to statements that reference archive tables or temporal tables. For other statements, this column is blank. Indicates the effect of the CURRENT TEMPORAL BUSINESS_TIME special register, the CURRENT TEMPORAL SYSTEM_TIME special register, and the SYSIBMADM.GET_ARCHIVE built-in global variable. These items are controlled by the BUSTIMESENSITIVE, SYSTIMESENSITIVE, and ARCHIVESENSITIVE bind options. Db2 implicitly adds certain syntax to the query if one of the following conditions are true: • The SYSIBMADM.GET_ARCHIVE global variable is set to Y and the ARCHIVESENSITIVE bind option is set to YES • The CURRENT TEMPORAL BUSINESS_TIME special register is not null and the BUSTIMESENSITIVE bind option is set to YES • The CURRENT TEMPORAL SYSTEM_TIME special register is not null and the SYSTIMESENSITIVE bind option is set to YES This column can have one of the following values: **'A'** The query contains implicit query transformation as a result of the SYSIBMADM.GET_ARCHIVE built-in global variable. **'B'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL BUSINESS_TIME special register. **'S'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register. **'SB'** The query contains implicit query transformation as a result of the CURRENT TEMPORAL SYSTEM_TIME special register and the CURRENT TEMPORAL BUSINESS_TIME special register. **blank** The query does not contain implicit query transformation.

PSPI

Tables that support query acceleration

To interact with accelerator servers, Db2 requires several tables that record characteristics of accelerated servers and tables.

The following table lists these tables, the table spaces and indexes for these tables, and the index fields for each index. The indexes are in ascending order, except where noted.

Table 274. Tables, table spaces, and indexes for tables that support acceleration of queries

Table	Description	Table space*	Indexes	Index fields
"SYSACCEL.SYSACCELERATORS table" on page 2632	Records the characteristics of accelerator servers.	SYSTSACC	DSNACC01	ACCELERATORNAME
"SYSACCEL.SYSACCELERATEDTABLES table" on page 2633	Records the characteristics of each table that is marked for acceleration.	SYSTSACT	DSNACT01	CREATOR, NAME, ACCELERATORNAME
"SYSACCEL.SYSACCELERATEDPACKAGES table" on page 2635	Records the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.	SYSTSACP	DSNACP01	LOCATION, COLLID, NAME, VERSION
			DSNACP02	LOCATION, COLLID, NAME, CONTOKEN
"SYSACCEL.SYSACCELERATEDTABLESAUTH table" on page 2634	Records the privileges that are held by user users over tables that are enabled for acceleration.	SYSTSATA	DSNATA01	TCREATOR, TNAME, ACCELERATORNAME, GRANTEE

* The table spaces listed in this table are universal table spaces (UTSs). Prior to these table spaces being migrated to type UTS, all of the catalog tables for accelerated queries used the SYSACCEL segmented table space. SYSACCEL is still supported; however, segmented table spaces have been deprecated. If you want to migrate from the single SYSACCEL segmented table space, see Migrating query acceleration tables to universal table spaces (Db2 Installation and Migration).

Related tasks

Creating database objects that support query acceleration (Db2 Installation and Migration)

SYSACCEL.SYSACCELERATORS table

The SYSACCEL.SYSACCELERATORS table contains rows that describe the characteristics of each accelerator server.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
ACCELERATOR-NAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G
LOCATION	VARCHAR(128)	Identifies the location name that is associated with the accelerator server.	G
ACCELERATORSRL	CHAR(64) FOR BIT DATA	Internal use only	I

Column name	Data type	Description	Use
ACCELERATOR_TYPE	SMALLINT NOT NULL	The type of accelerator: **1** Indicates Version 5 or earlier of IBM Db2 Analytics Accelerator for z/OS (an *on-premise* accelerator hardware appliance based on IBM PureData® System for Analytics and IBM Netezza® technology). **2** Indicates IBM Db2 Analytics Accelerator for z/OS on Cloud (built on the IBM Global Cloud infrastructure and based on IBM Db2 on Cloud software). The default value is 1.	G

SYSACCEL.SYSACCELERATEDTABLES table

The SYSACCEL.SYSACCELERATEDTABLES table contains rows that describe the characteristics of each table that is marked for acceleration.

Rows in this table can be inserted, updated, and deleted.

Column name	Data type	Description	Use
NAME	VARCHAR(128) NOT NULL	The name of the table.	G
CREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G
REMOTENAME	VARCHAR(128) NOT NULL	The name of the base alias object.	G
REMOTECREATOR	VARCHAR(128) NOT NULL	The owner of the base alias object.	G
ENABLE	CHAR(1) NOT NULL	Indicates whether the remote table is enabled or disabled for query acceleration: **Y** Enabled **N** Disabled **T** Transition state. Queries are not sent to an accelerator server.	G
CREATEDBY	VARCHAR(128) NOT NULL	The primary authorization ID of the user who created the table.	G

Column name	Data type	Description	Use
CREATEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the CREATE statement was executed for the table.	G
ALTEREDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the table was last altered.	G
REFRESH_TIME	TIMESTAMP NOT NULL WITH DEFAULT	The timestamp when the data was last refreshed. If the data was not refreshed, this column contains the default timestamp ('0001-01-01.00.00.00.000000').	G
SUPPORTLEVEL	SMALLINT NOT NULL	Internal use only.	I
ARCHIVE	CHAR(1)	The archive status of the table in the accelerator database: **A** The table is archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server contains active and archived data. **B** The table is partially archived in the accelerator server that is specified by the ACCELERATORNAME value. The accelerator server can answer queries that contain active data. **C** The table is archived in other accelerator servers. The accelerator server that is specified by the ACCELERATORNAME value contains only active data. **X** The table was restored on another accelerator server. The accelerator server that is specified by the ACCELERATORNAME value cannot answer queries. **blank** The table is not archived in an accelerator server.	G
REMOTELOCATION	VARCHAR(128) NOT NULL WITH DEFAULT	The location of the owner table of the referenced accelerator-only table. For tables that are not referenced accelerator-only tables, this column is blank.	G

SYSACCEL.SYSACCELERATEDTABLESAUTH table

The SYSACCEL.SYSACCELERATEDTABLESAUTH table records the privileges that are held by users over tables that are enabled for acceleration.

Column name	Data type	Description	Use
ACCELERATORNAME	VARCHAR(128) NOT NULL	A unique name for the accelerator server. This is the name by which the accelerator server is known to the local Db2 accelerated query tables.	G

Column name	Data type	Description	Use
GRANTOR	VARCHAR(128) NOT NULL	Authorization ID of the user who granted the privilege.	G
GRANTEE	VARCHAR(128) NOT NULL	Grantee who holds the privileges to access the table in the accelerator. Currently, only a location name for a referencing Db2 for z/OS subsystem is supported. The location name must be the name of a Db2 for z/OS subsystem that was paired to the accelerator when the ACCEL_GRANT_TABLES_REFERENCE stored procedure granted the privilege.	G
GRANTEETYPE	CHAR(1) NOT NULL	Indicates the type of grantee: **S** Subsystem location name	G
TCREATOR	VARCHAR(128) NOT NULL	The schema of the table.	G
TNAME	VARCHAR(128) NOT NULL	The name of the table.	G
SELECTAUTH	CHAR(1) NOT NULL	Indicates whether the GRANTEE can select rows from the table or view: **blank** Privilege is not held. **Y** Privilege is held without the GRANT option.	G
GRANTEDTS	TIMESTAMP NOT NULL WITH DEFAULT	The time when the GRANT statement was executed for the table.	G

SYSACCEL.SYSACCELERATEDPACKAGES table

The SYSACCEL.SYSACCELERATEDPACKAGES table contains rows that describe the characteristics of Db2 packages that are bound with the QUERYACCELERATION and GETACCELARCHIVE bind options.

Do not modify the definition of the SYSACCEL.SYSACCELERATEDPACKAGES table or its indexes unless directed by IBM Support.

Column name	Data type	Description	Use
LOCATION	VARCHAR(128) NOT NULL	Always contains blanks.	S
COLLID	VARCHAR(128) NOT NULL	The name of the package collection.	G
NAME	VARCHAR(128) NOT NULL	The name of the package.	G

Column name	Data type	Description	Use
CONTOKEN	CHAR(8) NOT NULL FOR BIT DATA	Consistency token for the package.	S
VERSION	VARCHAR(122) NOT NULL	Version identifier for the package.	G
OWNER	VARCHAR(128) NOT NULL	Authorization ID of the package owner.	G
CREATOR	VARCHAR(128) NOT NULL	Authorization ID of the owner of the creator of the package version.	G
TIMESTAMP	TIMESTAMP NOT NULL	Timestamp indicating when the package was created.	G
BINDTIME	TIMESTAMP NOT NULL	Timestamp indicating when the package was last bound.	G
RELBOUND	CHAR(1) NOT NULL	The Db2 release when the package was bound or rebound.	G
TYPE	CHAR(1) NOT NULL	Type of package. Identifies how the package is created: **F** A CREATE FUNCTION or ALTER FUNCTION statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a non-inline SQL scalar function package. **N** A CREATE PROCEDURE or ALTER PROCEDURE statement, or a BIND PACKAGE DEPLOY command created the package, and this package is a native SQL routine package. **blank** A BIND PACKAGE command created the package.	G
COPYID	INTEGER NOT NULL	Internal use only. The value is zero.	I

Column name	Data type	Description	Use
QUERYACCELERATION	CHAR(1) NOT NULL	Indicates the query acceleration behavior that is specified for the static SQL queries in the package. This behavior can also apply to dynamic queries in the package if the package does not issue an explicit SET for the CURRENT QUERY ACCELERATION special register. The QUERYACCELERATION bind option does not have a default value. **N** **NONE**. No static SQL query in the package is bound for acceleration or will be accelerated when the package runs. NONE is not a default value. **E** **ENABLE**. A static SQL query is bound for acceleration if it satisfies the acceleration criteria, including the cost and heuristics criteria. The query is routed to an accelerator when the application runs. If a static query does not satisfy the acceleration criteria, the query is bound for execution in Db2. **F** **ENABLEWITHFAILBACK**. Same behavior as **ENABLE**, except if an error occurs on the first OPEN of the accelerated static query when the application runs. In this case, instead of failing the query and returning a negative SQL code to the application, Db2 performs a temporary *statement-level* incremental bind of the query and runs the query in Db2. **L** **ELIGIBLE**. A static SQL query is bound for acceleration if the query meets the basic acceleration criteria, regardless of the cost or heuristics criteria. The query is routed to the accelerator when the application runs. **A** **ALL**. All static SQL queries in the application are to be bound for acceleration and routed to the accelerator when the application runs. If Db2 determines that a static query cannot be bound to run on the accelerator and the query references a user base table or view, Db2 fails the BIND or REBIND PACKAGE operation with an error message for that query.	G

Column name	Data type	Description	Use
GETACCELARCHIVE	CHAR(1) NOT NULL	Indicates whether a static SQL query should retrieve archived data from the accelerator instead of active data from the accelerator. This behavior can also apply to dynamic queries in the package if the package does not issue an explicit SET for the CURRENT GET_ACCEL_ARCHIVE special register. The GETACCELARCHIVE bind option does not have a default value. **N** **NO**. No static SQL query is bound to retrieve archived data from the accelerator. If the static query also is not bound for acceleration, the query is bound to run in Db2. If the static query is bound for acceleration because the QUERYACCELERATION bind option is specified, when the application is run the query is routed to the accelerator. However, the query retrieves only active data on the accelerator. Archived data is not retrieved. **Y** **YES**. If the static query is bound for acceleration, the query retrieves archived data on the accelerator when the application runs if the following criteria is met: • The QUERYACCELERATION bind option is also specified. • The static SQL query references an accelerated table that has partitioned data archived on an accelerator. If the static query cannot be bound for acceleration, Db2 fails the BIND or REBIND PACKAGE operation with an error message for that query.	G
ACCELERATOR	VARCHAR(128) NOT NULL	Indicates the preferred target accelerator or accelerators to be used for queries accelerated from this Db2 package: ***accelerator-name*** An unqualified name that identifies an accelerator. An accelerator name can consist of 1 - 8 uppercase characters or numbers. The name must be unique within the Db2 subsystem or data sharing group. This name can be a physical accelerator name or a logical name (alias) that maps to a physical accelerator name or a group of physical accelerator names. **blank** If the ACCELERATOR bind option not specified, this is the default value, which indicates that no preferred target accelerator will be used and Db2 will determine the target accelerator.	G

Tables that are used for program authorization

For program authorization, a table is provided to record the authorization for a program to execute a plan.

Table spaces and indexes for program authorization

Tables that are used for program authorization are contained in certain table spaces and have indexes.

The following table lists the table space and index for the table that is used for program authorization, and lists the index fields for the index. The index is in ascending order.

Table 275. Table spaces and indexes for the tables that are used for program authorization

TABLE SPACE DSNMDCDB. ...	TABLE SYSIBM. ...	INDEX SYSIBM. ...	INDEX FIELDS
DSNMDCTS	DSNPROGAUTH	DSNPROGAUTH_IDX 1	PROGNAME.PLANNAME

SYSIBM.DSNPROGAUTH table

The SYSIBM.DSNPROGAUTH table enables program authorization with or without program data integrity checking.

Column name	Data type	Description	Use
PROGNAME	VARCHAR(24) NOT NULL	Name of the application program that can run the plan.	G
PLANNAME	VARCHAR(24) NOT NULL	Name of the application plan for the application program.	G
PROGMDCVAL	CHAR(16) NOT NULL FOR BIT DATA WITH DEFAULT X'00000000000000 0-0000000000000000 0'	Reserved.	G
PROGMDCPAD	CHAR(1) NOT NULL WITH DEFAULT	Reserved.	G
CREATOR	VARCHAR(128) NOT NULL WITH DEFAULT CURRENT SQLID	The authorization ID under which the row was inserted or most recently updated.	G
ENABLED	CHAR(1) NOT NULL WITH DEFAULT 'N'	Whether program authorization is enabled: **Y** Program authorization is enabled. **N** Program authorization is disabled.	

Column name	Data type	Description	Use
CREATETS	TIMESTAMP NOT NULL WITH DEFAULT	The time at which the row was inserted or most recently updated.	G
REMARKS	VARCHAR(762)	A user-specified character string.	G

Sample user-defined functions

Some sample user-defined functions are provided with Db2. You can use the functions in your applications just as you would use other user-defined functions, or as examples to help you define your own user-defined functions.

All REST functions are created by installation job DSNTIJRF or the createUDFzOS.sql script and can be used to allow applications to access REST-based services through SQL. For all other sample functions, the following points apply:

- To use these functions in your applications: Use the functions only if installation job DSNTEJ2U, which prepares the functions for use, has been run. Because the external programs that implement the logic of the sample functions are written in C and C++, the installation job requires that your site has IBM C/C ++ for z/OS. For information on installation job DSNTEJ2U, see *Db2 Installation Guide*.
- If you want to use these functions as examples to help you define and implement your own user-defined functions: Data set *prefix*.SDSNSAMP contains the code for the sample functions.
- The detailed descriptions of the functions include their external program names and specific names. The functions are in schema DSN8. The functions are defined to treat character or graphic string parameters, both input and output, as EBCDIC-encoded data.

ALTDATE

The ALTDATE function returns the current date in the specified format or converts a user-specified date from one format to another.

The schema is DSN8.

The ALTDATE function returns the current date in one of the following formats or converts a user-specified date from one format to another:

```
D MONTH YY    D MONTH YYYY    DD MONTH YY    DD MONTH YYYY
D.M.YY        D.M.YYYY        DD.MM.YY       DD.MM.YYYY
D-M-YY        D-M-YYYY        DD-MM-YY       DD-MM-YYYY
D/M/YY        D/M/YYYY        DD/MM/YY       DD/MM/YYYY
M/D/YY        M/D/YYYY        MM/DD/YY       MM/DD/YYYY
YY/M/D        YYYY/M/D        YY/MM/DD       YYYY/MM/DD
YY.M.D        YYYY.M.D        YY.MM.DD       YYYY.MM.DD
              YYYY-M-D                       YYYY-MM-DD
              YYYY-D-XX                      YYYY-DD-XX
```

```
               YYYY-XX-D                      YYYY-XX-DD
where:
D:     Suppress leading zero if the day is less than 10
DD:    Retain leading zero if the day is less than 10
M:     Suppress leading zero if the month is less than 10
MM:    Retain leading zero if the month is less than 10
MONTH: Use English-language name of month
XX:    Use a capital Roman numeral for month
YY:    Use a year format without century
YYYY:  Use a year format with century
```

The ALTDATE function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTDATE function has two forms.

Form 1: ALTDATE(*output-format*)

This form of the function converts the current date into the specified format.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

Form 2: ALTDATE(*input-date, input-format, output-format*)

This form of the function converts a date (*input-date*) in one user-specified format (*input-format*) into another format (*output-format*).

input-date

The argument must be a date or a character string representation of a date in the format specified by *input-format*. The character string must have a data type of VARCHAR and an actual length that is not greater than 17 bytes.

input-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

output-format

A character string that matches one of the 34 date formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 13 bytes.

The result of the function is VARCHAR(17).

The following table shows the external and specific names for the two forms of the function, which are based on the input to the function.

Table 276. External program and specific names for ALTDATE

Conversion type	Input arguments	External name	Specific name
Current date	*output-format* (VARCHAR)	DSN8DUAD	DSN8.DSN8DUADV
User-specified date	*input-date* (VARCHAR) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDVVV
	input-date (DATE) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCD	DSN8.DSN8DUCDDVV

Example 1: Convert the current date into format 'DD MONTH YY', a format that will include any leading zero for the month, the name of the month in English, and the year without the two digits for the century.

```
VALUES DSN8.ALTDATE( 'DD MONTH YY' );
```

Example 2: Convert the current date into format 'D.M.YYYY', a format that will suppress any leading zero for the day or month and include the year with the century.

```
VALUES DSN8.ALTDATE( 'D.M.YYYY' );
```

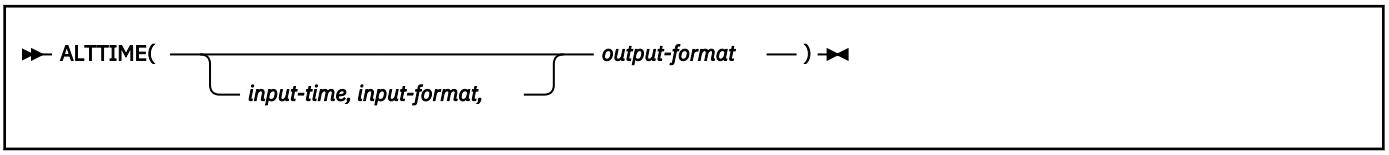
Example 3: Convert the current date into format 'YYYY-XX-DD', a format that will include the century, the month of the year as a roman numeral, and the day of the month with any leading zero.

```
VALUES DSN8.ALTDATE( 'YYYY-XX-DD' );
```

Example 4: Convert a date in the format of 'DD MONTH YYYY' to a date in the format of 'YYYY/MM/DD'.

```
 VALUES DSN8.ALTDATE( '11 November 1918',
                      'DD MONTH YYYY',
                      'YYYY/MM/DD' );
```

The result of the above example is '1918/11/18'.



Example 5: Convert the date that employee 000130 was hired, a date in ISO format, into the format of 'D.M.YY'.

```
SELECT  FIRSTNME || ' '
     ||  LASTNAME || ' was hired on '
     ||  DSN8.ALTDATE( HIREDATE,
                       'YYYY-MM-DD',
                       'D.M.YY' )
   FROM  EMP
  WHERE  EMPNO  = '000130';
```

Assuming that the HIREDATE is '1971-07-28', the above example returns: '`DELORES QUINTANA was hired on 28.7.71`'.

ALTTIME

The ALTTIME function returns the current time in the specified format or converts a user-specified time from one format to another.

The schema is DSN8.

The ALTTIME function returns the current time in one of the following formats or converts a user-specified time from one of the formats to another:

```
H:MM AM/PM           HH:MM AM/PM
HH:MM:SS AM/PM       HH:MM:SS
H.MM                 HH.MM
H.MM.SS              HH.MM.SS
where:
H:      Suppress leading zero if the hour is less than 10
HH:     Retain leading zero if the hour is less than 10
M:      Suppress leading zero if the minute is less than 10
MM:     Retain leading zero if the minute is less than 10
AM/PM:  Return time in 12-hour clock format, else 24-hour
```

The ALTTIME function demonstrates how you can create an overloaded function—a function name for which there are multiple function instances. Each instance supports a different parameter list enabling you to group related but distinct functions in a single user-defined function. The ALTTIME function has two forms.

Form 1: ALTTIME(*output-format*)

This form of the function converts the current time into the specified format.

output-format
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

Form 2: ALTTIME(*input-time, input-format, output-format*)
This form of the function converts a time (*input-date*) in one user-specified format (*input-format*) into another format (*output-format*).

input-time
The argument must be a time or a character string representation of a time in the format specified by *input-format*. A character string argument must have a data type of VARCHAR and an actual length that is not greater than 11 bytes.

input-format
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

output-format
A character string that matches one of the 8 time formats that are shown above. The character string must have a data type of VARCHAR and an actual length that is not greater than 14 bytes.

The result of the function is VARCHAR(11).

The following table shows the external program and specific names for the two forms of the function, which are based on the input to the function.

Table 277. External and specific names for ALTTIME

Conversion type	Input arguments	External name	Specific name
Current time	*output-format* (VARCHAR)	DSN8DUAT	DSN8.DSN8DUATV
User-specified time	*input-time* (VARCHAR) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTVVV
	input-time (TIME) *input-format* (VARCHAR) *output-format* (VARCHAR)	DSN8DUCT	DSN8.DSN8DUCTTVV

Example 1: Convert the current time into a 12-hour clock format without seconds, 'H.MM AM/PM'.

```
VALUES DSN8.ALTTIME( 'H:MM AM/PM' );
```

Example 2: Convert the current time into a 24-hour clock format without seconds, 'HH.MM'.

```
VALUES DSN8.ALTTIME( 'HH.MM' );
```

Example 3: Convert the current time into a 24-hour clock format with seconds, 'HH.MM.SS'.

```
VALUES DSN8.ALTTIME( 'HH.MM.SS' );
```

Example 4: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds.

```
VALUES DSN8.ALTTIME( '00:00:00','HH:MM:SS','HH:MM AM/PM' );
```

The function returns '`12:00 AM`'.

Example 5: Convert '00:00:00', a time in 24-hour clock format with seconds, to a time in 12-hour clock format without seconds and without any leading zero on the hour.

```
VALUES DSN8.ALTTIME( '06.42.37','HH.MM.SS','H:MM AM/PM' );
```

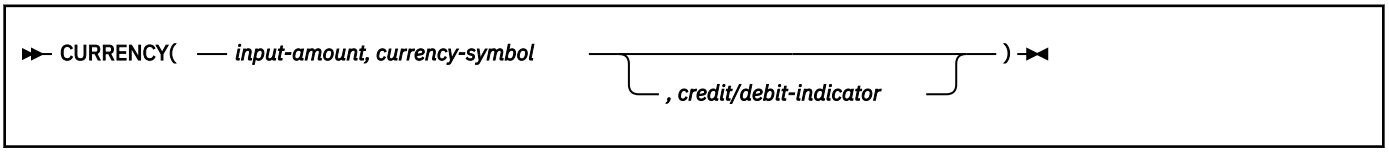
The function returns '6:42 AM'.

BASE64ENCODE and BASE64DECODE

The BASE64ENCODE and BASE64DECODE helper REST functions complete Base64 encoding or decoding of the provided text.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.



text
Specifies the text to encode or decode. For BASE64ENCODE, this argument is provided as a VARCHAR(2732) value and the function returns a Base64-encoded string. For BASE64DECODE, this argument is provided as a Base64-encoded VARCHAR(4096) value and the function returns the data as binary.

Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

CURRENCY

The CURRENCY function returns a value that is formatted as an amount with a user-specified currency symbol and, if specified, one of three symbols that indicate debit or credit.

The schema is DSN8.

input-amount
An expression that specifies the value to be formatted. The expression must be a floating-point value.

currency-symbol
A character string that specifies the currency symbol. The string must have a data type of VARCHAR and an actual length that is not greater than 2 bytes.

credit/debit-indicator
A character string that specifies the symbol that is included with the result to indicate whether the value is negative or positive. The string must have a data type of VARCHAR and an actual length that is not greater than 5 bytes. If *credit/debit-indicator* is not specified or is the value null, the result is formatted without an indicator symbol. You can specify the following symbols:

CR/DB
Bank style. Negative input values are appended with 'DB'; positive input values are appended with 'CR'.

+/-
Arithmetic style. Negative input values are prefixed with a minus sign '-'; positive values are formatted without symbols.

(/)
Accounting style. Negative input values are enclosed in parentheses '( )'; positive values are formatted without symbols.

The result of the function is VARCHAR(19).

The CURRENCY function uses the C language functions `strfmon` to facilitate formatting of money amounts and `setlocale` to initialize `strfmon` for local conventions. If `setlocale` fails, the CURRENCY function returns an error.

The following table shows the external program and specific names for CURRENCY. The specific names differ depending on the input to the function.

Table 278. External program and specific names for CURRENCY

Input arguments	External name	Specific name
input-amount *currency-symbol*	DSN8DUCY	DSN8.DSN8DUCYFV
input-amount *currency-symbol* *credit/debit-indicator*	DSN8DUCY	DSN8.DSN8DUCYFVV

Example 1: Express® '-1234.56' as an amount in US dollars, using the bank style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'$','CR/DB' );
```

The result of the function is '$1,234.56 DB'.

Example 2: Express '-1234.56' as an amount in Deutsche marks, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'DM','(/)' );
```

The result of the function is '(DM 1,234.56)'.

Example 3: Express '-1234.56' as an amount in Canadian dollars, using the accounting style debit/credit indicator to indicate whether the value is negative or positive.

```
VALUES DSN8.CURRENCY( -1234.56,'CD','+/-' );
```

The result of the function is '-CD 1,234.56'.

DAYNAME

The DAYNAME function returns the name of the weekday on which a given date falls. The name is returned in English.

The schema is DSN8.

input-date
A valid date or valid character string representation of a date. A character string representation The string must have a data type of VARCHAR and an actual length that is not greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The DAYNAME function uses the IBM C++ class`IDate`.

The following table shows the external and specific names for DAYNAME. The specific names differ depending on the data type of the input argument.

Table 279. External and specific names for DAYNAME

Input arguments	External name	Specific name
input-date (VARCHAR)	DSN8EUDN	DSN8.DSN8EUDNV
input-date (DATE)	DSN8EUDN	DSN8.DSN8EUDND

Example 1: For the current date, find the day of the week.

```
VALUES DSN8.DAYNAME( CURRENT DATE );
```

Example 2: Find the day of the week on which leap year falls in the year 2008.

```
VALUES DSN8.DAYNAME( '2008-02-29' );
```

The result of the function is 'Friday'.

Example 3: Find the day of the week on which Delores Quintana, employee number 000130, was hired.

```
SELECT  FIRSTNME || ' '
    ||  LASTNAME || ' was hired on '
    ||  DSN8.DAYNAME( HIREDATE ) || ', '
    ||  CHAR( HIREDATE )
  FROM  EMP
 WHERE  EMPNO  = '000130';
```

The result of the function is 'DELORES QUINTANA was hired on Wednesday, 1971-07-28'.

HDFS_READ

The HDFS_READ function reads data from a delimiter-separated file in the Hadoop Distributed File System (HDFS).

The schema is SYSFUN.

file-url
An expression that specifies the server address and path of the input file in HDFS. *file-url* is a VARCHAR(512) value.

options
An expression that specifies a list of *name=value* pairs. Each pair must be separated from the following pair by a space character. *options* is a VARCHAR(256) value. *options* can contain any of the following name and value pairs:

delimiter=*delimiter-value*
Identifies the character that is used as the delimiter in the input file that is specified by *file-url*.

user=*user-value*
Specifies an IBM InfoSphere® BigInsights® user name that has access to the input file that is specified by *file-url*.

password=*password-value*
Specifies the password for the IBM InfoSphere BigInsights user that is identified by user=*user-value*.

authport=*authport-value*
Specifies the port for form-based authentication of the input. The default is 8080.

The HDFS_READ function returns a table with one row for each record in the input file. HDFS_READ is a generic table function, which means that the columns in the returned table are defined when the table is referenced, instead of when the table is defined.

Example 1: Read an HDFS file whose URL is http://hdfssrv.svl.ibm.com:8080. The input file delimiter is a comma. Use the default authorization port. The records in the input file have two fields: a DECIMAL(8,3) field, and an INTEGER field.

```
SELECT * FROM TABLE(
 HDFS_READ(
 'http://hdfssrv.svl.ibm.com:8080',
 'delimiter=, user=biadmin password=passw0rd'))
 AS T1(C1 DECIMAL(8,3), C2 INTEGER);
```

Example 2: Read an HDFS file whose URL is the location to which the output of a successful Jaql query is written. That location is specified by the *return-string* parameter of the JAQL_SUBMIT invocation that submits the Jaql query.

```
SELECT * FROM TABLE(
 HDFS_READ(
  JAQL_SUBMIT(
   '[[15.3, 16],[170.99,180]]->
    write(del(location=''/tmp/test1.csv''));',
    'http://hdfssrv.svl.ibm.com:14000/webhdfs/v1/tmp/test1.csv',
   'http://jaqlsrv.svl.ibm.com:8080',
   'timeout=60 user='biadmin', password=passw0rd'),
  'user=biadmin password=passw0rd'))
 AS T1(C1 DECIMAL(8,3), C2 INTEGER);
```

HTTPBLOB

The HTTPBLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as BLOB data.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method
Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

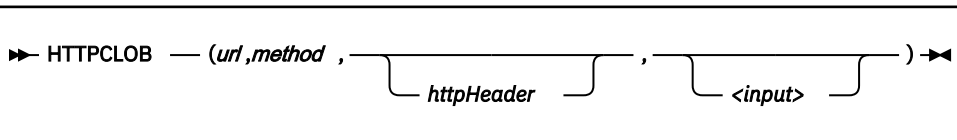
- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.



<input>
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M).

Related tasks
Creating REST user-defined functions (Db2 Installation and Migration)

HTTPCLOB

The HTTPCLOB REST function completes an HTTP request with the specified HTTP verb. Response messages from the server are returned as CLOB data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL at which to complete the request. This argument is defined as a VARCHAR(2048) value.

method
Specifies the HTTP verb to use. Valid values are GET, POST, PUT, and DELETE.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

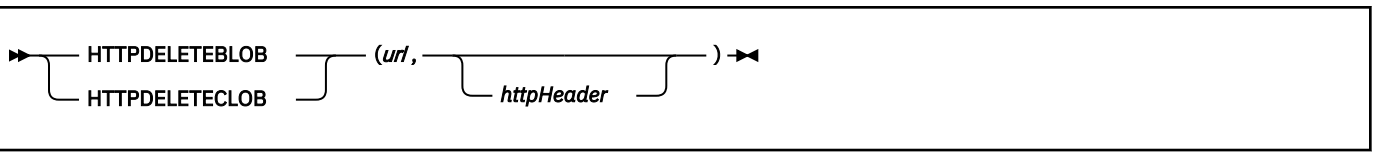
```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

<input>
Specifies the data to update at the specified URL. This argument is defined as CLOB(5M).



Related tasks

HTTPDELETEBLOB and HTTPDELETECLOB

The HTTPDELETEBLOB and HTTPDELETECLOB REST functions delete a binary or text-based resource from the specified URL through an HTTP DELETE request. HTTPDELETEBLOB returns messages as BLOB data. HTTPDELETECLOB returns messages as CLOB data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2

native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL of the resource being accessed. This parameter is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

HTTPGETBLOB and HTTPGETCLOB

The HTTPGETBLOB and HTTPGETCLOB REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. HTTPGETBLOB returns the resource as BLOB(5M) data.

HTTPGETCLOB returns the resource as CLOB(5M) data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL of the resource being accessed. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

Examples

The examples in this section assume that the following requirements have been met:

- db2restudf.jar is defined in your CLASSPATH.
- The REST user-defined function (UDF) has been created.
- The server that's specified in the SQL statement is running.

In most cases, the results that are shown are truncated to include only the relevant parts of the output.

Example 1. The following SQL statement retrieves data from an IBM developer community. You can use this statement to verify your configuration.

```
SELECT DB2XML.HTTPGETCLOB(
   CAST ('https://www.ibm.com/developerworks/community/blogs/e429a8a2-b27f-48f3-aa73-
ca13d5b69759/entry/Pattern' AS VARCHAR(255)),
   CAST(NULL AS CLOB(1K)))
 FROM SYSIBM.SYSDUMMY1
```

The results will contain output that's similar to this:

```
<!doctype html>
<html lang="en-US">
<head>
        <meta charset="UTF-8">
        <meta name="viewport" content="width=device-width, initial-scale=1">
        <link rel="profile" href="http://gmpg.org/xfn/11">
        <title>Community &#8211; IBM Developer</title>
<link rel='dns-prefetch' href='//unpkg.com' />
<link rel='dns-prefetch' href='//1.www.s81c.com' />
<link rel='dns-prefetch' href='//s.w.org' />
<link rel="alternate" type="application/rss+xml" title="IBM Developer &raquo; Feed"
href="https://developer.ibm.com/fee
  1 record(s) selected
```

Example 2. The following SQL statement retrieves information, in JSON format, about a book based on its ISBN identifier:

```
SELECT DB2XML.HTTPGETCLOB(
   CAST ('https://www.googleapis.com/books/v1/volumes?q=isbn:9781583478608' AS VARCHAR(255)),
   CAST(NULL AS CLOB(1K)))
 FROM SYSIBM.SYSDUMMY1
```

The results will contain output that's similar to this:

```
{
 "kind": "books#volumes",
 "totalItems": 1,
 "items": [
  {
   "kind": "books#volume",
   "id": "7qGQvgAACAAJ",
   "etag": "IfzEprGDfNA",
   "selfLink": "https://www.googleapis.com/books/v1/volumes/7qGQvgAACAAJ",
   "volumeInfo": {
    "title": "DB2 12 for Z/OS--The #1 Enterprise Database",
    "subtitle": "SECURE, SEAMLESS INTEGRATION for an Analytics, Mobile and Cloud World",
    "authors": [
     "Surekha Parekh"
    ],
    "publisher": "MC Press",
    "publishedDate": "2016-11-01",
    "de
  1 record(s) selected
```

Example 3. The following SQL statement retrieves information from the British National Library, and the results are returned in XML:

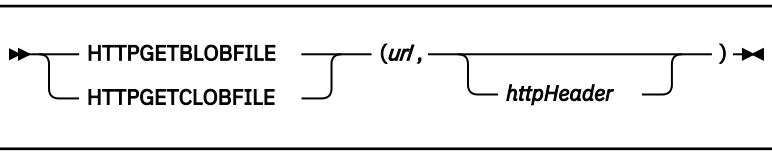
```
SELECT DB2XML.HTTPGETCLOB(
   CAST ('http://bnb.data.bl.uk/doc/resource/007446989.xml' AS VARCHAR(255)),
   CAST(NULL AS CLOB(1K)))
 FROM SYSIBM.SYSDUMMY1
```

This statement returns results that are similar to this:

```
<?xml version="1.0" encoding="utf-8"?>
<result format="linked-data-api" version="0.2" href="http://bnb.data.bl.uk/doc/resource/
007446989.xml">
<primaryTopic href="http://bnb.data.bl.uk/id/resource/007446989"><sameAs href="http://
bnb.data.bl.uk/id/resource/GB9212849"/>
<label>On parade / Leonard Sanitt</label><type><item href="http://purl.org/dc/terms/
BibliographicResource"/>
<item href="http://purl.org/ontology/bibo/Book"/></type><publication href="http://
bnb.data.bl.uk/id/resource/007446989/public
  1 record(s) selected
```

Example 4. When you query a server that requires authentication, you can use the following syntax to specify a user ID and password:

```
WITH Authorization AS (
  SELECT DB2XML.BASE64ENCODE(CAST('<userid>:<password>' AS   VARCHAR(64) CCSID 1208)) AS
Authorization_Identity
FROM SYSIBM.SYSDUMMY1
)
SELECT DB2XML.HTTPGETCLOB(
  CAST ('https://gateway.watsonplatform.net/tone-analyzer/api/v3/tone?version=2016-05-19&text='
|| DB2XML.URLENCODE('some text here','') AS VARCHAR(255)),
  CAST('<httpHeader><header name="Authorization" value="Basic '||Authorization_Identity||'" /></
httpHeader>' AS CLOB(1K)))
FROM Authorization
```



Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

HTTPGETBLOBFILE and HTTPGETCLOBFILE

The HTTPGETBLOBFILE and HTTPGETCLOBFILE REST functions retrieve a binary or text-based resource from the specified URL through an HTTP GET request. The resource is stored in a temporary file, and the path of the temporary file is returned as VARCHAR data. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL of the resource that is being accessed. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.

Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

HTTPHEAD

The HTTPHEAD REST function verifies the HTTP header for the specified resource through an HTTP HEAD request. The HTTP header is returned as CLOB or XML data.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL of the resource. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

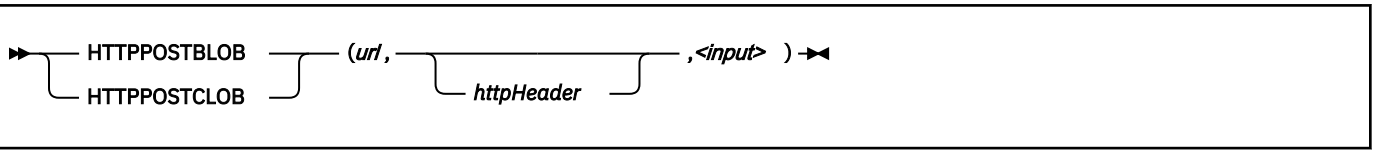
followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.



Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

HTTPPOSTBLOB and HTTPPOSTCLOB

The HTTPPOSTBLOB and HTTPPOSTCLOB REST functions update a binary or text-based resource under the specified URL through an HTTP POST request. Response messages from the server are returned as BLOB for HTTPPOSTBLOB or as CLOB for HTTPPOSTCLOB. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL at which to update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

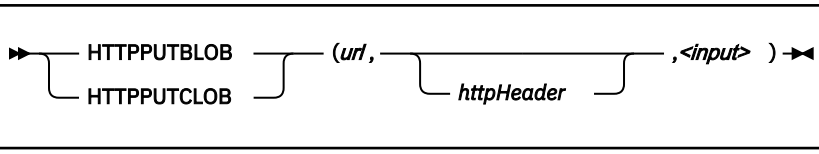
- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.



<input>
Specifies the data to update at the specified URL. This argument is defined as BLOB(5M) for HTTPPOSTBLOB or CLOB(5M) for HTTPPOSTCLOB.

Related tasks
Creating REST user-defined functions (Db2 Installation and Migration)

HTTPPUTBLOB and HTTPPUTCLOB

The HTTPPUTBLOB and HTTPPUTCLOB REST functions create or update a binary or text-based resource under the specified URL through an HTTP PUT request. Response messages from the server are returned as BLOB for HTTPPUTBLOB or as CLOB for HTTPPUTCLOB. The character set is converted into the database code page if necessary.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

url
Specifies the URL at which to create or update the data. This argument is defined as a VARCHAR(2048) value.

httpHeader
Specifies an optional header XML document. This argument is defined as a CLOB(10K) value.

The XML header document can provide additional HTTP header values in the following format:

```
<httpHeader headerAttribute="headerAttributeValue">
        <header name="name" value="value" />
</httpHeader>
```

headerAttribute
Specify any of the following optional attributes:

connectTimeout
Specifies an integer value for the connection timeout threshold in milliseconds.

readTimeout
Specifies an integer value for the read timeout threshold in milliseconds.

followRedirects
Specifies whether redirects should be followed. This is a boolean value.

useCaches
Specifies whether caches should be used. This is a boolean value.

responseMsgFormat
Specifies the header attribute value errorTagged, to indicate that when the server returns an error message to the user-defined function, the user-defined function returns the following values to the caller:

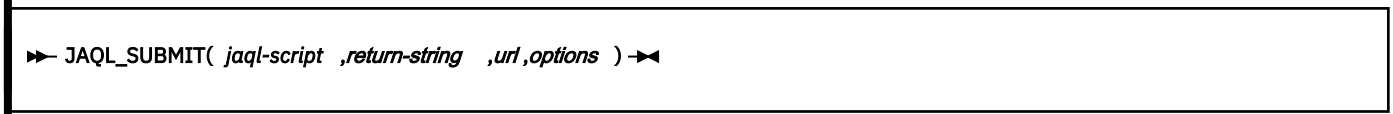
- SQLCODE 0
- The error message from the server, in the following format:

```
<error httprc="{HTTP-status-code}">
  {error-message-returned-from-server}
</error>
```

headerAttributeValue
Specifies a value for the *headerAttribute*. Separate *headerAttribute* and *headerAttributeValue* combinations with single spaces.

name
The header name.

value
The header value.



<input>
Specifies the data to create or update at the specified URL. This argument is defined as BLOB(5M) for HTTPPUTBLOB or CLOB(5M) for HTTPPUTCLOB.

Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

JAQL_SUBMIT

The JAQL_SUBMIT function invokes an IBM InfoSphere BigInsights Jaql query from a Db2 application.

The schema is SYSFUN.

jaql-script
Specifies a script that contains one or more Jaql queries, with or without parameter declarations. *jaql-script* is a VARCHAR(8000) value.

return-string
Specifies a string that is used as the returned value when the Jaql script completes successfully. *return-string* is a VARCHAR(512) value.

url
Specifies the URL of a Jaql server that accepts requests from the Db2 client, runs the queries that are specified in *jaql-script*, and returns results. *url* is a VARCHAR(512) value.

options
An expression that specifies a list of *name=value* pairs. Each pair must be separated from the following pair by a space character. *options* is a VARCHAR(256) value. *options* can contain any of the following name and value pairs:

timeout=*timeout-value*
Specifies the maximum time in seconds to wait for results to be returned from the Jaql server that is specified in the *url* parameter.

user=*user-value*
Specifies an IBM InfoSphere BigInsights user name that has access to the Jaql server.

password=*password-value*
Specifies the password for the IBM InfoSphere BigInsights user that is identified by user=*user-value*.

The JAQL_SUBMIT function returns a VARCHAR(512) string that contains the results of executing the Jaql script.

Example 1: Submit a Jaql script to a Jaql server. The Jaql script writes an array to a file, in delimited format. The URL of the Jaql server is http://jaqlsrv.svl.ibm.com:8080. Do not specify the string that is to be returned if the script completes successfully. Wait for a maximum of 60 seconds for output to be returned.

```
SELECT SYSFUN.JAQL_SUBMIT(
 '[[15.3, 16],[170.99,180]]->
 write(del(location=''/tmp/test1.csv''));',
 '',
 'http://jaqlsrv.svl.ibm.com:8080',
 'timeout=60 user=biadmin password=passw0rd')
 FROM SYSIBM.SYSDUMMY1;
```

Db2 11 for z/OS Technical Overview (IBM Redbooks)

MONTHNAME

The MONTHNAME function returns the calendar name of the month in which a given date falls. The name is returned in English.

The schema is DSN8.

input-date
A valid date or valid character string representation of a date. A character string representation must have a data type of VARCHAR and an actual length that is no greater than 10 bytes. The date must be in ISO format.

The result of the function is VARCHAR(9).

The MONTHNAME function uses the IBM C++ class `IDate`.

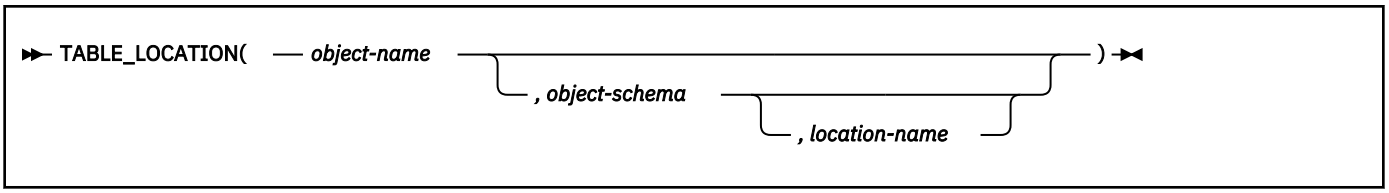
The following table shows the external and specific names for MONTHNAME. The specific names differ depending on the data type of the input argument.

Table 280. External and specific names for MONTHNAME

Input arguments	External name	Specific name
input-date (VARCHAR)	DSN8EUMN	DSN8.DSN8EUMNV
input-date (DATE)	DSN8EUMN	DSN8.DSN8EUMND

Example 1: For the current date, find the name of the month.

```
   VALUES DSN8.MONTHNAME( CURRENT DATE );
```



Example 2: Find the month of the year in which Delores Quintana, employee number 000130, was hired.

```
SELECT  FIRSTNME || ' '
    ||  LASTNAME || ' was hired in the month of '
    ||  DSN8.MONTHNAME( HIREDATE )
    ||  CHAR( HIREDATE )
  FROM  EMP
 WHERE  EMPNO  = '000130';
```

The result of the function is 'DELORES QUINTANA was hired in the month of July'.

TABLE_LOCATION

The TABLE_LOCATION function searches for an object and returns the location name of the object after any alias chains have been resolved.

The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location-name*. If the starting point does not refer to an alias, the location name of the starting point is returned. The resulting name can be of a table, view, or undefined object. The function returns a blank if there is no location name.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(16). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_LOCATION. The specific names differ depending on the number of input arguments to the function.

Table 281. External and specific names for TABLE_LOCATION

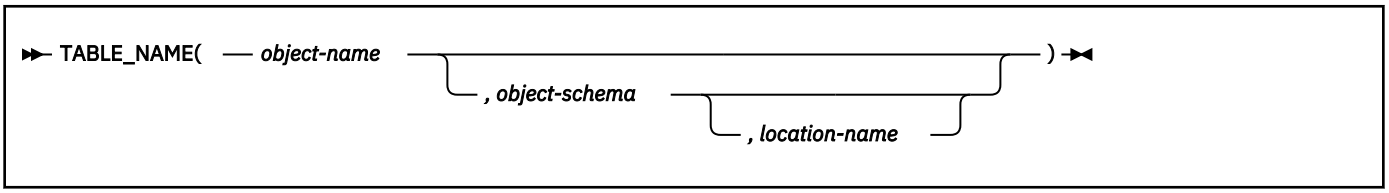
Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVV

Table 281. External and specific names for TABLE_LOCATION (continued)

Input arguments	External name	Specific name
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTILVVV

Example: Assume that:

- DSN8.ALIAS_RS_SYSTABLES is an alias of SYSIBM.SYSTABLES at location name 'REMOTE_SITE'.
- The CURRENT SQLID is DSN8.



Use TABLE_LOCATION to find the location name where the base object for ALIAS_RS_SYSTABLES resides.

```
    VALUES DSN8.TABLE_LOCATION( 'ALIAS_RS_SYSTABLES' );
```

The result of the function is 'REMOTE_SITE'.

TABLE_NAME

The TABLE_NAME function searches for an object and returns the unqualified name of the object after any alias chains have been resolved.

The schema is DSN8.

The starting point of the resolution is the object that is specified by *object-name* and, if specified, *object-schema* and *location name*. If the starting point does not refer to an alias, the unqualified name of the starting point is returned. The resulting name can be of a table, view, or undefined object.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR and an actual length than is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

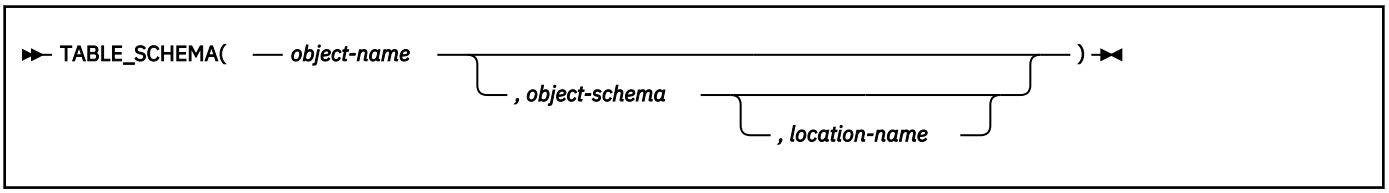
The following table shows the external and specific names for TABLE_NAME. The specific names differ depending on the number of input arguments to the function.

Table 282. External and specific names for TABLE_NAME

Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVV
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTINVVV

Example: Assume that:

- DSN8.VIEW_OF_SYSTABLES is a view of SYSIBM.SYSTABLES.
- DSN8.ALIAS_OF_VIEW is an alias of DSN8.VIEW_OF_SYSTABLES.
- The CURRENT SQLID is DSN8.



Use TABLE_NAME to find the name of the base object for ALIAS_OF_VIEW.

```
VALUES DSN8.TABLE_NAME( 'ALIAS_OF_VIEW' );
```

The result of the function is 'VIEW_OF_SYSTABLES'.

TABLE_SCHEMA

The TABLE_SCHEMA function searches for an object and returns the schema name of the object after any synonyms or alias chains have been resolved.

The schema is DSN8.

The starting point of the resolution is the object that is specified by *objectname* and *objectschema*. If the starting point does not refer to an alias or synonym, the schema name of the starting point is returned. The resulting schema name can be of a table, view, or undefined object.

object-name
A character expression that specifies the unqualified name to be resolved. The unqualified name is usually of an existing alias. *object-name* must have a data type of VARCHAR and an actual length that is no greater than 18 bytes.

object-schema
A character expression that represents the schema that is used to qualify the value specified in *object-name* before resolution. *object-schema* must have a data type of VARCHAR and an actual length that is no greater than 8 bytes.

If *object-schema* is not specified or is null, the default schema is used for the qualifier.

location-name
A character expression that represents the location that is used to qualify the value specified in *object-name* before resolution. *location-name* must have a data type of VARCHAR (and an actual length that is no greater than 16 bytes.

If *location-name* is not specified or is null, the location name is equivalent to "any".

The result of the function is VARCHAR(128). If *object-name* can be null, the result can be null; if *object-name* is null, the result is the null value.

The following table shows the external and specific names for TABLE_SCHEMA. The specific names differ depending on the number of input arguments.

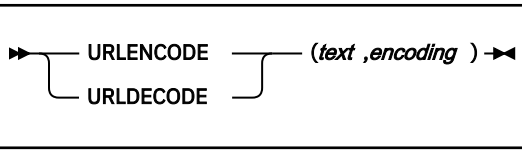
Table 283. External and specific names for function TABLE_SCHEMA

Input arguments	External name	Specific name
object-name (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISV
object-name (VARCHAR) *object-schema* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISVV
object-name (VARCHAR) *object-schema* (VARCHAR) *location-name* (VARCHAR)	DSN8DUTI	DSN8.DSN8DUTISVVV

Example: Assume that:

- DSN8.ALIAS_OF_SYSTABLES is an alias of SYSIBM.SYSTABLES.
- The CURRENT SQLID is DSN8.

Find the name of the schema of the base table for ALIAS_OF_SYSTABLES.



```
VALUES DSN8.TABLE_SCHEMA( 'ALIAS_OF_SYSTABLES' );
```

The result of the function is 'SYSIBM'.

URLENCODE and URLDECODE

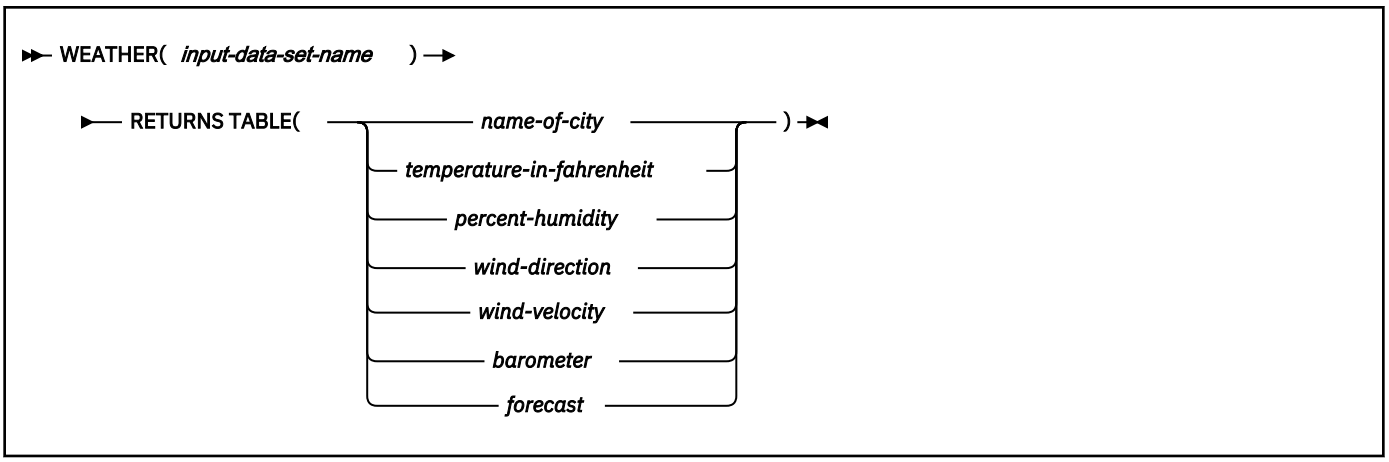
The URLENCODE and URLDECODE helper REST functions complete URL encoding or decoding of the provided text.

Tip: The sample HTTP user-defined functions are intended to be used within Db2 SQL applications to access remote non-Db2 REST-based services through SQL statements. Do not confuse them with Db2 native REST services, which supports using a REST-based interface to interact with Db2 data from web, mobile, and cloud applications.

The schema is DB2XML.

text
Specifies the text to encode or decode. This argument is defined as a VARCHAR(2048) value.

encoding
Specifies the character set that is to be used. It can be set to NULL where UTF-8 is used as the default.



Related tasks

Creating REST user-defined functions (Db2 Installation and Migration)

WEATHER

The WEATHER function returns information from a TSO data set as a Db2 table. The TSO data set contains sample weather statistics for various cities in the United States. The statistics are returned to the client

with a row for each city and a column for each statistic. The WEATHER function is provided primarily to help you design and implement table functions.

The schema is DSN8.

Unlike the other sample user-defined functions, which are scalar functions, WEATHER is a table function. WEATHER shows how to use a table function to make non-relational data available to a client for manipulation by SQL.

input-data-set-name
The name of the TSO data set that contains sample weather statistics. The name is a character string with a data type of VARCHAR and an actual length that is not greater than 44 bytes.

The result of the function is a Db2 table with the following columns. Each column can be null.

name-of-city
VARCHAR(30)

temperature-in-fahrenheit
INTEGER

percent-humidity
INTEGER

wind-direction
VARCHAR(5)

wind-velocity
INTEGER

barometer
FLOAT

forecast
VARCHAR(25)

The external program name for the function is DSN8DUWF, and the specific name is DSN8.DSN8DUWF.

Example: Find the name of and the forecast for the cities that have a temperature less than 25 degrees.

```
SELECT CITY, FORECAST
  FROM TABLE(DSN8.WEATHER('prefix.SDSNIVPD(DSN8LWC)')) AS W
  WHERE TEMP_IN_F < 25
  ORDER BY CITY;
```

This example returns:

```
Bessemer, MI     Slight chance of snow
Cheyenne, WY     Continued cooling
Helena, MT       Heavy snow
Pierre, SD       Continued cold
```

Information resources for Db2 11 for z/OS and related products

Information about Db2 11 for z/OS and products that you might use in conjunction with Db2 11 is available online in IBM Knowledge Center.

You can find the complete set of product documentation for Db2 11 for z/OS in IBM Knowledge Center.

Programming interface information

This information is intended to help you to code SQL statements. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by Db2 11 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by Db2 11 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of Db2 11 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

PSPI Product-sensitive Programming Interface and Associated Guidance Information... PSPI

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at "Copyright and trademark information" at: http://www.ibm.com/legal/copytrade.shtml.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions:

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s Privacy Policy at http://www.ibm.com/privacy and IBM’s Online Privacy Statement at http://www.ibm.com/privacy/details the section entitled “Cookies, Web Beacons and Other Technologies” and

the “IBM Software Products and Software-as-a-Service Privacy Statement” at http://www.ibm.com/software/info/product-privacy.
